General Marchand, who had been arrested by the seditions soldiers, was now brought before him. Indignant at the insult which had been offered to this officer, Napoleon ordered him to be immediately released, and pressed him to re-assume the command of the town. "I may appeal to yourself," replied the general, "that I once served you faithfully. Your abdication released me from my allegiance to you; and I have since sworn fidelity to the Bourbons. Here is my sword. I can again submit to become a prisoner, but I can never be a traitor." Napoleon mused for a moment. He was evidently and deeply affected: "General," said he, "take back your sword. You have hitherto used it as a true soldier, and I respect you too much to urge you now to use it in a way which your conscience would disapprove. You are at liberty to depart."

On the next day Napoleon gave audience to the municipality, and chief officers of the troops, when the mayor delivered the following address. "Sire! The inhabitants of Grenoble, enraptured to behold again the conqueror of Europe, the prince with whose name are associated the most glorious recollections, hasten to lay at the feet of your majesty the tribute of their respect and their love. Attached to your glory and that of the army, they have lamented, with your brave soldiers, the unfortunate events

events which, for a short time, have thrown a cloud over your eagles. They know that treason had delivered up our country to foreign troops; and, your majesty, yielding to the force of necessity, had preferred a momentary exile to the convulsive struggles of civil war. Like the great Camillus, the sovereign power had not unduly elated your mind, and banishment has not depressed it. Every thing is now changed. The cypress has disappeared. The laurels once more flourish. The French people recover their energy. The hero of Europe re-assumes his rank, and the great nation is immortal."

To this Napoleon replied, "Men of Dauphiny, You have gratified the expectations which I had formed of you. When I disembarked on the shores of France, I wished to arrive with the rapidity of an eagle in the good city of Grenoble, whose patriotism and attachment to my person were well known to me. I feel myself unable to express the esteem and regard for you which your elevated sentiments have inspired. My heart is full of the emotions which you have produced. I shall ever retain the recollection of them."

The treason of the garrison of Grenoble placed Napoleon at the head of an army of 10,000 men, with a considerable park of artillery. He was now confident of success. At two o'clock he reviewed his troops, and proceeded on his march towards Lyons. At this time he issued the following declaration to the French, and particularly to the Parisians: "After an abdication, the circumstances of which you are acquainted with; after a treaty, all the articles of which have been violated; after having seen my retreat penetrated by numerous assassins, all sent by the Bourbons; after having seen the French ministers intriguing at Vienna, to wrest from me the asylum to which I was reduced, and to take from my wife and son the states which had been guaranteed to them; from that son whose birth inspired you with so lively a joy, and who ought to have been to all the sovereigns a sacred pledge: all these attempts, made in violation of plighted faith, have restored me to my throne and my liberty. Frenchmen! soon I shall be in my capital; I come surrounded by my brave brethren in arms, after having delivered our provinces of the south, and my good city of Lyons, from the reign of fanaticism, which is that of the Bourbons. Fifteen days have sufficed me to unite these faithful warriors, the honour of France; and before the 30th of this month, your happy emperor, the sovereign of your choice, will put to flight those slothful princes, who wish to render you tributary to foreigners, and the contempt of Europe. France shall still be the happiest country in the world. The French shall still be the great nation; Paris shall again become the queen of cities, as well as the seat of sciences and the arts. In concert with you, I will take measures in order that the state may be governed constitutionally, and that a wise liberty may never degenerate into licentiousness. I will mitigate, to the satisfaction of all, those imposts, become odious, which the Bourbons gave you their princely word they would abolish, under the title of *droits réunis*, and which they have re-established under the title of indirect impositions. Property shall be, without distinction, respected and sacred, as well as individual liberty. The general tranquillity shall be constantly the object of my efforts; commerce, our flourishing manufactures, and agriculture, which, under my reign, attained so high a prosperity, shall be relieved from the enormous impositions with which an ephemeral government have burdened it. Every thing shall be restored to order; and the dissipation of the finances of the state, to gratify the luxury of the court, shall be immediately repressed. No vengeance; it is far from my heart. The Bourbons have set a price on my head, and I pardon them. If they fall into my power I will protect them; I will deliver them to their allies, if they wish it, or to that foreign country where their chief has already reigned nineteen years, and where he may continue his glorious reign. To this my vengeance is limited. Be calm, Parisians; and you, na-

tional guards of that noble city, you who have already rendered such great service; you who, but for treason, would have been enabled to defend it for some hours longer, against those allies who were ready to fly from France; continue to protect property and civil liberty; then you will have deserved well of your country, and of your emperor. From my imperial general head-quarters, Bourgoing.

(Signed)

NAPOLEON."

When the French government was first apprised of the landing of Napoleon at Cannes, it affected to hide, under the appearance of profound security, its heartfelt dismay. The Bulletin by which this event was made known, proclaimed "that Bonaparte, in a fit of madness worthy of crowning his life, had thrown himself on the coast of France at the head of 7 or 800 banditti; that the gendarmerie were in pursuit of him, and that he was deprived of all hopes of re-embarkation; that his having come of his own accord to receive the punishment due to his crimes, was a most fortunate event; that government had taken all the necessary precautions, and that the tranquillity of the public would not for one moment be disturbed by the mad attempt of an adventurer." The nobility that formed the court of the Bourbons, uniting credulity to presumption, gave implicit belief to these assertions; and, the succeeding bulletins having announced, "that, as soon as it was known that Bonaparte had disembarked, the surrounding population had run to arms, in defence of the legitimate sovereign; that it was even necessary to restrain their zeal; and that, Bonaparte being now penned up in the mountains, the news of his capture might be expected every moment; no doubt was entertained, but the *man of Elba* would soon grace a gibbet. A number of officers of the royal household, and of the placeless nobility, fearing that the least delay might make them lose the opportunity of displaying their devoted attachment, crowded to the war-office, to obtain the favour of being sent into the department of the Var. Some of them took post-horses at their own expense, resolving, they said, to ride down twenty horses if necessary, so as to be in at the death. It was with them a subject of mutual inquiry whenever they met, whether they intended to join the wild-boar hunt. The news of the defection of some regiments, and the taking of Grenoble, only created a momentary alarm: "Other troops," it was said, "were rapidly advancing to cut off his retreat. The defection of two or three regiments was of but little importance; and, were even the thirty or forty thousand men that composed the French army to forget every sense of duty (which God forbid), what resistance could they make against the mass of the nation? Could it be believed for one moment that France would once more submit to the yoke of the usurper, and would consent to abandon for him the best and most adored of monarchs, whose subjects had unanimously proclaimed him *Le Déniré*? No—a million of national guards were ready to sacrifice themselves for his defence; the departments of the North, East, and West, were ready to rise up in his cause; and Paris, that faithful and devoted capital, contained one hundred thousand fighting men, a force more than adequate to the destruction of the traitors." Such was the language of the court adherents, and of the pensioned journalists.

In the mean while, the imperial eagle flew from steeple to steeple; Napoleon advanced with gigantic strides. The people, far from opposing him, carried him in triumph; national guards, regular troops, all assumed the tri-coloured cockade; and Paris itself only awaited the departure of the king to send forth the cry of *Vive l'empereur*!

It was in vain that three millions of francs were offered for the head of the monster. It was in vain that the Congress of Vienna authorised his assassination. Not an assassin was to be found.

The Bourbons had spread themselves over France to collect their adherents. Monsieur (the duke d'Artois), with the duke of Orleans and count Damas, set out for Lyons; and

and the duke of Angoulême was ordered to proceed from Bordeaux to Nîmes. The duke of Berri was likewise about to join the army; but the marshals Macdonald and St. Cyr entreated him to relinquish the design, assuring him that his interference would be the death-warrant of his family. This prince had been unable to reconcile himself to the generals of Bonaparte and the former enemies of his house, and had rendered himself unpopular by some indiscreet and contemptuous language which he had used towards the most meritorious of the marshals.

Monsieur and the duke of Orleans arrived at Lyons, where they were joined by marshal Macdonald. The majority of the inhabitants were favourable to Napoleon, but a strong party of royalists yet remained at Lyons; and many of the young men of the principal families formed themselves into a guard of honour for the immediate protection of Monsieur. On the next day the troops of the garrison were reviewed. Monsieur harangued them. He dwelt on the virtues of Louis, and on the oath of fidelity which they had taken; and he painted in lively colours the perfidious character and atrocious projects of Bonaparte. His own escort, and the guard of honour, replied with the acclamations of "The king for ever!" but the troops of the line maintained a mournful and obstinate silence. Monsieur then addressed the colonel of the 13th dragoons, and asked him what were the feelings, what the intentions, of his regiment. "Interrogate them," said the officer, "they will frankly reply to you." Monsieur addressed the soldier who was nearest to him: "Are you well paid?" "Yes, my lord."—"Will you fight for the king?" "No my lord."—"For whom, then, will you fight?" "For Napoleon."—The prince dismounted, he proceeded through the ranks, and accosted every individual whose person he recollected. At length he came to an old soldier, covered with scars, and decorated with three medals. "Well, comrade!" said he, "a brave soldier, like you, cannot hesitate to cry the king for ever!" "You deceive yourself," answered the dragoon roughly: "no soldier will fight against his father; and my cry will be 'The emperor for ever!'"

Macdonald would not yet despair. The advanced guard of the rebels had reached the suburbs of La Guillotière. Macdonald ordered two battalions of infantry to proceed against them, and placed himself at their head. As they crossed the bridge that led to the suburb, a reconnoitring party of the 4th hussars, which had joined Napoleon at Grenoble, appeared, followed by some squadrons, and by a tumultuous populace shouting "The emperor forever!" The moment was decisive. The troops on each side rushed forward—not to imbrue their hands in each others blood, but to give each other the fraternal embrace.

Macdonald precipitated himself among them. His menaces and his entreaties were alike unheard. The voice of authority was disregarded. They forgot their allegiance, and increased the army of the invader. "We know nothing of the king," they exclaimed as he pointed to the standard of Louis, and urged them not to abandon it, "we never knew him; and you alone, who have taken an oath to him which our hearts disavow, will be culpable if you cease to be faithful to him. Napoleon was torn from us by treason, but he was never absent from our affections; and, as his noble enterprise has again restored him to us, it is to him that we ought to prefer an oath, which to him alone we have taken. To obey the king, and disobey the emperor, that only would be dishonour and perjury. To quit the standard of the king, and join the ranks of the emperor, is the best proof which we can give of our fidelity." In this moment of shameful dereliction of their duty they however, exhibited an honourable feeling which it is pleasing to record. The marshal was surrounded by the rebels, and made prisoner. The troops which had deserted him no sooner perceived this than they flew to his rescue, declared that they would defend him at the hazard of their lives, conducted him

safely within the gates, and returned to join the followers of Napoleon.

All was evidently lost, and Monsieur hastily quitted Lyons: even the guard of honour now forsook him, and one horseman alone had sufficient courage and fidelity to attend him.

Napoleon entered Lyons on the evening of the 9th. Next morning he reviewed the whole of his army, which now assumed a formidable appearance. During that review he exhibited one of those traits of greatness which are strangely mingled in his character with so many base and unworthy qualities. The guard of honour, which had been formed for the protection of Monsieur, presented itself before him, and entreated that they might be permitted to become his personal escort. "Your conduct towards the comte d'Artois," replied he, "assures me what I should expect from you, if I sustained a reverse of fortune." He dismissed them with contempt; and ordered a cross of the legion of honour to be transmitted to the faithful trooper who had accompanied the count.

Napoleon had now nothing to dread; and, being compelled to halt at Lyons to refresh his harassed troops, he assumed all the imperial state, and began to issue his proclamations and decrees, as if he were already reinstated on the throne. His reception in the second town of France justified this presumption. He mixed with the people in the streets, and at the ball which was given to him at the town-house, with the same unassuming confidence which had marked his former progress, and which was no less apparent during his advance upon the capital.

It was confidently reported by the partisans of the Bourbons, that numerous troops were advancing from the south to surround Bonaparte and cut off his retreat. The king, however, placed little reliance on this intelligence, to which the greatest importance was attached by his imprudent and infatuated courtiers. In fact, what reliance could he place on the professions of any of his troops after the defections of Grenoble and Lyons? He was more fully justified in this distrust by the intelligence which he had just received of the conduct of the garrison of Lille. Count Erlon had endeavoured to seduce the troops, to abandon the cause of the monarch. He had partially succeeded, when marshal Mortier, discovering the plot, caused him to be put under arrest. He was immediately tried and condemned to death: he was led to the square of the citadel; his eyes were bandaged; a file of soldiers were drawn up before him; their pieces were presented, and the fatal word was momentarily expected; when the troops suddenly rose against Mortier, and declared Erlon commander of the fortress. Erlon, however, speedily released the marshal, and sent him to Paris.

It was in opposition to the advice of the princes of his family, that Louis had convened the two chambers. These misguided men had been unable to relinquish the lofty ideas of the kingly prerogative in which they had been educated. They wished to have seen the sovereign assume a dictatorial power, for which the present crisis would have formed some colourable excuse, and which might have prepared the way for the future extension of the monarch's prerogative. But Louis, who was the victim of bad counsels, and a cruel concurrence of circumstances, and not of his own ambition, was now perfectly convinced, that, even if the pretensions of Bonaparte were crushed, there would be no security for himself and his family, but in the strict observance of the constitution which he had sworn to respect.

The two chambers having met on the 9th of March, after some preliminary business, they both voted loyal addresses to the king.

The government now began, in earnest, their efforts to stop the progress of Bonaparte; and troops were collected from all quarters to proceed against him. Great preparations were also made to collect a formidable army at Melun,

Jun, a town on the Seine, at the distance of ten leagues from Paris; and another at Montargis, a few hours march from Fontainebleau. The government now thought, that if Bonaparte attempted to proceed on the road to Paris he would be cut off, as he would thus be placed between two fires. Marshal Ney, the prince of Moskwa, had already reached Lons le Saulnier, with an army amounting to about 14,000 men, with which he threatened his rear. This officer had, in an effusion of loyalty, repaired to the Tuileries, and, proffering his services, had assured the king, on receiving the command of these troops, that he would bring Bonaparte to Paris in an iron cage. To which the king replied, with mild dignity, that this was not what he required, and that he only desired of the marshal to drive back the invader. The prince took his leave of the king, and departed.

Though it was greatly apprehended that the spirit of disaffection had pervaded the army in general, it was hoped that a part would yet be found faithful. The marshals, the national-guard, the representatives of the people, and the civil authorities, seemed to vie with each other in their professions of attachment and devotion. The knowledge that armies were placed in front, on the flanks, and in the rear, cheered the drooping spirits of the royalists, who, applauding the loyalty of the national-guard, rather than confiding in their prowess, saw with satisfaction the departure of the marshals to head the armies, and particularly the prince of Moskwa, whose assurances to the king were cited in his own phraseology, that he would bring the sovereign of Elba, in an iron cage, to Paris. The king, indeed, placed the fullest confidence in this general; and meeting with Madame Ney, two days afterwards, he said to her with emotion, "Madame, you have a husband whose loyalty is equal to his courage." For a short time confidence appeared to be in some degree restored. The government received favourable accounts from the north. Marshal Oudinot having assembled the garrison of Metz, amounting to 13,000 men, told them, that he had never deceived them when they had fought together; that he was ready to give passports to all who wished to join Bonaparte; but that he wished to be sure of those who willingly remained with him. The troops immediately renewed their oath of fidelity to the king. The old guard was foremost in professing its loyalty: "Although," said they, "he has not used us well; although he has degraded us from our rank of guards, and, above all, has shown that he distrusted our honour, we will prove to him and to France that we can be generous in proportion as others are unjust." When intelligence of this was brought to the king, he instantly ordered that every soldier should have the rank of sergeant; that every sergeant should be considered a commissioned officer; that each subaltern should rank as captain; and that the whole should receive pay as in the time of Bonaparte. His majesty likewise ordered that they should be henceforth called *the king's guards*, and should proceed by forced marches to Paris, and do the duty of the palace.

On the 11th of March, a report was made to the chamber of peers, by the king's order, in which the whole progress of Bonaparte from his landing was frankly related.

On the 14th Monsieur returned to Paris, and reported his unsuccessful mission. The king was now confirmed in the apprehensions which he had entertained from the beginning. His majesty was urged by many to retire to the northern departments, or to Belgium; but his most enlightened friends thought it best for Louis to attend at one of the sittings of the chambers, surrounded by the princes of his blood, and in the most public, solemn, and unequivocal manner, repeat his acceptance of the Constitutional Charter, and his determination to respect the property and the rights of all his subjects. It was justly and unanswerably argued, that, as the most sanguine hopes of the invader were founded on the suspicions and fears which unfortunately prevailed, that the charter would be

broken or eluded, his defeat could only be insured by the prompt removal of those fears.

On the 16th of March, therefore, the king went in great state to the hall of the deputies. The chamber of peers had been invited to assist at the sitting. Louis was received with the most lively testimonies of affection and respect. He placed himself on the throne, and thus addressed the assembly. "Gentlemen! In this momentous crisis, when the public enemy has penetrated into a part of the kingdom, and threatens the liberty of the remainder, I come in the midst of you to draw closer those ties which unite us together, and which constitute the strength of the state. I come, in addressing myself to you, to declare to all France my sentiments and my wishes. I have revisited my country, and reconciled her to all foreign nations, who will doubtless maintain, with the utmost fidelity, those treaties which had restored to us peace. I have laboured for the benefit of my people. I have received, and still continue daily to receive, the most striking proofs of their love. *Can I, then, at sixty years of age, better terminate my career than by dying in their defence? I fear nothing for myself; but I fear for France.* He who comes to light again amongst us the torch of civil war brings with him also the scourge of foreign war. He comes to reduce our country under his iron yoke. He comes, in short, to destroy that Constitutional Charter which I have given you; that Charter, my brightest title to the estimation of posterity, that Charter which all Frenchmen cherish, and which I here swear to maintain. Let us rally, therefore, around it! let it be our sacred standard! The descendants of Henry the Fourth will be the first to range themselves under it. They will be followed by all good Frenchmen. In short, gentlemen, let the concurrence of the two chambers give to authority all the force that is necessary; and this war, truly national, will prove by its happy termination what a great nation, united in its love to its king and to its laws, can effect."

At the close of this address the whole assembly rose, and extending their hands towards the throne, exclaimed with one voice, "The king for ever! We will die for the king! The king in life and in death!" The king, profoundly moved, presented his hand to Monsieur, which his royal-highness seized, and kissed with transport. Louis was no longer able to suppress his feelings, and pressed Monsieur to his breast. At this touching spectacle, every heart was melted; every eye moistened with tears; every faculty appeared absorbed, and not one voice dared to interrupt the sublimity of the scene. At length by one simultaneous impulse, all hands were again stretched towards the throne, and the hall rung with the most rapturous acclamations. "In one day," says a spectator, "the destinies of France would have been for ever assured; the king, the country, our dearest rights, would have been for ever safe, if all France could have been present at this scene." But, in the present crisis, scenes like these tended rather to the injury than the benefit of the royal cause. They generated a sort of loquacious patriotism, when it was far more necessary to act than to harangue. After the tribune had shouted forth some energetic and eloquent philippics against Napoleon, both the orator and his hearers fondly imagined that the invader was crushed, and the decisive measures that actually bid the fairest to crush him were neglected.

On his return from the assembly, Monsieur reviewed the national guard of Paris. Fifty battalions filed in close order in the inner court of the Tuileries, amounting to nearly 25,000 men. As each battalion entered the square, the cries of "The king for ever!" resounded from every soldier. Unfortunately, at the moment when the columns were commencing their march by the balcony in which Louis was seated, he was seized with so excruciating a paroxysm of gout, that his attendants were forced to carry him away in their arms; and the national-guard, after showing the spirit which animated them by one full

shout of "The king for ever!" were dismissed to their respective quarters.

In about an hour the pain abated, and Louis expressed his determination to review the troops of the line, consisting of 6000 men, who were drawn up in the Place du Caroussel. After the shameful defection of so many regiments, these were regarded with the most anxious solicitude. On them depended the fate of the Bourbon dynasty. As they approached the gates, Louis trembled. He was not long kept in suspense. The grenadiers of the first regiment hoisted their caps on the points of their bayonets, which action was immediately followed by all the troops: but they uttered no shout. Louis was evidently and profoundly affected. He attempted to address them, but he could not utter a word: he could only press his hand to his heart, and thus silently, but forcibly, appeal to them. The silence of the troops was regarded by every reflecting man as ominous of their approaching treachery; but those who surrounded the monarch thought differently; the fears of the courtiers were dissipated, and they predicted the speedy fall of Bonaparte, his followers, his principles, and his cause. Many of them, in the intoxication of their joy, congratulated each other that the enterprise of Bonaparte had been attempted. It exhibited, said they, the true character of the public feeling; it drew a useful line of demarcation between the good and the bad. They blessed the occasion which unmasked the one, and proved the fidelity of the other. A few days showed the folly of this conduct, and afforded a mournful and almost incredible proof of the levity of the French character, and the weakness of human nature.

Napoleon, after issuing his proclamations and decrees at Lyons, prepared to march forward; and on the 13th he departed for Villefranche, and reached Maçon in the evening. He travelled in an open carriage, seldom escorted by more than a dozen dragoons, and often without a single attendant. He was frequently more than a league before his advanced-guard. At many of the towns through which he passed, and at which he changed horses, he was not recognised. At one post-house, an English lady arrived in an opposite direction at the same moment. Neither she nor the master of the post-house knew him, and she requested that he would permit her to have the first set of horses, as she was pressed for time. He smiled, and replied, "that the object of his journey was rather pressing too, but that he must give way to a lady;" when she had proceeded about a league, she met the advanced-guard, and learned, to her great surprise, that it was the emperor Napoleon. A few posts from Lyons he met a regiment of cavalry marching with the avowed purpose of opposing him. He no sooner discerned the dragoons at a distance, with the white standard and cockade, than he quitted his carriage, mounted a led horse, and, attended by one aid-du-camp, rode forward to meet them. He advanced to the colonel, and, without one word of preface, ordered the regiment to break into column and follow him. The order was obeyed as quickly and as regularly as if they were on parade. In many towns the populace, hearing of his approach, assembled in crowds, and abandoned themselves to the greatest excesses. Every symbol of the royal government was destroyed, and those who appeared with the white cockade were insulted. When Napoleon appeared among them, they thronged around him; impeded his progress; and deafened him with their shouts of welcome. He smiled at one, caressed another; and distributed crosses of the legion of honour among some of the most distinguished, saying, at the same time, "It was for you, my friends, that I instituted the legion of honour, and not for the emigrants pensioned by our enemies." His progress towards Paris was most rapid. On the 15th he slept at Autun, and on the 16th at Avalon. The military every where obeyed him with alacrity; and his army, like a snow-ball, augmented as it rolled on. The French government had used every exertion to keep

the soldiers to their colours, and even threatened them with the punishment of death in case they deserted.

In the mean time, marshal Ney, with the whole of his corps, had joined Napoleon. It is said that this officer was taking measures for falling on the rear of the invader, and for that purpose was on the point of marching from Lons le Saulnier, where his forces were stationed, when, on the night of the 12th of March, some of Bonaparte's emissaries arrived, and were introduced to him. They delivered to him letters from the grand-marshal Bertrand, which painted, in the most glowing colours, the hopeless situation of the king, and the certainty of Napoleon's success. They assured him that the emperor had concerted this enterprise with Austria, through the mediation of general Koller; that the empress and her son were on the road to Paris; that England had connived at his escape; that Murat advanced triumphant towards Italy to assist his brother-in-law; that the Russians had retired to their distant country, and Alexander would no more intermeddle with the affairs of the south; that Prussia alone was unable to contend with France; that, if the marshal were disposed to resist, he had no longer the power; that Napoleon had secretly received the submission of every regiment in the service; that all Ney's most confidential officers had long been enrolled among the adherents of the emperor; and that a vain and useless attempt at resistance, would expose his country to the horrors of civil war. It was added, that Napoleon had for ever renounced his projects of arbitrary government and universal dominion, and wished now to reign for the happiness of France alone. Whatever might have been the sentiments of Ney before he received this communication, after pausing a short time, he resolved to join his troops to those of Napoleon. He saw evidently, that the king's cause was hopeless; "and he was weak enough," says Mr. Hobhouse, "not to do the only thing left for an honourable man. Instead of returning to Paris with the news, he marched with the revolted army; and has branded his name with an infamy that even the success of his cause has failed to obliterate. His name and crime furnished a pun for the Parisian wits, who say of his treachery, *Il faut être né pour ça*; and the king soon after designated him as the *Né plus ultra* of traitors."

This defection was decisive of the contest, for all confidence was now at an end. On the 17th, Bonaparte arrived at Auxerre. Here he met the fourteenth regiment of the line, which had proceeded by forced marches to range itself under his banners. As soon as these soldiers were drawn up before him, they trampled under foot the white cockade which they had sworn to defend. Napoleon smiled at this proof of their attachment; and walking through their ranks, addressed himself familiarly to several whom he recognised, or pretended to recollect. He stopped before an old soldier, who was decorated with three medals: "And you," said he, slapping him gently on the shoulder, "how long have you been in the service?" "Twenty-five years, sire!" "Ah! I recollect," interrupted Napoleon, "we were together at Rivoli, where we took seven pieces of cannon. I see that you are a good soldier, and I will take care of you." By these familiar conversations Napoleon always gained the hearts of the soldiers. On the 19th, at night, he turned off from the great road to sleep at Fontainebleau, determined that the palace which had witnessed his misfortunes should first receive him in his success.

The French court was in the greatest alarm. On the night of the 18th, a grand council was held at the Tuilleries, at which the princes, the ministers, and the generals, assisted. The generals declared that no dependence was to be placed in the army assembled at Melun, and deprecated any further resistance to the progress of Napoleon as a useless waste of blood. This was strenuously opposed by some of the courtiers, and one of the princes; and, it is said, the most violent and intemperate language was used.

used. The council broke up in disorder, and the king despairing and broken hearted. The two chambers, however, continued firm in their attachment to the king, notwithstanding the critical state of affairs; and, on the 17th, they voted two loyal addresses to his majesty, which were presented by deputations on the evening of the 18th.

Meanwhile the troops remained at Melun, and a battle was expected on the next day. The number of national guards, volunteers, and other troops, collected to stop the march and crush the hopes of the invader, was estimated at not less than 100,000 men. The best spirit seemed to prevail amongst them. They appeared devoted to the cause of the king, and eager to meet and repel his antagonist. A powerful artillery strengthened their positions. Relying on their numbers, they had left the town, the rocks, and the forest, of Fontainebleau unguarded, preferring the flat plains of Melun, where the whole of their army might act at once against the comparatively small band of the invader. Napoleon had at that time with him only 15,000 veteran troops; but other divisions were either following him, or advancing to support his right and left flanks on parallel lines of march.

Early on the morning of the 21st, preparations were made on both sides for the encounter which was expected to take place. The French army was drawn up in three lines, the intervals and the flanks armed with batteries. The centre occupied the Paris road. The ground from Fontainebleau to Melun is a continual declivity, so that, emerging from the forest, a clear prospect of the country presents itself; and, on the other hand, those who are in the valley can easily descry whatever appears on the eminence. An awful silence pervaded the king's army, broken at times by peals of martial music, intended to confirm the loyalty of the troops by repeating the popular airs of Henry Quatre, and La Belle Gabrielle, or by the voice of the commanders and the march of divisions to their appointed ground. All was anxious expectation. The chiefs were conscious that a moment would decide the fate of the Bourbon dynasty; and the troops were secretly awed at the thought of meeting in hostility the man whom they had been accustomed to obey.

On the side of Fontainebleau no sound was heard as of an army rushing to battle. If the enemy was advancing, his troops evidently moved in silence. "Perhaps his heart has failed him, and he has retreated," was the secret ardent wish of the friends of the Bourbons. At length a light trampling of horses became audible. It approached. An open carriage, attended by a few hussars and dragoons, appeared on the skirts of the forest. It drove down the hills with the rapidity of lightning. It nearly reached the advanced posts, when the escort threw down their arms, and rushed forward to embrace the king's troops. Surprised at this unexpected manoeuvre, the soldiers were for a moment irresolute. The carriage now reached them. The traveller was immediately recognised: "The emperor for ever!" burst from every mouth. "Napoleon! Napoleon the Great!" spread from rank to rank; for, bareheaded, Bertrand seated at his right, and Drouet at his left, Napoleon continued his course; now waving his hand, now opening his arms to the soldiery, whom he called his friends, his companions in arms, whose honour, whose glories, whose country, he now came to restore.

All discipline was forgotten, disobeyed, and insulted. The commanders-in-chief took flight. Thousands rushed on his passage. Acclamations rent the sky. At that moment his own guard descended the hill. The imperial march was played: the eagles were once more displayed, and they, whose deadly weapons were to have aimed at each other's life, embraced as brothers, and joined in universal shouts. In the midst of these greetings, Napoleon passed through the whole of the royal army, and, placing himself at its head, pursued his course to Paris.

Louis had anticipated this result, and at one o'clock on the morning of the 20th quitted Paris. His resolution was, however, so suddenly formed, and executed with

such haste, that his portfolio, containing his correspondence with the dukes d'Angouleme for many years, was found on the table in his apartment; and in his drawers were his correspondence with Louis XVI. a medal which he was in the daily habit of wearing, and many things calculated to compromise the safety of numerous individuals. He also left (what Napoleon found extremely convenient) about two millions of the public money in the hands of the different receivers. The household-troops alone had sufficient loyalty to accompany the fugitive. They escorted him to the frontiers with a fidelity which did them much credit.

When the departure of the king was known, astonishment and suspense seemed to have deprived the inhabitants of Paris of the power of action. All the authorities were withdrawn; yet the most perfect and mournful tranquillity, for a time, prevailed. At that moment the battle was supposed to be contesting at Melun, on which depended the fate of France; and each party, fearful of committing itself too soon, anxiously awaited the result.

The bank continued its payments as usual, without one moment's interruption. Though it was an establishment of all others most sensible to the influence of political changes, it did not sustain the slightest shock.

By degrees every street and square became crowded with anxious inquirers. Every avenue leading to the Tuileries was thronged. As the partisans of Louis and Napoleon came in contact, scenes of confusion began. The cries of "The king for ever!" resounded from a thousand voices, but they were drowned amid the shouts of "The emperor for ever!" From reproaches the parties proceeded to blows; but the national guard interfered, and by its moderation and firmness prevented the effusion of blood. About noon the national guard, at the command of their new colonel, assumed the tri-coloured cockade. The triumph and approach of Napoleon were proclaimed, and soon afterwards some of the troops who had marched out to oppose the Corsican returned bearing his colours.

It was now ludicrous to observe the activity of the shopkeepers in removing every vestige of royalty. Before evening innumerable signs prettily adorned with lilies had vanished, and a thousand eagles, appearing as it were by magic, proudly stretched their wings over the portals of the houses. Ribands and rings of a violet colour had long been worn by the Bonapartists, and that interesting flower had appeared in the button-hole of some of the boldest of the conspirators; but now it seemed as if the whole country had been laid under contribution, to furnish the bouquet which adorned every bosom, or was worn in the hat with all the ostentation of a cockade.

At two o'clock general Excelsmans arrived at the Tuileries, and, relieving the national guard, tore down the flag of the Bourbons and hoisted that of the empire. This was the signal for greater tumult. The inhabitants of the suburbs of St. Marceau and St. Antoine assembled in the Caroussel, and endeavoured to force the gates which separate that square from the courts of the palace. Had they effected their purpose, the late residence of Louis would probably have been levelled with the ground. They were, however, bravely resisted by the national guard.

At length more numerous bodies of troops began to pour in by different and opposite gates; and, as almost every detachment appeared to escort several carriages, the attention of the crowd was completely occupied, and the cry was continually raised that the emperor approached.

All the general officers then at Paris had set out early in the morning, with the municipal corps and some grand dignitaries, to meet him whom a twelvemonth ago they had branded as a tyrant, whom the day before they had stigmatised as an usurper, but whom they professed themselves eager to salute to-day as their emperor. A long file of led-horses and magnificent equipages accompanied them, destined for the use of Napoleon. He received them with apparent cordiality, but refused to accept

cept of their carriages, and continued his journey in the same spattered vehicle which had conveyed him from Fontainebleau to Elba, and from Cannes to the neighbourhood of Paris; the same chariot that was afterwards so profitably exhibited in London and other parts of England. It was not till nine o'clock in the evening that he entered the gate of the Tuileries, opposite the Pont Royal. There he was received by his soldiers and by the populace with an enthusiasm that approached to madness. They pressed around him, eager once more to gaze upon him; they incommoded, they endangered, him. "My friends!" he repeatedly exclaimed, "you will suffocate me, you will suffocate me." His officers then forcibly opened a passage, and bore him in their arms along the staircase and into the state-apartments, where his sisters Julia and Hortensia, some of his old ministers, and the officers of his household, were assembled to greet him. A battalion of officers bivouacked round the Tuileries, and did the duty of the palace. The weather had hitherto been cloudy and rainy; but by a curious coincidence, which the Parisians did not fail to remark, the entry of the grand actor in this strange scene was at the close of a beautiful day. The night was still and bright; and the whole population, actuated by different sentiments, crowded to the Tuileries.

Thus was accomplished a revolution, of which the annals of the world do not afford a parallel. It resembled more a theatrical illusion than an actual course of events; a romance of the imagination, more than the positive achievement of human faculties. In the *journey* of Napoleon, (for the military term *march* would be misplaced,) every soldier sent against him joined his force. Where resistance seemed for a moment to be threatened, it was disarmed by the sound of his voice. The ascendancy of a victorious leader over soldiers; the talent of moving armed multitudes by a word; the unextinguishable attachment of an army to him, in whom its glory is concentrated and embodied; were never before so brilliantly and tremendously exemplified. In twenty days he found himself quietly seated on the throne of France, without having spilled a drop of blood. The change had no resemblance to a revolution in an European country, where great bodies of men are interested in the preservation of authority, and where every body takes some interest for or against political mutation. It had nothing of the violence of a popular revolt. In the levity with which authority was transferred, it bore some resemblance to an oriental revolution; but the total absence of those great characteristic features, the murder and imprisonment of princes, destroyed the likeness. When kings are forced to descend from their thrones, they generally expect the consolation of seeing a few thousand of their friends sacrifice themselves in their cause. This consolation was denied to the Bourbons. Not a musket had been fired since Napoleon had landed; not a sword had been drawn in favour of Louis, to prevent his departure; and we shall presently see that not a (French) sword was drawn, on his side, when he was forced back again.

The unfortunate king, therefore, continued to retire towards the frontiers; and, at five o'clock of the afternoon of the 20th, he arrived at Abbeville without any military escort. There he proposed to wait for the household troops which followed, commanded by marshal Macdonald. His calm and dignified appearance disarmed the rancour of every Bonapartist, and the inhabitants received him with acclamations. The king attempted to address them from the window of the house at which he lodged, but his feelings overpowered him: he pressed his hand to his heart, bowed, and retired. The military, who lined the streets, maintained a deep silence. They respected the virtues of the monarch too much to insult him in his misfortunes; but when they returned to their barracks they shouted *Vive l'Empereur*. His majesty was much fatigued; but, before he had time to take any repose, Macdonald appeared, and urged him to proceed on his

journey without delay, alleging that, from what he had seen of the disposition of the garrison, he would not answer for the consequences should the household-troops arrive before he quitted the place.

The king reluctantly ascended his carriage, oppressed by mental and bodily pain. On the 22d, at one o'clock, he arrived at Lille, where he had determined to collect around him all who were faithful to his cause. The scene at Abbeville was repeated. A considerable proportion of the inhabitants welcomed him with enthusiasm; but the garrison, which consisted of several regiments, preserved a sullen and obstinate silence. The king would have addressed them, and endeavoured to recall them to the allegiance which they owed their legitimate sovereign; but he was entreated not to expose himself to unnecessary insult and danger.

On the same day, the Declaration of the Congress at Vienna (which we shall soon notice) was received. The king immediately ordered it to be placarded on the walls, and distributed among the soldiers, that they might perceive what would be the fatal consequences of their treason, and the inevitable calamities which they would bring on their country. But this, far from alarming the troops, exasperated them to the utmost; and they formed the sudden and desperate resolution of seizing on the person of the king, and carrying him prisoner to the camp of Napoleon. News now arrived that the duke of Berri approached, with the household-troops and two Swiss regiments. The garrison no sooner heard this, than they assembled tumultuously, and seemed ready to execute their daring purpose. Mortier hastened to his majesty, and urged his immediate departure, declaring that he dreaded the result if that departure was delayed a single hour. In half-an-hour Louis was on his journey towards Ostend. Mortier accompanied him to the gates of the town, and immediately returned with the duke of Orleans to endeavour to restrain the violence of the troops. He found them enraged at being disappointed of their prey. They fiercely attacked the duke of Orleans; and it was with the greatest difficulty, and at the hazard of his own life, that Mortier rescued him from their fury. On the 24th Louis arrived at Ostend completely enfeebled by anxiety, disease, and fatigue.

In the mean time the household-troops had passed through Abbeville in their journey towards Lille; but, being informed that his majesty had quitted Lille, they determined not to enter the town; and this determination probably prevented a dreadful effusion of human blood. Turning, therefore, from Lille, they directed their course towards the frontiers; but many of them, being unable to support the fatiguing rapidity of the march, were dismissed at Bethune; and those who reached the frontiers declared to the few officers who were desirous to take them further, "that they were Frenchmen; that they had sufficiently fulfilled their duty to their prince, that their dearest interests were at stake, and that nothing should induce them to pass the frontiers." They accordingly returned to Bethune.

It was now Louis's turn to protest; (see p. 501.) While on his retreat to Lille, he issued two ordinances: the first forbidding all his subjects to pay taxes of any kind to the so-titled imperial government, and all public functionaries and receivers to pay into its chests the sums in their hands, and also suspending the sales of timber and domains in the departments invaded by Bonaparte; the second forbidding obedience to the law of confiscation, or any other recruiting-order emanating from him. Louis afterwards removed his residence to Ghent, where he had with him three of his ministers, Clarke duke of Feltre, and the counts Blacas and Jaucourt; to these he added in his council count Lally Tollendal and M. de Chateaubriand. The marshals Marmont duke of Ragusa, and Victor duke of Belluno, were also at Ghent.

The Congress was still sitting at Vienna; but the ministers of the European powers had nearly closed their deliberations,

liberations, and the sovereigns had announced their departure for their respective capitals, when the intelligence of the landing of Napoleon at Cannes unexpectedly burst upon them. To the astonishment with which every statesman was at first overwhelmed, succeeded apprehension and dismay. Although the force which he had brought with him from Elba was feeble and contemptible, they knew not how soon the discontented soldiery of France might flock round his standard, and enable him once more to menace the peace of Europe. It was therefore necessary, by some prompt and unequivocal manifesto, to declare their resolution to oppose him with their united forces. Lord Castlereagh had departed from Vienna for England, and was succeeded by the duke of Wellington. The intelligence that Napoleon had quitted Elba arrived at Vienna on the 7th; but his real destination was not known. On the 11th Talleyrand received a dispatch, announcing his landing on the coast of France: and on the 13th the following Declaration was published.

"The powers who have signed the Treaty of Paris, assembled at the Congress at Vienna, being informed of the escape of Napoleon Bonaparte, and of his entrance into France with an armed force, owe it to their own dignity and the interest of social order, to make a solemn declaration of the sentiments which this event has excited in them.

"By thus breaking the convention which established him in the island of Elba, Bonaparte destroys the only legal title on which his existence depended; by appearing again in France with projects of confusion and disorder, *he has deprived himself of the protection of the law*, and has manifested to the universe, that there can be neither peace nor truce with him. The powers consequently declare, *that Napoleon Bonaparte has placed himself without the pale of civil and social relations; and that, as an enemy and disturber of the tranquillity of the world, he has rendered himself liable to public vengeance.*

"They declare at the same time, that, firmly resolved to maintain entire the Treaty of Paris of 30th May, 1814, and the dispositions sanctioned by that treaty, and those which they have resolved on, or shall hereafter resolve on, to complete and to consolidate it, they will employ all their means, and will unite all their efforts, that the general peace, the object of the wishes of Europe, and the constant purpose of their labours, may not again be troubled; and to guarantee against any attempt which shall threaten to replunge the world into the disorders and miseries of revolutions. And, although *entirely persuaded that all France, rallying round its legitimate sovereign, will immediately annihilate this last attempt of a criminal and impotent delirium*, all the sovereigns of Europe, animated by the same sentiments and guided by the same principles, declare that, if, contrary to all calculations, there should result from this event any real danger, they will be ready to give to the king of France, and to the French nation, or to any other government that shall be attacked, as soon as they shall be called upon, all the assistance requisite to restore public tranquillity, and to make a common cause against all those who should undertake to compromise it.

"The present declaration, inserted in the register of the Congress assembled at Vienna, on the 13th March, 1815, shall be made public. Done and attested by the plenipotentiaries of the high powers who signed the treaty of Paris: Vienna, 13th March, 1815."

Here follow the signatures, in the alphabetical order of the courts.

AUSTRIA.—Prince Metternich, Baron Wissenberg.

FRANCE.—Prince Talleyrand; the Duke of Dalberg, Latour du Pin; Count Alexis and Noailles.

GREAT BRITAIN.—Wellington; Clancarty; Cathcart; Stewart.

PORTUGAL.—Count Pamella Saldonna Lobs.

PRUSSIA.—Prince Hardenberg; Baron Humboldt.

RUSSIA.—Rasumowsky, Stakelberg, Nesselrode.

SPAIN.—P. Gomez Labrador.

SWEDEN.—Lafmenhelm.

VOL. XVIII. No. 1261.

The return of Napoleon to France, at the head of an armed force, had annulled all the rights which the treaty of Fontainebleau had given him, and had again placed him in a state of hostility with the coalesced powers. Until he had shown that the treaty had been previously violated on the part of the allies, and that he was again acknowledged by the French, and re-invested by them with the sovereignty, he was a mere brigand chief; not, indeed, the proper subject of private assassination, but amenable to the legal vengeance of the country which he had invaded.

As it had been whispered that there were considerable misunderstandings between the principal courts; and as Bonaparte had affirmed that he was secretly supported by some of the allied powers; that Austria was his assured friend; that his return would be immediately followed by that of the empress and the king of Rome; and that England and Russia, tired of war, were indisposed to interfere in a quarrel in which they had no concern;—it was necessary for the members of the Congress to convince the world, by some solemn and striking proceeding, that they were determined to complete and consolidate the work which they had begun, and that they were ready to combat against every one as a common enemy who should threaten, by a new war or a new revolution, to disturb the general peace of Europe. On the 25th of March, before the arrival of Bonaparte in Paris was known at Vienna, but after it had appeared evident that no effectual resistance could be opposed to him, the following treaty was entered into by the allied powers.

"Their Majesties the Emperor of all the Russias, the Emperor of Austria, the King of Prussia, and the King of the United Kingdom of Great Britain and Ireland, considering the consequences which the entrance of Bonaparte into France, and the present situation of that kingdom, may have with respect to the security of Europe, have determined, in these weighty circumstances, to carry into effect the principles consecrated in the treaty of Chaumont. They have therefore agreed, by a solemn treaty, mutually signed by each of the four powers, to renew the engagement that they will defend the so-happily restored order of things in Europe against all violation, and to adopt the most effectual measures for carrying this engagement into effect, and also to give it that necessary extension which existing circumstances imperiously demand.

(Here follow the appointments, in the usual form, of the different plenipotentiaries whose names are undersigned.)

Art. I. The high-contracting powers solemnly engage to unite the resources of their respective states, for the maintenance of the treaty of peace concluded at Paris on the 30th of May 1814, as well as that of the Congress of Vienna; to carry into full effect the dispositions contained in these treaties; and to defend them against every attack, and especially against the projects of Napoleon Bonaparte. Towards this end they bind themselves, should the king of France desire it, and in the spirit of the Declaration issued on the 13th of March, with common consent and mutual agreement, to bring to justice all such as may have already joined or shall hereafter join the party of Napoleon, in order to compel him to relinquish his projects, and to render him incapable in future of disturbing the tranquillity of Europe.

II. Although so great and salutary an object does not permit that the means destined to its attainment should be limited, and although the high-contracting powers have resolved to devote to this object all such resources as they can, in their respective situations, dispose of; yet they have nevertheless agreed, that each of them shall constantly have in the field 150,000 men complete, of whom at least one-tenth shall be cavalry, with a proportionate artillery; and to employ them in active and united service against the common enemy. (His Britannic majesty shall have the option, either of furnishing his contingent in men, or of paying at the rate of thirty pounds

sterling per annum for each cavalry-soldier, and twenty-pounds per annum for each infantry-soldier, that may be wanting to complete the number stipulated.)

III. The high-contracting parties solemnly engage not to lay down their arms but in agreement with each other, nor until Bonaparte shall be wholly and completely deprived of the power of exciting disturbances, and of being able to renew his attempts to obtain the chief power in France.

VII. As the engagements entered into by the present treaty have for object to maintain the general peace, the high-contracting powers agree to invite all the powers of Europe to accede to them.

VIII. As the present treaty is simply and solely entered into with a view to support France, and every other threatened country, against the attempts of Bonaparte and his adherents, his most Christian majesty shall be specially invited to accede thereto; and, in the event of his majesty's claiming the force specified in Article II. he shall make known what assistance his circumstances enable him to contribute towards the object of the present treaty.

IX. The present treaty shall be ratified, and the ratifications exchanged, within the period of one month, or sooner if possible. In testimony whereof the respective plenipotentiaries have signed and sealed the same.

RUSSIA.—Count Rasumowsky; Count Nesselrode.

AUSTRIA.—Prince Metternich; Baron Wessenberg.

PRUSSIA.—Prince Hardenberg; Baron Humboldt.

GREAT BRITAIN.—Wellington."

The eighth article of the treaty, which invites the accession of the king of France, seemed to include a determination in the allies, not merely to attack the usurped power of Bonaparte, but to re-instate the Bourbons on the throne, thus interfering with or denying the right of the French to choose their own form of government. But, to force any particular dynasty or form of government on a people is inconsistent with the fundamental principles of the British constitution, and the liberal policy on which it has been the pride of England ever to act: when, therefore, the ratification of the treaty by the prince-regent was sent to Vienna, the following explanatory declaration accompanied it, a declaration highly honourable to the British government: "The undersigned, on the exchange of the ratifications of the treaty of the 25th of March last, on the part of his court, is hereby commanded to declare, that the eighth article of the said treaty, wherein his most Christian majesty is invited to accede, under certain stipulations, is to be understood as binding the contracting parties, upon principles of mutual security, to a common effort against the power of Napoleon Bonaparte, in pursuance of the third article of the said treaty; but is not to be understood as binding his Britannic majesty to prosecute the war with the view of imposing upon France any particular government. However solicitous the prince-regent must be to see his most Christian majesty restored to the throne, and however anxious he is to contribute, in conjunction with his allies, to so auspicious an event, he nevertheless deems himself called upon to make this declaration, on the exchange of the ratifications, as well in consideration of what is due to his most Christian majesty's interests in France, as in conformity to the principles upon which the British government has invariably regulated its conduct.

CASTLEREAGH."

At this time an event occurred at Vienna which caused considerable sensation. Several persons arrived in the villages near Schönbrunn, the residence of the little ex-king of Rome. Among them was Count Montesquieu, a near relative of the governors of the child. He contrived to gain admittance into the palace, under the pretence of visiting his aunt; and, corrupting some of the domestics, he formed the plan of carrying off the son of Napoleon. The time was appointed; carriages were ordered to be in waiting, and relays were bespoken at every post to the very frontiers of France. A chambermaid over-

heard some suspicious language from one of the women who attended on the young prince, and immediately hastened to the imperial palace to put the court on its guard. In the mean time, the police had been informed of the whole plot, and suffered it to proceed to the last moment, that they might secure all the accomplices. Every thing was prepared. A maid had the little Napoleon in her arms, and, attended by one of the chief of the conspirators, was just stepping into the carriage, when the officers appeared, and the whole band was arrested. It was probably with the hope of the success of this plot, that Napoleon had so diligently disseminated the account that the king of Rome and his mother would soon arrive at Paris.

All the powers of Europe now began to arm; and the different roads in Germany and Prussia were covered with troops marching to the French frontiers. The British government sent strong reinforcements to the troops in the Netherlands; and on the 6th of April a message from the prince-regent was delivered to each house, communicating the information, that "the events which had recently occurred in France, in direct contravention of the engagement concluded with the allied powers at Paris in the course of the last year, and which threatened consequences highly dangerous to the tranquillity and independence of Europe, had induced his royal highness to give directions for the augmentation of his majesty's land and sea forces; and that he had deemed it incumbent upon him to lose no time in entering into communications with his majesty's allies, for the purpose of forming such a concert as might most effectually provide for the general and permanent security of Europe."

Although Napoleon well knew that he had deceived the French people, by asserting that he was supported by the Austrians, he yet hoped that Austria would ultimately prove his friend. He could not conceive that Maria Louisa and her son were not certain pledges of an alliance which had only been broken by a momentary exasperation. His ministers partook of those sentiments, and flattered themselves with the hope that the disasters of their country were at an end; and that they should at length be permitted to enjoy that rational liberty for which they had contended so long, and sacrificed so much. They hoped that the powers of Europe would leave them to choose the government which suited them, provided they remained faithful to the stipulations of the Treaty of Paris. On the very day, however, on which they entered upon the functions of their office, the Declaration of the Allies (13th of March) arrived at Paris, which overwhelmed them with surprise and dismay. At first they doubted its authenticity; but, when the proofs of its genuineness crowded upon them, they saw the situation in which they were placed. A council was called, and it was immediately resolved to publish a vindication of the conduct of Napoleon in re-seizing the throne; to state to the world the moderation of his views, and his determination to abide by the treaties already formed; to transmit direct overtures of conciliation to every European court, and to propose to the acceptance of the French a Constitution which would satisfy every friend of liberty, and endear the emperor and his government to the hearts of his subjects.

On the day after his entry into Paris, Napoleon reviewed his troops in the Place du Caroussel. After having passed through the ranks, and noticed every soldier whose person he recollected, he formed them into a square, and addressed them as follows:

"Soldiers! I arrived in France with six hundred men, because I calculated upon the love of the people, and on the remembrance of the veteran soldiers. I was not deceived in my expectation. Soldiers! I thank you. Glory like that which we are about to acquire is every thing to the people, and to you! My glory is, that I have known and valued you!

Soldiers! the throne of the Bourbons was illegitimate, because

because it was built by the hands of strangers; because it was proscribed by the vow of the nation, declared in all our national assemblies; because, in short, it offered a guarantee only to the interests of a few men, whose arrogant pretensions were opposed to our rights. Soldiers! the imperial throne only can secure the rights of the people, and, above all, the first of our interests—our glory. Soldiers! we are now to march to hunt from our territories these princes, auxiliaries to strangers; the nation will not only second us in our protestations, but will follow our impulse. The French people and I calculate upon you. We will not interfere with the affairs of foreign nations, but woe to those who shall interfere with ours!”

As Napoleon was about to conclude his harangue, Gen. Cambronne, and the officers of the guards of the battalion of île of Elba, appeared, with the ancient eagles of the guard. Napoleon continued, and said to the soldiers; “These are the officers of the battalion that have accompanied me in my misfortunes. Every man is my friend. They are dear to my heart! Every time I beheld them, they brought before my eyes the different regiments of the army, for among these 600 brave fellows are men from every regiment. They have recalled to my memory those glorious days of which even the memory is so dear; for they are all covered with honourable scars, gained in memorable battles. In loving them, it was you, soldiers! the whole French army, that I loved. They bring you back your eagles. Let them serve as a rallying-point. In giving them to the guards, I give them to the whole army. Treason and unfortunate events had covered them with a melancholy veil; but, thanks to the French people and to you! they now re-appear, resplendent in all their glory. Swear that they shall always be present wherever the interests of the country shall require them; and that traitors, and those who would wish to invade our territory, shall never endure their sight.”—“We swear it!” exclaimed the soldiers.

In the mean time, the new revolution was strengthening itself in different parts of France, the greatest part of which seemed to adopt with enthusiasm the tri-coloured flag and the sovereignty of Napoleon; but the latter only under the form of the head to a popular government. This idea was explicitly declared in the different addresses presented to Napoleon, in his imperial capacity, at the Tuileries, on the 27th of March. That of the ministers led the way. The whole strain of this address corresponds to the following passage: “*The cause of the people, the only legitimate cause, has triumphed.* Your majesty is restored to the wishes of the French: you have resumed the reins of government amidst the blessings of your people and your army. France, sire, has for the guarantee of this, its will, and its dearest interests. She has also the expressions of your majesty, uttered amidst the throngs that crowded around you on your journey.” They proceeded to mention the maxims which he had announced as those by which the nation was in future to be governed: “We are to have no foreign war, unless to repel unjust aggression: no internal re-action: no arbitrary acts. Personal security, protection of property, the free utterance of thought: such are the principles which your majesty has pledged to us.”

To addresses like these Napoleon was obliged, at this juncture, to return corresponding answers. To his ministers he replied, “The sentiments you express are my own. All for the nation; all for France. That is my motto. Myself and family, whom that great people have raised to the throne of the French, and whom they have maintained there, notwithstanding political storms and vicissitudes; we desire, we deserve, we claim, no other title.”

The address of the council of state was remarkable for the independence of its language, the caution which it gave Napoleon for the regulation of his future conduct, and the conditions on which alone it pledged itself to support him. “The council of state, in resuming their functions, conceived it a duty to make known the prin-

ciples which form the rule of their opinions, and of their conduct. *The sovereignty rests in the people. The people are the only source of legitimate power.* The emperor is called to guarantee anew, by fresh institutions, for which he has pledged himself in his proclamations to the army and to the nation, all the liberal principles, individual liberty, and the equality of rights, the liberty of the press, the abolition of the censorship, the freedom of worship, the voting of taxes and laws by the representatives of the nation freely elected, the inviolability of national property of every origin, the independence and irremovability of the tribunals, the responsibility of the ministers, and of all the agents of power. For the better conservation of the rights and obligations of the people and of the monarch, the national institutions shall be reviewed in a grand assembly of the representatives, already announced by the emperor.”

It appears to have been Napoleon's intention, in forming his ministry, to have rallied round him the various political parties into which France was divided. To effect this purpose, he had selected, as his confidential ministers, the heads of what was termed the republican party, but who had abandoned their extravagant notions of liberty, and had become friendly to a limited monarchy. While they formed an efficient part of his ministry, he gave an unequivocal pledge that his government would not be disgraced by any arbitrary or tyrannical measures. When he arrived at Paris, an interesting interview took place between him and Carnot. In the course of their conversation, Napoleon acknowledged that he had acted wrong. He deplored the mania of conquest which had led him into such fatal excesses; and renounced the idea of the grand empire, and a military government. He however, demanded some sacrifices from Carnot and his party. He required they should relinquish the sternness of the republican character; and that Carnot should accept a title of nobility, as a proof of their being content with a limited monarchy on a representative basis. To this Carnot, after consulting with his friends, agreed; and the title of count was conferred upon him. He was afterwards appointed minister of the interior.

Carnot was one of the ablest engineers, and most skilful generals, that France has produced. In 1791, he was chosen a member of the legislative assembly, and became a zealous and conscientious republican. In the following year he voted for the death of the unfortunate Louis; and, although the injustice of the sentence cannot be doubted, no one ever accused the honest intentions of Carnot. In the first edition of this work, vol. iii. p. 808, 9. we gave some anecdotes of his public career, reaching to the year 1797; at which time, deceived by the flying reports of the day, we supposed he had been killed. It is to correct that error that we now resume the subject; happy to record, that at that perilous juncture Carnot escaped to Switzerland.

When Bonaparte returned from Egypt, he remembered the talents of Carnot, and the many obligations under which he lay to him; and recalled him to power. He was once more placed at the head of the war-department; and the conquest of Italy and Germany were soon the proofs of his skilful arrangements. But the ambitious character of Napoleon then began to be displayed: Carnot remonstrated with him in vain; and, disdaining to be the base instrument of tyranny, again retired to the bosom of his family. In 1802, he was dragged from his retirement, and chosen member of the tribunate. Here he distinguished himself as the fearless opponent of every arbitrary measure. He voted against the assumption of the consulate for life; and, in 1804, after privately using every argument to dissuade Bonaparte from his ambitious purpose, he stood alone in the tribunate, and opposed the motion to confer on him the imperial dignity. “Shall we,” said he, “because this man has restored the peace and prosperity of his country, reward him with the sacrifice of her best interests, the very liberty which we are grateful

grateful to him for preserving? Shall we replace the pride and heroism of the masculine republican virtues, by ridiculous vanity and vile adulation? Shall freedom then be shown to man, that he may never enjoy it? Perpetually presented to him, is it a fruit which he may never reach? Has our common nature been so much a stepmother as to make the most pressing of all our wants that one which we must never gratify?—No!—I will not consent to regard this greatest good, so universally prized above all others, except as one without which all others are mere illusions. My heart tells me that liberty is practicable, and that a free government is more easy and more stable than the gloomy stillness of despotism."

When the tribunate was suppressed, in 1806, Carnot once more returned to private life, and all intercourse with Napoleon was at an end. Eight years were now spent in the pursuit of his favourite studies, and in the society of his family, and those friends who dared to brave the displeasure of the emperor by occasionally visiting him. But, when the fortunes of Napoleon were on the wane, preferring even the government of the existing tyrant to the horrors of a new revolution, he again offered his services, (Jan. 1814.) and spoke to him in a language so firm and frank as to atford all the servile instruments of his unbridled ambition. The letter is short, and is a model for an honest subject to his sovereign.—"Sire! So long as victory crowned your eagles, I kept myself to my studies in the closet, and employed myself in the education of my children. Now that she appears to abandon them, and that you have need of devotion, I hasten to offer my services. Do not disdain them, though they are those of an old soldier, above sixty years of age. He can rally round your eagles many Frenchmen, undecided as to the part which they ought to take. It is yet time, sire, to obtain an honourable peace, and to regain the love of the people, which you have lost. CARNOT."

In forwarding this letter, Carnot said to a friend, to whom he showed it, that it would either send him to the Chateau de Vincennes, or give him a mark of the emperor's confidence which would be auspicious to the return of moderation and freedom for France. Napoleon was pleased with this noble sincerity; and, though he could not immediately bring himself to receive his former sturdy monitor as his confidential minister, intrusted him with the defence of Antwerp. Carnot soon rendered the town impregnable, and continued to hold it until the complete re-establishment of Louis, when he surrendered it to him, and adhered to the constitutional charter. Louis offered him a place of honour and confidence; but, perceiving, or fancying that he perceived, a determination in the court to break the conditions on which the royal family was restored, he declined all connexion with the Bourbons. Such a man must be an acquisition to any government, and particularly to a government so unsettled and precarious as was Napoleon's at this time.

It could not have been Carnot who advised that ill-judged decree which Napoleon issued on the 11th of April, (though dated at Lyons so far back as the 12th of March,) excepting, from the general amnesty which he then published, some of the most distinguished characters in France, whose property was declared to be sequestrated, who were to be brought to trial, and, in case of condemnation, to suffer the penalties of the criminal code. The following are the names of the thirteen proscribed individuals: Lynch, mayor of Bourdeaux; Baron Vitrolles, appointed Louis's commissioner in the southern provinces, and detained under arrest at Toulouse; Marmont duc de Ragusa; Talleyrand prince de Benevent, (then at Vienna;) the Abbé de Montefiquiou, de la Roche Jacquelin, Alexis de Noailles, Sothene de la Rochefoucault, Bourrienne, Bellart, Comte de Bournonville, Comte de Jaucourt, and Augereau duc de Dalberg.

Monf. Chaboulon gives the following account of the noble and upright behaviour of General Bertrand upon this occasion. "It was I," says M. Chaboulon, "who

wrote this decree, from the dictation of the emperor. When I had finished it, he ordered me to go and get it signed by count Bertrand, who had countersigned the decrees of Lyons. I went to the marshal. He read the decree, and returned it to me, saying, 'I will never sign it: this is not what the emperor promised us: they who advise him to take such measures are his bitterest enemies: I will speak to him about it.' I related this firm and courageous answer to Napoleon, word for word. He ordered me to return to the grand marshal, to endeavour to overcome his repugnance, and, if he still persisted, to bring him to him. Count Bertrand instantly followed me into the emperor's closet. 'I am astonished,' said Napoleon to him, in a dry tone, 'that you make such difficulties about it to me. The severity I wish to display is necessary for the good of the state.'—'I do not think so, sire.'—'I do, I tell you; and it is my business alone to judge of it. I did not ask your advice, but your signature, which is only a matter of form, and cannot in any way compromise you.'—'Sire, a minister, who countersigns the act of a sovereign, is morally responsible for that act; and I should think myself wanting in my duty to your majesty, and perhaps to myself, if I were weak enough to set my hand to such measures. If your majesty choose to reign by the laws, you have no right arbitrarily to pronounce, by a simple decree, sentence of death, and forfeiture of property, against your subjects. If you choose to act as a dictator, and to have no law but your own will, you have no need of the addition of my signature. Your majesty has declared, by your proclamations, that you would grant a *general amnesty*. I countersigned them most cordially: and I will not countersign the decree that revokes them.'—'But you well know, I always told you that I never would pardon Marmont, Talleyrand, and Augereau; and that I promised only to overlook what had passed since my abdication. I began with being indulgent, even to weakness; and the royalists, instead of appreciating my moderation, have abused it: they bestir themselves, they conspire, and I ought and will bring them to their senses. I had rather have my blows fall on traitors than on men who are misled. Besides, all those who are on the list, Augereau excepted, are out of France, or in concealment. I shall not seek for them: my intention is to terrify them more than harm them. You see therefore,' continued the emperor, softening his voice, 'you have not rightly considered the business: sign this for me, my dear Bertrand: you must.'—'I cannot, sire. I request your majesty's permission to submit my observations to you in writing.'—'All that my dear sir, will make us lose time: you are startled, I assure you, without any reason: sign, I tell you; I request you; you will do me pleasure.'—'Permit me, sire, to wait till your majesty has seen my observations.' The marshal went away, and delivered to Napoleon a statement of his reasons. It did not alter his resolution; it only determined him to give it a legal form: persuaded, however, that Bertrand would still adhere to his former opinion, the decree in its altered shape was not presented to him: and it appeared without being countersigned."

Napoleon, however, was capable of better things. Three days after his public entry into Paris, he removed every restriction which the Bourbons had laid on the liberty of the press, and dismissed the censors, to whom every pamphlet, and every article in all the journals, was submitted previous to its publication. This decree excited equal surprise and satisfaction. If the freedom of the press was sincerely accorded, the dictatorial power with which Napoleon was now necessarily invested found in that a full and sufficient counterpoise. The utmost license was given to political discussion. Compositions which censured most freely the measures of government, and the characters of which it was composed, and whose evident object was to excite discontent and to prepare for reaction, were circulated without restraint. The justificatory memorial of Marmont duke of Ragusa, containing

taining expressions against Napoleon, which, if uttered against an English sovereign, would have condemned the author to long imprisonment, was sold in all the shops. The Negative Vote of Kergelay was afterwards disseminated without control, though it contained this remarkable sentence: "I am obliged to protest against this article, because I am convinced that the re-establishment of this dynasty (the Bourbon) on the throne is the only means of giving happiness to Frenchmen."

The editors of a publication, called *Le Censeur*, were however brought before the tribunals, for having published the following libel on the French army: "If a fraction of the people could dispose of the crown, that would soon happen to us which happened to the Roman people after the reign of the first emperors: we should have for chiefs none but soldiers, and the reigning family would be murdered as soon as it ceased to be pleasing to the satellites by whom it was surrounded." This gave great offence to the army. To be branded with the degrading title of satellites was more than they could bear: "It is an inexcusable term of contempt," said some of the officers to Napoleon, at the public levee; "they are the defenders of the nation." Napoleon, thus appealed to, was compelled to interfere. The publication was seized, and the editors summoned before the tribunal; but that tribunal had secret instructions to suffer the affair to drop.

This unrestrained license was politic and advantageous. It put the public feeling completely to the test. It destroyed the importance which falsehood and calumny would have derived from mystery and privacy; and it suffered the friends of the Bourbons, and all the springs and agents of revolt, to expose and entrap and entangle themselves, without the trouble of any extraordinary apparent exertion.

Another of the first decrees of Napoleon was, the abolition of the slave-trade, a decree in which every benevolent mind must exult. "Napoleon, Emperor of the French. We have decreed, and do decree as follows: 1. From the date of the publication of the present decree, the trade in negroes is abolished. No expedition shall be allowed for this commerce, neither in the ports of France nor in those of our colonies. 2. There shall not be introduced, to be sold in our colonies, any negro the produce of this trade, whether French or foreign. 3. Any infraction of this decree shall be punished with the confiscation of the ship and cargo, which shall be pronounced by our courts and tribunals. 4. However, the ship-owners who, before the publication of the present decree, shall have fitted out expeditions for the trade, may sell the product in our colonies. 5. Our ministers are charged with the execution of the present decree. NAPOLEON."

It is evident, that, if Napoleon dared, without preamble or apology, to order, "From the date of the present decree the slave-trade is abolished," and this at a time when every consideration required that he should conciliate all parties, and show that he was determined in every action to consult the prosperity and happiness of France, the conduct of the former government in continuing this infamous traffic was highly disgraceful and criminal.

Another decree contained several alleviating regulations relative to the *droits réunis*. These, next to the conscription, were the greatest grievances imposed upon the people by Napoleon's former government; and it will be recollected, that the promise of the abolition of both was the grand boon by which the Bourbons courted and obtained popularity on their re-entrance into France. The pledge for the abolition of the *droits réunis* was broken by the king's government; and, notwithstanding the resistance and repugnance of the people, this odious and oppressive tax continued to be levied. Napoleon was thus furnished with an opportunity of gaining much credit and popularity, by the early attention which he seemed to pay to the interests of the people. Yet Louis, alluding to these decrees in his Second Declaration from Ghent, May

2, 1815, is pleased to say, that "The usurper begins to abolish things which have been long since abolished."

Soon afterwards another measure was adopted which reflected credit on the new government. Carnot addressed a memorial to the emperor, descanting on the inestimable advantages of elementary instruction, when bestowed on the lower classes of society, and stating that there were in France two millions of children destitute of primary education: "I do not speak," says he, "of that education which forms half-philosophers, or men of the world; but such only as will form good artisans and moral men, by affording the elements of indispensable knowledge, good habits, and respect for the laws." He concludes with a high eulogium on Dr. Bell and Mr. Lancaster, for whose system he solicits the patronage of the emperor.

Napoleon immediately issued the following decree. "Considering the importance of education for improving the state of society; considering that the methods hitherto used in France have not attained that degree of perfection which it is possible to reach, and desiring to place this branch of our institutions on a level with the intelligence of the age; we have decreed, and do decree, as follows: 1. Our minister of the interior shall invite around him the persons who deserve to be consulted, as to the best methods of primary education; he shall examine and decide on those methods, and direct the experiment of such as he shall deem preferable. 2. There shall be opened at Paris an experimental school of primary education, so organized as to serve for a model, and to become a normal school to form primary teachers. 3. After satisfactory results shall have been obtained from this school of experiment, our minister of the interior shall propose to us the measures calculated to enable all the departments to enjoy the advantages of the new methods which shall have been adopted. NAPOLEON."

These acts of Napoleon astonished and confounded the superficial politicians of every nation. They had expected and wished that the dictatorship which he had established by usurpation would have been supported by terror. Their conclusion suited with the character of Napoleon, but it was inconsistent with the policy which his peculiar circumstances and necessities demanded: for, whatever might be his private wishes and designs, he saw, at present, an insuperable obstacle opposed to his ambition and impetuosity. These furious and insane bursts of passion, by which he had tarnished the lustre of his former achievements, were repressed by the influence of his advisers, and the difficulties which surrounded him.

Meanwhile the south of France continued in a state of opposition to the new government. The duke of Bourbon, the most popular of all the French princes, except perhaps the duke of Orleans, betook himself to La Vendée, to endeavour to rouse the dormant affections of the friends of royalty in that district. The people were disposed to second his views; but he had to contend with the prompt and vigilant administration of Napoleon. On his arrival at Beaupriére, he summoned the inhabitants, and, powerfully and successfully appealing to their best feelings, engaged them to sanction a proclamation requiring every man from eighteen to fifty years of age to take up arms in the royal cause. Great numbers immediately flocked to his standard; but they were unarmed and undisciplined, and, ere they could be rendered effective, the troops of Bonaparte advanced against them. The general of Napoleon, acting under the express orders of his master, to avoid as much as possible the dreadful appeal to arms, dispatched a herald to the duke, to remonstrate with him on the folly of opposing his raw and hasty levies against the veteran troops which were marching upon him, and offering an amnesty to his followers, and passports for himself and all who chose to accompany him, if he would abandon the enterprise. After mature consideration, the duke was convinced of the inutility of resistance; and, receiving safe conduct for himself and forty of his officers, proceeded to Nantes, where he embarked.

The duke and duchess of Angoulême were at Bourdeaux. The inhabitants of the maritime towns had suffered most by the protracted wars of the revolution. Their population had been thinned, their commerce had been destroyed, and they were almost driven to despair. They therefore welcomed the return of the Bourbons with the utmost enthusiasm. The duke of Angoulême had lately visited all the southern provinces, and had inspected the fortifications of Bourdeaux; and the Bordelese had expressed great anxiety to see among them the daughter of their former revered sovereign. On the 2d of March the duke and duchess arrived at Bourdeaux. They were received with cries of joy, and with the ardent benedictions of a countless multitude which had poured in from every neighbouring town. On the 5th a fête was given by the merchants. In the midst of the festivities a courier arrived, with dispatches for the duke, containing the fearful intelligence of the landing of Napoleon. His royal highness was unwilling to throw a damp on the public joy, and concealed the purport of the letters, deferring until night his departure for the south, where he imagined his presence might be necessary. At midnight he quitted the city. In the morning the duchess communicated the news to the magistrates, and in the course of the day the intelligence was made public through the city. On the following day all the civil and military authorities came, uninvited, to offer their protestations of attachment, and to renew their oaths of fidelity. The national-guards were called out. Places were appointed for the enrolment of volunteers, and almost the whole population of the town demanded arms, some to defend their native city should it be attacked, and others eager to march to the most distant department against the invader. The officers of the troops of the line declared that they would answer with their heads for the garrison of Bourdeaux and the neighbouring forts.

Meanwhile the news became more disquieting. Bonaparte had advanced unresisted to Lyons. The national-guards and volunteers were more eager in their professions of ardent devotion; but arms and ammunition were wanting, and only a few hundreds could be regularly embodied. As the progress of the invader became known, the zeal of the troops of the line evidently cooled, and cries of sedition began to be heard in some of the barracks. The superior officers, however, daily waited on the princes, and renewed their assurances of loyalty; but the remarked that the commandant of the fort of Blaye, an important out-post, had not appeared during some days. Orders were sent to require his attendance. Two days passed, and he came not. A general was then dispatched to examine the state of the forts, and report the disposition of the garrison. He returned, and reported that the place was in an excellent state of defence. "But why," asked the duchess, "did he not obey the orders which were transmitted to him several days ago, and repair hither?"—"He did not answer me on that point," said the general; "but he will be here to-morrow."

On the morrow he appeared. He offered a slight apology for his apparent disobedience; and, being required to renew his oath of fidelity, muttered some indistinct and unmeaning sounds, with which the duchess, unwilling to proceed to extremities, thought it prudent to appear satisfied. She, however, consulted with the governor of Bourdeaux on the propriety of removing the present commandant from Fort Blaye, and replacing him and his troops by others on whom she could rely. The governor acknowledged that this was desirable, but hinted that it was absolutely impracticable. He was ordered to attempt it.

To have dispatched a battalion of the line to dispossess their brethren, would have afforded them an opportunity of showing that disaffection which he suspected they secretly cherished. The affair was therefore committed to some national guards, a sufficient number of whom were

sent to occupy the fort for a short time, but not enough to attempt the reduction of the place, should the garrison attempt resistance. This prudent measure prevented the effusion of blood, and probably preserved the city from destruction. The national-guards were refused admittance to the forts, on which the tri-coloured flag was now hoisted; and they returned peaceably to Bourdeaux.

General Clausel, commanding the troops of Napoleon, now approached. Picquets were sent out to guard the bridges which were situated on the principal roads; but some of them fled after a short resistance, and the rest went over to the enemy.

The duchess summoned the governor in great haste; and, willing to spare the town from the horrors of a bombardment or a siege, declared her resolution to march out at the head of the garrison, and attack the foe. Against this the governor warmly remonstrated, assuring her that he could not answer for the fidelity of the troops. "Then," replied she, "the national-guards and volunteers are sufficient: they are eager for the combat, and on their good resolution I can surely rely." It was answered, that, if the national guard and volunteers passed the river, the garrison would follow, and, placing them between two fires, cut off every man. The duchess hesitated: "Is it then," said she, "impossible to employ, or even to rely on the neutrality of, that garrison, for the fidelity of which you pledged yourself so lately?"—"Impossible."—"I will satisfy myself," said the heroic princess: "assemble your troops in their respective barracks." The governor in vain represented the danger of this proceeding. "I did not ask you, sir!" said she, "if there would be danger; I only require you to obey my orders."

She alighted at the barrack of a regiment of infantry, and, placing herself in the centre of the square, addressed the troops. She painted in lively colours the character and designs of the invader, and the dangers which threatened France. She reminded them of the oath which they had taken, and urged them to share with the national guards in the honour of combating the rebels. A mournful silence succeeded. Again she addressed them; "Will you not fight for the daughter of your king?"—"No! no!" resounded from every rank.—"Will you then remain neutral if the national-guard and volunteers advance to the attack?"—"No!" they again replied. The princess burst into tears. "Will you then betray me, and give me up to mine enemies?"—"No!" said they; "but we do not wish for a civil war, and we desire you to quit France."

Although foiled in her first attempt, the princess would not despair. She proceeded to the barracks of the other troops; but her eloquence was exerted without effect; her tears flowed in vain. Seeing that resistance would now be unavailing, her next care was to preserve the town from pillage. She hastily returned to the quay on which the guards and volunteers were assembled. They received her with enthusiastic shouts, and eagerly demanded to be led against the foe. Silence was at length procured, when she thus addressed them: "Swear all to obey me!"—"We swear;" was the unanimous reply. "Brave Frenchmen!" she continued, "faithful Bordelese! I entreat you to think no longer of defending the city: you are not supported by the troops, and your efforts will be useless."

The troops of general Clausel were at this moment drawn up on the other side of the river. The guards and volunteers, as if actuated by one impulse, fired on them a volley. Fortunately it did no execution, and was not returned. "You have sworn to obey me," exclaimed the duchess: "remain faithful to your oath: if there be any disgrace, it will fall on me: I will be answerable to the king and to France: the sacrifice which I require of you is as terrible to my heart as to yours; but it is the only means of saving the city." With difficulty she was allowed to depart; and she returned to the palace. She had no sooner quitted

ted them, than a herald was dispatched to general Clausel entreating him to suspend his attack, as the princess was preparing to depart. He readily consented, and guaranteed the safety of the city. The best friends of the royal cause now hastened to the princess, and besought her to depart immediately. She acceded to their request, and at eight o'clock on the same evening embarked on-board a small vessel which the English consul had stationed in the river for her use.

General Clausel now entered the place without opposition. The garrison hoisted the tri-coloured cockade, and received him with acclamations; the national guard submitted in silence; and, notwithstanding the apparently universal feeling, a few hours before, in favour of the Bourbons, an immense croud assembled round the gates, and welcomed Napoleon's general with shouts of joy.

The duke of Angouleme proceeded to the south of France, and for a while fortune seemed to smile on his expedition. Some regiments of the line followed him with apparent fidelity, and his little army increased to more than six thousand men. In his first encounter with the troops of Napoleon he met with considerable success; but, being betrayed by those in whom he confided, the loyalty of the troops being seduced, and numerous corps of the enemy approaching him on every side, *he was constrained to surrender to general Gilly*. His force was sufficiently respectable to ensure honourable conditions. An universal amnesty was granted. The lives and property of his followers were secured, and the duke received safe convoy to Cette, where he was to embark for Spain or England. He had scarcely set out on his journey when general Grouchy arrived, and assumed the chief command of Napoleon's troops. Imagining that the former commander had exceeded his powers, he would not permit the duke to proceed to the place of his destination, and dispatched a courier to Paris for instructions. Napoleon could not refuse to accede to the terms which had been granted by general Gilly, without subjecting himself to the utmost opprobrium; but he adroitly seized the opportunity of giving a colour of generosity to what was merely an act of justice. He wrote the following letter to Grouchy, in which, without adverting to the convention already agreed on, he acceded to its substance; but made the further demand, that his royal highness should engage for the restitution of the crown-jewels, which had been carried away by Louis. "Count Grouchy; The ordinance of the king, dated March 6, and the declaration signed by his ministers on the 13th at Vienna, might authorize me to treat the duke of Angouleme as that ordinance and that declaration proposed to treat me and my family; but, adhering to the views which induced me to order that the members of the Bourbon family should be permitted to leave France freely, my intention is, that you should give orders for conducting the duke of Angouleme to Cette, where he shall be embarked, and that you watch over his safety and protect him from all bad treatment. You will also take care to recover the money which has been removed from the public chests; and to require of the duke of Angouleme to bind himself to the restitution of the crown diamonds, which are the property of the nation. You will also make known to him the enactments of the laws of the national-assemblies, which are renewed, and which apply to the members of the family of Bourbon who may enter the French territory. You will, in my name, thank the national guards for the patriotism and zeal which they have manifested, and the attachment which they have shown to me in these important circumstances."

NAPOLEON."

On the 2d of April, the Justificatory Manifesto of Napoleon in answer to the Declaration of Congress (see p. 512.) was published. As it is a document of the first importance, we shall present to the reader a few of the articles.

1. The committee, composed of presidents of sections of the council of state, has examined the Declaration of

the 13th of March, the Report of the Minister of General Police, and the documents thereto produced.

2. The Declaration is in a form so unusual, conceived in terms so strange, expresses ideas so anti-social, that the committee was ready to consider it as one of those forgeries by which despicable men seek to mislead the people, and produce a change in public opinion.

3. But the verification of legal minutes drawn up at Metz, and of the examinations of couriers, has left no ground for doubt that the transmission of this Declaration was made by the members of the French legation at Vienna; and it must, therefore, be regarded as adopted and signed by them.

4. It was in this first point of view that the committee thought it their duty to examine, in the first instance, this production, which is without precedent in the annals of diplomacy; and in which Frenchmen, men invested with a public character the most respectable, begin by a sort of placing without the law, or, to speak more precisely, by an incitement to the assassination, of the Emperor Napoleon.

5. We say, with the minister of police, that this declaration is the work of the French plenipotentiaries; because those of Austria, Russia, Prussia, and England, could not have signed a deed which the sovereigns and the nations to which they belong will hasten to disavow.

6. For, in the first place, these plenipotentiaries, most of whom co-operated in the treaty of Paris, know that Napoleon was there recognised as retaining the title of emperor, and as sovereign of the isle of Elba; they would have designated him by these titles, nor would have departed, either in substance or form, from the respectful notice which they impose.

8. An oblivion of those principles, which it is impossible to ascribe to plenipotentiaries who weigh the rights of nations with deliberation and prudence, has in it nothing astonishing when it is displayed by *some French ministers*, whose consciences reproach them with more than one act of treason, in whom fear has produced rage, and whom remorse deprives of reason.

11. The French nation, brave and generous, revolts against every thing bearing the character of baseness and oppression; its affections become enthusiastic when their object is threatened or attacked by a great injustice; and the assassination to which the Declaration of the 13th of March incites, will find no arm for its execution either among the 25,000,000 of Frenchmen, the majority of whom followed, guarded, protected, Napoleon from the Mediterranean to the capital, or among the 18,000,000 of Italians, the 6,000,000 of Belgians and Rhenish, or the numerous nations of Germany, who, at this solemn crisis, have not pronounced his name but with respectful recollections; or amidst the indignant English nation, whose honourable sentiments disavow the language which has been audaciously put into the mouths of sovereigns.

17. Nations and posterity will judge on which side, at this great conjuncture, has been respect for the rights of the people and of sovereigns, for the laws of war, the principles of civilization, the maxims of laws civil and religious. They will decide between Napoleon and the house of Bourbon.

18. If, after having examined the pretended Declaration of the Congress under this first view, it is discussed in its relations to diplomatic conventions, and to the treaty of Fontainebleau, of the 11th of April, 1814, ratified by the French government, it will be found that its violation is only imputable to the very persons who reproach Napoleon therewith.

19. The treaty of Fontainebleau has been violated by the allied powers and the house of Bourbon, in what regards the Emperor Napoleon and his family, in what regards the interests and the rights of the French nation.

1st. The Empress Maria-Louisa and her son ought to have obtained passports, and an effort, to repair to the emperor; and, far from executing this promise, they separated

parated violently the wife from the husband, the son from the father, and that during distressing circumstances, when the firmest soul has need of looking for consolation and support to the bosom of its family, and domestic affections.

3dly. The duchies of Parma and Placentia were given in full property to Maria-Louisa for herself, her son, and her descendants; and, after long refusals to put her in possession, they gave the finish to their injustice by an absolute spoliation, under the delusive pretext of a change, without valuation, without proportion, without sovereignty, without consent: and documents existing in the foreign-office, which have been submitted to us, prove that it was on the solicitations, at the instance, by the intrigues, of Talleyrand prince of Benevent, that Maria-Louisa and her son have been plundered.

4thly. There should have been given to the Prince Eugene, adopted son of the emperor, who has done honour to France which gave him birth, and who has conquered the affection of Italy which adopted him, a suitable establishment out of France; and he has obtained nothing.

5thly. The emperor had (Art. 9. of the Treaty) stipulated in favour of the heroes of the army, for the preservation of their endowments on the *Monte Napoleone*: he had reserved on the extraordinary domains, and on the funds of the civil-list, means of recompensing his servants, of paying the soldiers who attached themselves to his destiny: all was carried away and kept back by the ministers of the Bourbons. An agent for the French military, M. Bresson, went in vain to Vienna to claim for them the most sacred of properties, the price of their courage and blood.

6thly. The preservation of the goods, moveable and immovable, of the family of the emperor, is stipulated by the same Treaty, (Art. 6.) and they have been plundered of one and of the other; that is to say, by main force in France by commissioned brigands; in Italy, by the violence of military chiefs; in the two countries, by sequestrations, and by seizures solemnly decreed.

7thly. The emperor Napoleon was to have received 2,000,000, and his family 2,500,000, francs per annum, according to the arrangement established in the 6th article of the treaty. The French government has constantly refused to fulfil this engagement; and Napoleon would soon have been reduced to dismiss his faithful guard for want of means to secure their pay, if he had not found, in the grateful recollections of the bankers and merchants of Genoa and of Italy, the honourable resource of a loan of 12,000,000 which was offered to him.

8thly. In short, it was not without a reason that they wished by all means to separate from Napoleon those companions of his glory, models of devotedness and constancy, the unshaken guarantees of his safety and of his life. The island of Elba was secured to him in full property, (Art. 3 of the Treaty;) and the resolution to spoil him of it, which was desired by the Bourbons, and solicited by their agents, had been taken at the Congress.

28. And, if Providence had not in justice provided for him, Europe would have seen an attack made on the person, on the liberty, of Napoleon, banished for the future to the mercy of his enemies, far from his family, and separated from his servants, either to St. Lucia, or to *St. Helena*, which was intended for his prison.

37. France has been treated by the Bourbons like a revolted country, reconquered by the arms of its ancient masters, and subjected anew to a feudal dominion.

38. Louis Stanislaus Xavier did not recognize the treaty which alone made the throne of France vacant, and the abdication which alone permitted him to ascend it.

39. He pretended to have reigned nineteen years, thus insulting both the governments which had been established in this period, and the people who had consecrated them by its suffrages, and the army which had defended them, and even the sovereigns who had recognized them in their numerous treaties.

40. A Charter digested by the senate, all imperfect as it was, was thrown into oblivion.

41. There was imposed on France a pretended Constitutional Law, as easy to elude as to revoke, and in the form of simple royal decrees, without consulting the nation, without hearing even those bodies become illegal phantoms of the national representation.

44. The return of feudality in its titles, its privileges, its lucrative rights, the re-establishment of ultramontane principles, the abolition of the liberties of the Gallican church, the annihilation of the Concordat, the restoration of tithes, the intolerance arising from an exclusive religion, the domination of a handful of nobles over a people accustomed to equality; such was what the Bourbons either did or wished to do for France.

45. It was under such circumstances that the Emperor Napoleon quitted the isle of Elba; such were the motives of the determination which he took, and not the consideration of his personal interests, so weak with him compared with the interests of the nation to which he has consecrated his existence.

46. He did not bring war into the bosom of France; on the contrary, he extinguished the war which the proprietors of national property, forming four-fifths of French landholders, would have been compelled to make on their spoilers; the war which the citizens, oppressed, degraded, humiliated, by nobles, would have been compelled to declare against their oppressors; the war which Protestants, Jews, men of various religions, would have been compelled to sustain against their persecutors.

47. He came to deliver France; and was received as a deliverer.

48. He arrived almost alone; he traversed 220 leagues without opposition, without combat, and resumed without resistance, amidst the capital and the acclamations of an immense majority of the citizens, the throne deserted by the Bourbons, who, in the army, in their household, among the national guards, were unable to arm an individual to attempt to maintain them there.

49. And yet, replaced at the head of the nation, which had already chosen him thrice, which has just designated him a fourth time by the reception it gave him in his rapid and triumphant march and arrival; of that nation by which and for the interest of which he means to reign; what is the wish of Napoleon?

50. That which the French people wish; the independence of France, internal peace, peace with all nations, the execution of the treaty of Paris of the 30th of May, 1814.

NAPOLEON.

Two days afterwards, pacific overtures were made by the French government to all the courts of Europe. These were accompanied by a letter in the hand-writing of Napoleon himself to each of the sovereigns. On this occasion, the minister of foreign affairs (Caulincourt) sent a letter to lord Castlereagh. That letter was accompanied by another, which inclosed one from Napoleon to the prince-regent of Great Britain. There is nothing sufficiently remarkable in either of these documents to make them worth insertion. Lord Castlereagh, in his answer to the duke of Vicenza, informed him, that the prince-regent had given orders to transmit the letters to Vienna, for the information and consideration of the allied sovereigns there assembled.

Although nothing decisive had been resolved on by the British ministers, yet no doubt existed of their determination to join the allies in a war against Napoleon. This, however, was a measure of such serious consequence, that many members of parliament hesitated to concur in it without fuller proof of its political necessity; and some felt considerable doubts as to the moral justice of drawing the sword to compel a nation to discard a ruler whom it had with apparent consent adopted. Under the impression of these feelings, Mr. Whitbread, on the 28th of April, rose to make a motion for an address to the prince-regent. He began by commenting upon the gross delusion practised

tified on the public by the ministers, in taking no notice of the Treaty between the allies, on the 25th March; of which they had received an account on the 5th of April, when the regent's message was brought down on the 6th, and taken into consideration on the 7th; by which suppression they had held forth the possibility of an alternative between peace and war, whilst, in fact, they had engaged themselves to the latter. He then made some severe animadversions on the declaration of the allies, by which one individual was placed out of the pale of civil society; and endeavoured to show that there was neither justice nor policy in making him the object of a war. He concluded by moving, "That an humble address be presented to the prince-regent, to intreat his royal-highness that he will be pleased to take such measures as may be necessary to prevent this country being involved in war, on the ground of the executive power being invested in any particular person."

Lord Castlereagh opposed the motion, and defended the conduct of government with respect to the charge of concealment, by saying, that he was unwilling, by a premature disclosure of a treaty, of which the ratifications had not been exchanged, to prevent a reconsideration of the policy to be pursued towards France, under the circumstances which had recently occurred. In the course of his speech his lordship unequivocally declared it to be the firm conviction of all the allied sovereigns, that it was not possible to avail themselves of the blessings of tranquillity; and that Bonaparte was a person with whom it was impossible to live in relations of peace and amity: in fine, that war with him was unavoidable. As an instance of his bad faith, this man, when he made his movement upon Bar-sur-Aube, on the rear of the allies, the success of which was problematical, sent instructions to Caulincourt at Chatillon, which instructions happened to come into his (Lord C.'s) possession, directing him to accede to the terms proposed by the allies; but to contrive, by keeping certain points suspended and delayed, to afford him (Bonaparte) an opportunity, if circumstances should enable him, to prevent the fulfilment of the treaty. He wished to retain Antwerp, which was not the key of France, but of Great Britain; Mayence, which was the key of Germany; and Alexandria, which was the key of Italy. The motion was negatived by 273 to 72 votes.

The following are the instructions alluded to by Lord Castlereagh in his speech. They were sent in a dispatch from the duke of Bassano (Maret) to Caulincourt at Chatillon. "Sir, Your excellency will have received, or will doubtless in the course of to-day receive, a dispatch from Rheims, of which M. Frochet was the bearer, and which was accompanied by a letter from the emperor. The emperor desires that you will avoid explaining yourself clearly upon every thing which may relate to delivering up the fortresses of Antwerp, Mayence, and Alexandria, if you should be obliged to consent to these cessions: his majesty intending, *even though he should have ratified the treaty*, to be guided by the military situation of affairs. Wait till the last moment. The bad faith of the allies, in respect to the capitulations of Dresden, Dantzic, and Gorkum, authorises us to endeavour not to be duped. Refer, therefore, these questions to a military arrangement, as was done at Presburg, Vienna, and Tilsit. His majesty desires that you will not lose sight of the disposition which he feels not to deliver up those three keys of France, if military events, on which he is willing still to rely, should permit him not to do so, even if he should have signed the cession of all those fortresses. In a word, his majesty wishes to be able, *after the treaty*, to be guided by circumstances to the last moment. He orders you to burn this letter as soon as you have read it. March 19, 1814."

The allies at that time declared that they would no longer treat with Napoleon or his family. What reliance then could be placed on his present professions? Not yet firmly seated on his throne, his army disorganized, and his funds exhausted, there was every probability of

crushing him by one simultaneous effort. But if he was permitted to mature his projects, and call into action the yet powerful resources of France, the attempt to destroy or even to curb him might be impracticable. If they suffered him to remain unmolested, the peace, if peace it could be called, would be a feverish state of anxiety and suspicion, as expensive and burdensome as war itself.

But it was the general and very reasonable opinion, that it was his full intention to take the first opportunity of recovering Belgium and the Rhine as a boundary. This was the wish also of the majority of the French nation. A number of pamphlets were published in Paris, at this time, which tended to encourage the public opinion in this idea. In one of them, entitled *De l'Empereur Napoleon et du Comte de Lille*, is the following passage: "What have we seen, great God! After twenty years of combats, of fatigues, and glory, all the fruits of our labours passing into foreign hands; and, if any act of our government displease, in two days they can reach the walls of our capital, and impose laws upon us at their pleasure! What! Belgium, our first conquest, passes under other masters! What! all the country extending from the Meuse and the Moselle to the Rhine is the prey of a sovereign whom we have twice driven from his states!" The same pamphleteer also talks of the "treason of Prussia, Bavaria, and Wirtemberg;" of the "clemency and pity of Napoleon towards Austria in 1809, and of the total oblivion of the benefits which the magnanimous Napoleon had conferred on the whole of the allies, &c." One Gaillard, in a pamphlet entitled *Du Retour des Bourbons en France*, speaking of the Treaty of Paris, says: "We well recollect the bitter vexation which this high-minded people felt when this humiliating treaty was published. An indefinable astonishment seized all French hearts: thus were destroyed, in one day, the labours of five-and-twenty years: the fruits of so many battles, so many sacrifices, fell into foreign hands." Another pamphlet, entitled *L'Homme du Siècle et de la Patrie*, contains the following: "We were told, that with the return of the Bourbons we obtained peace with foreign powers. What a peace! the peace of disgrace and of death! our military renown was impaired; the natural boundaries of France, those glorious fruits of twenty-five years labour, were surrendered."

On these grounds, therefore, the war which united Europe prepared to wage against him, was not only justifiable, but necessary. The disposition of the French army, nay, even of the French people, and the character of the individual at the head of the government, demonstrated that surrounding nations could not be at peace. The restless ambition and thirst of foreign conquest, and the disregard for the rights and independence of other states, which had characterized Napoleon and his army, exposed the whole of Europe to renewed scenes of devastation and blood. His destruction, as a ruler, was therefore required, not only as an expiation of former crimes, but as a necessary measure of precaution and security. The unbounded influence which he had hitherto exerted over a people so vain-glorious, so volatile, and so demoralized, as the French, and the calamities in which, by these means, he had involved every surrounding country, not only justified those countries in uniting, but imperiously called upon them to unite, and prohibit France from again placing herself at the disposal of a man in whose hands the must ever be an object of alarm and terror.

Candour requires the acknowledgment, that some enlightened men, who had the best opportunity for observing him, and who would not be easily imposed upon, were persuaded that the intentions of Napoleon were honest. They imagined that he had seen the folly of his conduct; that he wished to atone for his errors; and that he had determined to respect the liberties of France and the peace of Europe. Carnot was of this opinion.

Others, with some degree of plausibility, reasoned thus: The ruling passion of Napoleon is ambition. That passion

is not, never can be, extinct. To excite the admiration of his contemporaries, and to become the hero of future annals, is the grand aim of all his actions, the only end for which he appears to live; for this he will commit crime without malignant intention, and practise virtue without merit. The same passion which formerly suggested the romantic plan of universal empire, will now direct and constrain him to adopt an opposite course. Public opinion, on which he so much depends, and which is so necessary to his existence, repels with horror the chains of despotism, even though fabricated of gold, and the palms of victory if stained with blood. Opinion, the mistress of the masters of the world, now exacts from him peace and liberty; peace founded on justice and cemented by good faith, and liberty protected and supported by the laws. At this price she promises him glory and immortality, and at this price he will purchase the objects of his most ardent wishes.

This reasoning, however plausible, however interesting, would not heal the yet-bleeding wounds which Russia, Prussia, and Austria, had received at Friedland, Jena, and Austerlitz. The allies could not trust him. He had no pledges to give; and, without sufficient pledges, they were not justified in compromising the peace and security of Europe.

During fifteen years he had unceasingly aimed at the subjugation of Europe. It had been the object of his daily meditations, and his nightly dreams. "In five years," said he to one of his ministers, at a time when he was at peace with every continental power except Spain, "in five years I shall be master of the world. Russia alone will remain; but I will crush it," added he, with a most expressive gesture. "Paris shall reach to St. Cloud. I will build fifty vessels every year; but I will not send one of them to sea till I have 500. I shall then be master of the ocean as well as the land."

A strong attachment to royalty and the Bourbons still subsisted in Brittany and La Vendée; and the royalists in those parts at this time took up arms in defence of the Bourbon cause, and became masters of the country which they inhabited; but they were not able to extend themselves towards Paris. There was, indeed, a want of concert and combination in all the efforts of the Bourbonists, which rendered them desultory and ineffectual; and they had little influence in diverting the attention of the French government from the means to resist the foreign storm which was rising against it.

This danger was so imminent, that it was become absolutely necessary no longer to conceal it from the nation, which was to be prepared for exerting all its powers of resistance. On the 14th of April, a long report from the minister of foreign affairs to the emperor was published at Paris. This document gives a correct view of the state of Europe, and of the preparations of the allies at that period. But it is too long for insertion; and we must refer the reader to Gifford's History, where he will find it at full length, p. 1299. Suffice it to say, that, in consequence of its contents, every effort was now made to increase the regular army; an energetic proclamation was published; and the national guards were ordered to be embodied, and distributed among the different fortresses of the country: 3130 battalions, of 720 men each, were commanded to be immediately equipped for service; making a grand total of 2,255,040 soldiers. Had Napoleon been able to have called into action this immense body, and to have instilled a sufficient portion of enthusiasm into their ranks, he might have bid defiance to the world: but scarcely a tenth part were ever enrolled. The old soldiers, however, crowded to the imperial standard; and a brave and numerous army was soon placed at his disposal, with which he might expect at least to open the campaign with eclat; and he indulged the hope that some brilliant action at the commencement of the contest might excite the enthusiasm of the French, or disconcert or disunite the allies.

Workmen were employed in fortifying the heights of Montmartre, Chaumont, and Mesnil-Montant, in the neighbourhood of Paris; while orders were issued to inspect and complete the fortifications of every garrison-town: Soissons, Laon, Lafère, Saint-Quentin, Guise, Château-Thierry, Vitry, and Langres, were placed in a respectable state of defence; Chalons, Rheims, Dijon, the Vosges, Jura, and Argonne, already strong by nature, were rendered nearly impregnable; many hundred workmen were daily employed in the fortifications of Lyons; and no effort was spared to oppose every obstacle to the progress of the invader. Every defile was guarded; fortifications were erected at the heads of the bridges; batteries crowned the summit of every mountain, and the din of preparation sounded from the northern frontier to the Mediterranean sea.

On his first landing in France, Napoleon had pledged himself to give the French a constitution agreeable to their wishes, and favourable to their liberties. He now hastened to redeem his pledge. Inclination and necessity equally prompted this measure. He appointed a commission to draw up the form of a Constitution to be submitted to the choice of the nation. Bishop Gregoire, well known for his attachment to rational liberty, and Benjamin Constant, who had lately and so boldly spoken his sentiments of the emperor, and so strenuously opposed his cause, were members of this commission.

This document, called the "Acte additionel," which was published on the 23d of April, contains, under the several heads, all the provisions for establishing a free representative government, similar to that of England, which it obviously had in view; but, since this Act was never acted upon, it is unnecessary for us to insert it. It will be found in the elaborate work referred to above, at p. 1304. and to the curious enquirer it will be considered as a record so far valuable as it affords a view of what was thought necessary to satisfy the expectations of the party which then possessed the principal political influence, and to whose views Bonaparte would probably have been obliged to conform, had he been unable to re-establish a military despotism.

The promulgation of this new constitution was, however, to form a grand spectacle, a thing highly agreeable to the Parisians, indeed to all popular assemblies. Every Frenchman of mature age was, in the first place, invited to inscribe his vote for or against it, in registers which were opened in every town and district. These votes were to be collected, and the grand result published, at the Champ de Mai, which was convened for the 26th of May.

The Champ de Mai, or Champ de Mars, is a large expanse in front of the Military School, (see p. 467.) It was appropriated, like the Campus Martius at Rome, to the reviews of troops, and to horse and foot races on public festivals. It did not, however, derive its name from any imitation of the Roman Campus Martius. In the early periods of the French monarchy, the general assemblies of the nation were held in this place: the objects of the meeting were to frame new laws, to submit the complaints of the people to the royal ear, to compose differences among the barons, and to review the forces of the kingdom. It was denominated the Champ de Mars, because the assembly took place in the month of March. In the middle of the eighth century, Pepin transferred it to the month of May, as a milder and more convenient season. After this it was called either the Champ de Mars or the Champ de Mai. Under the second race of kings, similar meetings were held both in the beginning of the year, and in August or September. Under the third race they gradually changed their character, and assumed the title of parliaments and états généraux, which they preserved to the period of the revolution.

One circumstance attending the promulgation of the Additional Act gave great offence. The army and navy were invited to deliberate on it, and transmit their approval

proval or dissent. In every state which boasts the slightest portion of liberty, a deliberative voice has been jealously withheld from the military. The duty of the army is to defend the country from invasion, and to obey the commands of the executive power. Its very character renders it dangerous and fatal to freedom, to permit it to have a voice in the legislative deliberations of the country. This novel compliment now paid to the army was the result of the difficult circumstances in which Napoleon was placed. His chief dependance was on the attachment and devotion of his soldiers. His fate was in their hands; and by their aid alone could he avert the destruction which threatened to overwhelm him. Yet even on this ground his conduct was not justifiable. It was an unnecessary violation of every constitutional principle. His troops would not have claimed a privilege, to which in no country had the army ever been entitled; and the gratuitous offer of it excited in the mind of every rational man the most painful suspicions, and prepared the way for alienation and disgust.

We must now advert to the situation of Louis XVIII. at Ghent, where he was surrounded by his small but faithful court. On the 12th of April he issued a Declaration, in which may be seen the early avowal of the determination of the allies to re-seat the Bourbons on the throne. It contains the following expressions: "Treason has forced us to quit our capital, and to seek refuge on the confines of our states. However, Europe has taken up arms; Europe, faithful to its treaties, *will know no other king of France except ourselves*. Twelve hundred thousand men are about to march to assure the repose of the world, and, a second time, to deliver our fine country."

This was followed, on the 24th of April by a Manifesto from Louis to the French Nation. On this document, as well as on the former, we shall offer only two remarks. In the first place, it is very strikingly observable, that the language of all addresses to the French nation, whether proceeding from Napoleon or Louis, are deeply tinged with the same faults: their language is pompous and inflated; their sentiments exaggerated; little is addressed to cool reason and sober judgment: almost the whole to feeling or passion. In the second place, Louis, by so frequently and strikingly dwelling on the Charter, and on the inviolability of property, evidently was sensible, that he had not been acting as he ought to have acted with respect to these points.

These papers were probably drawn up by Chateaubriand. He also drew up about the same time a Report on the State of France. This report is important and interesting as exhibiting a strong contrast with the Report laid before Bonaparte. The first head of this report relates to the acts and decrees for the interior. Under this head the reporter contrasts the benedictions that followed the king on his departure with the gloom that was caused by the return of Bonaparte: he remarks on the system of official lying: the proclamations of Bonaparte, promising the return of the golden age, &c. If Bonaparte abolishes the excise, he only undoes his own work; by what right, among a free people, does he alter the mode of levying the taxes prescribed by the law?

The second head relates to the exterior. Under this head are stated the attempts made by Bonaparte to deceive foreign powers by the hopes of peace, while, at the very same time, he was flattering his army with the recovery of Belgium, the natural boundary of the Rhine and Italy. The question of foreign interference is also stated and argued under this head.

The third head of the report relates to reproaches made to the royal government. Under this head the reporter shows the reproaches concerning the lavish expenditure to be wholly groundless; and *endeavours to justify the non-payment of Bonaparte's allowance in Elba*, because he had immense debts in France.

Such were the employments of Louis and his ministers during his exile at Ghent. But though, in his manifesto and in the official report, he represented the majority of

the French nation (or rather the whole French nation, with the exception of the army and a very few individuals) as hostile to Bonaparte, and warmly attached to himself; yet it was evident that he looked for his re-establishment on the throne to the allies alone, not to his subjects, not to Frenchmen; and the event proved that he was right, for, as we have before observed, not a French sword was drawn in his cause.

The allies, then, upon whom Louis relied, being determined on war, it was necessary that no time should be lost in bringing their troops into the field. Most of the Russians had already retired within the frontiers of Poland; the Prussians had also returned to their country; and the Austrians were engaged in Italy. But, as the allies were deeply impressed with the indispensable necessity of the most prompt and vigorous measures, it was resolved that all the troops which they were to furnish, and even more than their quotas, should, without the least delay, assemble on the French frontiers.

The allied powers, however, could not stir in this momentous affair unless Great Britain subsidized them most liberally. For this purpose the chancellor of the exchequer proposed, and carried with little opposition, the renewal of the income-tax; and a loan of thirty-six millions was also raised. Among the benefits expected from the conclusion of a general peace in the last year, scarcely any was more cordially greeted by the people of England than a liberation from that burdensome and vexatious impost, the property-tax, which was necessarily to expire at a certain period after the signature of a definitive peace. In the suspicion, however, that ministers might be tempted to renew it, as the easiest mode of providing for the great demands which would be occasioned by the winding up of the war-expenses, petitions were drawn up in almost all the principal places in the kingdom, to be laid before parliament, warmly deprecating such a measure. Whatever might have been the intention of the government, this decided expression of the national desire had the effect of causing the adoption of other financial plans; and, on February the 20th, at a committee of ways and means, the chancellor of the exchequer introduced his plan of new taxes to supply the place of the property-tax. But the return of Bonaparte to France re-plunged this nation into all its difficulties; and in the month of May the tax was revived, exactly in the same form as before, for one year from the 5th of April, 1815.

Great Britain then entered into twelve treaties of accession, and twenty-five treaties of subsidy. By the treaty of accession with Baden, his Britannic majesty engaged in his own name, and in that of his allies, not to lay down his arms without particularly taking into consideration the interests of the Grand Duke of Baden, and not to permit the political existence of the duchy to be violated. The other treaties of accession were with Bavaria, Denmark, Hanover, the Grand Duke of Hesse, the King of the Netherlands, Portugal, Sardinia, Saxony, Switzerland, Wurtemberg, and the princes and free towns of Germany. The treaties of subsidy were with the same powers: and by these Baden was to furnish 16,000 men; Bavaria, 60,000; Denmark, 15,000; Hanover, 26,400; Hesse, 8,000; Sardinia, 15,000; Saxony, 8,000; Wurtemberg, 20,000; besides the troops to be furnished by the princes and free towns of Germany; so that Great Britain had at her command upwards of 200,000 troops. Of the whole collective force of allies, lord Castlereagh gave the following statement to parliament:

Austria	-	-	-	300,000
Russia	-	-	-	225,000
Prussia	-	-	-	236,000
States of Germany	-	-	-	150,000
Great Britain	-	-	-	50,000
Netherlands	-	-	-	50,000
				1,011,000

The sum of five millions was voted by parliament to be divided between Austria, Russia, and Prussia; and 2,500,000. between the smaller powers. There were also some other arrangements concluded between Russia, Holland, and Great Britain; by which the latter had to pay an additional sum of 2,500,000. making all together 10,000,000.

The exertions of the continental powers were now as unbounded as John Bull's generosity. Every road was thronged with troops hastening by forced marches to the Sambre and the Rhine. The Prussians were particularly active in equipping their troops for the field; and the king published a very energetic and earnest address to his people to assist him once more against his bitter enemy. Would he had been as much in earnest as to fulfilling the promises he made to them at that time!

Napoleon was not remiss in preparing the means by which he expected to be able to defend and support himself. These means were of two descriptions: in the first place, he endeavoured to raise as large a military force as possible; and, secondly, he used the most strenuous exertions to rouse the people in his favour. His ministers were, undoubtedly, men of great talents; and some of them men of great influence with the people. The collecting and equipment of the army were committed to the care of Carnot and Davoust. The regular army at this time consisted of between 3 and 400,000 men, of which about 100,000 were assembled on the frontiers of Belgium, 40,000 on the Rhine, 30,000 at Chambery, 10,000 in La Vendée, and about the same number at Bourdeaux. The remainder were distributed in garrisons, or were on march to join their different corps. It has appeared surprising to many that the French army was not more numerous, particularly as upwards of 300,000 prisoners had returned to France during the year 1814. It is, however, easily accounted for. The Bourbons, finding that the disposition of the troops were hostile to them, and also that the finances were not sufficient to support a numerous army in time of peace, had taken all the means in their power for reducing it. For that purpose all the young soldiers were discharged; and a vast number of foreigners, such as Italians, Germans, Dutch, and Belgians, after the treaty of Paris, were picked out and assigned over to their respective sovereigns. By this means the French army, which, on the abdication of Bonaparte, consisted of upwards of 400,000 men, was reduced before the end of the year to 175,000. The exertions of Bonaparte and his ministers, therefore must have been great, to have added, in the short space of two months, 200,000 men to the army. Indeed, there is every reason to believe, that, if the allies had not been quick in their preparations, a few months more would have swelled the numbers of the French army to a most enormous amount.

The present amount of the French army, it is evident from the statement which we have given of the opposing force of the allies, was by no means adequate to the support of Bonaparte, even if France had been tranquil and well-disposed towards him. But this was far from being the case. In the west, particularly in La Vendée, the royalists were very numerous and daring. They were headed and encouraged by La Roche Jaquelin, of a family long noted for hatred to the revolution and attachment to the Bourbons, and one of the persons excepted out of Bonaparte's general amnesty. For the purpose of producing a counterbalance to the royalists of Brittany, a federal compact was proposed to the five departments of that province, of persons devoted to the emperor and the national cause, who were to form a part of the national guard. Accordingly, confederacies were formed in several parts of Brittany, the members of which professed "to consecrate all their means to the propagation of liberal principles; to support the public spirit during the present crisis, and to oppose all disorders;

to maintain public security in the interior, and to march to all places in the provinces which might be threatened by foreign and domestic foes; to employ all their influence and credit to keep each other in the line of his duty to his prince and his country; to bear succour effectually and promptly at the first requisition of the public authority; to defeat all plots against the constitution and the emperor; and to lend one another mutual assistance and protection according to events." emissaries were sent into the suburbs of Paris, to induce the inhabitants to enter into similar confederations, and thus to set a patriotic example to the other cities of the empire. The invitation was quickly obeyed, and 15,000 men soon enrolled themselves and demanded arms. Similar confederacies were formed in many other parts of the empire. Indeed the general feeling of the people, though their enthusiasm was considerably abated, was evidently in his favour. They suspected and feared him; but they feared yet more the return of their former masters, backed by the force of united Europe. The new proprietors especially felt that their security was inseparably connected with the cause of Napoleon.

The assembly of the Champ de Mai, which had been postponed from time to time, was at length appointed to be held on the 1st of June; so that, after all, it was neither a Champ de Mars nor a Champ de Mai. However, the month of June, 1815, will ever be remarkable in the annals of history, for the important events which were crowded into it.

On the day appointed every thing was done that could render the spectacle solemn and imposing; and, though all the deputies from the departments had not arrived, yet the *tout ensemble* was grand, and such as must have answered, in some degree, the real object which Napoleon had in view. "Every thing that could interest and elevate the soul; the prayers of religion; the compact of a great people with their sovereign; France represented by the flower of her citizens, agriculturists, merchants, magistrates, and warriors, collected around the throne; an immense population covering the Champ de Mars, and joining in vows for the great object of that magnificent ceremony; all excited the most ardent enthusiasm, of which the most memorable epochs have left us the recollection." Such is the language in which this spectacle was described in the official papers of the French government. But, even granting that this was a fair and unexaggerated description, what could be inferred from it respecting the views or feelings of the French people? How often had they before, during the revolution, displayed an enthusiasm at least equal to that which they were now represented to feel!

The emperor's throne was erected in front of the Military School, and in the centre of a vast semi-circular inclosure, two thirds of which formed on the right and left grand amphitheatres, in which 15,000 persons were seated. The other third, in front of the throne, was open. An altar was erected in the middle: further on, and about a hundred toises distant, was another throne, which overlooked the Champ de Mars. Eighty-seven banners decorated the inclosure, bearing the names of the eighty-seven departments. The national colours mingled with these banners, and every vacant space was occupied by the imperial eagles surrounded with garlands of flowers emblematic of peace. The sloping banks which arise round the Champ de Mars, were crowded with people, and its immense plain was filled with cavalry. On the preceding evening, a deputation of the colleges met to collect and cast up the votes. Eleven departments and several regiments had not made any returns. The general result of the votes received, gave 1,288,357 for the additional act, only 4207 against it: one fourth of the negative votes proceeded from the department of the Cotes du Nord.

Napoleon left the Tuileries soon after eleven o'clock, in

in a carriage drawn by eight horses, amid discharges of artillery. He was accompanied by his brothers Joseph, Lucien, and Jerome, who were dressed in Roman costume. The emperor was preceded by the commandant of Paris, heralds, ministers of state, grand officers, &c. On arriving at the Champ de Mars, the troops, which amounted to about 50,000 men, were drawn up in order of battle, and the procession passed between the lines. Napoleon took his place on the throne about one o'clock, when he was saluted by prolonged shouts from the multitude which occupied the vast inclosure of the Champ de Mars. The electors sat under the rotunda, and the grand national authorities occupied some tribunes in front of it. The officers of the crown were behind Napoleon; his ministers surrounded him; and the generals were on either side. Mass was then celebrated by the archbishop of Tours, assisted by cardinal Bayanne and four other bishops. When mass was concluded, the members of the central deputation of the electoral colleges advanced to the foot of the throne, the steps of which they ascended in order to have a nearer view of the emperor, and to be better seen by him. They were about 500 in number. They were presented to his majesty by the arch-chancellor. One of the members of the deputation (M. Dubois d'Angers, elector and representative for the department of the Maine and Loire) pronounced, with a loud and animated voice, the following address, in the name of the French people:

"Sire; The French people had decreed you the crown, which you abdicated without its consent; its suffrages now impose upon you the duty of refusing it. A new contract has been formed between the nation and your majesty. Assembled from all quarters of the empire around the tables of the law, upon which we have just inscribed the will of the people, that will which is the only legitimate source of power, it is impossible for us not to repeat the cry of France, of which we are the immediate organs, not to declare, in the presence of Europe, to the august chief of the nation, what it expects of him, and what he ought to expect of it. Our words shall be grave as the circumstances which inspire them. What are the designs of the league of allied kings, with those warlike preparations with which they terrify Europe and afflict humanity? By what act, by what violation, have we provoked their vengeance, occasioned their aggression? Have we, since the peace, endeavoured to give laws to them? We wish only to make and to follow such as are adapted to our manners. We will not have for our head him whom our enemies choose for us, and we will have him to whom they are averse. They presume to proscribe you personally—you, sire, who, though so often master of their capitals, had generously re-established them on their tottering thrones! This hatred of our enemies strengthens our attachment to you. Were the meanest of our citizens proscribed, we ought to defend him with the same energy: he would be, like you, under the ægis of the law, and of the power of France. We are threatened with an invasion! and yet, shut up within frontiers which nature has not given us, which long before your reign victory and peace itself had extended, we have not passed those narrow bounds, out of respect for treaties which you have not signed, but which you have offered to respect.

"Do they ask for guarantees? These are to be found in all our institutions, and in the will of the French people henceforth united with your's. Ought they not to be afraid of reminding us of very different times, and a very different state of things, which, however, might once more recur? It would not be the first time that we should have conquered Europe armed against us. It is to the French nation that they dare deny a second time, in the nineteenth century, in the face of the civilized world, those sacred imprescriptible rights which the smallest tribe never claimed in vain at the tribunal of justice and of history! Because France is determined to be France, must she be degraded, torn, dismembered; and is the fate

VOL. XVIII. No. 1262.

of Poland reserved for us? In vain would they cloak fatal designs under the mask of the sole intention of separating you from us, in order to give us masters with whom we have nothing in common, whom we do not understand, and who cannot understand us; who seem to belong neither to the age nor to the nation, which received them for a moment into its bosom only to behold its most generous citizens proscribed and degraded by them. What each of us had, for twenty-five years, considered as titles of glory, as services worthy of reward, was to them a cause of proscription, a seal of reprobation. A million of functionaries, of magistrates who, for twenty-five years, have followed the same maxims, and from among whom we have just chosen our representatives; 500,000 warriors, our strength and our glory; six millions of landed proprietors invested by the revolution; a still greater number of enlightened citizens, who make a deliberate profession of those ideas which have grown up among us into political dogmas; all these worthy Frenchmen were not the Frenchmen of the Bourbons; they wished to reign only by a handful of privileged persons, punished or pardoned for twenty-five years past. Opinion itself, that sacred property of man, they persecuted, persecuted even in the peaceable sanctuary of letters and arts.

"Sire, a throne erected for a moment by foreign arms, and environed with incurable errors, has crumbled to pieces in an instant before you, because you bring back to us from retirement, fruitful in grand ideas to great men only, all the traces of our real glory, and all the hopes of our real prosperity. How must your triumphal march from Cannes to Paris have opened all eyes? In the history of all nations, and of all ages, is there a scene more national, more heroic, more imposing? Is not this triumph, which has not cost a drop of blood, sufficient to undeceive our enemies? Do they wish for more bloody ones? Sire, you may expect from us every thing that an heroic founder has a right to expect from a nation faithful, energetic, generous, not to be shaken in its principles, invariable in the object of its efforts, independence abroad and liberty at home. The three branches of the legislature are on the eve of operation. One sentiment alone will animate them. Confiding in the promises of your majesty, we commit to it, we commit to our representatives, and to the chamber of peers, the care of revising, consolidating, and perfecting, our constitutional system, and the institutions which are to secure it.

"Sire, nothing is impossible; nothing will be spared to secure honour and independence, those benefits more dear than life. Every thing will be attempted, every thing will be done, to repel an ignominious yoke. We say it to nations—may their chiefs hear us! If they accept your offers of peace, the French people will expect from your administration, strong, liberal, and paternal, motives to console it for the sacrifices which peace has cost us: but, if they will leave us only a choice between war and shame, the whole nation rises entire for war; it is ready to extricate you from the offers, perhaps too moderate, which you have made to spare Europe a new convulsion. Every Frenchman is a soldier. Victory will attend your eagles; and our enemies, who reckon upon our divisions, will soon regret having provoked us."

At the conclusion of this Address, the whole Champ de Mars resounded with cries of "Vive la Nation! Vive l'Empereur!" At this moment the arch-chancellor proclaimed, that the Additional Act to the Constitution of the Empire had been accepted almost unanimously. The herald then declared, in the name of the Emperor, that the Act was accepted by the French People. Napoleon then, seating himself on another throne, which was in the centre and overlooked the assembly, spoke in the following terms:

"Gentlemen Electors of the Colleges of the Departments and Districts; Gentlemen Deputies of the Army and Navy, at the Champ de Mai;—Emperor, Consul, or Soldier,

Soldier, I derive all from the people. In prosperity, in adversity, on the field of battle, in council, on the throne, and in exile, France has been the sole and constant object of my thoughts and actions. Like Codrus king of Athens, I sacrificed myself for my people, in the hope of realizing the promise given to preserve to France her natural integrity, her honours, and her rights. Indignation at seeing those sacred rights, acquired by twenty years of victory, disavowed, and lost for ever; the cry of French honour tarnished, and the wishes of the nation, have replaced me upon that throne which is dear to me, because it is the palladium of the independence, the honour, and the rights, of the people. Frenchmen, in traversing, amidst the public joy, the different provinces of the empire to reach my capital, I had reason to rely on a lasting peace. Nations are bound by treaties concluded by their governments, whatever they may be. My thoughts were then all occupied with the means of establishing our liberty by a constitution conformable to the will and interests of the people. I convoked the Champ de Mai. I soon learned that the princes who have disregarded all principles, who have trampled on the sentiments and dearest interests of so many nations, wish to make war against us. They meditate the increasing of the kingdom of the Netherlands, by giving it as barriers all our northern frontier places; and to make up the quarrels which still divide them, by sharing among themselves Lorraine and Alsace. It was necessary therefore to prepare for war. However, before personally exposing myself to the risk of battles, my first care was to give, without delay, a Constitution to the nation. The people has accepted the act which I presented to it.

"Frenchmen, when we have repelled these unjust aggressions, and Europe shall be convinced of what is due to the rights and independence of 28,000,000 of French, a solemn law, enacted according to the forms prescribed by the Constitutional Act, shall combine the different dispositions of our constitutions that are now scattered.

"Frenchmen, you are about to return into your departments. Tell the citizens, that circumstances are arduous; that with union, energy, and perseverance, we shall come off victorious from that struggle of a great people with its oppressors; that future generations will severely scrutinize our conduct; that a nation has lost every thing when it has lost its independence. Tell them, that the foreign kings whom I raised to the throne, or who are indebted to me for the preservation of their crowns; who all, in the time of my prosperity, courted my alliance and the protection of the French people; are now aiming all their blows at my person. If I did not see that it is against the country that they are directed, I would place at their disposal this life against which they manifest such animosity. But tell the citizens also, that, while the French shall retain for me the sentiments of love of which they give me so many proofs, this rage of our enemies will be impotent.

"Frenchmen, my will is that of the people: my rights are its rights: my honour, my glory, my happiness can never be distinct from the honour, the glory, and the happiness, of France."

The archbishop of Bourges, officiating as grand almoner, then approached the throne, and, kneeling, presented the New Testament to the emperor, who took the oath in these terms: "I swear to observe the constitutions of the empire, and to cause them to be observed." This was followed by an oath of obedience to the constitution, and of fidelity to the emperor, pronounced by the arch-chancellor, and repeated by the whole assembly.

After *Te Deum* was sung, the presidents of the electoral colleges advanced to receive the eagles destined for the national guards of their respective departments. Napoleon, in presenting them, spoke as follows: "Soldiers of the national guard of the empire, soldiers of the army and navy; I confide to you the imperial eagle with the national colours; swear to defend it at the price of your

blood against the enemies of the country and of this throne! Swear that it shall always be your watch-word; swear!"

Universally-repeated cries of "We swear it," resounded throughout the inclosure. In the midst of these acclamations, and surrounded by the eagles of all the armed corps of France, the emperor went with his whole retinue to place himself on the elevated throne in the middle of the Champ de Mars, where, as colonel of the national guard of Paris, and of the imperial guard, he gave the eagles to the presidents of the departments and of the six arrondissements, and to the chiefs of his guard. All the troops marched in battalions and squadrons, and surrounded the throne, the officers standing in the first line. The emperor said: "Soldiers of the national guard of Paris, Soldiers of the imperial guard! I confide to you the imperial eagle with the national colours. You swear to perish, if necessary, to defend it against the enemies of the country and of the throne." (The whole army, assembled around the throne, was within hearing, and interrupted the emperor with a thousand times repeated cries of "We swear it!") "You swear never to acknowledge any other rallying sign." (Unanimous cries again resounded of "We swear it!") The drums beat, and silence was restored.) "You, soldiers of the national guard of Paris, swear not to suffer the enemy to pollute again the capital of the great nation. It is to your valour that I shall confide it." (Cries of "We swear it!" were again repeated.) "And you, soldiers of the imperial guard, you swear to surpass yourselves in the campaign that is about to open, and to die all of you rather than suffer foreigners to come and dictate laws to the country." The acclamations, the shouts of "We swear it!" resounded again, and were repeated throughout the whole extent of the Champ de Mars.

The composition of such addresses as these is certainly Napoleon's forte; and he never delivered them but they had their full effect of inspiring or reviving the love of the soldiery to his person. The spectacle being finished, he re-ascended his carriage, and returned to the Tuileries in the same state and order of procession that he came.

Thus ended the ceremony; but it must not be forgotten, that on that day and the next, amusements, such as theatricals, rope-dancing, horsemanship, ascension of balloons, &c. were given gratis. Along the avenue of the Champs Elysées, thirty-six fountains flowing with wine, and twelve buffets for the distribution of patties, pullets, sausages, &c. were placed.

On the following day the chamber of representatives commenced its sittings. Their first business was to elect a president. The choice fell on Lanjuinais, who had been a member of the old convention, and who, in the preceding year, had been peculiarly active in drawing up the list of crimes committed by Bonaparte, and which was officially published as the justification of his dethronement. La Fayette had the greatest number of votes next to him. This was sufficient to show that the members were actuated by a very different spirit from what had ever before appeared among them during the former reign of Napoleon; and that they regarded him only in the light of the chief magistrate of the state, whom they were not bound to obey, or even respect, except in so far as he conscientiously discharged the duties of his office. In the sitting of the 4th of June, the day the president was chosen, this spirit was first made manifest. The chamber of representatives had intimated to him their wish to have the official list of the chamber of peers: to this expressed with an official answer was sent from the minister of the interior, signifying that the list of the peers would not be published till after the regular opening of the session: upon this a member rose with warmth, and proposed that the chamber, in reply to this letter, should declare that it would not constitute itself till the list was communicated. This, however, was over-ruled.

In the sitting of the following day, the minute of the election

election of M. Lanjuinais was presented, and read; at the bottom of it were written these words; "I approve. NAPOLEON." Loud applause followed. M. Lanjuinais advanced with a calm and modest demeanour to the chair, which was resigned to him by M. Desfranges; and then, addressing the chamber, said; "Dear and honourable colleagues, I cannot find expressions capable of explaining the sentiments I feel on the honour you have bestowed upon me, and the approbation which the emperor has been pleased to add thereto. I am sensible of my inability to make a suitable return to this distinguished mark of your confidence; and I shall constantly solicit your indulgence and your advice in the execution of the duty you have imposed upon me. Wholly devoted to the emperor, the country, the national glory, the independence of France, and liberty, I shall never cease to wish for an honourable peace, and for the happiness of the people. I shall have no occasion to change either my principles or my conduct." The speech of the president was ordered to be printed.

Lanjuinais was, before the revolution, an advocate and professor of canon-law. He was a deputy of the *tiers-état* to the states-general, and one of the founders of the Jacobin club, though never disgraced by the atrocities of that execrable society. In August 1789, he showed that, though he was an ardent friend to liberty, he was not disposed to league himself with the disciples of anarchy, for he warmly opposed the sequestration of the property of the clergy; yet he was the person who proposed the abolition of all titles, and objected to that of Prince being still conferred on the members of the reigning family. When the reign of terror commenced, he closely allied himself with the moderate party. On the 15th of December, 1792, he spoke in favour of Louis XVI. and demanded that counsel and the means of defence should be granted to him. On the 26th of the same month, he again appeared as the advocate of that unfortunate monarch. He exposed the injustice and atrocity of a trial in which the enemies of Louis were at once accusers, witnesses, jurymen, and judges; nor would he move from the tribune, although he was assailed with the most furious clamour, and his voice repeatedly drowned by the most diabolical outcries and threats of revenge. On the nominal appeal, he declared that Louis XVI. was guilty, and voted that he should be imprisoned until a peace, and then banished.

He then distinguished himself by his fearless opposition to all the deeds of injustice and blood which disgraced that period of the revolution. On one occasion, he kept possession of the tribune, though several of the mountain-party attempted to drag him thence with violence. He was condemned to imprisonment at that very meeting, but, eluding the vigilance of the soldier who guarded him, he escaped the fate in which all his colleagues were soon involved. He was then outlawed, and remained a fugitive and proscribed until 1795, when he was recalled to the legislative assembly. In June 1795, he was appointed president of the assembly, and continued to display equal love to his country, and determination to avoid the extremes of anarchy and despotism. He opposed every law against the relations of emigrants, and every decree which seemed unnecessarily severe. In 1800, he became one of the conservative senate, and strenuously opposed the arbitrary measures of Bonaparte. In 1802, before Bonaparte was made first consul for life, a project was entertained by his partisans to raise him to the imperial dignity at once. Rœderer made a speech to sound the conservative senate on the point. Lanjuinais replied to him, and exclaimed, that "Whoever he was that would take upon himself the title of emperor, he would consider him as an enemy to his country and a usurper." Marshal Kellerman immediately drew his sword, and asked, "whom he meant to stigmatize as a usurper?" adding, "that, if he meant the first consul, he would run him through the body!" The senate interposed; but Lanjuinais was resolute, and persisted in his declaration, without naming any person.

His firmness and eloquence produced so much effect on the senate, that it was deemed prudent to drop the plan for the present. When Bonaparte was made emperor, Lanjuinais violently opposed it; "What," said he, in the senate, "are you so degraded as to give your country a master taken from a race of men so ignominious that the Romans disdained to use them even as slaves?"

On the 7th of June, Napoleon proceeded in state to the hall of the representatives to open the session of the chambers. The peers being in attendance, and the oath of fidelity to the Emperor and the Constitution having been taken, Napoleon uncovered himself a moment; afterwards covered himself, and said; "Gentlemen of the Chamber of Peers, and Gentlemen of the Chamber of Representatives; Within the last three months, existing circumstances, and the confidence of the nation, have invested me with unlimited authority. The present day will behold the fulfilment of the wish dearest to my heart: I am now going to commence a Constitutional Monarchy. Mortals are too weak to insure future events; it is solely the legal institutions which determine the destinies of nations. Monarchy is necessary to France to guarantee the liberty, the independence, and the rights, of the people. Our constitution and laws have been scattered; one of our most important occupations will be, to collect them into a solid body, and to bring the whole within the reach of every mind. This work will recommend the present age to the gratitude of future generations. It is my wish that France should enjoy all possible liberty; I say possible, because anarchy always resolves itself into an absolute government.

"A formidable coalition of kings threatens our independence; their armies are approaching our frontiers. The frigate la Melpomene has been attacked and captured in the Mediterranean, after a sanguinary action with an English ship of 74 guns. Blood has been shed in time of peace! Our enemies reckon on our internal divisions. They excite and foment a civil war. Assemblages have been formed, and communications are carried on with Ghent, in the same manner as with Coblenz in 1792. Legislative measures are, therefore, become indispensably necessary; and I place my confidence, without reserve, in your patriotism, your wisdom, and your attachment to my person.

"The liberty of the press is inherent in our present constitution; nor can any change be made in it, without altering our whole political system; but it must be subject to legal restrictions, more especially in the present state of the nation. I therefore recommend this important matter to your serious consideration.

"My ministers will inform you of the situation of our affairs. The finances would be in a satisfactory state except from the increase of expense which the present circumstances render necessary; yet we might face every thing if the receipts contained in the budget were all realizable within the year. It is to the means of arriving at this result that my minister of finances will direct your attention. It is possible, that the first duty of princes may soon call me to fight for the country. The army and myself will do our duty. You, peers and representatives, give to the nation an example of confidence, energy, and patriotism; and, like the Roman senate, swear to die rather than survive the dishonour and enslaving of France. The sacred cause of the country shall triumph."

This discourse was followed by loud acclamations, and cries of "Vive l'Empereur! Vive la Patrie! Vive la Nation!" and a committee was afterwards appointed for the purpose of drawing up an address in reply to the speech.

When the French government had clearly ascertained that the allied powers had really determined on war, and that the British parliament had voted large subsidies, they made the most vigorous preparations for meeting the approaching storm. Till the decision of the British parliament was known, it seems they had some reason for believing that, notwithstanding the mighty preparations of the

the allies, war would not take place. Whether this was their opinion or not, it is certain that they endeavoured to infill it into the minds of the French people; and the French press, during the months of April and May, teemed with accounts from different parts of Europe, for the purpose of showing that the allies were at variance in their views, and that public opinion was against a war with France. At the same time the French papers, in several articles which they inserted, no doubt according to orders, endeavoured to convince the French with what dread the allied powers viewed the talents and power of the emperor, in the event of war. Of the plans and dispositions of the allies they gave the following account. "Hitherto the cabinets have formed no other plan than that of holding themselves on the defensive; and the idea generally prevails, that to attack France would be to repeat the faults of 1793, to give to the war that national character the force of which is terrible. This opinion is so fixed, that the enemies of France rely much on the enterprising character of Napoleon, and hope that he will be the first to attack. This they wish for, because then the national feeling would be weakened, and would be transposed to the Germans, who would overwhelm the French with their mass. No man of sense can venture to advise the invasion of France. The people do not wish for war. It is certain that lord Wellington has been requested to draw up a plan of campaign, and that his grace has replied he had none to give; that he did not sufficiently know the spirit which reigned in France; but that, as a general principle, and still more from late events, the soldiers commanded by the emperor could only be attacked by forces double their number. Such are, in the most exact truth, the position of affairs, and the disposition of mind of both parties."

But, whether the allies were in earnest or not, the French government prepared for the worst. Every town in France, from Paris to the frontiers, of any consequence, was fortified. The capital itself and the country was covered with fortifications or covered with them. "All the fortresses on the northern frontiers," said the *Moniteur*, "from Dunkirk to Charlemont, are armed and provisioned. The sluices are prepared, and will be opened to inundate the country, on the first hostile movement that takes place. Some works have been constructed in the forest of Mormole. Measures have been taken to make entrenchments in the different passes of the forest of Argonne. All the fortresses in Lorraine are ready. Some entrenchments have been constructed in the five passes of the Vosges. The fortresses in Alsace are armed. Orders have been given to defend the passes of the Jura, and all the frontiers of the Alps. They are preparing the fortresses of the Somme, which are in the third line. In the interior, Guise, La Fere, Vitry, Soissons, Chateau Thierry, and Langres, are arming and fortifying. Orders have been given to construct works upon the heights of Montmartre and Menil Montant, and arm them with 300 pieces of cannon. His majesty has also ordered that Lyons shall be put in a state of defence; a *tête-de-pont* will be formed at Brotteaux, and the drawbridge of La Guillotiere is re-establishing. The ground between the Saone and the Rhone will be fortified; some redoubts are preparing to be constructed in front of this ground. A redoubt will be constructed on the heights of Pierre en Sise, to support a work which defends the town on the right bank. The heights commanding the quarter of St. Jean, on the bank of the Saone, will be defended with several redoubts: eighty pieces of cannon, with the necessary ammunition, are proceeding towards Lyons. Sisteron, and Pont St. Esprit, will be placed in a state of defence. The works around Paris have been laid out with skill. All that part of Paris, from the heights of Montmartre to those of Belleville and Charonne, and thence to Vincennes, will be secured against attack. The canal which receives the waters of the Ourcq, and conveys them to St. Denis, will render the left unassailable; the fort constructed half-way between the bar-

rier of the Throne and Vincennes, by taking advantage of the old walls, will place the right in equilibrium with the centre and the left. The artillery at Vincennes is ready."

At length, finding the general councils of Europe were decided and unanimous, the French government changed their mode of attack; and, proclaiming war as inevitable, they endeavoured to stir up and bring into full play all the fiercest passions, prejudices, hatred, and vanity, of the whole French population. They described the resolute intentions of the allies to be to inflict every possible enormity and cruelty upon the French nation, particularly the military part of it. According to them, these were doomed to endless captivity or death; and the people, after their property being laid waste, to the most servile chains and bondage. "The Prussians," said they, "show great resentment towards the French; and are disposed to do all possible mischief to France, should the war commence. The Austrian and Bavarian officers speak of nothing but burning, plundering, and other severe treatment, to France. Such language has already been held at Vienna. On the 3d and 4th of April, it was agreed by the allies at Vienna, that all the French prisoners of war should be sent to the extremity of Russia, and neither be restored nor exchanged. Those who choose to serve will be sent to the army of Caucasus, others may form colonies, and those who refuse to do any thing are to be sold for slaves. The other allied powers are to treat the prisoners they make with all the severity and contempt due to the conduct of a nation which arrogates to itself the right of choosing its own government."

Events were now rapidly approaching to a crisis. The decision of the British legislature dissipated all doubts and fears of the lukewarmness of any power on the continent. The allied forces were arriving daily on the French frontiers on every side. But the plan of the allies was understood to be not to make any movement on the offensive till their whole forces were in line from the straits of Dover to the shores of the Mediterranean. This done, and before the sword was unsheathed, a solemn appeal was intended to be made by them to the French nation, calling upon them to return to a state of amity, by abandoning the man who had brought so many calamities and this fresh war upon Europe, and to re-mould the treaty of peace which they had violated. This offer unsuccessful, as they calculated it would be, their intention was to enter France at every point with an overwhelming force; and from every quarter to advance without delay upon Paris, which, again in their power, they supposed would disorganize and scatter the government and resources of Napoleon.

Of this Napoleon was perfectly aware, and also deeply sensible how unable he was to oppose an effectual resistance, on every point, against the vast force advancing against him. He therefore determined to take them in detail, and before their plans were matured and completed. In furtherance of this object, the allied armies, stationed in the Netherlands, under the command of Wellington and Blücher, engaged his earliest attention, as being those nearest the capital of his empire; and these he resolved to attack first. In this resolution he seems to have had four great objects in view. The first was the gratification of French ambition and vanity, by the conquest of Belgium, so generally wished for in France; (see p. 521.) The second was, to remove the danger of invasion to a point as far distant from his capital as possible. The third was of still greater importance, namely, if he succeeded in forcing back the armies here stationed, he would then have it in his power to menace the rear of the right wing of the grand allied army, which was to enter France by the Upper Rhine, thereby either retarding or endangering their forward movements. If he succeeded in these important operations, it was of less consequence at what expense he did so. He conceived that he should thereby crush the voice of disaffection in France, and call forth once more, around his conquering standards, the

energy and unprincipled ambition of the nation. Last, and not least, as the surest road to ultimate success, by gaining the first point, he was certain that he should succeed in removing the war from the French territories, and make other countries, as formerly, support the expense; without which, he was aware France would not long bend with perfect satisfaction to his sway.

He had it in his power, when acting on the offensive, to choose his point of attack with greater security than the allies could; because he had a much more formidable chain of fortresses in his line to support his operations, and behind which he, no doubt, calculated that he should be able to retire, if he found he could not accomplish his object. His army was not only formidable in point of numbers, but more so from the quality of the troops. These men were the flower of France, and of the military strength. They had their characters to regain, their glory to re-conquer, their fortunes to re-establish, and their future repose to secure. Perjury and treason had lowered them in the eyes of honour and worth. These feelings combined, stung their souls, and goaded them to fury. The utmost exertions were to be expected, from both them and their leader. Their fate, their fortune, and their fame, they had altogether to re-create, and these were all irretrievably committed in this dreadful struggle. They marched to it with a resolution which the utmost strength of rage and despair could inspire. The attempts of their government to inflame their hearts with the deadliest animosity and resentment against the allies, and particularly against the Prussians, by publishing accounts about the intended cruelties to be committed by the latter in France, had but too well succeeded. "It is particularly against the Prussians," said an article in the *Moniteur*, "that the French army manifests an implacable hatred, and we have some reason to fear that it will not be willing to make any prisoners of that nation."

The opinions of mankind, in some countries, were divided upon the issue of the approaching conflict. All were convinced that it would be severe; some, that it would be long and bloody; but the general opinion was, that it could not, from its means and its object, be of long duration. One party, with France herself, contended that it was impossible to conquer a warlike nation, with a condensed population of 29,000,000 of people. Forming their judgment upon what she had before done, they contended that she could do as much again, and with greater ease, inasmuch as she was wiser from experience, better instructed in the art of war, and more united than she was at the revolution. They calculated that the daring arm of Napoleon would carry the horrors of war out of the French territories, where he would, as usual, live at the expense of his adversaries; and when the glare of conquest would again, as it had done before, crush the voice of disaffection in France, and raise the nation to follow, without feeling or reflection, their darling pursuit. Thus employed, they were aware that the French people would trouble their heads very little about who governed them. On the other hand, if this could not be carried into effect, they relied on the strength of her armies and her frontiers; but, above all, upon that spirit generally prevalent in France, of devotion to the integrity of the country, to unite all hands and all hearts in its defence, which they conceived sufficient to repel the invaders, when, by discomfiture in their views, and the effects of intrigue and jealousy sown in their councils, France, they prophesied, would, at length, break up the formidable confederacy. Then she would be able to resume her former dictatorial situation and arbitrary dominion. So the rulers of France, and those who advocated her cause, considered the matter; so, calculating upon human energies as all on the side of France, they prognosticated the issue of the approaching contest. Another party, however, argued that France was not so powerful as she was in 1792. That, though her territory remained unimpaired, yet her spirit and her resources were broken, and

could not be reproduced. They beheld Europe from necessity become a military people; her leaders, from long experience, wise; her armies, from principle, brave; they saw the armed population of Europe driven, by every sentiment or feeling that can touch or animate the human soul to exertion, to attack the regular armies of France; and not the armed population of France, roused into frenzy, attacking the regular forces and disunited councils of Europe. They considered the immense means which the allies possessed, the spring which gave life, vigour, and unanimity to their councils; and they had no doubt but that these were superior to any thing that France, however condensed, unanimous, and powerful, could bring against them. They considered that bitter experience had taught the allies the fatal effects of carelessness and disunion; and that, as one interest animated the sovereign and the subject, therefore, the insidious machinations of France could make no impression upon their resolution, and find no entrance into their councils. They, therefore, augured well of the contest. It might be bloody, it might be long, but it could hardly be unsuccessful; while its duration and violence would only draw down on the head of France wider destruction, and deeper humiliation.

Most important events now crowd upon our attention, and demand our consideration. The hour, big with the fortune of empires and the fate of millions, advanced with accelerated speed. Immediately upon the conclusion of the ceremony of the Champ de Mai, Soult, who was advanced to the rank of major-general of the French armies, the situation formerly held by Berthier, addressed a proclamation to the French army, in which he informed them, that a "new oath" united France and the emperor; and that all the efforts of an "impious league" would not be able to separate the interests of the people from "the hero who was the admiration of the universe." "What," said he, in that haughty tone which Frenchmen had long assumed, "is the hope of this new coalition?" He told them, that their object was to "erase France from the list of nations," to impose slavery upon 28,000,000 of men, which he hinted might again, as it had done before, add to their "aggrandizement and their glory." He told them that their enemies were "numerous;" but that the contest was neither beyond the genius of Napoleon, nor their strength; and that the number of their foes would only render "victory more glorious," and "their defeat more conspicuous."—"To arms, therefore," said he: "the signal for battle will soon be given; and, while Napoleon guides our steps, and we fight for our beautiful country, we shall be invincible. We will rally round the emperor, the protector of liberal ideas; around a prince who, educated in the revolution, advances with the age in which he lives, and wishes to extend the dominion of the mind, instead of circumscribing it. Instructed by misfortunes, he will see the conquerors of Austerlitz, of Marengo, and of Jena, march anew under the colours which so often led them to victory; and the event will not be doubtful."

Napoleon had also been making preparations for putting himself at the head of his army. On Sunday, the 11th of June, deputations from the chamber of peers and the chamber of representatives waited upon him with their addresses. To these suitable answers were returned, (see Gifford, 1386.) and at half past three the next morning, the emperor quitted Paris, and took the road for the Netherlands. According to his usual custom, he travelled with great rapidity, reaching Soissons by ten o'clock, and Laon by three in the afternoon of the same day. The day before, his army had been reviewed at Maubeuge.

The departure of Bonaparte to the army announced the approach of hostilities; the route he took decided the point where these were to take place. The attention of Europe was deeply fixed, and her eyes instantly turned to the Sambre. There her fate, for years, perhaps for ages, was once more suspended in the mighty balance: and there the greatest talents and courage which she could

produce stood opposed to each other, in order to turn the mighty scale. The most callous felt interested; the thoughts of the most careless were arrested; all ranks and degrees stood breathless with expectation, while they listened to those alarms which struck the Meuse with fear and the Sambre with dismay.

The situation of the affairs of Napoleon demanded immediate activity. It was in character with him to display it. His army was numerous, picked, well appointed, and eager for battle. His adversaries were opponents worthy of his proudest days, and his greatest glory. Blucher and Bonaparte had before met. The bloody banks of the Marne, and proud frontiers of Laon, bore witness with divided praise. Napoleon had encountered Austrians, Germans, Prussians, and Russians; but British troops, and their leader Wellington, he had never met. The latter had again and again, and in every instance, vanquished his best generals, and his choicest troops. The British general was hailed by the general voice, as the first leader of the age: "It is yet doubtful," said Napoleon; "we have never met." The question, however, was now about to be fairly and finally decided.

On the 13th of June, Napoleon having joined the army, the head-quarters were established at Beaumont. The first corps, under d'Erlon, was at Soire on the Sambre; the second corps, under Reille, at Ham-sur-Heure; the fourth corps under Girard, at Philipville; the third, under Vandamme, on the right of Beaumont; the position of the 6th, under Lobau, is not stated.

Three corps of the Prussian army, consisting of, at least, 80,000 men, occupied Charleroi, Givet, Namur, &c. and the left bank of the Sambre. The fourth corps, commanded by general Bulow, and which amounted to 30,000 men, was at a considerable distance in the rear, being stationed in the country between Liege and Hannut.

The British army was posted in the neighbourhood of Brussels, at which city the duke of Wellington had his head-quarters. As it was impossible to know at what point Napoleon would commence the attack, the British and Hanoverian troops were cantoned over a wide space of ground; but they were so disposed as to afford the means of quick combination and mutual support. The duke's force was divided into two corps d'armée, and consisted as follows: the first under the command of the prince of Orange, comprising the 1st, 3d, and 5th, divisions, under the orders of generals Cooke (of the guards), Alten, and Picton; the second corps was commanded by general lord Hill, and composed of the 2d, 4th, and 5th, divisions; the two former of which were under the orders of sir H. Clinton and general Hinuber; and the 6th, nominally that of sir L. Cole, who had not yet joined the army.

This force contained about,

British bayonets	-	-	27,000
German legion	-	-	5,000
Hanoverian infantry, new levies	-	-	24,000
Brunswick and Nassau	-	-	10,000
Dutch 5000 }	-	-	10,000
Belgic 5000 }	-	-	10,000
Total infantry			76,000
Artillery—British, thirty brigades, of six guns each, German legion, Hanoverians, &c.			
	-	-	5,000
Cavalry—British	7000	}	13,500
German legion	3500		
Dutch, &c.	3000		
			94,500

Napoleon, having assembled the different corps of his army, addressed the following proclamation to them, preparatory to the commencement of hostilities.

"Avesnes, June 14, 1815.

"Soldiers! This day is the anniversary of Marengo

and of Friedland, which twice decided the destiny of Europe. Then, as after Austerlitz, as after Wagram, we were too generous! We believed in the protestations and in the oaths of princes whom we left on the throne! Now, however, coalesced among themselves, they would destroy the independence and the most sacred rights of France. They have commenced the most unjust of aggressions. Let us march, then, to meet them. Are they and we no longer the same men?

"Soldiers, at Jena, against these same Prussians, now so arrogant, you were one against three, and at Montmirail one against six! Let those among you who have been prisoners of the English, detail to you the hulks, and the frightful miseries which they suffered! The Saxons, the Belgians, the Hanoverians, the soldiers of the Confederation of the Rhine, lament that they are compelled to lend their arms to the cause of princes, the enemies of justice and of the rights of all nations. They know that this coalition is insatiable! After having devoured twelve millions of Poles, twelve millions of Italians, one million of Saxons, six millions of Belgians, it must devour the states of the second rank of Germany.

"Soldiers! we have forced marches to make, battles to fight, dangers to encounter; but, with steadiness, victory will be ours; the rights, the honour, the happiness, of the country will be reconquered! To every Frenchman who has a heart, the moment is arrived to conquer or perish.

NAPOLEON."

Napoleon was particularly anxious, before he left Paris, to have his army ready for service before he joined it; and on the 10th of June his minister of war issued the following general order: "It being the intention of his majesty the emperor, that all officers who have received letters of service repair to their destination, the general informs them of the obligation they are under to set off within twelve hours to rejoin their corps. The officers of the staff of Paris, and especially the chief of the military police, are charged to watch over the execution of this order. The staff and superior officers and others, who have not yet received letters of service, and who are in Paris, must present themselves to the staff of the place, Rue Vendôme, there to be informed of the destination assigned to them by the minister at war. The officers are informed that they will receive no pay till they prove that they have so presented themselves. In the departments forming part of the first military division, the major generals commanding departments will immediately take the necessary measures for the prompt execution of the instructions of the war-minister of the 5th instant, relative to all disposable officers of infantry."

As Bonaparte had determined to take the allies by surprise if possible, he caused an embargo to be laid on all vessels on the coast, and no strangers, or indeed any person, were allowed to proceed to the frontiers. The embargo took place on the 11th of June. On the same day, in a letter which he wrote to count Lavalette, the post-master, he says, "As I said in my speech this day, that I should depart this night, I wish you would look to it, that no post-horses be taken from the road by which I travel; that particular attention be paid to the persons to whom horses are given on the neighbouring roads; and that no courier, or estafette, be sent off."

In other letters written on the same day, he requested that marshal Massena should take the command of the third and fourth military divisions. Speaking of marshal Ney, he said, "Let Ney come if he wishes to be present at the first battle; he must be at Avesnes by the 13th, where my head quarters will be. Acquaint marshal Suchet that hostilities will commence on the 16th, and on that day to make himself master of Montmeillan."

At the same time he wrote to the minister of war and marine as follows:—"To the Prince of Eckmühl (Davoust.) Look to it, that 240 pieces of naval cannon be placed in battery by the 20th, that I may be without anxiety about the city of Paris." Speaking of muskets,

"They

"They must be sent quickly, that, when we are victorious, I may arm with them the peasants in Belgium, Liege, &c. Give me also a list of Belgian officers who are here."

Every thing being now ready, the French army broke up from Beaumont at day-break on the 15th of June, and commenced their march for the Sambre. The advance of Bonaparte was bold and sudden. His whole force advanced at all points by Thuin and Lopez, along both banks of the river; upon Charleroy, Marchienne-au-Pont, and Gosselies; where the first corps of the Prussian army, under general Ziethen, was stationed. The 2d corps attacked the outposts of the Prussians, drove them in, and pursued them as far as Marchienne-au-Pont. At the same time, the light cavalry of the French, following the 2d corps as far as Marchienne, turned to the right, after crossing the Sambre, and pushed along the left bank as far as Charleroy. Some severe fighting took place here; and, in consequence of this rapid and unexpected movement, Charleroy was taken before the Prussians had time to destroy the bridge. The French then advanced on Gosselies, a large town situated on the road to Brussels, with the intention of intercepting, at that quarter, the troops driven out of Charleroy. The Prussians retired in great confusion on Fleurus, where their main body was concentrated. They were attacked several times by the French advanced-guard, who afforded them no time to take any position. The presence of Napoleon seemed to electrify the French troops. Some squadrons of his guard charged the Prussian infantry several times; in one of which his aid-de-camp, general Letort, received a mortal wound.

The French thus far overcame all the obstacles opposed to their advance. Towards night they ceased the pursuit; and Napoleon, leaving the third corps on the road to Namur, and the second at Gosselies on that to Brussels, returned with his head-quarters to Charleroy. The French stated, that the loss sustained by the Prussians in these engagements was 2000 men, 1000 of which were prisoners. The French said that the inhabitants of Belgium received them as deliverers. "The joy of the Belgians," said they, "it would be impossible to describe. There were some villages which, on the sight of their deliverers, formed dances; and every where there is a movement which proceeds from the heart."

The actions of the 15th were but the prelude to a more extensive and sanguinary action on the following day. On the 16th, at four in the morning, the French columns which remained on the right bank of the Sambre put themselves in march and passed the river, when the whole army advanced forward. The command of the left wing, consisting of the first and second corps of infantry, commanded by generals Erlon and Reille; and the second corps of cavalry, consisting of four divisions, under the command of count Valmy (Kellerman), was given to marshal Ney, who arrived the evening before at head-quarters, and received orders to march by Gosselies and Frasnes on the road to Brussels.

All the rest of the army, under the immediate command of Napoleon, prepared to march against Blucher. The right wing under the command of marshal Grouchy, consisting of the third and fourth corps of infantry, and third of cavalry, occupied the height in the rear of Fleurus, and were destined to march upon Sombref. The sixth corps, with the remainder of the cavalry, and all the imperial guards, advanced from Charleroy.

The Prussian army was posted on the heights between Brie and Sombref, and beyond the latter place, occupying at the same time, in great force, the villages of St. Amand and Ligny in their front. The whole under the immediate command of marshal Blucher, consisted of three corps, and amounted to 80,000 men. On their right was stationed a considerable force of Dutch and Belgian troops, 12 or 13,000 strong, under the command of the prince of Orange, who, on the 15th, had repulsed an attack made by the enemy on the position of Frasnes. Such were the positions and such the strength of the contending armies

on the 16th. We must now proceed to notice the movements of the army under the duke of Wellington.

The intelligence of Bonaparte's movements reached Brussels on the evening of the 15th, at which time the duke of Wellington, and most of his officers, were at a ball given by the dukes of Richmond. Nothing, however, being known at which point the enemy intended to attack, orders were given to the troops in Brussels and the neighbourhood to prepare to march. On the same evening, the duke received dispatches from Blucher, with the information that Charleroy was taken, and that the French were advancing in the direction of Fleurus. Orders were immediately issued for the troops to march in the direction of *Quatre Bras*; and, at the same time, the cavalry, artillery, and guards, who were stationed at Enghien, were directed to move in the same direction. The spectacle at Brussels, as the troops were collecting and falling into their ranks, is described to have been most peculiar and impressive. It was one o'clock in the morning of the 16th when the bugle sounded, summoning the soldiers to their proper rendezvous. The officers had been in a bustle of preparation for the previous hours since the evening, when they received orders to hold themselves in readiness. Brussels was agitated and anxious in all her hearts; every house was the scene of adieus, not the less tender and sorrowful on account of the shortness of the intimacy that had preceded them. The troops commenced their march before it was day-light. Among the first to muster in Brussels were the 42d and 92d highland regiments. The hasty march was long and painful. The officers, though they knew the enemy had attacked the Prussians, did not think that they were on the road to immediate battle. But the fact was so. As early as five o'clock in the morning of the 16th, some Belgian troops under the command of the prince of Weimar, which the preceding evening had been forced back from Frasnes to *Quatre Bras*, were attacked by part of the left wing of the French army, commanded by marshal Ney. The prince of Weimar, being hard pressed, was forced to fall back; but being reinforced with another brigade by the prince of Orange, he was enabled to regain so much of the ground that had been lost, as to command the communications, leading from Nivelles and Brussels, with marshal Blucher. The combat then continued, without any result, till noon; when the French were greatly reinforced, and quickly returned to the combat with overwhelming numbers. The prince of Orange himself was forced to give way, and by two o'clock had fallen back to *Quatre Bras*.

In the mean time, the British troops from Brussels were pushing forward to this point with the greatest expedition. The duke of Wellington remained some hours in Brussels after the troops had quitted it. He probably waited to hear news from the more distant divisions of his army, in reply to the orders sent them over-night. He then set off for the scene of action on horseback, followed by four or five gentlemen; and arrived on the field before the troops; at which time the Belgians were falling back. Soon afterwards the British regiments began to arrive, one by one. Each, as it arrived, marched directly into the field, and took up its position. The troops belonging to the fifth division, which consisted of two brigades, was commanded by lieutenant-general sir Thomas Picton. This division was followed by the duke of Brunswick's corps; and after them marched the Hanoverian infantry, and the contingent of Nassau. The whole consisted of about 15,000 men; and they were without either cavalry or artillery. Sir Thomas Picton's division, already mentioned, arrived at *Quatre Bras* at the moment when the enemy was about to commence a fresh attack, which would have put them in possession of the great road to Brussels, and separated the British from the Prussian army. The troops composing this division had previously marched about twenty miles in a warm summer day; and, as scarcely any water was to be found on the road, were both thirsty
and

and weary. Little time was given to refresh themselves, before immense columns of the enemy, consisting of both infantry and cavalry, were seen approaching their position.

The road to Brussels, on the right hand of the English position, was skirted by a wood, along the edge of which was a hollow way. The French were aware that, if they could gain possession of this wood, they might debouche upon the Brussels road. The prince of Orange had made every effort to defend it; but the Belgians under his command again gave way, and the French succeeded in occupying the post.

The duke of Wellington, soon after three o'clock, rode into that part of the field of battle which is close to the village of Quatre Bras. He was followed by his staff, which was not very numerous. He halted a few yards in front of the 92d regiment, and was exposed to a very heavy fire of round shot and grape. He spoke little or nothing. He looked intently at various parts of the field where there was firing going on, and often pulled out his watch, as if calculating on the arrival of the regiments not yet come up. The shot in the mean time was plunging into and along the ground, close to him. He had not been long in the field before the arm of a gentleman with whom he had just been in conversation was carried off by a ball. Shortly afterwards, the duke dismounted from his horse, and, causing his staff to do the same, sat upon the ground for a short time. The regiments, as they came up, entered the field by the road near which his grace was: the balls were perpetually flying in amongst them; one carried off the knapsack of a private from his shoulders; it went to a considerable distance, but the man ran after it, and brought it back amidst the loud laughter of all those who saw the thing happen. The Brunswick cavalry were charged back upon this point by the French cuirassiers. The duke retired from before their charge. The French troops fought with the most desperate fury; and the attacks of the cuirassiers, in particular, were most impetuous and dreadful. They surrounded the British squadrons with such temerity, that it frequently happened that, in their defence, the squares had to charge their desperate enemies on three sides at once. But every effort of the French was fruitless. Though they suffered severely, the British troops stood firm; and the only difficulty that their officers had, was to restrain their impetuosity, which, against such numbers, might have proved fatal. The general wish of the soldiers was to charge the enemy with the bayonet, without waiting for an attack; but the superior judgment of their great leader commanded it otherwise. The fire of the French was incessant and severe: that returned still more destructive. Nothing was seen in the French columns but men and horses tumbling over each other. It is impossible to convey an idea of the obstinacy with which the contest was maintained.

From half past three till six in the evening, the French kept up a very heavy fire, and twice attempted to carry the right of the British position. The Brunswick troops in advance had been compelled to abandon the post committed to their care, and were falling back before overwhelming numbers. Fresh columns advanced to their support. At this time the duke of Brunswick was killed. He was leading on his men amidst a horrible fire of grape-shot, when his ardour carried him into the thickest of the fire. A ball passed through his bridle-hand, and entered his belly. The liver was penetrated: he fell; and in ten minutes breathed his last. The fall of this brave prince, in the prime of his life, was generally regretted. The treatment which his father had received from the hand of Bonaparte, and his own misfortunes, had created a general feeling in his favour. Both himself and his troops had made a vow to wear mourning till they had avenged his father's death. The fields where he fell did so, though he did not live to see it. He terminated his life, however, on a memorable occasion, and before the eyes of one who could appreciate his bravery and his worth; and his regret, so forcibly expressed, is sufficient

to hand down his name to the latest posterity with honour and applause. Their leader thus lost, his troops were compelled to give way. The French advanced after them, conceiving that they had gained their object. They were mistaken. The 92d regiment, which was posted behind a ditch, on the right of the road from Brussels to Fleurus, and in the centre of which the duke of Wellington was stationed, stood ready to receive them. They allowed nearly all the Brunswick troops to pass, when they opened such a fire upon the French cavalry as stretched them on the ground in numbers, and compelled the remainder to retire in disorder; and not only so, but the repulse of the cuirassiers, and the great number of wounded which were carried to the French rear, created alarm, confusion, and flight, among the numerous attendants of their army. The French assert, that, in this charge, though unfortunate in its issue, a private of their 11th regiment took one of the colours of the English 69th. About four o'clock, however, the French, reinforced, returned to the charge, and, by another furious attack, endeavoured to gain the right of the British position. Again they were driven back with great loss. The 79th regiment charged through and through the French line, and afterwards, returning to its former position, repulsed the repeated desperate attacks of the French. It suffered severely.

In this manner the combat continued for many hours without any prospect of its termination. The French continued to bring forward fresh troops, the British to resist their fury. The Prussians were at this time engaged with Napoleon, while a brigade of guards, and part of the first division, remained at Quatre Bras. The French appeared still to direct their principal efforts against the right of the British position. About seven o'clock the combat raged with the utmost fury. The fire of the French artillery was tremendous, and was the forerunner of another most formidable attack. Through the volumes of smoke, the French was soon seen advancing. As they came near, the fire of the artillery slackened, and the bloody struggle began. The moment was pressing. The duke, who stood with the 92d regiment, turned to them, and said with energy, "Ninety-second, you must charge these fellows." The order was cheerfully obeyed. They rushed against the *black battalions* with an ardour nothing could resist. The French columns fled before this daring band, leaving the field covered with the dead, dying, and wounded. The 92d followed them for a mile, till they came near the main body of the enemy, and till the re-advance of the cavalry rendered it prudent for them to retire, which they did to a wood, where they remained during the remainder of the engagement.

Meanwhile the battle raged in the centre and on the right. The French attempted to separate the divisions of the British army as they came up, but without success. They however still held the wood, which, in some measure, commanded the right of the allied position. It was of the greatest importance to obtain the possession of it. The division of the guards under general Maitland, had newly come up, and were immediately commanded by the duke of Wellington to drive them from this point. They advanced to the charge, and the tirailleurs of the French fled before them. Driven into the wood, the French defended themselves with the greatest obstinacy, disputing every inch of ground, and making every tree a rampart, from behind which they annoyed the British. It was at length cleared; but scarcely had the British troops passed it, when they were attacked by the French cavalry repeatedly, and with the greatest fury; but the guards repulsed all their attacks. The French charged in amongst them, and were almost cut to pieces with comparatively little loss; a square of black Brunswickers, on this occasion behaved firmly, and occasioned the French great loss. Their light troops, however, advanced in such numbers, that they again obtained possession of the wood; but, after three hours severe fighting, it was finally wrested from

from them; and the English guards, though they sustained considerable loss, retained undisputed possession of this important post, which commanded the road to Brussels.

The French were now in great confusion; but, as Ney had left the first corps in reserve, he determined to renew the combat; and, these troops being fresh, he thought of overwhelming the British with superior numbers. On sending for it, however, he was much mortified at finding that Napoleon had called it away to his own aid against the Prussians. He therefore ordered up the reserve of the second corps to cover his broken battalions; and at length retired to his original position at Frasnes.

The loss of the British in this action was very severe; and, as the cavalry and artillery had not come up, they fought under every disadvantage. Including officers, the loss amounted to 2251 killed and wounded, and 31 missing. The whole, including that of the Hanoverians, Dutch, Belgians, Brunswickers, &c. consisted of about 5000 men. The loss of the French was also very considerable, as they acknowledged it to amount to 4200. The field of battle, which was confined to a narrow space, was thickly covered with the slain. The groans and lamentations of the wounded and dying, to whom little relief could be afforded, was dismal and distressing, and filled the hearts of the survivors with pain and anguish. The numbers of dead round Quatre Bras was very great. The walls of the houses were, in many places, covered with blood, which had spouted in streams from the wounded, who retired to lean against them, in order to support their dying bodies. An orchard of four acres, which was thickly planted with fruit-trees, had in many of them from eighty to one hundred balls. In a house at Place Nay, three hundred holes were made in the walls and roof, from the number of bullets which had penetrated into it. In one cellar lay five of the imperial guards, who had been dispatched by the 79th regiment; and a well contained the bodies of twenty Frenchmen, whose putrid remains had completely spoiled the water. Indeed, all the water on this bloody field, as late as the 25th, was quite red, stagnating in puddles, and the smell from it most offensive.

While marshal Ney was engaged with the allies under the duke of Wellington, Napoleon had marched with the whole of his remaining force against the Prussian army, posted at Sombref. Marshal Blücher occupied a strong position on a line where three villages, built upon broken ground, served each as a separate redoubt, defended by artillery and infantry; his right wing occupied the village of St. Amand, his centre Ligny, and his left Sombref. The ground behind these villages was considerably elevated; a deep ravine in front of this elevation. The villages were in front of the ravine, and masses of infantry were stationed behind each. The force with which Napoleon advanced to the attack of the Prussians has never been exactly ascertained; but it probably amounted to about 100,000 men. It appears to have been his intention to turn the principal part of his force against the Prussian general before he could be supported by the army under the duke of Wellington. He calculated upon giving the Prussian army a decisive defeat, separating it from the British general, and forcing it back upon Maëstricht. As Blücher was informed that Wellington had put some troops in motion to support him, and expecting the arrival of the fourth corps of his army in the evening, he determined to give battle. On approaching the Prussian army, Napoleon found some change in his dispositions necessary. He "changed front, the right in advance, and pivoted upon Fleurus." The third corps, under Vandamme, marched upon St. Amand. Girard, with the fourth corps, marched against Ligny; Grouchy upon Sombref, while the reserve, or sixth corps, with the rest of the cavalry, the guards, and the cuirassiers of general Milhaud, were drawn up on the heights of Fleurus.

The battle began at three in the afternoon by a furious

cannonade from the French; and nearly 200,000 men, and 500 pieces of cannon, commenced the work of mutual destruction. The first effort was to turn the right of the Prussian army. Lefol's division of Vandamme's corps attacked the village of St. Amand. The Prussians defended it most gallantly; but the French, charging with the bayonet, succeeded in gaining possession of it, and established themselves in the church and church-yard. As this village was the key of their right wing, the Prussians made several desperate attempts to regain it; and the combat here was peculiarly obstinate and bloody. Each side, at this point, was supported by 50 pieces of artillery. At length the village was stormed by the Prussians, and re-taken; but it was recovered again by the French. The action, meanwhile, extended along the whole line; as Napoleon directed a vast number of troops against the third corps of the Prussian army stationed at Sombref.

It was at Ligny, however, that the combat was most severe and destructive. Having been repulsed in endeavouring to turn the right here, the French attempted to force the centre of the Prussian army. This memorable village stands upon a small river of the same name, a tributary stream to the Sambre. It was large and solidly built, and in the centre of the Prussian line. The utmost efforts of the French were directed against this important point; and the most determined bravery, on the part of the Prussians, was exercised to defend it. Two hundred pieces of cannon, from both sides, were directed against this devoted spot. The battle round this was terrible and bloody. It was maintained hand to hand, and man to man, for seven hours. Both sides continued to bring up fresh troops; and while the contest, from time to time, continued to rage in other parts of the line, it never ceased for one moment at Ligny. Alternate attempts were made to wrest this place from each other for upwards of four hours. Blücher in person, sword in hand, continually led his troops to the combat. The artillery of the enemy was planted on the right bank of a rivulet, and that of the Prussians on the left bank. Each side had, behind that part of the village which they occupied, great masses of infantry, which maintained the combat, and whose ranks were continually renewed by reinforcements, which they received from the rear and also from the heights, both on the right and on the left. The movements on the bloody field were confined to a very narrow space. The French stated, that the village of Ligny "was taken and re-taken several times;" but Blücher says, "Villages have often been re-taken; but here the combat continued for five hours in the villages themselves, and the movements were confined to a very narrow space."

The charges of the cavalry were numerous, severe, and destructive. In one of these charges, on the part of the Prussians, which was led on by Blücher in person, but which proved unsuccessful, that brave general had a very narrow escape from either death or captivity. The French in their turn advanced. A shot struck the marshal's horse. Furious from the pain, the animal darted forward, till exhausted it dropped down dead. It fell, however, upon its gallant rider, who, stunned by the fall, lay entangled under it. The French cuirassiers advanced; the last Prussian horseman had passed their chief, without knowing his situation. One adjutant alone remained. He alighted beside him, resolved to share his fate. The French, pursuing the charge, passed rapidly by without seeing the veteran chief. The Prussian cavalry returned to the charge. The French were driven back, and again passed him without perceiving his helpless situation; and then, and not till then, the gallant Blücher was extricated from his perilous state. He mounted a dragoon horse; and the first words he uttered were, "Well, my brave fellows, let us charge them again." In the mean time, the combat continued at all points with unabated fury. Part of the village of St. Amand was re-taken, by a battalion commanded by Blücher in person. The re-capture of part of this village, and, in consequence thereof, of a height

adjoining thereto, seemed to throw a gleam of hope on the Prussian arms. From the map it appears, that Blücher was here very near separating the enemy's line, and turning the left of his main body, which was attacking him. This bright prospect was, however, but of short duration. At this moment, accounts were received that the English division, destined to support them, was violently attacked by a French corps, and that it could barely maintain itself at Quatre Bras. The fourth corps, under Bulow, had not made its appearance, as had been calculated upon; and no prospect remained of deriving any benefit from its assistance during the day. The Prussians invoked, but invoked in vain, the arrival of those succours which were so necessary. Ligny was still held; there the combat raged with the same fury, and with an equality of success. The Westphalian and Berg regiments fought at this point. A whole company of the former fell in the court-yard of the church; and on the terrace before it lay fifty dead. Each side made a fortress of the houses occupied by them. The French held one end of the village, and the Prussians the other. The French were driven out four times, and as often resumed the ground which they had lost: at length the village was set on fire by the French, and the combatants fought amidst the burning houses. All the Prussian divisions either were or had by this time been engaged. No fresh corps remained at hand to support them. The French, on the other hand, continued to pour forth fresh troops to the combat. But even their strength, numerous as it was, had been nearly exhausted. "By seven o'clock," said they, "we remained masters of all the villages situated on the banks of the ravine which covered the Prussian position." Part of these they had obtained, but not yet all. On the heights of Büffly and Ligny the Prussian masses still remained unshaken. A desperate effort became necessary to decide the bloody day. "Almost all the troops," said the French, "had already been engaged in the villages." How hard they were pressed, and how uncertain the combat long was, appears from Ney's letter, wherein we are informed that, without acquainting him, the emperor took away the first corps of the army to his assistance, as also a division of Girard's corps, which Ney depended upon for support. The emperor must, therefore, have been very doubtful of the issue of the combat where he was, before he would venture to withdraw half of his force from Ney, without consulting him. In fact, the bravery of the Prussians proved long equal to his fiercest attacks. At St. Amand, the destruction had been so great amongst the French troops, that Napoleon was, in reality, forced to call forward, in the greatest haste, the first corps to his assistance at this point. But by the time this force arrived, the Prussians had been compelled to abandon this place. It was then sent back to Ney; but it arrived too late to render him any assistance.

At Sombref, on the Prussian left, general Thielman, with the third corps, remained immovable against all the efforts of the French. Bonaparte, therefore, resolved to complete his success by one of those skilful and daring manœuvres which characterised his tactics. In the village of Ligny, which fronted the centre of the Prussian line, he drew up the imperial guard, which he had hitherto kept in reserve. Eight battalions of these troops formed into one solid column, supported by four squadrons of cavalry, two regiments of cuirassiers, and the horse-grenadiers of the guard, traversed the village at the *pas-de-charge*, threw themselves into the ravine which separates the village from the heights, and began to ascend them, notwithstanding a dreadful fire of grape and musketry from the Prussians. Their advance, however, was not stopped, nor even in the smallest degree shaken, by this fire; but, boldly coming up the heights of Büffly, they made such an impression on the masses of the Prussian line as threatened to break through the centre of their army. The combat at this moment was truly dreadful;

but the impetuosity of the French grenadiers surmounted every obstacle, and cut their way through the opposing ranks with a horrible carnage. The division of Pechaux, supported by the cuirassiers, having made a circuit round Ligny, came from both sides at once, unobserved, upon the main body of the Prussian force at this point, which was posted behind the houses. At the same moment also the Prussian cavalry, which were posted on a height behind the village, were repulsed in repeated attacks upon the French cavalry. It was now dark. "The movement made by the enemy," said Blücher, "was *decisive*." Nevertheless, though thus surrounded, and in the shades of night, which heightens the idea of danger in the human mind, the Prussian columns behind Ligny did not suffer themselves to be discouraged. "Formed in masses, they coolly repulsed all the attacks made upon them; and this corps retreated in good order upon the heights, whence it continued its retrograde movement upon Tilly." In consequence, however, of this sudden eruption of the enemy's cavalry, the artillery belonging to the Prussian army, in their precipitate retreat, got into defiles, in which they fell into disorder, and Blücher acknowledged that fifteen pieces were taken by the enemy.

The Prussian army retreated during the night, and the next morning was followed by general Thielman, with the third corps, who retired upon Gembloux, where the fourth corps, under Bulow, had arrived during the night. The whole army then retreated upon the village of Wavre, where Blücher established his head-quarters. The French did not attempt to pursue them. The loss of the Prussians, in the battle of Ligny, amounted to at least 20,000 men; that of the French was also severe. Although hostilities had commenced only on the preceding day, yet, in this short space of time, upwards of 40,000 men had fallen in the three armies. Great, however, as this destruction was, it is trifling to what followed.

In the night of the 16th, the conversation in the French camp turned on the events of this sanguinary day. The Prussians had given way; and how had it happened that the British, whom the French had made sure of defeating, had gained ground? It was owing, said the infantry officers, to the inferiority of the French in number, and to the cavalry not having boldly repeated their charges; *ils n'avoient pas franchement abordé l'infanterie*. Marshal Ney has declared his opinion that, had Napoleon, on the 16th, directed his preponderating force against Quatre Bras, he would have overpowered the British, without incurring great danger from the Prussians, who might have been watched or opposed by the remainder of the French. He should, however, have taken into the account that such a movement could not have escaped the observation of the Prussians, or of the British van-guard; that our regiments would have received orders to halt before they reached Quatre Bras; that, the march of the French being thus unavoidably lengthened, the action could not have begun till late in the afternoon; and that, on the next day, Blücher would not have failed to have burst through the opposing division of the enemy, and have marched to our support. It must at the same time be admitted that the extent of mischief might have been fully as serious in this case as in that which actually took place, and would have been owing in both to the same cause.

It is a very general notion, even among the duke of Wellington's admirers, that at the outset of the operations he allowed himself to be taken by surprise; and some of them have gone so far as to apologize for him by throwing the blame on Fouché, who, it is gravely alleged, sent a female with an exact plan of Bonaparte's operations to the frontier, but managed so that her arrival at the British head-quarters should not take place till *after* the battle of Quatre Bras. (Paul's Letters, p. 92.) Some sagacious politicians imagine that Fouché acted thus in order that he might *keep in* with both parties: but the fact will be found to be, that the duke of Wellington, like

like other eminent commanders, would not place much faith in the intelligence received from sources that may be so easily corrupted. Frederic II. was surprised at Hochkirchen, in consequence (it is said) of his secret correspondent in the Austrian camp being discovered by marshall Daun, and obliged to send him a false dispatch: but, be this as it may, the truth is, that the greatest military successes are obtained, not by relying on such precarious information, but by vigilance and activity in watching the enemy's movements. If ever a general was fitted for the intriguing business of *espionnage*, it was Bonaparte; yet, if we scrutinize the causes of his mightiest victories, whether in his memorable campaign of 1796, in his capture of Mack in 1805, or in the movements that led to the more disastrous day of Jena, we shall perceive that the whole may be explained without a reference to such mysterious communications. It admits of no doubt that at the battle of Quatre Bras our troops were in a very unprepared state: but the explanation of this fact will be found to involve very little censure on a general who had been always distinguished, when commanding separately, for his promptitude in point of information. The duke seems to have erred in nothing but in placing too much confidence in the vigilance of the officers, whether Prussian, Belgian, or British, who were stationed on the frontier: but the great cause of our fighting unprepared is to be sought in the temper of a veteran (Blucher) glowing with all the impatience of youth to come into contact with the oppressors of his country, and determined to fight in Flanders, as he had done in Champagne, without allowing much time for the co-operation of his allies.

The plan of the Prussians, against so active an enemy as Bonaparte, should have been to place in the advanced positions such small bodies of horse or foot as might have made a temporary resistance during the two days that were evidently necessary to collect the numerous bodies of the allied troops scattered over an extent of fifty or sixty miles. These detachments might have been ordered to retreat, or authorized to surrender, as soon as their commanders had ascertained the decided superiority of the enemy, and could transmit such intelligence to headquarters as would enable the allied generals to determine with confidence the real direction of Napoleon's march.

On this system, the day for a general action would have been the 17th; by which time all the allied troops might have arrived, from right and left, at a central position on the Brussels road in the neighbourhood of Waterloo or Genappe. Blucher, however, chose to try the fate of arms on the 16th, without calculating the time required by the British to arrive, and even without waiting for one of the divisions of his own army. "The marshal's plan," says the Prussian official account, "was to fight a general engagement with the enemy *as soon as possible*. On the 16th, Bulow's corps had been delayed in its march, and had not yet come up; nevertheless, the field-marshal resolved to give battle:" a resolution in which he persisted without considering that the British general was not on the frontier, but at Brussels.

No time appears to have been lost by the duke, in acting on the intelligence transmitted to him by the Prussians. It reached him only on the evening of the 15th, and our troops (at least our infantry) began their march from all points at daylight on the 16th. Had the assembling of the French force been made from the east, the duke would have had less hesitation in directing his march immediately towards the Prussians: but a great part of the enemy came from the west, and might have threatened Brussels by a shorter road than that which they actually took. The consequence of making a stand in so advanced a position as Ligny was that, as early as the forenoon of the 16th, Ney's vanguard was in possession of the great road of communication between the British and the Prussians. The intercourse of the two armies was thus interrupted; so that the duke remained during the whole of the succeeding night in uncertainty as to the issue of the

battle of Ligny. A patrol sent by his grace in the direction of Ligny, in the morning of the 17th, seems to have brought him the first account of Blucher's retreat: it was confirmed by a Prussian aid-de-camp some time afterward, but too late to save the double labour of first bringing up our artillery, and afterward dragging it back all the way to Waterloo.

In thus animadverting on the over-eagerness of Blucher, we must not be deemed insensible to the merits of that gallant and estimable veteran. His fierce impetuous mode of fighting had great effect in checking and enfeebling the French; which was apparent, among other things, by Bonaparte finding it necessary to call to his assistance, on the 16th, the corps of 25,000 men from under the command of Ney.

While the Prussian army was retreating, the duke of Wellington and the army under his command, remained on the field-of-battle at Quatre Bras; (so named from its standing near where the roads from Brussels to Charleroi, and from Nivelles to Namur, cross each other.) He had been joined by the cavalry and artillery, and the rest of the army. By the morning of the 17th, he had placed the whole in the position of Quatre Bras, and was combining his measures to attack Ney at Frasnes, when he received a dispatch from Blucher, informing him of the unfortunate result of affairs on his side. The retreat of the Prussian army rendered a corresponding movement, on the part of the British general, absolutely necessary, in order to maintain his communication with the Prussians. He accordingly resolved on retreating towards Brussels, which was done in the most perfect order.

Such were the results of the sanguinary combats of Ligny and Quatre Bras, where, according to marshal Soult, "the overthrow was terrible, and the effect *dramatic*." The emperor had, indeed, at one point beaten, but not broken, the line, so far as to compel the allies to choose other ground to re-form it; but from that he was not able to derive any material advantage, and certainly none such as he had anticipated. Although the allies had found it necessary to retreat, yet he did not attempt to pursue them. In the battle of the 16th, both sides fought with the utmost resolution; but the French soldiers with the bitterest animosity. The first and third corps of the French army had hoisted the *black flag*, and resolved to give no quarter to their enemies. But the animosity of the French troops was particularly directed against the Prussians: "On the 15th, before Charleroi," said an official account to Davoust, "several squares of Prussian infantry were broken by some squadrons: of 5 or 6000 men, who composed those squares, only 1700 could be saved." The *Moniteur*, however, comes closer and more boldly to the point. On the 16th, said that paper, "the firing of our troops against the Prussians, whose government has been the principal instigator of this unjust war, was such, that the emperor was obliged to order the recall to be beaten three times, for the purpose of enjoining the making of prisoners, and of stopping the carnage."

The retreat of the allied armies gave the French an opportunity, at which they are adepts, and which at this time was peculiarly necessary, namely, to claim great and brilliant victories; and also to anticipate the most happy and decisive results in their favour. Bulletin after bulletin was transmitted by telegraph to the interior, and to the shores of the ocean, to announce that the emperor "had completely beaten the united armies of Wellington and Blucher." Three of these dispatches were received at Boulogne on the morning of the 18th. Paris was illuminated. The most extravagant joy was manifested by the friends of the emperor. The whole vanity and arrogance of the ambitious and thoughtless French people were again brought forward to public notice: "His majesty," said the *Moniteur*, "was to enter Brussels the day after this glorious action, in which, it is said, the safety of the general-in-chief, Wellington, is compromised. Whole bands of prisoners are taken. We do not know

what

what is become of their commanders. The rout is complete on this side; and I hope we shall not soon hear again of these Prussians, if they should ever be able to rally at all. As for the English, we shall see what will become of them. *The emperor is there.*"

On the 17th, Napoleon having sent the third and fourth corps of infantry, under Girard and Vandamme, and the third corps of cavalry, under general Pagol, the whole amounting to about 35,000 men, and commanded by marshal Grouchy, to follow the movements of the Prussian army to Wavre, proceeded with the remainder of his force to the position which the troops under Ney occupied; but, before his arrangements were completed, and his orders given for his army to advance, the British troops were in full retreat, with the exception of the rear-guard, which was still at Quatre Bras. Napoleon, thinking the British army remained in their position at this place, advanced his troops in strong columns of attack against them; but, when they reached the heights above the village of Frasnes, he was surprised to find that the British had retreated; and that the troops against which his columns were advancing were nothing more than a strong rear-guard, which fell back as his troops advanced. He immediately ordered his cavalry to advance in pursuit; and his columns of infantry continued their march in the direction of Brussels. Many skirmishes took place with alternate success, until the rear of the British army arrived at Genappe. The British had to defile through the narrow streets of this village, and over the bridge which there crosses a small river, in the very face of the pursuing enemy. The cuirassiers being in advance, the earl of Uxbridge ordered the 7th hussars to charge them; but their horses were too small to produce any effect, and their swords shivered into atoms like glass, when they struck the steel armour of these men; and the regiment was forced to retire with some loss. The cuirassiers pursued them rapidly, and took the rear-squadron prisoners. The life-guards were then ordered up to protect the hussars, and the rear of the army. The guards immediately charged; and, after a short but severe contest, the French retired in confusion. Several other charges took place with the same success, in which the Oxford blues greatly distinguished themselves. The retreat of the British was then continued, without any further interruption, to the heights of Mount St. John, in advance of *Waterloo*, a village in front of the forest of Soignies, and on the great road to Brussels, within nine miles of that city.

During the whole of the afternoon of the 17th the rain fell in torrents, accompanied by dreadful thunder and lightning, as if the elements also had collected to this point all their destructive engines to engage in the mighty conflict. This state of the weather was of great advantage to the allied army; and, the roads being broken up by their artillery, rendered it difficult for the French to pursue. It was five o'clock when the allied troops arrived at the position destined for them by their skilful commander. Napoleon's army halted in the neighbourhood of Genappe. In the evening a short cannonade took place towards Hougomont, but without any result. On the left the Belgian troops advanced in parties in front, brandishing their arms, shouting, and firing some cannon, in token of defiance to the enemy; but to this they paid no attention.

All the army of Wellington was now collected at *WATERLOO*; and the duke wrote to marshal Blucher, that he was resolved to accept the battle in that place, provided that the marshal could spare two corps of his army to assist him. This the gallant veteran not only agreed to do, but promised, if necessary, to come with all his army to the assistance of the British general. At the same time he proposed, that, if Napoleon did not attack the allies on the 18th, they should, on the subsequent day, attack him with all their forces. When the evening approached, the allied soldiers, wet, weary, and hungry, took up their bivouack amidst the dripping corn, mud,

and water, and in the open fields, with scarcely any covering. The ground afforded no shelter for the troops; so that generals, officers, and men, were equally exposed to the rain, which was falling in torrents.

The French army was in a similar situation. The troops had been gradually coming up, during the evening, and occupied a ridge nearly opposite to the position of the English army. Napoleon slept at the farm-house of Cailou, near Planchenoit. Thus arranged, both generals and their respective armies waited the arrival of morning, and the events it was to bring. During the greater part of the night, the thunder and lightning continued most tremendous, accompanied by a high wind, and incessant and heavy rain; but, though this night was dreadful to the soldier, it must have been still more so to the wretched inhabitants of the country which the armies occupied. Obligated to abandon their humble dwellings, in despair they had fled to the deep recesses of the forest for security, and in the hope of saving their lives. The rich crops of grain, which were fast hastening to maturity, were trodden under foot, or eaten up by the cavalry; and the helpless farmer saw the labour of a whole year destroyed in a single day!

Napoleon had been partially successful. His great object remained yet to gain; and which, if he did not gain immediately, would have compelled him to relinquish all the advantages which he had previously obtained. Numerous reinforcements, he was well aware, were at hand to augment the armies of his opponents. Three corps of the Prussian army were on their march, and making every exertion to join their comrades. He had therefore no alternative but to persevere before these corps joined, or to return into France before the forces of the enemy. From the bravery of the allies on the 16th, he must have been aware that the object which he had in view was a most arduous, and even a doubtful, undertaking. Nevertheless he was resolved to persevere; and believed that, however difficult it might be, still he could carry his point. His self-confidence here led him into one of those errors which had oftener than once before proved fatal to him. He calculated that he had gained much more from the bloody operations of the 16th than he really had. He believed that Blucher's army was incapable of any further resistance that could be serious, or impede him. "He believed," said the Prussian general, "that the Prussian army was retiring upon Maestricht." The duke of Wellington therefore alone remained, as Napoleon conceived, to offer any serious resistance to his progress; and he had determined to attack him before he could receive any assistance from the army of Blucher. The former disposed of, he calculated he should be able to turn a sufficient force against the disordered remnant of the Prussian army, which he made sure of destroying altogether. Accordingly he had dispatched the army, under marshal Grouchy, to turn the left of the Prussian army, attack its rear at Wavre, and be ready to advance upon the road to Brussels, and in the rear of the whole, at the hour when he calculated that he should be able to force the front of both the allied armies, and completely separate them the one from the other, should the Prussians at all attempt to come to the assistance of the British general. Such were his prospects; such were his schemes. The possession of the capital of the Netherlands, and the destruction of Wellington and Blucher, two of the most celebrated generals of the age, were the mighty prizes for which he immediately contended. Others more remote were also in his view. His tottering power to re-establish, his tarnished glory to restore, and to disorganize the general plan of his mighty and numerous adversaries, were the next objects for which he fought. No common motives impelled him on; no common energies seconded his movements. An army, considering its numbers, more select than any France had ever before sent to the field, stood ready, heart and soul, to second his exertions. The whole were personally and enthusiastically attached

to their chief. They were also known to each other, bound together by one common feeling and one common interest; confident in their leaders; the flower of France; and composed of those veterans, returned from European prisons, who had formerly carried terror over the continent. All were burning to wipe away the stains which the previous campaigns had heaped upon their arms; and all were eager to earn fresh laurels, honours, and rewards.

On their parts, the commanders of the allied armies were not idle. The character of Blecher, for firmness and decision, was well known. That of Wellington, many a proud day had celebrated over the world. The position of Waterloo had been previously pitched upon by his comprehensive mind, as the best he could choose to cover Brussels, and to meet the fury of his formidable antagonist. The untarnished fame of Wellington was now fairly and conspicuously opposed to the ruler of France, who had long been characterized, and was still believed by many, to be the greatest captain of the age; who also, in the present contest, had every thing to hope from success, and absolute ruin to expect from defeat. The army of Wellington was confident in, and proud of, their chief; but they were composed of five different nations, scarcely known to each other. The Dutch and Belgian troops were newly raised, and in their first assay in arms. The Hanoverians, forming a fourth of the army, were all new levies, and young troops. Yet with these the duke of Wellington resolved to face his skilful adversary. Europe watched the movements of each with fear and silence; Britain with anxiety and hope. The British general, and the British troops, were thus, even under very disadvantageous circumstances, pitched against the *élite* of France and her boasted leader.

In the mean time, various unpleasant rumours had spread through Brussels and the surrounding country, in consequence of the retreat of the allied armies. After the British army had left Brussels, on the morning of the 16th, that city looked like a perfect desert. Every countenance was marked with anxiety or melancholy; every heart was filled with anxious expectation. It was not, however, supposed that any action would take place that day. What was then the general consternation, when, about three o'clock, a furious cannonading began! It was certainly in the direction the British army had taken; it came from Waterloo! In vain did every one ask questions which none could answer—numbers of people in carriages and on horseback, set off towards Waterloo, and returned no wiser than they went, each bringing back a different story. A thousand absurd reports, totally devoid of foundation, were circulated. What was told one minute was contradicted the next. According to some, Blecher had been completely beaten; according to others, he had gained a complete victory. Some would have it, that 30,000 French were left dead on the field of battle; others, that about the same number were advancing to surprise Brussels.

This last conjecture was improved into almost a certainty by the sudden appearance, between five and six in the morning of the 17th, of a troop of Belgic cavalry, covered, not with glory but with mud, galloping through the town at full speed, as if the enemy were at their heels. The alarm was soon given. In less than two minutes, the great square of the Place Royale, which had been crowded with men and horses, carts and baggage-waggons, was completely cleared of every thing, and entirely deserted. The cry was, "The French are at the gates of the town!" The doors of all the bed-rooms were thrown open; the people flew out with their night-caps on, scarcely half-dressed, and looking quite distracted, running about pale and trembling they knew not whither, with packages under their arms; some carrying huge heterogeneous collections of things down to the cellars, and others loaded with their property flying up to the garrets. In the court-yards of the inns, a scene of the most dreadful confusion ensued. Description can give but a faint idea

of the scuffle that took place to get at the horses and carriages; the squabbling of masters and servants, ostlers, chambermaids, coachmen, and gentlemen, all scolding at once, and swearing in French, English, and Flemish; while every opprobrious epithet and figure of speech, which the three languages contained, was exhausted. Some made use of supplication, and others had recourse to force; words were followed by blows. Those who had horses, or means of procuring them, set off with most astonishing expedition; and one English carriage after another took the road to Antwerp.

It was impossible for the people of Brussels, who were wholly ignorant of the event of the battle, and acquainted only with the disadvantageous circumstances under which it had been fought, not to fear that the enemy might at least have succeeded in breaking through the British, or at least the Prussian, lines; or that Bonaparte, ever fertile in expedients, might have contrived to elude their vigilance and to send a detachment, under cover of night, by a circuitous route, to seize the unguarded city, the possession of which was to him of the highest importance. The news of the advance of the French; the alarming reports which had been brought in from all quarters during the night; the flight of the Belgic troops, and, above all, the failure of any intelligence from the British army; tended to corroborate this last alarm, and it seemed but too certain that the enemy were actually at hand. At length, after a considerable interval of terror and suspense, an aid-de-camp of the duke of Wellington arrived, who had left the army at four o'clock; and, to the unspeakable joy of the people, this was found to be a false alarm. It had been spread by those dastardly Belgians who had been scampering through the town, and who had, it is supposed, met with some straggling party of the French. A considerable number of French did indeed enter the town soon after; but they were French prisoners.

The defeat which the Prussians had sustained could not, however, be concealed; and the Belgians were still filled with consternation and dismay. The corpse of the duke of Brunswick had passed through Brussels during the night, and his fate seemed to make a great impression upon the minds of the people. Waggons filled with the wounded began to arrive, and the melancholy spectacle of these poor sufferers increased the general despondency. The streets were filled with the most pitiable sights. A Belgic soldier was seen dying at the door of his own home, and surrounded by his relatives, who were weeping over him; numerous were the sorrowful groups standing round the dead bodies of those who had died of their wounds in the way home. Numbers of wounded, who were able to walk, were wandering upon every road; their blood-stained clothes, and pale haggard countenances, perhaps giving the idea of sufferings much greater than the reality.

It would be endless to dwell upon every fresh panic. An open town, like Brussels, within a few miles of contending armies, is subject to perpetual alarms; and scarcely an hour passed without some false reports occurring to spread terror and confusion. Every hour only served to add to the dismay. So great was the alarm in Brussels on the evening of the 17th, that a hundred Napoleons were offered in vain for a pair of horses to go to Antwerp, a distance of thirty miles; and numbers set off on foot, and embarked in boats upon the canal. Next day, the terror and confusion reached its highest point. News arrived of the French having gained a complete victory; and it was universally believed. A dreadful panic had seized the men left in charge of the baggage in the rear of the army, and they ran away with a rapidity that could not have been surpassed even by the French themselves. The road between Waterloo and Brussels, which lies through the forest of Soignies, is completely confined on either side by trees; it was soon choked up; those behind attempted to get past those before; officers' servants were struggling to secure their masters' baggage; panic-struck people forcing their way over every obstacle,

with the desperation of fear; and a complete scuffle ensued, which might really be called a battle burlesqued, in which numbers of horses were killed, and some lives lost, not to mention the innumerable broken heads and bruises sustained on the occasion.

At Antwerp, though more distant from the scene of action, the consternation was nearly as great. Long rows of carriages lined the streets, filled with fugitives, who could find no place of shelter; and people of rank and fortune were glad to eat and sleep in one and the same miserable hole, which, at any other time, they would have disdained to enter. So great was the universal anxiety, that during the whole of the 18th, though the rain was almost incessant, the great Place de Maire was crowded with people, who stood from morning until night, under umbrellas, impatiently watching the arrival of news from the army, and assailing every body who entered the town with fruitless inquiries.

But to return to the movements of the contending armies. Napoleon found, upon bringing up his troops on the evening of the 17th, that it was too late, for that day, to make any attempt against the position chosen by his skilful adversary. "It would have required three hours more of day-light," said he, "to have attacked them;" in consequence of which, he deferred the attack till the 18th.

We shall here endeavour to state the amount of the French army on the morning of that day as nearly as possible. We have already said that it consisted of 130,000 men, before the invasion of the Netherlands took place; but, when Napoleon joined it with his guards and other troops on the 12th, it was increased to between 140 and 150,000 men. It was divided into five corps of infantry, and four of cavalry, and was accompanied by 300 pieces of artillery. The cavalry consisted of 25,000 men; and a finer body never entered a field. It was supposed that Napoleon was peculiarly weak in this arm; but the reverse proved to be the case. Among the cavalry were the lancers, who were distinguished by their address, activity, and ferocity; and the cuirassiers, of whom there are said to have been nine regiments, were remarkable for the excellence of their equipments, and the superior power of their horses. Of the quality of this last corps we shall have occasion to notice hereafter. It is impossible to speak too highly of the French infantry in point of bravery and discipline in the field. The *élite* of the army consisted of the imperial guards, who were, at least, 20,000 strong. All these troops were completely armed and equipped, and supplied even to profusion with every kind of ammunition. Their loss, in the battles of Quatre Bras and Ligny, amounted to about 15,000 men, leaving a force of about 130,000 on the morning of the 18th of June. Of these, however, 35,000 were with marshal Grouchy, observing the Prussians; but there still remained 95,000 effective men to attack the British army, though Napoleon himself affirms he had but 71,000.

We have already noticed the amount and composition of the allied army under the duke of Wellington. Deducting the loss which it sustained on the 16th, and a corps which had been detached under prince Frederic of Orange, it was now reduced to about 70, or 75,000 men.

The glorious "field of Waterloo" has been so often described, that little novelty is to be expected from any account given to the public at this comparatively late period. It is quite impossible for us, however, to refrain from entering into the details of that memorable day; and we hope that the account we shall give may conduce to illustrate some tactical observations which appear to have escaped the attention of former writers. Much has been said in praise of the talents of the rival commanders, and the gallantry of their troops; but scarcely any one has made a point of specifying, in a clear and connected detail, the dependence of one event on another; or has tried to analyze, with the deliberate eye of an historian, the causes to which our triumph is to be attributed. The time is now

come to exchange the enthusiasm of admiration for calm inquiry; and, without pretending to many other sources of information than such as are furnished by the various official reports and the printed letters of individual officers, we shall contribute our humble endeavours towards preparing a more precise colouring than has yet been given to this dazzling picture. We may thus hope to enable our readers to form their decision with regard to several interesting questions, which are still introduced as doubtful in print or in conversation; and, if we do not seem to rival some cotemporary writers in high-sounding panegyrics on the British army, we shall not be backward in tracing and pointing out the distinguished features of its superiority; assured that, the more close is our examination, the more substantial will be found that basis on which rest both the pride of our troops and the security of our country.

The army under the command of the duke of Wellington was, as we have already noticed, posted about a mile in front of Waterloo, at the point where the position crossed the high roads leading from Brussels to Charleroy and Nivelles. Its right was thrown back to a ravine near Merke Braine, which village was occupied. Its left extended to a height above the hamlet of Ter la Haye, which was likewise occupied. In front of the right centre, and near the Nivelles road, his grace occupied the house and garden of Hougoumont, or Chateau Goumont, which covered the return of that flank; and, in front of the left centre, he occupied the farm of la Haye Sainte (the Holy Hedge). The centre occupied the village of Mount St. John. A road runs from Ter la Haye to Ohain, and the woody passes of St. Lambert, through which the duke of Wellington kept up a communication by his left with the Prussian army at Wavre. The whole position was situated upon an eminence, and extended about a mile and a half. The army was disposed in two lines. The first line, which was composed of the choicest troops in the duke's army, occupied the top of the hill, and were defended on the left partly by a large ditch and hedge, which ran in a straight line from Mount St. John. The second line lay behind the brow of the hill; and was, in some degree, sheltered from the enemy's fire. The reserve, under the command of lord Hill, was placed in reserve on the right of the position, in front of the village of Merke-le-Braine, with its right resting on Braine-la-Leud.

The Prussian army, which began to move at break of day, was placed as follows, viz. the fourth and second corps marched from Wavre by St. Lambert, where they were to take a position covered by the forest of Soignes, near Frischermont, in order to take the French in the rear when the moment should appear favourable. The first corps was to operate by Ohain, on the right flank of the enemy. Their line, in the evening, extended about a mile and a quarter.

The French army was posted on a range of heights, in front of the army under the British general. The first corps was placed with its left on the road to Brussels, in front of the village of Mount St. John, and opposite the centre of the allied army. This corps had not been engaged on the 16th, and was consequently entire. The second corps had its right on the road to Brussels, and its left upon a small wood within cannon-shot of the English army. The cuirassiers were in reserve behind, and the imperial guards in reserve on the heights. The sixth corps, with the cavalry of general Detourmont, under the chief command of count Lobau, was destined to oppose the Prussians on the rear of their right. The rest of the cavalry were with the guards, and the other two corps of the army. Over the whole position of the French army there were sixty batteries of cannon. The front, when extended to meet the Prussians, was about two miles and a half.

The country thus occupied by the armies was the most elevated ground in those parts, and rises from every quarter as you approach it. The whole forms numerous ridges,

ridges, without any very prominent eminences; and the valleys betwixt them are intersected with ravines. For half a league in advance of Waterloo the ground invariably rises to Mount St. John. It is interspersed, as it rises, with ridges, like the waves of the sea, wave behind wave. The position occupied by the Prussians; at the close of the day, joined the British at Ter la Haye. From that place, the ridge which forms Mount St. John, turns first in a south, and then in a south-west, direction, by Frischermont, towards Planchenoit. Its front, opposite the French position, rose like an amphitheatre, in several swells or ridges, each higher than the other, but all inferior in height to the chief ridge, on which Mount St. John is situated. At their foot is a valley, from whence the ground again rose, in an elevated chain, towards the position of the French. On the front opposite, and nearly on similar ground, with a valley between the allies and them, and also between their centre and their right wing, the French army was posted. All these eminences were covered with artillery.

In the valley, which lay between the positions of the French and British armies, about half-way between the two ridges, and to the right of the centre of the British, is situated the farm-house and chateau called Hougoumont, or Chateau Goumont. This was a gentleman's house, of the old Flemish architecture, having a tower and battlements: it was surrounded on one side by a large farm-yard, and on the other opened to a garden, and fenced by a brick wall, which was loop-holed by the British on the night of the 17th. The whole was encircled by an open grove of tall trees, covering a space of about three or four acres, without any underwood. This chateau, with the advantages afforded by its wood and gardens, formed a strong point d'appui to the British right wing. The duke of Wellington had occupied this house, as also the wall and garden, with a detachment of guards from the second brigade, and a regiment of the troops of Nassau. It was a post of the utmost importance; for, while it was held, the French could not approach the right of the British army.

The country around is generally open, groups of trees only appearing behind Frischermont, Planchenoit, Mon Plaisir, and near the so-much-talked-of Observatory. Several villages and farm-houses rose amidst those fields, which were cultivated in the highest manner, and covered chiefly with rye, at this season of the year in the utmost luxuriance of vegetation. From the incessant rain all the ground was very soft; and, in some new-ploughed fields the troops could not move without sinking to the calf of the leg. In the rear of those memorable fields lies the vast forest of Soignies, consisting chiefly of bushes, extremely tall and beautiful. Through this forest, for several miles, runs the great road from Brussels to the frontiers. In passing the position which we have just described, the duke of Wellington, on the preceding year, remarked that it was a spot which he should choose were he ever called upon to defend Brussels. Little did he at that moment imagine, that he should so soon be called upon to defend Brussels; and still less could he think that it would be against such an enemy.

Such was the ground, and such were the positions of the formidable armies who were about to contend for the fate of Europe. The shades of a short, but gloomy, rainy, and uncomfortable, night, were past. The morning of the 18th (Sunday) dawned. Like the night, it was cheerless and rainy; dark and sullen clouds obscured the face of heaven, and blackened the approach of this eventful and bloody day. No sun of Austerlitz here shed his morning beams on those ranks who looked upon such omens as an infallible sign of victory. With the morning arose thousands who were destined never to see the dawn of another. Stiff, and almost motionless, from having slept on the open fields, and under such deluges of rain, the officers and soldiers awoke, and began to prepare for battle.

It appears, however, as if Napoleon did not expect that the British would await the issue of a battle in the position they had taken up; for, when the dawning of the 18th of June showed him his enemies still on the heights, and apparently determined to maintain them, it is said he could not suppress his satisfaction; and, while he stretched his arm towards their position, as if to grasp his prey, he exclaimed, "Ah! I have them, then, these English!" Afraid, however, that they would still steal away, he sent the most pressing orders to hasten up his columns from the rear, that he might commence the attack. The weather still continued tempestuous; but, about nine o'clock, it cleared a little, and soon afterwards the sun made his appearance from amidst the dark clouds which rolled along the atmosphere.

The British troops were in the act of preparing their breakfast, when aid-du-camps, passing through their ranks, proclaimed that the French were moving. The troops immediately stood to their arms, and the artillery moved to the front. Before entering upon the terrible details of of this day, it may not be unnecessary to state, for the better understanding the subject, that this battle may properly be divided into six great periods. The first was the impetuous attack upon the right at Hougoumont, which lasted from eleven to one; the second was the dreadful attack from the centre to the left, which lasted from one till three; the third was the tremendous attack along the whole line, but severest towards the centre, which lasted from three till past six; the fourth was the terrible attack made by the imperial guards, which lasted from half-past six till eight; included in these periods also is the murderous combat maintained by the Prussians against the French right wing; the fifth was the general attack upon the offensive, on the part of the allies, and the attempt of Napoleon to resist it, which lasted from eight till near ten; the sixth was the general rout and pursuit, which lasted from ten till near midnight on the part of the British, and on the side of the Prussians all night. In each attack arose a multiplicity of sanguinary combats; and each were equal in their consequences to combats which, in other wars, had decided the fate of empires.

The whole of the French line now appeared to be in motion; their columns formed rapidly; and a terrible cloud of cavalry and cuirassiers hung opposite the British right. From a deep column of infantry, which was afterwards known to be composed of the imperial guard, and also ascertained to be the head-quarters where Napoleon himself was stationed, numerous officers were seen, from time to time, passing to and fro in all directions. These were carrying the necessary and definitive orders. Immediately after this, Napoleon passed before the line, and addressed the troops, in order to encourage them to greater exertions. He reminded them of their former victories. He pointed out to them the consequences of defeat in the present instance. He held out to them honours and rewards; and pressed upon their minds the glory which they would gain by vanquishing the English, their ancient and most inveterate enemies, and the great cause of all the opposition against them. He asked them if they would suffer the newly-organized troops of Holland, Belgium, and the petty states of Germany, once their servants, to vanquish them. He told them that a rich reward for all their toils lay before them, and was within their grasp; for "to-night," said he, "we shall be in Brussels."

1. It was near eleven o'clock when the battle began, with the attack on Hougoumont. Napoleon, upon reconnoitring, had seen the importance of that post, and the necessity there was for his getting possession of it. He therefore sent orders for marshal Ney, who commanded the left wing of his army, to direct an attack upon it with such a force as should at once take it. That officer immediately ordered the division of infantry, commanded by Jerome Bonaparte, to advance against Hougoumont. About eleven o'clock, the first columns of Jerome's divi-

sion made their appearance from the ravine, or rather hollow ground, which leads down from the public-house of la Belle-Alliance to the chateau. The British artillery had taken up a position on the ridge of the hill in front of the line of infantry; and the moment the French made their appearance with loud shouts of *Vive l'Empereur*, the nine-pounders opened a tremendous fire. So great was the effect produced by this fire, that all Jerome's bravery could not make his soldiers advance; and in a moment they were again hidden by the rising ground, from under cover of which they had but just emerged. This, which was the commencement of the action, was considered a very favourable omen by the British soldiers who witnessed it; and, for a short time, they were much amused with the manoeuvres of Jerome's division, and the cautious manner in which it seemed to emerge from its hiding-place.

This state of things, however, did not last long, as the French were observed bringing up a powerful artillery to bear upon the guns which had so annoyed his first advance. Under the protection of this artillery, they attacked Hougoumont with such vigour, that the troops of Nassau-Ussingen, who lined the grove of Hougoumont as sharpshooters, abandoned that part of the post; and the chateau itself must have been carried, but for the stubborn and desperate courage of the detachment of guards. The occupation of the wood by the French made Hougoumont, for a considerable time, an invested and besieged post, indebted for its security to the strong walls and deep ditches with which the garden and orchard were surrounded, but more to the bravery of those by whom they were maintained. The impetuosity of the French troops was incredible, and the fire of their artillery terrible. Every tree, every walk, every hedge, every avenue, was contended for with an obstinacy altogether inconceivable. The garrison fired through the holes which they had knocked out in the garden-walls; and the assailants made the most desperate attempts to carry the post, but in vain. This part of the British line was supported by thirty pieces of cannon, which made dreadful havoc amongst the enemy. The French were killed all round to the very door of the house; but they were never able to penetrate beyond the threshold.

As Hougoumont was in some degree insulated, and its defenders no longer in communication with the rest of the British army, the French cavalry were enabled to march round it to the British right wing, which they attacked with great vigour. The light troops, who were in advance of the line, were driven in by the fury of this general charge; and the foreign cavalry who ought to have supported them, gave way on all sides. The black Brunswick infantry, however, stood firm. They were drawn up in squares, as most of the British forces were, in this memorable battle.

The duke of Wellington, with his usual quickness, had foreseen the nature of the attack that would be made upon his line; and, when the troops stood to their arms in the morning, he gave orders that they should be formed into squares of half-battalions, and in that state to await the attack. These squares were not quite solid, but nearly so, the men being drawn up several files deep. The distance between these masses afforded space enough to draw up the battalions in line, when they should be ordered to deploy; and they were posted, with reference to each other, much like the alternate squares upon a chess-board. It was, therefore, impossible for a squadron of cavalry to push between two of these squares without finding themselves at once assailed by a fire in front from that which was to the rear, and on both flanks from those betwixt which it had moved forward.

2. After the French had made the most desperate efforts to push back the right wing of the British army, and to establish themselves on the road to Nivelles, the battle slackened in some degree in this quarter, to rage with greater fury towards the left and centre of the British line.

The French had been foiled in every attack which they had hitherto made, and therefore turned their attacks to the left of the British, in order to gain the road to Brussels. This attack was made in columns of cavalry and infantry, protected by the fire of upwards of a hundred pieces of artillery, which did dreadful execution. The French advanced with intrepidity, and charged with such resolution, that it required the utmost skill of the British general to post his troops, and valour of the soldiers, to resist the overwhelming numbers that were brought against them. The attempt against Hougoumont and the right was severe; "but on this point," said marshal Blücher, "the enemy attacked with fury," intending to throw the left wing of the allied army upon the centre, and thus effect its separation from the Prussian army. The combat was of the severest description. La Haye Sainte was the enemy's first object. This was a large farm-house, with offices, surrounded with a high wall, and lay upon the right of the great road from Brussels to Charleroy, in front of Mount St. John, at the bottom of the ridge. The garden attached to this house, which had only a brushwood fence, extended about fifty yards into the plain. Being a covering-point of much importance, the duke had occupied it with a considerable force of the light troops of the German legion. The French attacked this post with great fury, but were repeatedly repulsed; they, however, advanced again with fresh troops, the place was carried, and all its brave defenders were put to the sword.

While the combat raged with the utmost violence at La Haye Sainte, the columns of the French pressed forward against the whole body of the British left wing, directing their efforts along this part of the line, towards the village of Mount St. John. It was about one o'clock that the attack on the left became serious. Three columns of between 3 and 4000 men each, and 40 pieces of cannon, advanced against the line on the left, where the Belgians were posted. The fifth division, a brigade of heavy dragoons, and two brigades of artillery, assisted them. The combat was severe, and the slaughter dreadful. For about an hour, the Belgian infantry, assisted by the fire of the British artillery, arrested their progress; but they were at length obliged to give way. The 3d royals and 44th regiment were then sent to occupy the ground which the Belgians had abandoned; but these troops, after the most gallant conduct, and the greatest exertions, were, in about half-an-hour, also forced to yield; and the French succeeded in getting to the hedge that ran in front of the position. They were, however, driven back by the brave 92d, under general Pack; and the Scotch greys followed, who did terrible execution. The French, however, rallied, and with fresh troops renewed the attack: they advanced in deep and solid columns, with loud cheers, and confident of victory. General Picton, who was with his division on the road from Brussels to Charleroy, advanced with the bayonet to receive them: the conflict was close and murderous; unable to withstand the shock, the French soldiers turned and fell back in disorder, suffering at the same time a terrible loss. In this furious conflict, however, general Picton fell, mortally wounded, while leading on his division to the charge.

The French were not to be deterred by this repulse. They immediately brought a large body of cavalry to cover their infantry, and the attack commenced again. These attacks were sometimes carried on by cavalry and infantry intermixed, and sometimes separate. In those, however, made at this period of the day, both were employed, in which the most desperate attempts were made to drive the British from their position at the village of Mount St. John; but they were unsuccessful. The cannonade, at this moment, on both sides, was dreadful. The French artillery, which was led by count d'Erlon, vomited forth terrible showers of grape-shot, which made frightful chasms in all the left of the British line, which nevertheless remained firm and immovable. The British artillery

lery also did considerable execution. It cut to pieces the masses of the French infantry and cavalry as they advanced. The French, exasperated at the loss which they sustained, attempted to charge the guns with their cavalry. In these charges the artillerymen stood at their guns as long as they could, and then retired under the bayonets of the infantry; and, as soon as the French cavalry were driven back, they returned to their guns, and gave them a parting salute.

During all this first terrible struggle on the left, the scene, said a person who was present, was indescribably grand and terrific. The atmosphere, for some time, was heavy and tempestuous, which prevented the smoke, occasioned by the cannon and musketry, from rising; and, while both armies fought under these gloomy clouds, they served to conceal the advance of the columns of the French infantry till they were close at hand. Hence the prospect was more terrific. The cries of the wounded and dying, the thunder of the artillery, the volleys of musketry, the bursting of shells, the noise occasioned by Congreve's rockets, the fury of the combatants, the cries of *Vive l'Empereur* on the one side, and of *Vive le Roi*, and the British huzzas, intermixed with the loud cheers of "Scotland for ever," from the other side, formed a scene which it is impossible to describe. The shot from the French artillery passed over the line of the British guns, and fell into the squares of infantry behind them, and occasioned a great loss to several regiments, without their having been at all engaged. The French army was also similarly situated with regard to the tremendous fire of their antagonists. Many of the rockets, in particular, carried destruction to a great distance, passed over the front lines, and fell amidst the equipage which was placed behind on the road, which rendered it indispensably necessary to remove the train to a greater distance.

Though repulsed in every onset, and notwithstanding the loss which the French had sustained, they still persevered, and sent forward fresh troops to reinforce those which had been defeated. In one of these attacks, general Ponsonby charged with his brigade, consisting of the 1st dragoon-guards, the Scotch greys, and the 6th or Inniskillen dragoons. Sir William Ponsonby led the charge at the head of the latter regiment, which cut down every thing before them; and the French troops were overthrown with great loss. The charge, however, though successful, proved fatal to the brave sir William Ponsonby. In returning from the charge which he had made, his horse stuck fast in a newly-ploughed field. The French had rallied, and were again advancing. Finding it impossible to escape from a column of lancers, he alighted, and was in the act of giving his aid-de-camp his watch and a picture, in order that these memorials might be delivered to his wife and family, when the lancers came up. Both were cut to pieces in an instant; and, when his body was found, it was pierced with seven lances. His brigade afterwards came up, and amply revenged his death, and the lancers were nearly annihilated.

Finding all their efforts fruitless, the French now sent another column of cavalry against the British lines. At the head of this column marched those formidable troops named *cuirassiers*. These soldiers were not only clad in armour, but were all chosen men, about six feet high; their horses were the best and strongest which could be procured; and it was necessary to have served in three campaigns, and to have been twelve years in the service, before they got into that corps. From their chin downwards to the lower part of the body they were cased in armour: the front cuirass was made bright, and in form of a pigeon's egg; the back one was made to fit the back: the inside was stuffed with a pad, and both were fitted on with a clasp. They were easily put off and on; and weighed from nine to eleven pounds each, according to the size of the man: they resisted in a great measure musket-balls, which, striking against them, flew off in an oblique direc-

tion. On their heads they had large maffy helmets; and their weapons were straight long swords and pistols. These troops being brought forward, they advanced against the British line with the utmost confidence. The attack of this body of troops was tremendous, and for a considerable time every attempt that was made to repel them proved unavailing. The British light-cavalry were found to suffer cruelly in their unequal contest with the ponderous and sword-proof cuirassiers, and even with the lancers. They were driven back with considerable loss, and many were made prisoners. Even the German legion, so distinguished for discipline and courage during the peninsular war, were unequal, on this occasion, to sustain their shock. They then attacked the infantry, who, notwithstanding the loss which they sustained, remained immovable, and repelled every attack made upon them. The 28th regiment particularly distinguished itself; and its colonel, sir Philip Benson, had four horses shot under him. In this manner the engagement continued at this point upwards of an hour. Both sides behaved with the most extraordinary gallantry, and neither the one nor the other would yield an inch of ground. The attacks of the French, however, were incessant and severe; three times were they upon the point of carrying the position at this point, and as often were they repelled. The cuirassiers deliberately advanced to the mouth of the British cannon: at one time they galloped along, and at another coolly walked their horses in front of the British squares, continuing to look for an opening into which they might dash: but none appeared, the ranks were filled up as soon as they were broken; while with the bayonet they resisted and unhorsed these armour-equipped cavaliers. Some of these men were so bold, that they frequently rushed singly out of their columns, and, firing their pistols in front of the British line, endeavoured to irritate the troops so as to make them throw away their fire upon them, that their main columns might attack with more safety.

These cuirassiers repeatedly charged the 30th regiment; but they did not succeed in making the least impression. When the horsemen had passed, the regiment deployed into line, that its fire might be more extended and effectual. As soon as this was done, the word was given, "Re-form square; prepare to receive cavalry." The cuirassiers several times walked round this gallant regiment, eagerly watching for an opportunity to dash in. Finding no opportunity of breaking this regiment, the cuirassiers marched off to try another; and, having come upon the 69th before the square was completely formed, cut down a vast number. These cavalry frequently penetrated between the squares to the very rear of the British line; but in retiring they suffered dreadfully.

In order to repel these desperate attacks on the British line, sir John Elley, now quarter-master-general, was directed to bring up the heavy brigade of cavalry, as the other cavalry were found inadequate to the task. These consisted of the life-guards, Oxford blues, and Scotch greys, who instantly charged, and the most sanguinary cavalry-fight ever witnessed took place. Notwithstanding the weight and armour of the cuirassiers, and the power of their horses, they proved unable to withstand the shock of the heavy brigade, being literally rode down both horse and man, while the strength of the British soldiers was no less pre-eminent when they mingled and fought hand to hand. Several hundreds of French were forced headlong over a fort of quarry, or gravel-pit, where they rolled a confused and undistinguishable mass of men and horses, exposed to a fire which, being poured closely into them, soon put a period to their struggles.

This great movement of the French against the left comprehended one of the severest attacks during this tremendous day. The cavalry was completely beaten off, after losing immense numbers; and of the infantry, two regiments, the 45th and 105th, were broken, and lost an

eagle and a standard, and from 2 to 3000 prisoners. The colours of the 105th were a present from the empress Maria Louisa. The eagle of the 45th was most superbly gilt, and inscribed with the names of Austerlitz, Jena, Friedland, and Wagram. In the struggle to take it, it was much tarnished, and covered with blood and dirt. It was a Serjeant Ewart, of the Scotch greys, who captured this trophy; in effecting which, he first killed the bearer, then a lancer, and, lastly, a foot-soldier, who, at the moment, successively attacked him. The cuirassiers also lost an eagle, which was taken by the royal horse-guards.

While this tremendous struggle was going on in the centre and left of the British line, the attack upon Hougoumont and the right was renewed with greater fury than before. The French made the most furious attempts against Hougoumont, in order to turn the right of the British position; but the guards disputed the wood and orchard most gallantly. About three o'clock, when Napoleon found that Jerome's division could not drive the guards from Hougoumont, he ordered the chateau to be set on fire. The shells from several mortars, which were brought to bear upon the houses, soon had the desired effect; but the British troops, retiring into the garden, did not yield one inch of their ground; and the only thing which he gained by this cruel measure was the destruction of some wounded British soldiers, who were too ill to be removed, and who fell a prey to the flames.

Meanwhile, the attack was renewed along the whole line of the British right wing, by successive columns of cavalry, who rolled after each other like waves of the sea. These were supported by a most tremendous fire of artillery, which seemed to threaten to sweep every thing before it. The Belgian horse were forced to give way, and galloped from the field in great confusion. The advanced line of guns were stormed by the French, and several pieces fell into their hands. After gaining these, the French cavalry rode furiously up and down among the small squares of British infantry, seeking some point where they might break in upon them. A brigade of horse-artillery, commanded by major Norman Ramsay, opened its fire upon the French cavalry, which forced them to retreat repeatedly; but they again advanced with fresh fury. As often as they retired, the British artillerymen rushed out of the squares where they sheltered themselves, and began again to work their pieces. On the part of the French, a most wonderful degree of bravery was displayed in this part of the battle; and, on the part of the British, at least an equal degree of bravery, united with much more coolness.

Though the French had hitherto not been able to break the British line, yet the situation of the latter was critical. The duke of Wellington had placed all his best troops in front; and these had suffered so dreadfully, that it became necessary to bring forward troops from the second line. These were not of equal quality, and some of them were found unfit for the task. The duke himself saw a Belgian regiment give way at the instant it crossed the ridge of the hill: he rode up, halted the regiment, and again formed it, intending to lead them into the fire himself; but as soon as they crossed the ridge of the hill, and again encountered the storm of balls and shells, they went to the right-about once more, and fairly left the duke. Upon this he brought up a Brunswick regiment, who kept their ground with more steadiness.

The battle continued to rage with the utmost fury in every part of the line; and "the British army," as Blucher justly said, "fought with a valour which nothing could surpass." But the French renewed their attacks with such rapidity, that, with whatever firmness the allied army maintained their position, it was impossible but that such heroic conduct, and such continued and immense exertions, must have had a limit. The arrival of the Prussians, therefore, who were known to be advancing to co-operate with them, was most anxiously expected.

The duke of Wellington had dispatched an officer of his staff, about two o'clock, to the head-quarters of Blucher, to ascertain his movements, and to know when it was probable his advance would come in contact with the enemy.

3. Nearly four hours had now elapsed, during which the battle had been maintained with the most determined courage and obstinacy on both sides. Yet it was little in comparison to what followed. It was three in the afternoon. Affairs became more urgent. Napoleon having been baffled in every attempt which he had made upon the British lines, except the temporary success at La Haye Sainte, resolved to make some alteration in his plan of attack. He had hitherto remained on an eminence near La Belle Alliance, from whence he had a clear view of the whole field of battle. He continued walking in deep thought, sometimes with his hands joined together, and at other times taking snuff copiously, but all the while in great anxiety. The story of his standing upon the observatory, which is a mile distant, is an idle tale: at La Belle Alliance was his station during the afternoon. "It was there," said marshal Blucher, "that Napoleon was during the battle; it was there he gave his orders, and that he flattered himself with the hope of victory." From this point he contemplated the immediate and complete success of those terrible French tactics, which had so often appalled his enemies. He was, however, much chagrined when he saw some of his best troops, and his cavalry and cuirassiers, driven back, heels over head, at every onset, by the British line, and with amazing carnage. A great part of his troops had already been engaged, except his guards, which were the flower of his army, and who idolized and adored him. He, therefore, determined to bring a part of these troops forward, and, with all his cavalry, formed into masses, to make one desperate effort against the centre of the British army.

Having formed his plan, the infantry and cavalry were formed into columns, and advanced rapidly to the attack, under cover of a most tremendous cannonade, which was directed against the whole line, but severest towards the centre. The British cavalry was driven to the rear of the infantry, after sustaining several charges, in which the carnage on both sides was dreadful. The French cavalry then charged the infantry, who, being in squares, repulsed them. They returned to the attack, and charged with both infantry and cavalry in such numbers, that it required every effort on the part of the British to resist them; and the combat became close and sanguinary. About 300 pieces of artillery opened against the British lines, the fire from which was incessant and terrible. "It unfortunately," said the Spanish general Alava, "made horrible ravages in our line, and killed and wounded officers, artillerymen, and horses, in the weakest part of the position." The loss of the third battalion of the 1st regiment of British guards, and the rifle-battalion of the German legion, was immense. Files upon files were carried out to the rear from the carnage. Shocking as the slaughter was, it would have been much greater had it not been for the state of the ground, which was thoroughly soaked with rain; for although this, by preventing dust, afforded better aim to the artillerymen, many shots never rose after they had touched the ground, and none bounded so often as they would otherwise have done. The shells also frequently turned themselves, and, when they exploded, threw up the mud like a fountain.

For more than three hours, the French continued to make charge after charge, from one end of the British line to the other, in order to force it wherever they could. Victory was several times doubtful; but the duke of Wellington was every where present, exposed to the hottest fire, animating his men. He often threw himself into the midst of the squares, in full determination to stand or fall with them.

Though repulsed in every point, the French continued their attacks with such impetuosity, that the squares began

gan to assume the appearance of a great reduction of numbers. One English officer was under the necessity of stating, that his brigade was reduced to one-third of its numbers, that those who remained were exhausted with fatigue, and that a temporary relief, of however short a duration, was a measure of peremptory necessity. "Tell him," said the duke, "what he proposes is impossible: he and I, and every Englishman on the field, must die on the spot which we now occupy."

In order to give our readers a better idea how this dreadful conflict was carried on, it may be proper to explain, at one view, how the attacks of the enemy were made. In general, the whole French artillery first advanced in front, towards the British lines, pouring a most destructive fire of grape-shot and shells into them. Its approach was close indeed. This artillery played upon the British squares at the distance of 150 paces (375 feet.) Next succeeded the tremendous charges of cavalry and cuirassiers; and, lastly, the bold and determined attacks of the close columns of infantry. These repelled, the French retired behind their guns, which again advanced while the cavalry and infantry re-formed, and prepared to renew the onset in the same order. To separate the British army, to break through the centre, and to crush their firm battalions, the French made the most astonishing and reiterated efforts. Six times, from two o'clock to seven, said the Austrian official report, did Bonaparte make the attempt with equal courage, and as often was he driven back. "No troops but the English," said the same important document, "could have resisted such attacks." As the wave impels the wave, so column propelling column advanced to the attack, while the artillery and the mortars scattered destruction along the British line. The French cavalry repeatedly attacked squares after squares, and were repulsed ten or eleven times with immense loss. One mass was no sooner repulsed and broken, than another took up its place. The British squares remained immovable; and nothing could shake them.

The battle was maintained, on both sides, with inconceivable violence. The fire of the artillery and the attacks of the cavalry were so terrible, and so severe, that the allied troops absolutely looked upon the present attacks of the infantry as a breathing-time from their unparalleled toils. The anxiety of the duke for the sufferings of his gallant comrades became great: "I saw him," said a person who was present, "pull out his watch several times, calculating, no doubt, when the Prussians would arrive."

Blücher in the mean time was not idle; but his army had great and unforeseen difficulties to encounter before a junction with the British could be effected. The fourth corps, as we have already observed, had been in motion since four o'clock in the morning. Blücher himself, weary and unwell from the dreadful crush which he had received on the 16th, was in bed when he received the intelligence that the duke was attacked. He instantly arose; followed his army; and, putting himself at the head of the first corps, hastened to the field of battle. The cross-roads in that part of the country through which they had to pass were, from the late incessant rains, almost impassable. The Prussians experienced considerable difficulty in passing the defile of St. Lambert; and this, added to the badness of the roads, retarded their march some hours, so that it was past four o'clock in the afternoon before two brigades only of the fourth corps arrived at the covered position which was assigned them. The decisive moment was come: there was not an instant to be lost; and general Bulow resolved to commence the attack with what forces had come up. The Prussians, therefore, immediately advanced towards Planchenoit, against the right wing of the French. Napoleon, however, had been aware of a movement of this description, and had endeavoured to guard against it. From a letter intercepted on the preceding evening, he learned that 15,000 Prussians were to arrive on his right. The rest of the Prussian army he seems not to have thought of; and, no doubt, considered that it

would be fully occupied with the French troops under marshal Grouchy. Therefore, when the small body of Prussians appeared on his right, he immediately sent his reserve, or sixth corps, under count Lobau, against them; and a most sanguinary contest commenced at this point. The Prussians fought with uncommon courage, and the most dreadful animosity; and the tarnish which their arms had sustained on the 16th, they were resolved, if possible, to wipe away. The conflict, on this side, continued long uncertain; while the battle with the British army raged with the same violence as ever. Napoleon still had the strongest hopes of succeeding in beating the British army: "These English," said he, "are devils; yet, though they fight bravely, they must give way soon." Marshal Soult, however, who had some cause to know these devils better, told him that such an event as their giving way was not probable. "And why not?" said Napoleon, rather peevishly. "Because," said Soult, "they will rather be cut to pieces." Napoleon, however, continued to think otherwise; and, notwithstanding the delay which he had already experienced, he observed, jesting, that "he should yet be in Brussels time enough for supper." He brought up fresh troops, and the battle every moment became more bloody.

The humanity of two French officers in this battle deserve to be noticed. The honourable colonel Ponsonby, of the 12th light dragoons, fell in the first of the three charges of the light horse, soon after the commencement of the action. His wounds were desperate, and he was lying in a helpless state, when a lancer, probably to ascertain the fact of his existence, in the barbarous manner of all soldiers, plunged his lance at his shoulder, which penetrated to his lungs; meaning, as it was supposed, afterwards to plunder him, when an advance of another corps drove him away. In this state he lay for a considerable time, with several severe wounds, and suffering great agony, particularly from thirst. At length his situation was noticed by a French officer, who lay severely wounded at some distance, and, with great difficulty, crept towards him, and presented a bottle to his mouth, when he seemed at the last gasp, from which he drank some kind of spirit. This saved his life. After his recovery, he made every endeavour to find this officer, that he might return his grateful acknowledgments; but in vain.—Colonel Hervey, of the 14th, was also in a charge of the light horse, when he found himself opposed to a French officer, who was proceeding to make a cut at him, when, perceiving the colonel had but one arm, he dropped his sword, exclaiming, he would never use his sword against a man thus situated. In this instance, also, the gallant colonel was not able to find his noble opponent.

In the mean time, the contest on the left of the British was so severe, that for some time all that the Prussians could do was to maintain their position. More Prussian troops, however, came into line, and more were still advancing; Bulow's force soon amounted to 30,000 men, and the second corps were hastening to join them. Napoleon, therefore, without relinquishing his object in front, found it necessary to send general Duhesme, with the young guard and several battalions of the reserve, to this part of the line. These troops, making a vigorous attack upon the Prussians, forced them back with considerable loss; and, having made themselves masters of Ter la Haye, Pappelotte, and Frischermont, separated the Prussians from the British army.

Napoleon now determined to improve his success by following up the attack upon the centre of the British army. He had observed the destruction which his artillery had made in the British line; and about six in the evening he made a most vigorous attack upon the centre, with the whole cavalry of his guard. These succeeded in penetrating to the top of the ridge, and took the artillery which was in front. The duke of Wellington, however, who was at this point, immediately charged them with three battalions of British and three battalions of Brunswickers,

wickers, and compelled them to abandon the artillery. The British, however, were unable to withdraw them, for want of horses; nor did the French dare to advance to recover them. At this time, the earl of Uxbridge (now marquis of Anglesea) made some brilliant charges with the cavalry of household-troops, and repelled the French. Two battalions of the old guard were cut to pieces.

It was now near seven o'clock in the evening, and the battle still raged in every part of the line. Of the Prussian army, only the fourth corps had as yet come up. Marshal Blücher, with the first corps, as he was approaching the scene of action, received, about six o'clock, intelligence from general Thielman (Zeithen) that he had been attacked, and was hard pressed at Wavre by a formidable force of the French, and "who were already disputing with him the possession of the town." Blücher, however, notwithstanding that his rear was thus threatened with a superior force, said, that he "did not suffer himself to be disturbed by this news; it was on the spot where he was, and no where else, that the affair was to be decided." He therefore directed Thielman to do the best he could, and not to look to him for any immediate assistance. The moment, indeed, was critical. Had Blücher hesitated for one half-hour, the most fatal consequences must have ensued; but, instead of endeavouring to secure his rear, he continued to advance with his columns to the assistance of the British army.

General Thielman, thus left to himself, was obliged to maintain an unequal contest with the French troops, under Grouchy, at Wavre. We must here attend to the operations of these two generals, as they formed a part, and no mean part, of the battle of Waterloo. If Thielman, when attacked by Grouchy, had yielded or given way early on that important day, Bulow's corps would have been taken in the rear, as Napoleon calculated that it would be, almost as soon as it was engaged. Indeed, Napoleon relied much upon the diversion which he supposed Grouchy was making in the Prussian rear; and he expected that he would have come up and decided the day, as Desaix did at Marengo. Marshal Soult had transmitted an order to Grouchy, on the evening of the 17th, to proceed with the third and fourth corps of infantry under Girard and Vandamme, and the third corps of cavalry under Pajol, towards the Dyle, in order to throw himself in the rear of the Prussian army, which, at that time, Napoleon conceived to be disorganized and incapable of much resistance. Grouchy accordingly marched with this force, consisting of about 35,000 men, by St. Lambert, and on the right bank of the Dyle. On the 18th, he fell in with the third corps of the Prussian army, under Thielman, which had suffered least in the battle of the 16th, and a severe engagement immediately commenced. The French carried that part of the town of Wavre situated on the right bank of the Dyle, after much resistance: but, having gained this point, they found considerable difficulty in passing the river; and general Girard, in endeavouring to carry the mill of Bielge, was wounded in the breast by a ball. The mill, however, could not be carried; and, without that, the river could not be crossed. Grouchy was aware of the march of Bulow's corps to the assistance of Wellington, and was therefore eager to proceed against it. His orders were urgent, and his object most important. "Impatient," said he, "to co-operate with the army of your majesty on that important day, I detached several corps to force the passage of the Dyle, and to march against Bulow." General Vandamme continued the attack on the town of Wavre and the mill of Bielge; and Grouchy, having arrived at Limale, passed the river, and, after an obstinate struggle, carried the heights. In Wavre and Bielge, however, the Prussians remained immovable against all the efforts of the French; and, by the time the heights were carried, it was so late, that nothing more could be done that day. Thus Thielman, though much inferior in numbers, was enabled, by the difficult nature of the country, interspersed with defiles, woods, and ra-

vines, to oppose an obstinate resistance; and, what was of still greater importance, it kept all Grouchy's force from the point where it was so much wanted; and though the distance was only about twelve miles, it was, in the words of Ney, the same to the rest of the French army as if he "had been a hundred leagues from the field of battle."

In the mean time, the battle continued to rage on the heights of Mount St. John with as much fury as ever. The allied army remained firm at their post, without wavering for a moment, against every effort of overwhelming and furious numbers, led on by a skill which was of the first order, and by a spirit which neither relented nor melted at the sight of human suffering or blood. The carnage in both armies was dreadful; and the British soldiers, like their general, had made up their minds to die where they stood. At this time the fifth division was reduced from 6000 to 1800 men; and these, stationed in that part of the line against which the principal attacks were directed: the 92d regiment was reduced to less than 200 men. But Hougomont, with its gallant defenders, defied all the shells, balls, bayonets, and swords, of the French. Napoleon, however, and his army, were in a critical situation. As yet, indeed, he thought things went on well. He had succeeded in repulsing the Prussian troops under Bulow; and, thinking Grouchy was now near at hand to attack them in the rear, he determined to make one desperate effort against the left centre of the British army, near the farm of La Haye Sainte, and decide the day in his favour. For this purpose, he brought forward the reserve of his guards, amounting to about 15,000 men. These troops, the *élite* of his army, had always been considered invincible, and only brought forward to decide the fortune of such tremendous days and the fate of kingdoms.

4. Napoleon having formed his resolution, the guards prepared to advance to the attack. At the same moment, he dispatched instructions to every part of the line, that the movement, which was to decide the victory in his favour, was taking place, and commanding a simultaneous movement against the whole line of the British army. Every thing being now ready for the final attack, Napoleon addressed his guards, and told them, that by his previous attacks he had destroyed the greater part of the British cavalry and infantry, and that the artillery alone remained, which they were to attack with the bayonet. He then led them to the rise of the hill, and pointing to the causeway, exclaimed, "There, gentlemen, is the road to Brussels." The guards immediately raised a shout of *Vive l'Empereur*, which was distinctly heard by the British, and induced them to believe that the emperor himself was coming against them. Napoleon, however, ordered marshal Ney to head them. These veteran warriors, so long esteemed the first troops in Europe, advanced across the plain which divided the two armies, with a firmness which nothing could exceed; and, though the grape and cannister shot from the British artillery made dreadful havoc in their ranks, they were never disconcerted for a single moment. In their advance to the charge, the imperial guard rallied the broken and dispirited troops. The French army resumed its vigour, and the combat was renewed along the whole line. The artillery on both sides made a terrible carnage. Although the foreign troops in the British army acted with great resolution and much ardour, yet it was not to be expected that many of them, who as yet had never witnessed a contest of this kind, could stand against the flower of the French troops, led against them by consummate skill, and in formidable masses. Of this the duke of Wellington was well aware; and, therefore, he took the precaution to support each body of them by English infantry, all disposed in such a manner as to succour the point threatened.

The imperial guard continued to advance against the British line, under cover of the fire of their artillery. They charged a body of Brunswickers who attempted to arrest

arrest their progress, and drove them back with great slaughter. The moment was critical. The duke of Wellington, from the extraordinary loss of men, was obliged to bring up the last of his reserve, and to withdraw his artillery into the second position. Victory now hung in the balance in such a manner, that, to all appearance, a grain would have turned the scale. The British line had to sustain the most impetuous attacks from the French; and one time the victory appeared more than doubtful. The duke was aware of the importance of the moment. He rallied the Brunswick troops, and said, "My brave men, we must not be beat." He put himself at their head; and, charging the French, again restored the combat. The prince of Orange and the Belgian troops conducted themselves with the greatest gallantry, being in that part of the line which marshal Ney attacked in person. In this attack the prince was wounded by a ball in the shoulder, which obliged him to be removed from the field. The French troops, in some places, approached within forty paces, and in others within twenty yards, of the British artillery, which opened a dreadful fire upon them. The French, however, continued to fight with great resolution, notwithstanding the numbers which fell in their ranks at every fire, and which they closed up with the greatest coolness. The first brigade of guards, and a Dutch brigade, made a dreadful slaughter amongst them, and more than 300 fell at this point. The British 92d, although reduced to less than 200 men, charged a column of the imperial guards; and, being followed and supported by the Scotch greys, the whole was nearly cut to pieces. The carnage was dreadful. The imperial guard, however, once more advanced to the attack, covered by their artillery. As soon as they reached the ridge, the British foot-guards, who had lain on the ground for the purpose of avoiding the fire of the enemy's artillery, were now ordered to rise. The duke had watched their approach; and, when they were within a hundred yards of his men, he exclaimed, "Up, guards, and at them." They needed no second bidding. In an instant they sprang up, and rushed upon the attacking columns with the bayonet. This charge even the imperial guard could not stand against; and those undaunted troops, who, at one time, considered themselves the conquerors of the world, were obliged to give way. In this attack the British and French guards were, for the first time, fairly opposed to each other. The shock for a moment was dreadful. The French refused to take or give quarter, and the carnage was horrible; at last the whole of their ranks were broken, all discipline was at an end, and they began to give way in the utmost confusion. The tirailleurs of the imperial guard gallantly attempted to cover their retreat, and, for a short time, did considerable execution among the British; but, being charged by a body of cavalry, they fled in disorder.

Thus terminated the last dreadful effort of the French against the British line. In this attack the dead of the French guards, without exaggeration, lay in sections, men and horses together. From this moment the spirit of the French soldier was fairly broken; the cries of *Vive l'Empereur* were silenced; and Napoleon, with grief, beheld the field of battle covered with the bodies of his best troops, and on the exertions of whom were placed his firmest and his last reliance. Marshal Ney, who had witnessed many severe battles, declared that he had never witnessed such a scene of carnage as the field at this moment exhibited. To reanimate the troops, when leading them to the last attack, Bonaparte had recourse either to a direct falsehood, or else he must have been grievously and culpably ignorant of his situation. He caused to be circulated throughout the army that Grouchy had arrived, and was overwhelming the Prussian rear. "At seven in the evening," said Ney, "after the most dreadful carnage I ever witnessed, general Labedoyere came to me with a message from the emperor, that marshal Grouchy had arrived on our right, and was attacking the left of the united

English and Prussian army. This general (Labedoyere), continued he, circulated this intelligence to animate the troops."

5. While this last attack was going on against the British line, the whole of the fourth corps and a part of the second corps of the Prussian army, had successively come up, attacking, as they arrived, the right wing of the French with the greatest impetuosity. Marshal Blucher had also joined with the first corps. The head of this corps reached Ter la Haye soon after seven o'clock, and immediately attacked and drove the French from that place, and also from Pappelotte, and Frischermont, and completely opened the communication between the British army and the fourth corps, which had before been separated. At this extremity of the allied line were stationed the troops of Nassau, whose uniforms were so much like those of the French, that the Prussians mistook the former for the latter, attacked them with the utmost fury, and drove them from their post, before discovering their error. The Prussians, which had now arrived on the right of the French army, amounted to 40,000 men.

The duke of Wellington beheld with satisfaction the firm and determined advance of the Prussians against the right wing of the enemy, which was giving way every moment. The Prussian artillery formed one tremendous roar, from Ter la Haye to Planchenoit. "There goes old Blucher at last, and like himself," exclaimed the duke. With the eye of the eagle when in search of his prey, he now perceived that the victory was his. He saw Napoleon's laurels withering upon his brow; and, with his characteristic decision and energy, he seized that fortunate moment. He had particularly noticed the confusion in which the enemy had retired from his last attack, and also that the march of general Bulow by Frischermont upon Planchenoit and la Belle Alliance had begun to take effect. He immediately ordered the whole line of infantry, supported by the cavalry and artillery, to advance against the French. At the same time, he put himself at the head of the foot-guards; and having addressed a few words to them, to which they replied with a general *hurrah*, he led them on with his hat in his hand. The whole army advanced with the greatest intrepidity up the opposite heights, notwithstanding the fire of the French from 150 pieces of cannon. So impetuous and furious was this attack, that all idea of quarter, on either side, was for some time out of the question; and the contest thus became a perfect massacre. The French position was soon carried; and, their artillerymen having deserted their guns, the whole army fled in the utmost confusion. Entire columns threw down their arms and cartouch-boxes, in order to escape the better; and 150 pieces of cannon, with their ammunition, fell into the hands of the conquerors. What added to the confusion, the Prussian corps, under general Zeithen, with which marshal Blucher was, charged the right flank of the French, near the village of Smouhen, at the same time that the duke of Wellington attacked them in front. The right wing of the French army was broken in three places. The battle at this point was for a short time most sanguinary. Officers of all ranks exposed themselves like the meanest soldier. General Gneisenau, the chief of Blucher's staff, had first one horse killed by a cannon-ball, and then another twice wounded by musket-balls. His sabre was once beat out of the scabbard, and once shot to pieces.

Previous to the engagement on this day, Napoleon had taken along with him a farmer, of the name of Lacoste, as a guide, to point out to him the country. This man related, that, when Bonaparte saw the Prussian troops advancing, and supposing them to be the troops of Grouchy, he desired an officer to inform him whose columns these were that advanced towards the right? "Prussian," was the reply. A death-like paleness, for a moment, overspread his countenance; but he did not say a word.

Although the French army was now in one mass of confusion,

confusion, the means of retreat was not yet cut off. They still held the village of Planchenoit in their rear, with a part of the old guard in reserve. The Prussians advanced against them; and the ground for the attack was extremely favourable. It rose like an amphitheatre, so that the Prussian artillery could open from the summit of a great many heights, which rose gradually above each other. The old guard, however, stood firm to the last; but the place was at length stormed. The slaughter was dreadful; for the Prussians were so exasperated, that they neither gave nor fought quarter. From this moment the rout was general and complete; and the road soon became choked with fugitives, equipages, cannon, and wrecks of every description. The commanders, of all ranks, were separated from their corps, and hurried along with the multitude. In vain did Napoleon make an effort to rally his troops, by bringing up some battalions of the young and old guard, which had not yet been engaged; but it was useless. Intimidated by the confusion around them, overpowered by the recoiling friend and advancing foe, they soon yielded to the alarming torrent. Emperor, princes, generals, officers, and soldiers, fled in dismay, and in the utmost alarm and terror. The soldiers of the wagon-train cut the traces of their horses, the artillerymen fled from their guns, the officers of the highest rank were hurried away and lost in the crowd; and not a single battalion existed, behind which another could rally. Cavalry, infantry, and artillery, rushed pell-men upon each other, and became blended in one mass of confusion. The dragoons rode over the foot-soldiers, and trampled them to death. A complete panic had spread itself throughout the field of battle.

6. The cavalry and infantry of the allies pursued them rapidly; and for about five miles the ground was covered with the dead bodies of Frenchmen only. At the farm-house of La Belle Alliance the slaughter was prodigious. The French formed a battery of the garden-wall, by making holes through it. All the trees in the orchard were stripped by the bullets. Every house, and every hole, was found full of dead and dying Frenchmen. The duke of Wellington met marshal Blücher at the small public-house at this place, where they cordially embraced, and congratulated each other upon their glorious and decisive success. The British army having been warmly engaged for upwards of nine hours, and exhausted with fatigue and hunger, was now halted, the Prussian general promising to continue the pursuit during the night. Before halting, the British columns gave the flying enemy three cheers. If any thing had been wanting to raise the spirits of the duke of Wellington's army, or to exalt the glory of Britain, at this important moment, it was found in the conduct of the Prussians. In the pursuit, when they came in contact with the British columns, they made way for them to take the lead; and, when the British halted for the night, the Prussians, as they passed their bivouacks, stopped for a moment and played "God save the king." About half-past nine, Blücher assembled the whole of his superior officers, and gave orders for them to send every man and horse in pursuit. The van of the Prussian army accelerated its march; and the French army, being pursued without intermission, became absolutely disorganized. The Prussians, taking advantage of this dreadful confusion, attacked with their cavalry and heightened the disorder. Nature seemed to conspire for the destruction of the enemy. The weather had cleared up, and the night was beautiful and serene. The moon shone bright through the clear midsummer sky, and directed the march of the Prussians towards their enemies. The situation of the French army was indeed become deplorable. No words can paint their distress. From this moment their situation disarms all repentment, and awakens only pity. Their menacing aspect was gone; and their glory was set in blood. On all sides the roads, the fields, the woods, the streams, were covered with dead and dying Frenchmen. The officers that

escaped stated, that the horrors they experienced in their flight from Moscow were unequal to those which surrounded and accompanied them from Waterloo to the Sambre. The Prussian army, being comparatively fresh, continued to pursue them with the most unwearied perseverance. In vain they attempted to snatch one moment's repose. They were driven from nine bivouacks at the point of the sword. They then attempted to defend themselves in the villages or insulated houses; but they were immediately driven from them, cut down, or made prisoners; and hundreds were consumed in the flames of the barns set on fire in these conflicts. Not only on the high road, but for a hundred feet in breadth on each side of it, paths were made where every thing was beat down and covered with dead and wounded. The road was in many places blocked up by artillery; and the military waggons, endeavouring to escape, were in many places driven sixteen abreast on the causeway.

During this disastrous retreat Napoleon ran great danger of being taken prisoner. When the last battalions of the guard were overthrown, he was hurried away with them, surrounded on all sides by the troops of the allies, into a cider-orchard, near the farm of Caillou. There he was met by two cavaliers of the guard, who conducted him cautiously through the Prussian parties that were scouring the country; but who, fortunately for him, were all employed in plundering.

When the wreck of the French army arrived at Genappe, a part of the troops seemed resolved to halt for the night, and the entrance into the town was barricaded with broken waggons and gun-carriages, and a few guns were planted in the principal streets. Impressed with some idea of security, after these preparations, the houses were filled in a moment with the hungry and fatigued, in search of food and repose. They had not halted above half-an-hour when the advance of the Prussian cavalry was heard. The French for a short time, opened a brisk fire of musketry and artillery; but, the Prussians having brought up some cannon, the place was stormed, and a dreadful slaughter ensued. The French soldiers ceased resistance; and suffered themselves to be cut down like cattle. General Duhesme was cut down at the gate of an inn by a Brunswick hussar, who accompanied the stroke with these words; "The duke fell yesterday; and now thou also shalt bite the dust." The fury of the Brunswickers knew no bounds. Upwards of 800 French were killed in Genappe. From this point the flight, if possible, became more disorderly than ever: arms, knapsacks, every thing, was thrown away. Here Napoleon escaped with great difficulty. The waggons and baggage were so closely wedged together, that it took an hour and a half for him, and about 150 of his staff, to get through them. A German officer afterwards asked Lacoste, the guide we have mentioned, why he did not take Bonaparte by the bridge of Ways, where nobody passed; he replied, "I was not aware of that bridge." Thus, with all the maps of the war dépôt, with all the engineer geographers, who, with their repeating circles, can set off the geographical position of places even to a second, Napoleon, and with a large staff, here depended on the ignorance of a peasant, who did not know that there was a bridge over the Dyle at Ways. People talk a great deal of military skill and military science; while often, in the decisive moment, the whole depends upon the knowledge of a very common man.

So close were his pursuers, that, in escaping from his carriage, Napoleon was obliged to defend himself with his pistols; and scarcely had he quitted his seat, when the vehicle, with six beautiful horses which drew it, fell into the hand of the victors. So great was his haste to escape, that in it he left his hat, his sword, his magnificent embroidered state-mantle, and the perspective glass with which he surveyed the battle; all of which fell into the hands of Blücher himself. His seal-ring, all his jewels and equipage, fell into the hands of the Prussian soldiers.

All

All the orders with which he had been invested, and those which he usually wore, were also taken; amongst which was the Prussian order of the black eagle, with the motto, "Every man his own." His baggage, many fine Arabian horses, his library, were also taken; and, along with these, whole bales of revolutionary proclamations, addressed to the Belgians, ready dated on the 19th, from the palace of Lacken, near Brussels. Mounted on horseback, he left Genappe, and with his followers proceeded in the utmost haste to the frontiers.

From Genappe the Prussians continued to pursue the wrecks of his wretched army. It was continued till the next day was far advanced, the whole march "being but one continued chase, either in the corn-fields or the houses." The whole period was employed by the Prussians only in firing and cutting them down, for no resistance could be attempted. At every footstep, cannon, equipages, arms, and accoutrements, fell into their hands. Before daylight sixty pieces of cannon had been taken by the Prussians. "The causeway," said Blucher, "presented the appearance of an immense shipwreck; it was covered with an innumerable quantity of cannon, caissons, carriages, baggage, arms, and wrecks of every kind." About 40,000 men, partly without arms, and carrying with them only twenty-seven pieces of their numerous artillery, the remains of the whole army, and that in complete disorder, passed through Charleroy on the forenoon of the 19th. About five in the morning Napoleon, with about fifty companions, passed the Sambre at this place. Here he took some refreshment, the first for twenty-four hours. The Prussians advanced with unremitting ardour. The French army fled before them with increasing confusion. When they came to Charleroy, the crowd upon the bridge became so great, that Napoleon placed a company with fixed bayonets upon it, in order to stop the fugitives. The attempt was vain: this guard was overpowered, and then it was impossible to stop the torrent. The Prussians found nine cannon and a hundred caissons, abandoned by the French, in this place. Twenty-seven pieces only passed the bridge, and of these six pieces more were left between Charleroy and Sobre-le-Chateau. At Charleroy, Napoleon left the direction of his remaining troops to Soult; and, getting into a carriage, set out for Paris, taking the road by Rheims and Soissons.

The fugitives, having once effected their passage across the Sambre, thought they might venture to halt, and had established bivouacs in the meadows and orchards on its right bank, when an alarm was given that the Prussians were approaching: without waiting for any orders, without destroying the bridge, or even reconnoitring, they renewed their disorderly flight; the whole started at once, and every one provided for himself, without knowing whither to direct his steps. At a short distance from Charleroy there are two roads, one leading to Avesnes, and the other to Philippeville. No directions having been given to them, the fugitives divided themselves into two parties, the most numerous of which took the road by which they had before advanced, while the other took a direction towards the left, and marched on Philippeville. Numbers of stragglers, without any other design than that of avoiding the pursuit of the Prussians, threw themselves into the surrounding woods. Thus the army, became more and more dispersed, till at length scarcely 20,000 men remained, and a great part of these were without arms.

Meanwhile marshal Grouchy, ignorant of the fate of the rest of the army, still continued in the neighbourhood of Wavre. Early in the morning of the 19th, he was attacked in the position in which we left him, by Thielman; but, after a severe contest, he succeeded in compelling that general to abandon Wavre and the mill of Bielge, and to fall back upon the rest of the Prussian army. At the same time, Grouchy continued to advance; and had arrived in front of Rozierne, ready to march upon Brussels, when a French officer brought him the account of

the loss of the battle of Waterloo. He then found himself in a truly perilous situation; but after much difficulty, and some loss, he succeeded in effecting his escape from Wavre to Namur. Here he was attacked by the Prussians, and, after a severe conflict, compelled to abandon the place, and make the best of his way to Dinant, where he arrived on the 20th, with about 25,000 men, having thus lost in the various actions 10,000 men.

To the mismanagement of this general, still more than to that of Ney, we afterwards find Napoleon imputing the disastrous issue of the campaign; and he alleges that this officer might have pressed the Prussians much more closely on the 17th, and have marched on the next day as soon as they did to the field of battle at Waterloo. Grouchy published an explanation of his conduct; and the facts of the case are briefly these. After the loss of the battle of Ligny, the Prussians passed the night at a short distance from the field; and, beginning their retreat at an early hour, they arrived before the evening at Wavres, a small town situated fully sixteen miles from Ligny. Though they were not pursued by the French, this retrograde march was attended with much confusion; partly from the heavy rains, and partly from the multitude of men, horses, and carriages, that encumbered the roads. The French, however, having gained at Ligny nothing but the field of battle, and Bonaparte being eager to march his main body to the left against the English, Grouchy did not set out in pursuit of the Prussians until noon; by which time they were at the distance of eight or ten miles. Their numbers were so great as to mislead the inhabitants of the country, from whom the French sought information; and Grouchy, possessing little discrimination as to reports, instead of marching straight to Wavres, turned to Gembloux on his right, and was not apprised till six in the evening that he had mistaken the direction of the Prussian main body. At that hour his troops were taking rest and refreshment, and he committed a second fault in postponing their march till the next morning. The following day proved rainy, the roads were wretched, and, by a delay wholly at variance with the habits of the French or the plans of Bonaparte, the troops under Grouchy were not in motion till after nine o'clock; whereas the Prussians, as early as four o'clock, had detached Bulow from Wavres, in the direction of Waterloo. They also experienced inclement weather and miserable roads, being obliged to occupy more than ten hours in conveying their artillery a distance of ten miles. Some time afterward, a farther and more numerous body, led by Blucher, followed on the same road; a measure which, says Bonaparte, would never have been adopted, if Grouchy's army had been in fight and threatened an attack. To complete the disappointment, one of the officers dispatched by Bonaparte on the morning of the 18th, with notice of the approaching battle, did not reach Grouchy; who, learning only at four o'clock the urgency of the emperor for his aid, conceived that his best plan was to follow up the attack already begun on the Prussian force at Wavres, considering it as their main body, and having no idea that the latter had marched to Waterloo. Still, supposing Grouchy to have marched early, and to have reached the vicinity of Waterloo as soon as Blucher, the result would have been only that he might have covered the retreat of the French, who had already lost 20,000 men in the battle; and who would, even after the junction, have been considerably inferior to the allies.

The charges against Grouchy, made by the emperor at the time, are repeated in the "Historical Memoirs," written by himself, and published so lately as the year 1820. And these Memoirs, though composed after so long a period of retirement, contain no acknowledgment of past errors, nor any tribute to the generalship of his adversaries; but repeated assertions that, had not accidental causes prevented, his boldest schemes would have been crowned with success. He censures not only Grouchy, Ney, and

and Vandamme, but Blucher and Wellington; the latter of whom, in his opinion, committed a great imprudence in standing a general engagement at Waterloo. Had the weather been fair during the night, the French, we are told, would have begun the battle, and have decided it before the arrival of the Prussians: but, in the case of dry weather and good roads, the Prussian corps under Bulow would have reached the field of battle by eleven o'clock instead of four, and Blucher a few hours afterwards. Next as to the chance of support from Grouchy, can it be deemed probable that a force of 36,000 men would have been allowed to march across the country, without a corresponding movement on the part of the far greater army opposed to it by the Prussians? A campaign, said Frederic II. is little else than a series of mistakes: but the ex-emperor puts in the scale only those that operated against him, instead of admitting that the efforts of his opponents were enfeebled by similar causes. In fact, the truth comes out, indirectly and reluctantly, in the last page of this very work; where, in contradicting the well-known pamphlet given some years ago to the public under the name of *Manuscrit de Ste. Helène*, Bonaparte adds, "in other times the French would have gained the victory; which, indeed, the obstinate and unyielding bravery of the English troops alone prevented them from obtaining."

The loss of the French army, in the battle of Waterloo, (without including that of Grouchy at Wavre,) in killed, wounded, and prisoners, amounted to, at least, 60,000 men. Such a victory, however, could not be gained without great loss on the part of the allies. The loss of the British, Hanoverians, Belgians, &c. and Prussians, was little short of 30,000 on this important day. The field-of-battle on the next morning presented a most melancholy scene. About 40,000 dead, all of whom had been stripped naked, and perhaps the same number of wounded, whom, as yet, it had been impossible to remove lay crowded into a narrow space. Near 25,000 horses, dead or wounded, lay mixed with their former riders, and increased the horrors of the scene. It was not so much the ghastly wounds which had deprived them of life, which disfigured their mangled remains. But these had been farther trampled by the cavalry, crushed by the artillery, and torn to pieces by the continued showers of bullets, which the latter vomited forth over these positions. The number of dead upon the field-of-battle, said an eye-witness, could not be numbered. According to the most accurate accounts which can be procured, the total number burnt or buried in these fatal fields amounted to 40,000. For many days several thousand carriages, and many peasants from the surrounding countries, even as far as Mons, were employed in burning or burying the dead. The task was not only loathsome but dangerous; and the Prussians were absolutely forced to compel them at the point of the bayonet. To avoid infection from their corrupting remains, the peasants first dug large pits, and then, by means of hooks, dragged the bodies into them. The country, for several miles, presented the appearance of one continued grouse of hillocks, so thickly was its surface covered with large graves, in which hundreds of the bodies of men and horses were thrown together. In one acre of ground a beholder counted forty graves thus filled with dead. The weather having become dry after their burial, the wet mould, which had not been thrown over them to a sufficient depth, cracked from the heat, and, opening, showed in some places their ghastly remains. Notwithstanding the burning and the burying the dead, for several weeks after the battle the smell from their putrid carcases was insufferable, and a pestilential gale continued to be wafted over the surrounding country from this theatre of death. For many days the number of carrion-flies which fed on the dead bodies was dreadful, and most annoying to those who visited the spot. It is said that some soldiers absolutely

lost their reason from the remembrance of this dreadful scene.

The diameter of the principal part of this field of blood was about two miles, wherein every thing was totally destroyed. The dead were absolutely lying in ranks, and horses grouped in heaps with their riders. All the wells, and all the water in the neighbourhood, for many days after the battle, were red with blood, and became putrid from the number of dead bodies found in them. The churches in the surrounding villages were filled with dead and dying. Every village, every hamlet, all the ravines, corn-fields, and forests, were filled with wounded soldiers, who had crawled to these places for shelter, and whom, even when they were seen, it was for several days after found impossible to remove. It was as late as the Thursday following before all the wounded then discovered could be removed. "On the 21st," says one who visited the field-of-battle, "I saw in one grouse of wounded, thirty-six out of seventy-three who had lost an arm or a leg, besides flesh-wounds;" while the roads, even on the 25th, were covered with waggon-loads of wounded, shrieking with pain. On the morning after the battle, numbers of the wounded were seen raising themselves up amongst the heaps of dead, and imploring from the visitors, some a mouthful of water; others, that the beholders might put an end to their miseries. Every road, in every part of the country for thirty miles round, was full of wounded soldiers, wandering about in the extremes of agony and want. After a damp day on the 18th, the night became clear and chill, which had a fatal effect on the wounded. Thousands perished for want of timely medical aid. Many were found in cottages and obscure retreats, their bodies become half putrid from the severity of their wounds, yet still in life. Thousands were cut off in the extremes of hunger and distress. At the end of ten, twelve, and fifteen, days, there were found in bye corners, wounded men who had preserved life by gnawing the flesh from the dead bodies of their comrades, or of horses that chanced to be near them. Others, slightly wounded, were found several days after the battle, on the field, using the French cuirasses as frying-pans to dress their scanty meals. Even in the rear of the allied position, such scenes of distress were numerous. From Waterloo to Brussels, the road, for nine miles, was so choked up with scattered baggage, that the wounded could with difficulty be brought along. The way was lined with unhappy wretches who had crept from the field; and many, unable to proceed, lay down and died. Holes dug by the side of the road formed their graves, while their tattered garments and accoutrements covered the surrounding lands. In Brussels alone, more than 23,000 wounded were assembled, where they were treated with the utmost kindness and attention. The people, in crowds, went out to meet them with refreshments, bandages, &c. The principal families, and women of rank, supported them with every necessary, and frequently administered to their wants with their own hands. The treatment, however, of the French prisoners by the peasantry was different. They were treated with harshness; and these poor creatures now felt the severest want and neglect. By the British only were they treated with humanity.

Besides the loss of men, and all the best horses which Bonaparte had for cavalry, the French army lost above 300 pieces of cannon, 500 caissons, all their baggage, and almost all their arms. Such were the consequences, in part, of Napoleon's escape from Elba; and such the third page of that terrible sheet, on which, according to the *Moniteur*, in March preceding, "the emperor had just written the finest page of history, and to which the annals of the world afford no comparison." The present page indeed, in blood and its results, stands unparalleled in the annals of the world. The sheet of Napoleon's political life to which it belonged was nearly full. The last page

page alone remained. The consequences of Waterloo filled it!

That the French army, and their chief, fought with the greatest bravery, is a fact undeniable and just. The enthusiasm of the former was never more conspicuous than at Waterloo. The plans of their leader, to accomplish the object which he had in view, were skilfully laid; but, considering the abilities of his opponents, and his own peculiar situation, they were hazardous and dangerous. They were, however, all in character of the man, and also of the nation. But his faults, as a general, do not take away from the personal bravery of himself and his troops. All exposed themselves in the most resolute manner; and the prisoners said they never saw the emperor expose himself so much; that he seemed to court death, in order not to outlive a defeat fraught with such fatal consequences. The idle stories about his cowardice on this day deserve no attention. They are the tricks of some vain Frenchmen, who want to make it appear that their countrymen were defeated solely because their leader was unworthy of his troops. It would be doing an act of great injustice to those who conquered him, to give any credence to such stories. At Waterloo he was worthy of his troops. His vanity at the commencement of the battle, and despair at the end, made him expose himself more than he had done in any other action. He afterwards, indeed, forsook the troops, but not till they could face their foes no longer. The duke of Wellington did justice to Napoleon's courage, as well as to his judgment: "He fought the battle," said the duke in a private letter to his mother, "with infinite skill, perseverance, and bravery. Never was I in a harder-fought battle; never was I obliged to exert myself so much, and never was I so near being beaten."

Napoleon proceeded rapidly on his way to Paris, where he arrived about nine o'clock in the evening of the 20th. During his absence, the different parties into which the ministry and chambers were divided had not been idle; but, as long as he was at the head of the armies, they found it impossible to accomplish any thing prejudicial to his interests.

Fouche appeared to be at the head of one of the parties. Another party wished the duke of Orleans to be at the head of the government. A considerable number were attached to the principles of La Fayette, and desired a republican form of government. There were very few royalists in either chamber. The majority of the chambers, however, were only waiting to know the event of the campaign, in order to declare themselves. Napoleon, before he joined the army, had diligently watched the formation and designs of these parties, and had had several conferences with his brother Lucien and some friends, respecting the measures it would be advisable to adopt in case he should meet with any disasters in the field; but nothing was finally determined upon, although Lucien was of opinion, that, if the emperor was unfortunate, he should make use of his constitutional privilege and dissolve the chambers, and thereby deprive his enemies of the power of injuring him.

The inhabitants of Paris had passed two days in painful surmise and trembling expectation; but, in the afternoon of the 20th, it began to be whispered that affairs were not going on well, and that the army had sustained some terrible reverse. Every one hastened towards the Tuileries, anxiously inquiring what was the news. The most alarming reports were circulated, and the whole city was in the utmost confusion. Late in the evening, three carriages, covered with dust, entered the courts of the palace of the Elysée, and the gates were immediately closed behind them. The crowd pressed forward to see who were in them. General Drouet descended from the first, and, advancing to a friend that stood by, took him by the hand and said, "We are all lost!" The third carriage now drew up, in which was Napoleon. He alighted, and, rushing up the stairs, entered the apartments of the palace, without speaking a word, or looking at a single person.

VOL. XVIII. No. 1264.

As he approached the door of the saloon he suddenly stopped, and casting a look of anguish on Drouet, exclaimed, "Dishonoured! disgraced!" He then threw himself on a sofa, and rising again he entered his cabinet. Having taken some refreshment, which was a little soup, he ordered his secretary, M. St. Didier, to write to the duke of Bassano (Maret,) and to the count Regnault de St. Jean d'Angeley, requiring their immediate presence. He again threw himself in his clothes on the sofa; and, ordering one of his pages to wake him as soon as the ministers arrived, fell asleep.

In the interval, an interesting interview took place between M. St. Didier and general Drouet, during which Drouet gave St. Didier the following particulars of the battle of Waterloo: "After the first advantages, at Charleroy, and the brilliant affair of Fleurus, we lost every thing, from two evident causes; to which a third might be added, which was more strongly felt, but not so well proved. The first of these causes is the inflexibility of the emperor, who, at the end of two days of victory, was desirous of astonishing the world, of giving confidence to France, and spreading consternation over Europe, by a third decisive triumph. This was a sublime but frantic project, which must necessarily enthrone the conqueror in the opinion of the world, or, if vanquished, lead him to a scaffold: a project which was seen into by the prudent Wellington, and which he disconcerted by leading on its heroic and extravagant author to the very gulf in which his power, his influence, and almost his very glory, were to expire. In reality, the third battle, which we call the battle of *Mont St. Jean*, from the name of the village which was the principal scene of action, and which the English will call the battle of *Waterloo*, from another village occupied by them; and the Prussians that of *La Belle Alliance*, from the name of a castle which was occupied as the head-quarters of Blucher;—this third action, after balancing the victory by turns, which made it (if I may use the expression) fly backward and forward from the French colours to those of the allies, from noon till eight in the evening, has demonstrated how the negative quality, patience, could disconcert the combinations of a rash and impetuous general. Here then is the second cause of our defeat. The prudent conqueror of Salamanca, of Toulouse, of Vittoria, by a manœuvre worthy his immortal genius (though it was purchased with the loss of some of his choicest troops,) constrained the fiery victor of the Pyramids, of Marengo, of Austerlitz, of Friedland, of Jena, to lower his humble laurels before those whom he had so often vanquished. I shall attribute the third cause of our defeat to intrigue, to corruption, to treason. These, united together, produced mistrust, misunderstanding, fear, and disorder. History will search into these sources, which I can but point out; but to which the allies (whose bravery I am nevertheless very ready to admit), and above all the private enemies and the personal competitor of Bonaparte, undoubtedly owe their success. Let them make haste to secure their triumph, and to make the best use of their victory; for the lion is not dead, but only wounded."

When the ministers arrived, and Napoleon awaked, the night was far advanced. As the secretary placed himself at the table, to take notes of the proceedings, Napoleon remarked his paleness and agitation. "What!" said he, "Drouet has been informing you of the affair. An evil which may be repaired is not a great one; and, even if it were irreparable, we should submit with becoming resignation. Sit down and write."

The bulletin of the battle of *Mont St. Jean* was now drawn up. Napoleon dictated the greater part of it, and then gave it to Regnault to correct. The emperor then paced the room with rapid strides, biting his nails, and taking snuff every moment. The correction of the bulletin was finished. Maret had a cold and reserved air; Regnault was more affected. He stood at the table, unconsciously drawing lines with his pencil on the bulletin

7 A

which

which lay before him. Now and then he raised his eyes, and regarded Napoleon with a look of anxiety, pity, and affection. The emperor continued to pace the room with more rapid steps; at length he suddenly stopped. "Well! this bulletin?" he exclaimed. "Here it is corrected," answered the count. "Let us see," said the emperor.

Regnault began to read it. The emperor frequently interrupted him. "It was gained! It was gained! The victory was mine." When the bulletin was concluded, he added, with a sigh, "It is lost! and with it my glory." He continued; "Let the ministers be convoked forthwith. I wish the chambers to be made acquainted with every thing this very night."

Regnault now took his leave, but Maret remained with the emperor, who, notwithstanding his fatigue, gave audience to Cambaceres, Decrès, Caulincourt, and the two Carnots, who hastened to him as soon as they heard of his arrival, and eagerly proffered their services. Some of the ministers were of opinion that something should immediately be done, and, urged Napoleon to dissolve the chambers, and proclaim himself *dictator*. His brother Lucien insisted upon the measure, as he knew the parties would set themselves to work, the moment they heard of the extent of the disaster, to overturn the throne; but Napoleon would not consent. The danger of the chambers proceeding to extremities against him, and even depriving him of the crown, was hinted. To this he would not listen for a moment. He affirmed that the thing was impossible; and that they could not so soon forget the oath which they had taken to him. At all events, the truth should be fairly told them; he would put their fidelity and patriotism to the test, and he did not doubt that he should afterwards be able to foil any attempt which they might make against him.

In the mean time the chambers met. Anxiety and fear sat on every countenance. The funds sunk five per cent. M. de la Fayette, being made acquainted with what was agitating at the palace, repaired immediately to the chamber of representatives; and, the president having taken the chair, he mounted the tribune. "Gentlemen," said he, "for the first time, during many years, you hear a voice which the old friends of liberty may yet recognize. The country is in danger, and you alone can save it. The sinister reports which have been circulated during the last two days are unhappily confirmed. This is the moment to rally round the national colours; the tri-coloured standard of 1789; the standard of liberty, equality, and public order. It is you alone who can now protect the country from foreign attacks and internal dissensions. It is you alone who can secure the independence and the honour of France. Allow a veteran in the sacred cause of freedom, and a stranger to the spirit of faction, to submit to you some resolutions, which the dangers of the present crisis demand. I am assured that you will feel the necessity of adopting them:

"Art. 1. The chamber declares that the independence of the nation is menaced. 2. The chamber declares its sittings permanent: all attempts to dissolve it shall be considered high-treason. 3. The army of the line and the national-guards who have fought, and still fight, for the liberty, the independence, and the territory of France, have merited well of the country. 4. The minister of the interior is invited to assemble the principal officers of the Parisian national-guard in order to consult on the means of providing it with arms, and of completing this corps of citizens, whose tried patriotism and zeal offer a sure guarantee for the liberty, prosperity, and tranquillity, of the capital, and for the inviolability of the national representatives."

These propositions were adopted without delay. The resolutions were then transmitted to the house of peers, and directed to be circulated through all the departments.

In the house of peers, Carnot, the minister of the interior, appeared with a message from the emperor, informing them, "That upon his arrival the emperor had convoked

a council of ministers; that, after having destroyed the *élite* of the Prussian army at Fleurus, the army had fought a great battle, two days after, within four leagues of Brussels; that the allied army had been beaten throughout the day, and six English standards taken; that the day was *decided*, when, upon the approach of night, some disaffected persons spread an alarm, which the presence of his majesty could not recover; the consequences of which had been disasters which could not be arrested. That the army was assembling under the walls of Avesnes and Philippeville; and, in short, that his majesty had returned to Paris, to confer with his ministers, in order to supply the army with *materiel*, and to consult the chambers about what measures were necessary in the present emergency. At this moment, the message from the house of representatives was received, which was immediately read. Resolutions, similar to those voted in the other house, were immediately agreed to.

Thus terminated the meetings on the first day after the accounts of the battle of Waterloo had reached them. These, however, were only the public acts. In secret there were springs in motion which were to produce still more extraordinary and important deliberations and events.

Meanwhile, the citizens of Paris anxiously awaited the result of the impending struggle; and vast numbers assembled on the walls, on the quays, and on the Boulevards. The whole population of the suburbs was in motion, and a violent commotion was expected. The chambers, however, had taken the necessary precaution of assembling the national-guards, under general Durosnel, who immediately adopted measures for preventing any tumult in the capital.

We shall now return to the proceedings at the palace. Soon after the departure of count Regnault St. Jean d'Angle, Fouché arrived, and professed his deep regret at the events that had occurred, and his unshaken fidelity and affection. He tried to calm the agitation of the emperor; and assured him the evil was not irremediable. He asserted that the parties were tranquil, and meditated no design against his person or authority, and that he might confidently rely on their zealous co-operation in re-organizing the army and defending the country. Napoleon very much doubted these assertions of Fouché. He, however, appointed a meeting of the council at eight o'clock, when the state of the public feeling might be discussed, and the necessary measures adopted. It appears that the object of Fouché, in this business, was to gain time; and, to accomplish this, it was necessary to delude and impose upon his master, by a false report of the state of parties. Napoleon, however, had received a correct report of the proceedings of the different parties during his absence, and of their present intentions and strength, from an agent of the private police which he had himself established.

At eight o'clock the ministers again assembled in council. Napoleon having joined them, the question of the dictatorship was refused. Lucien said, it was the only means of averting from his brother the disgrace which his enemies were preparing, and would also save the country. This, however, was opposed by Fouché and Carnot. Regnault supported it, and Decrès and Davoust were inclined to the same opinion; but the resolutions of the chambers having now reached them, with a summons from the representatives, requiring the attendance of the ministers, the council broke up without coming to any determination.

In the evening, an extraordinary meeting took place at the palace, composed of the ministers holding departments; the ministers of state; the president, and four members, of the chamber of peers; the president, and four vice-presidents, of the representatives; the heads of the civil and military authorities of Paris, and some state-councillors, peers, representatives, and citizens, who were invited by Napoleon.

On the arrival of the emperor, who was attended by his brothers, all the assembly rose. He saluted them respectfully, after which the members re-seated themselves, and a profound silence succeeded. At length Napoleon attempted to speak. He was pale and agitated, and evidently laboured under much distress. At first he spoke in a low and almost unintelligible tone, and his sentences were imperfect and disjointed; but by degrees he became calm, and master of himself. He acknowledged the full extent of the disasters which the army had experienced, and confessed that he had now no resource but in the affection, fidelity, and zeal, of his people. He therefore intreated the advice of the assembly as to the measures which it was necessary to adopt.

Count Regnault then addressed the assembly in a long speech. He proposed the immediate recruiting of the armies. "The only conquest for which we fight (said he) is peace; but, in order that we may not be compelled to beg it on our knees, it is necessary that the number of our soldiers should correspond with their courage. A nation defeated, but which never will be utterly vanquished, should not present the reed of peace, but when leaning upon the massive club of war. I conclude with moving, 'That the chambers make an appeal to French valour, whilst the emperor is treating of peace in the most steady and dignified manner.'"

La Fayette next rose, and spoke as follows: "The last speaker has proposed that pacific overtures should be made to the allies; that, while an appeal is made to French valour, the emperor should treat for peace in the most dignified manner. But with what prospect of success will he, or can he, treat? Have not our enemies pledged themselves to a line of conduct, which, adopted when the issue of the contest was uncertain, and while all France appeared to have rallied round the emperor of their choice, will not be readily abandoned now that victory has crowned their efforts? Mingled sentiments of affection and respect prevent me from being more explicit. There is *but one measure* which can save the country; and, if the ministers of the emperor will not advise him to adopt it, his great soul will reveal it to him."

This speech was received with much disapprobation by those attached to the emperor, but was applauded by many of the opposite party. Napoleon received it with a smile of disdain.

The discussion continued several hours, during which count Lanjuinais and M. Constant supported the sentiments of M. La Fayette. At the close, Carnot, at the suggestion of Napoleon, addressed the assembly: he very earnestly deprecated violent measures; and, to conciliate all parties, he concluded with moving, "that the chambers should be invited to treat with the allied sovereigns, through an embassy of their own choosing; and that the ministers should propose a law for the raising of men and money." The assembly afterwards broke up, although no one appeared satisfied.

It is now necessary to return to the proceedings of the two chambers. After a night spent in suspense and fear, the members assembled early next morning, the 22d. Their deliberations were stormy and important. We can only give here a very brief recapitulation of their most prominent features.

M. Crochon thought measures necessary to procure means for supporting the war; while negotiations for obtaining peace should also be set on foot. He then proposed that the assembly should issue a declaration, stating that the "French nation renounced for ever all desire of conquest, and all offensive and ambitious war. She would never again take up arms but for the defence of her territory, to avenge the outrages committed against her dignity, or for the defence of an ally unjustly attacked." Crochon also proposed to declare, that five commissioners, two from the house of peers, and three from their body, should be sent to the allies to negotiate a peace.

On this proposition the order of the day was called for; when M. Duchesne came forward and said, that he could not see that these propositions could be attended with the desired effect; that they could expect no favourable issue to negotiations, as the allies had expressly declared that they would listen to no overtures while Napoleon was at their head. The president then declared that the assembly would soon receive from the emperor a message which would meet all its wishes.

M. Durbach said, "There is no middle course: we must proceed. We have only one resolution left, which is to engage the emperor, in the name and safety of the state, in the sacred name of a suffering country, *to declare his abdication.*" The motion is seconded! exclaimed several voices, amidst expressions of impatience. "Yes," said general Solignac, "we ought to consider the safety of the empire. I move that a deputation of five members be appointed to proceed to the emperor, which deputation shall express to his majesty the urgency of his decision." It was again stated, that a satisfactory message would soon be received from the emperor.

The sitting, after some difficulty, was suspended for an hour. Almost immediately after this, Davoust entered; and, the president having resumed his seat, the former communicated to them some advices from the army: such as, that 20,000 men must have been assembled at Avesnes, and that 5,000 more had been armed from some waggons which had been found on the road; that, on the 20th, Soult had rallied at Rocroy 2000 troops of the old guard, and some other detachments. That Grouchy, on the 18th, had beat the Prussian army, and had nearly 40,000 men with him. This force, said he, leaves 60,000 men on the line of the north; and he could immediately send 10,000 more, with 200 pieces of cannon. He called upon the chambers to adopt vigorous measures.

While these important deliberations were going on in the chambers, equally important were taking place at the Elysée palace, where Bonaparte was. He had passed a sorrowful night. His friends were in terror and consternation. His ministers consulted only their own safety, their own ambition, and desire of power. After the breaking up of the council on the preceding evening, these ministers remained at the palace, and many of them urged his voluntary abdication. They endeavoured to convince him of the impossibility of resisting the progress of the allied armies; and also of the determination of the allied sovereigns never to treat with him, or to sheath the sword while he continued on the throne. After reminding him of their former fidelity, &c. they stated that they had a sacred duty to their country to discharge, and were compelled no longer to conceal that he formed the only obstacle to the salvation and happiness of France. They describe the glory which would attach to a sacrifice so great and so noble. Notwithstanding a great many arguments of this sort that were adduced, Napoleon would not listen to the proposition. At length, after the whole night had passed in discussion, he promised that, if the negotiations of the chamber failed, he would make the sacrifice required.

He then retired to his cabinet, where he awaited, in the most anxious suspense, the proceedings of the chambers. During the day, some of his ministers and counsellors of state entered the apartment. At length, general Solignac, a member of the chamber of deputies, was announced. "Solignac!" exclaimed the emperor; "he has not spoken to me these five years; what can he want?" The ministers withdrew, and Solignac was immediately admitted. The meeting was of course entirely private; but we are able to quote the words in which the general afterwards stated the substance of the conversation. "I came to anticipate the positive vote of the chamber of representatives; I informed him, that the chamber had determined to exclude him from the throne; but it was wished to show regard for the army in proceedings concerning the person of its chief, whose authority the troops

troops had so long been accustomed to respect. There was also reason to fear that the decree of his forfeiture might be made the pretext of an insurrection; the capital might become the scene of serious troubles, and the country be involved in a civil war. It appeared necessary, therefore, in order to avoid these evils, that the abdication of Napoleon should proceed from himself, and be considered as a voluntary act of devotedness for the country. To obtain this object, I employed the means of persuasion which appeared to me best calculated for success. After an hour and a half's conversation, Napoleon at last yielded to my urgent recommendations. He appeared touched with the frankness and energy with which I spoke, while, at the same time, I preserved the respect which was due to his rank, and still more to his misfortunes. In a word, I left the emperor with the assurance that he would transmit his act of abdication; and I arrived at the chamber of representatives before the forfeiture, which was then under consideration, became the subject of positive decree."

The sitting, that had been suspended for one hour, being again resumed, and the chamber cleared of all strangers, except the officers wearing the uniform of the national-guards, Lanjuinais informed them that he had received from the emperor, by the duke of Otranto, an important document, which he read as follows:

"Frenchmen! In commencing war for maintaining the national independence, I relied on the union of all efforts, of all wills, and the concurrence of all the national authorities. I had reason to hope for success; and I braved all the declarations of the powers against me.

"Circumstances appear to me changed. I offer myself as a sacrifice to the hatred of the enemies of France. May they prove sincere in their declarations, that they really directed them only against my power! My political life is terminated; and I proclaim my son, under the title of Napoleon II. Emperor of the French.

"The present ministers will provisionally form the council of the government. The interest which I take in my son induces me to invite the chambers to form without delay, the regency by a law. Let all unite for the public safety, in order to remain an independent nation.

NAPOLEON."

The chamber of representatives immediately resolved, "1. That the president, with his bureaux, shall repair to Napoleon for the purpose of expressing to him, in the name of the nation, their acknowledgments, and the respect with which it accepts the noble sacrifice which he has made to the independence and the happiness of the French nation. 2. That there shall be named, without delay a commission of five members, of which three shall be chosen from the chamber of representatives, and two from the chamber of peers, for the purpose of exercising provisionally the functions of government; and that the ministers shall continue their respective functions under the authority of this commission."

These resolutions were immediately acted upon. 1. Napoleon (no longer emperor) received the deputation as graciously and as firmly as could be expected, and made a suitable reply. 2. The president having returned to the chamber, the members for the provisional government were then chosen; and the choice fell on Carnot, Fouché, and Grenier. The sitting, which had been declared permanent, was next day resumed at eleven o'clock, and the debate turned wholly upon the acknowledgment of Napoleon II.

One member moved the suspension of that discussion until they could be informed of the result of the negotiations.

General Duvernet insisted that the chambers should proclaim Napoleon II. as the sole means of encouraging the military.

M. Manuel replied, "Gentlemen, opinions are divided on the question which occupies our attention. Some think that it is necessary immediately to proclaim Napoleon II. others believe that political circumstances

require delay, and that the chamber ought not to explain itself till negotiations shall have acquainted us with our true interests. The powers who have already once declared that they will not treat either with Napoleon or with his family, will they consent to see his son reign? Such is the objection made. But, in thus publishing our fears before all Europe, in a discussion which may be regarded itself as a real calamity, have we not shown that they may require such a sacrifice? Is there need of enlarging on this point? I love to believe that in this assembly there is but one object—that of saving the country. But gentlemen, since this discussion has been opened, it is necessary, it is urgent upon us, to recognize Napoleon II. emperor. At the same time, it is fit that France should know the motives which influenced us in the nomination of the executive commission; and that, in composing it of wise and upright men, we intended to form a council of regency. If the foreign powers refuse to acknowledge Napoleon II. there will still be time to come to a determination; and no one will balance between one man and twenty millions of men."

This speech made a lively impression on the chamber, which immediately decided that the discussion was closed; and, according to the proposal of M. Manuel, passed to the order of the day on all the motions presented to them; the order of the day being grounded on this, that by the conditions of the abdication of his father, and by virtue of their constitutions, Napoleon II. was proclaimed emperor. As soon as this resolution was pronounced by the president, all the members rose up, crying, "Long live the emperor!" A deputation was then directed to proceed to the ex-emperor to inform him of this resolution; at the same time it was decreed, that the members of the provisional government should take an oath of obedience to the constitutions of the empire, and of fidelity to Napoleon II. Emperor of the French. This done, the chamber adjourned.

In the chamber of peers similar messages were received and dispatched, and similar measures took place. The house then proceeded to choose the two members for the provisional government, and the choice fell upon Caulincourt and Quinette. These two, with Grenier, Carnot, and Fouché, now formed the government that was to rule over and to save France. Of this conclave, Fouché was president.

The provisional government, being appointed, immediately commenced its functions. A decree was passed authorizing the government to procure, by means of requisitions, supplies for the army, and transports for the troops. Another decree was passed, calling out the remainder of the conscription of 160,000 men for 1815, decreed in 1813.

The next step was to name commissioners to treat for peace with the allies: the persons appointed were—General Sebastiani, the count de la Foret, M. de la Fayette, Benj. Constant, and Mons. d'Argenson. These gentlemen repaired to the head-quarters of the Prussian army, which was in advance of that of the duke of Wellington, and presented a note to marshal Blücher; explaining the object of their mission. The Prussian general refused to grant a suspension of arms; but, after much altercation, he gave them passports, which, having received, the commissioners proceeded immediately to the head-quarters of the allied sovereigns. In addition to the deputies sent to the allied armies to solicit peace, a messenger was dispatched to England; but he was ordered to return; and Mons. Otto, who was sent on a similar journey, was forced to remain at Boulogne for want of passports to proceed across the channel. It was generally supposed that his mission related to negotiations concerning the personal safety of Bonaparte, and to receive passports for him to proceed to America.

In the mean time, Wellington and Blücher were advancing with rapid strides towards Paris; and both armies entered the French territory on the 21st; the Prussians by Beaumont,

Beaumont, and the combined forces under Wellington by Bayay. The former advanced upon the road to St. Quentin, and the latter to Cambrai and Perouse.

The French army, under Soult, retreated on Laon in great confusion. The troops commanded by Grouchy, which had reached Dinant, retired in better order; but they were cut off from the wreck of the main army, and also from the direct road to Paris. Grouchy, therefore, was compelled to take the road to Rethel, whence he proceeded to Rheims; and, by forced marches, he endeavoured to force a junction with Soult, and thus reach the capital before the allies. The duke of Wellington proceeded rapidly into the heart of France; but, as there was no enemy in the field to oppose his progress, the fortresses alone demanded his attention.

The following order of the day was issued to the British army before they entered France. "As the army is going to enter the French territory, the troops of different nations, now under the command of field-marshal the duke of Wellington, are desired to remember, that their respective sovereigns are the allies of his majesty the king of France, and that France must therefore be considered as a friendly country. It is ordered, that nothing be taken either by the officers or soldiers without payment."

The regulations contained in the above order were strictly adhered to, which reflects the highest credit on the British army and their commander. The English soldiers, wherever they were quartered, paid the greatest respect to the inhabitants; and, every thing which was furnished them being punctually paid for, the French looked upon them rather as friends than as enemies. The conduct of the Prussians, on the other hand, was directly the reverse: their footsteps were every where marked with blood and rapine, and the most brutal behaviour towards the unfortunate inhabitants, whom they plundered of every thing they could lay their hands on, and then wantonly set fire to their habitations. These barbarians excited such a dread among the peasantry, that they deserted their villages, and fled into the woods, till at length the country looked like a complete desert.

From Beaumont, the Prussians advanced to Avesnes, which surrendered to them on the 21st. The French at first seemed determined to defend the place to the last extremity, and made considerable resistance; but a magazine having blown up, by which 400 men were destroyed, the rest of the garrison, which consisted chiefly of national guards, and amounting to 439 men, surrendered at discretion. The greatest excesses were committed by the Prussian soldiery, when they entered the town, which instead of being restrained was encouraged by the officers. The following letter will give the reader some idea of the manner in which this war was conducted by the Prussians.—"Sir, The fortrefs of Avesnes fell into our power this morning; and the garrison are prisoners of war. The officers are to be conducted to Wesel, and strictly guarded in the citadel; the soldiers are destined for Cologne, that they may be employed in working on the fortifications. All are to be treated with the necessary severity. BLUCHER."

The duke of Wellington, on his arrival at Malplaquet, the scene of one of Marlborough's victories, issued a proclamation to the French people, in which he referred to the order of the day addressed to his army, as containing an explanation of the principles by which his conduct would be guided. It is as follows: "I announce to the French that I enter their territory at the head of an army, already victorious, not as an enemy, (*except of the usurper, the enemy of the human race, with whom there can be neither peace nor truce,*) but to aid them to shake off the iron yoke by which they are oppressed. I therefore give to my army the subjoined orders, and I desire that every one who violates them may be made known to me.

"The French know, however, that I have a right to require that they conduct themselves in such a manner that I may be able to protect them against those who

would seek to do them evil. They must, then, furnish the requisitions that will be made them by persons authorized to make them, taking receipts in due form and order; and they must remain quietly at their homes, and have no correspondence or communication with the usurper or with his adherents. All those who shall absent themselves from their homes after the entrance of the army into France, and all those who shall be absent in the service of the usurper, shall be considered as enemies and his adherents, and their property shall be appropriated to the subsistence of the army. WELLINGTON."

On the 24th, sir Charles Colville took the town of Cambrai by escalade, the governor retiring into the citadel, which he afterwards surrendered on the 25th, when it was given up to the order of Louis XVIII. St. Quentin was abandoned by the French, and was occupied by Blucher: and, on the evening of the 24th, the castle of Guise surrendered to the Prussian arms. On the 27th, Quesnoy surrendered to the prince Frederic of Orange: the garrison, which amounted to 2800 men, chiefly national guards, obtained liberty to retire to their homes. On the 26th, Peronne was stormed by the British troops; the garrison obtaining leave to retire to their homes. On the 28th, the Prussians, under Blucher, were at Cresly, Senlis, and La Fere Millon; and, on the 29th, their advanced-guards were at St. Denis and Gonaillé. The resistance experienced by the British army at Cambrai and Peronne, detained them one day behind the Prussian army; but forced marches enabled them to overtake it in the neighbourhood of Paris.

In the mean time, Soult was displaced from the chief command of the army, which was conferred on Grouchy. The reason of this remarkable step, according to Soult, was because the provisional government suspected his fidelity. This was very likely the true reason; or they could scarcely at this moment have dismissed a man confessedly superior to his successor, in point of abilities. The rapid advance of the allied armies caused Grouchy to redouble his speed to reach Paris before them. This he effected, after considerable loss, particularly on the 28th, at Villers Cotterets, where he fell in with the left wing of the Prussian army, and afterwards with the division under Bulow, which drove him across the Marne, with the loss of six pieces of cannon and 1500 prisoners. Grouchy fairly acknowledged, that his troops would not fight, and that numbers deserted. In fact, though the French army was daily receiving reinforcements from the towns and depôts in its route, and also from the interior, the desertion from it was so great, that its number was little if any thing at all augmented. With the remainder, however, Grouchy succeeded in throwing himself into Paris, where he joined the wreck of the main army, the whole consisting of about 40 or 50,000 troops of the line, the wretched remains of 150,000 men, which fought at Quatre Bras and Waterloo. To these, however, were to be added the national guards, a new levy called *les tirailleurs de la garde*, and the *fédérés*: according to Bonaparte's portfolio, found at Waterloo, these latter amounted to 14,000 men. All together, these forces were at least 40,000 more. Paris was, therefore, still formidable, and capable of much resistance.

Meanwhile, the duke of Wellington continued his operations with unabating activity. As the armies approached the capital, Fouché, president of the government, wrote the following letter to the British commander, supplicating him to arrest the progress of war. "My Lord, You have just illustrated your name by new victories over the French. It is you especially who can appreciate the French nation. In the council of sovereigns united to fix the destinies of Europe, your influence and your credit cannot be less than your glory. Your law of nations has always been justice, and your conscience has always been the guide of your policy. The French nation wishes to live under a monarch, but it wishes that that monarch should live under the empire of laws. The re-

public made us acquainted with the extreme of liberty; the empire, with the extreme of despotism. Our wish now (and it is immoveable) is to keep at an equal distance from both these extremes. All eyes are now fixed upon England: we do not claim to be more free than she; we do not wish to be less so. The representatives of the nation are incessantly employed on a social compact of which the component powers, separated, but not divided, all contribute, by their reciprocal action, to harmony and unity. From the moment this compact shall be signed by the prince called to reign over us, the sovereign shall receive the sceptre and the crown from the hands of the nation. In the existing state of Europe, one of the greatest calamities is hostility between France and England. No man, my lord, has it more in his power than yourself to replace Europe under a better influence, and in a finer position. Paris, June 27, 1815. FOUCHÉ."

This letter, as may well be supposed, met with no attention whatever; and the allied armies drew nearer and nearer to the city. Their approach had been concealed as long as possible. Reports had been industriously spread of plenipotentiaries, suspension of arms, the defection of Austria from the other coalesced powers, and of the arrival of a considerable part of the grand army in good order. But the reign of subterfuge and deception was at an end. The answer to all the eloquent declarations of the Bonapartists was the arrival of crowds of flying peasantry, seeking refuge within the walls of the capital. The fugitives, however, were fewer in number than on the same occasion last year. The country people had learnt that the invading army was that of the English, and they had heard that the English troops are an exception to the general practice of plunder and devastation; that they never ill-treated the inhabitants; that they paid liberally for what they wanted, and cared for the little children. The excellent reputation they had acquired last year in the south had flown over France to the north: and it was well known that, wherever the English passed, the unarmed inhabitant had nothing to fear.

What a singular picture did that part of the Boulevard present, where the fugitives arrived! The passage of the Porte St. Martin was almost entirely obstructed by the crowd of Parisians, mingled with the peasantry, and their cortège of wearied animals. On one side of the Boulevard the people were struggling for admission to the celebrated new piece of the *Pie Volante*, the Thieving Magpie. On the other, a little black horse dragged along the cart, or ambulant shop, which ever since the departure of Louis XVIII. had been established there for the sale of Carnot's famous pamphlet on Regicide; once sold at six francs, and now offered to the public at the moderate and reduced price of twelve sous. Farther on, a portion of the remains of the imperial guard were marching along, thundering out *Vive l'Empereur!* and one of them striking with his sabre a poor old man, who had the imprudence to articulate, in a feeble voice, *Mes amis, criez Vive le Roi!* Five or six persons on this day fell the victims of this forbidden exclamation, by the hands of those Pretorian bands. The small number of them that survived the battle of Waterloo had returned with rage at their defeat, and despair at the abdication of their chief.

Bonaparte, after several disagreeable altercations with some of his late ministers, now become his masters, withdrew from Paris to Malmaison. His continuance at Paris had begun to excite considerable alarm. These apprehensions had been increased by the daily entrance of corps of regular troops into the capital, with the accustomed cries of *Vive l'Empereur!* and of whose concurrence Bonaparte was assured, whenever he might think it expedient to exert his imperial energies. Rumours of menacing tendency were spread abroad; the means of evil were still in Napoleon's power, and he would not neglect the occasion. The provisional government, who were too highly interested in his movements not to watch them with an attentive eye, invited him, in terms

that could not be misunderstood, to withdraw from Paris.

Between the signature of the abdication and his departure for the coast, a week elapsed; during which, though retired from public functions, and living at Malmaison, he kept an anxious eye on the proceedings of the chambers, who had now commenced negotiations with Blücher and Wellington. Among other projects, Napoleon revolved that of proceeding to England, and declaring that he came to take up his residence among us as a private individual: he next decided on attempting to escape to the United States; for which purpose two frigates were placed at his disposal by the provisional government. The latter, however, dreading an attack on his part for the resumption of power, withdrew most of the officers who were with him, and appointed a general of their own, Becker, to attend his person. Still he lingered at Malmaison; and, on the approach of the Prussian vanguard, the sound of the cannon seemed to revive his military energy: he discovered that the advance of the enemy was unsupported, and pledged himself, if placed for only a few days at the head of the army, to chastise their rashness. But the provisional government was inflexible; and he departed at last for Rochefort, but not till the 29th of June.

He had previously dispatched a farewell letter to the French army under the walls of Paris, dated from Malmaison, the 25th of June, 1815. This letter was addressed to the heroes of the army; and no doubt the lowest drummer fancied he saw his own name on the direction.

Napoleon to the brave Soldiers of the Army before Paris.

Soldiers! While obeying the necessity which removes me from the brave French army, I carry with me the happy certainty that it will justify, by the eminent services which the country expects from it, the praises which our enemies themselves have not been able to refuse it.

Soldiers! I shall follow your steps, though absent. I know all the corps; and not one of them will obtain a single advantage over the enemy but I shall give it credit for the courage it shall have displayed. Both you and I have been calumniated. Men, very unfit to appreciate our labours, have seen, in the marks of attachment which you have given me, a zeal of which I was the sole object. Let your future successes tell them that it was the country, above all things, which you served by obeying me; and that, if I have any share in your affection, I owe it to my ardent love for France, our common mother.

Soldiers! Some efforts more, and the coalition is dissolved. Napoleon will recognize you by the blows which you are going to strike. Save the honour, the independence, of the French. Be to the last the same men that I have known you for these last twenty years, and you will be invincible.

NAPOLEON.

This letter of adieu was distributed to the army. It intimated absence; but the absent might return, of which himself was the proof. That he would return, they believed firmly; and, had his death been announced; they would probably have expected his resurrection. Even the belief of his absence was by no means general; it was imagined that he was lurking in some shape or other in their ranks, and that he would stand up in his own, whenever the great day of general contest should take place.

The first attack made by the allied armies was to the north of Paris; at three in the morning on the 30th of June the first cannon was fired from the heights of Belleville. The Butte of Chaumont on the right, and the heights of Montmartre on the left, presented their formidable artillery, which was at that moment pouring forth its horrible contents; while, at intervals of silence, the note of earliest birds floated along the air, and seemed to reproach mankind for this disturbance of nature. The attack was chiefly confined to mucketry, and slackened very sensibly at six in the morning. Notwithstanding the fortifications on the heights, the city might have been entered on this side, but the slaughter must have been excessive;

cessive; and the duke of Wellington, who knew well the ground around Paris, made himself master of the best positions; and, no longer attempting an entrance on the north, the allied army drew off by the river, towards Neuilly and St. Germain.

Miss Helen-Maria Williams, who was in Paris at this moment, gives a very curious account of the characteristic levity of the inhabitants under such circumstances of alarm.

"The musketry, which had continued in the plain of St. Denis, ceased altogether at about three in the afternoon. I then went on the Boulevards; all the gay shops that enliven that brilliant walk were closely shut up, and what sinister presages might be read in every visage of the crowd! On examining the hostile passions portrayed in every countenance, it seemed as if the assembled multitudes waited only the signal for civil war. We appeared to be treading on a mine ready to receive the spark of explosion. At length, however, the report was generally circulated, that the allies were about to turn the siege into a blockade; that we had nothing to fear from pillage, and that we should only be starved. The arrival, however, of the accustomed provisions the next day, through the midst of the enemy's camp, led the Parisians to apply to Wellington the well-known trait of Henry the Fourth, when he besieged Paris.

"On the 1st of July, the scene on the Boulevards was quite changed since that of yesterday. The Parisians expected that the enemy would have entered on the first attack; and they were tired of the delay. They heard the cannon at intervals during twenty-four hours; yesterday this was a novelty; but to-day they felt as if accustomed to be besieged, and returned to their usual avocations and pleasures. Yesterday the theatres were shut, which was indeed a striking signal of distress in Paris; to-day, though the great theatres were closed, the Thievish Magpie resumed his triumph at the theatre of the Porte St. Martin; and that of La Gaîté prepared for the public amusement the Bombardment of Algiers, a melodrame fitted to fill up the interval of the great melodrama of national events.

"In the evening the Italian Boulevard was crowded, as usual, with the gay tribes, who, seated on double rows of chairs, with an interval for the walkers, pass the latter part of their summer evenings inhaling the dust in good company. This evening the walk, as usual, had its itinerant band of music, its ices in the adjoining cafés, and all its accustomed attractions. These amusements were occasionally varied by the march of troops, the beating to arms, the swift pace of couriers, the sound of cannon at intervals; and sometimes all gayety was suspended (though but for a moment) by the sad spectacle of the wounded victims of those skirmishes, writhing in agony, and covered with blood."

The provisional government also continued labouring in its vocation: it was earnestly occupied in fabricating another new constitution, which was to be offered to the acceptance of whoever should take the sovereign authority; and this was the standing business, or order of the day. It may be amusing, however, to notice some of the proceedings of the chambers, certain members of which now began to lower their tone, and some of the most violent to recall their words. They were aware that the abdication of Napoleon was the return of the Bourbons; and, therefore, they prepared to make their peace with them. Of these, M. Durbach was the foremost. In the sitting of the 1st of July, he begged to correct a typographical error which had crept into his speech of the preceding day, but now printed, and distributed among them. "In that speech," said he, "I am made to have said—I need not retrace to you the picture of the crimes, faults, pretensions, perfidies of that ephemeral reign." (of Louis XVIII.) The word *crimes*, continued he, should be rectified; and has been done by writing in a certain number of copies distributed. "I observed," said he, "the proceedings of the royal govern-

ment: I have recognized its faults, its *errors*, and the abuses which it brought along with it; but I never made use of the expression which appeared in print." M. Dupin also endeavoured to correct an error which had taken place in printing his speech. In the copy of the law proposed to secure the public safety, the paragraph had been omitted "which ordains that the motives of arrest should be communicated to the accused." In truth M. Dupin did not think this a very material point, or necessary at the time; but, as he was not sure but his turn might come soon, he wanted to be prepared to get all justice. The march of Wellington and Blücher did wonders; they corrected many errors both in print and manuscript.

It is now necessary to turn our attention to the proceedings of Louis XVIII. Immediately after the battle of Waterloo, on the invitation of the duke of Wellington, he left Ghent, accompanied by other members of his family, and by Talleyrand, Marmont, Clarke, and other attendants, and advanced into France, in the rear of the British army. It is said, that some of his ministers advised him to remain at Ghent, till he was recalled by the nation; and not to sanction, by his presence, the calamities which the allied armies must necessarily inflict upon his people. "Let it appear," said they, "that the war is carried on between the coalesced sovereigns and the adherents of Bonaparte, and not between the king of France and his subjects. The allies are sufficiently strong to overcome all your enemies; and your presence, while it could add little to their numerical force, would impede their operations, throw suspicion on the sincerity of their professions, and raise against them an unnecessary and murderous opposition. Your unwillingness to appear while the blood of Frenchmen continues to flow, will be attributed to an amiable and honourable feeling, and will make a favourable impression on the minds of your subjects. But, were you to advance in conjunction with the allies, it would show that you are determined to be king again, whether they will have it so or not. You have friends enough among the allies, and secret friends enough at Paris, to take care of your interests there; while you will have the merit of being recalled by the affection and fidelity of your subjects, and not forced upon them by the bayonets of foreigners."

This advice, however, did not please the princes of his family. The conduct of these princes had done no good to the cause of Louis during his former reign, and it was not likely they would be of any great advantage to him at the present moment; but, as they were anxious to return to power, they opposed the advice of the ministers. After deliberating two days upon the policy of entering France with the allies, Louis at length acceded to the wishes of his family, on receiving the duke of Wellington's invitation. He quitted Ghent on the 22d of June, and on the next day arrived at Mons. On the 24th, he set out for Chateau-Cambresis, and from thence proceeded to Cambay, where he was received with every mark of respect. On the 28th, he addressed the following proclamation to the French nation, for the purpose of informing them of his future intentions:

THE KING TO THE FRENCH PEOPLE.

The gates of my kingdom at last open before me; I hasten to bring back my misled subjects, to mitigate the calamities which I had wished to prevent, to place myself a second time between the allied and the French armies, in the hope that the feelings of consideration of which I may be the object, may tend to their preservation. This is the only way in which I have wished to take part in the war. I have not permitted any prince of my family to appear in foreign ranks, and have chained in the courage of those of my servants who had been able to range themselves around me.

Returned to the soil of my country, I take pleasure in speaking confidence to my people. When I first re-appeared among you, I found men's minds agitated and heated by conflicting passions. My views encountered on

every

every side nothing but difficulties and obstacles. My government was liable to commit errors: perhaps it did commit them. There are times when the purest intentions are insufficient to direct, or sometimes they even mislead.

My subjects have learned, by cruel trials, that *the principle of the legitimacy of sovereigns is one of the fundamental bases of social order; the only one upon which, amidst a great nation, a wise and well ordered liberty can be established. This doctrine has just been proclaimed as that of all Europe.*

In these latter times, my subjects of all classes have given me equal proofs of love and fidelity. I wish them to know how sensibly I feel them, and that it is from among all Frenchmen I shall delight to choose those who are to approach my person and my family. I wish to exclude from my presence none but those whose celebrity is matter of grief to France, and of horror to Europe. In the plot which they hatched, I perceive many of my subjects misled, and some guilty.

I promise—I who never promised in vain (all Europe knows it)—to pardon to misled Frenchmen all that has passed since the day when I quitted Lille, amidst so many tears, up to the day when I re-entered Cambray, amidst so many acclamations. But the blood of my people has flowed, in consequence of a treason of which the annals of the world present no example. That treason has summoned foreigners into the heart of France. Every day reveals to me a new disaster. I owe it, then, to the dignity of my crown, to the interest of my people, to the repose of Europe, to except from pardon the instigators and authors of this horrible plot. They shall be designated to the vengeance of the laws by the two chambers, which I propose forthwith to assemble.

Given at Cambray, this 28th of June, in the year of our Lord 1815, and of our reign the twenty-first. LOUIS.

From Cambray the king proceeded towards the capital, and on the 7th of July he arrived at St. Denis, where for the present we shall leave him.

Meanwhile the allied armies continued to invest Paris, which had been strongly fortified on the north side. From the Seine, above the city, along the heights of Belleville, by Montmartre, and to St. Denis, the fortifications were one continued chain. To have forced them would have cost many valuable lives, and probably have occasioned the total ruin of the city. The provisional government neglected no possible means of averting the threatened danger; and repeated overtures were in vain made to Wellington and Blucher to procure an armistice. Davoust, prince of Eckmühl, the commander-in-chief of the army, determined to make another effort, and accordingly he sent a letter to the duke of Wellington; of which the following are the chief passages.

"My Lord, Your hostile movements continue, although, according to their declarations, the motives of the war which the allied sovereigns make upon us no longer exist, since the emperor Napoleon has abdicated. At the moment when blood is again on the point of flowing, I receive from Marshal Suchet, duke of Albufera [whose army was opposed to the Austrian general Frimont], a telegraphic dispatch, of which I transmit you a copy. My lord, I guarantee this armistice on my honour. All the reasons you might have had to continue hostilities are destroyed, because you can have no other instruction from your government than that which the Austrian generals had from theirs. June 30, 1815."

A similar letter was sent to Blucher, to which he replied, "That the French marshal was wrong in supposing all cause of war removed, as the abdication of Napoleon was only in favour of his son; and that he must know the declaration of the allies excluded from the throne not only Napoleon, but all the members of his family. General Frimont's conduct, he said, was no rule to guide theirs; that they would certainly follow up their victory, which God had given them the means and the will to

do." He desired Davoust to beware how he brought ruin upon a great city; and asked him if he wished to bring down on himself the curses of Paris, as he had those of Hamburg. They were resolved to enter Paris; and no armistice could be concluded except in that place. He concluded his answer by saying, "according to the usual forms of established civility, I have the honour to call myself, M. Marshal, your servant, BLUCHER."

The same day Davoust, Pajol, d'Erion, Freminet, Vandamme, and about twelve other generals, commanding the troops in the lines before Paris, addressed a letter to the house of representatives, which we shall subjoin. "Representatives of the People; We are in presence of our enemies; we swear before you and the world to defend, to our last breath, the cause of our independence and the national honour. It is wished to impose the Bourbons upon us, and these princes are rejected by the immense majority of Frenchmen. There are in war, especially when it has been long conducted, successes and reverses. In our successes we have been seen great and generous; in our reverses, if it is wished to humiliate us, we shall know how to die. The Bourbons present no guarantee to the nation. We received them with sentiments of the most generous confidence; we forgot all the calamities they had caused us, in wishing to deprive us of our most sacred rights. What reply did they make to this confidence? they treated us as rebels and vanquished. Representatives, these reflections are terrible, because they are true. Inexorable history will one day relate what the Bourbons did to replace themselves on the throne of France; it will also tell the conduct of the army, of that army essentially national, and posterity will judge which best deserved the esteem of the world." The liveliest applauses succeeded to the reading of the above letter, which was ordered to be printed and sent to the armies.

But Wellington and Blucher continued their operations; and on the very same day had recourse to a movement which proved decisive of the fate of Paris. Marshal Blucher, having taken the village of Aubervilliers, made a movement to the right, and, crossing the Seine at St. Germain, below the capital, threw his whole force upon the south side of the city, where no preparations had been made to receive an enemy. On the morning of the 2d of July he had his right at Pliesse Pique, and his left at Meudon, with his reserve at Versailles. Carnot blames Bonaparte for not fortifying Paris on that side, and says he forewarned him of the danger. The French were thus obliged to abandon the works they had constructed for the defence of the capital, and cross the Seine to meet Blucher. The contest was obstinate; but the Prussians finally surmounted all difficulties, and succeeded in establishing themselves firmly upon the heights of Meudon and in the village of Issy. The French loss, on this day, was estimated at 3000 men. Next morning, by three o'clock, the Prussians were attacked in their positions already mentioned, but the French were repulsed with much loss.

In the mean time the allied army, under Wellington, had advanced to Gonaiffe. The right immediately threw a bridge over the Seine at Argenteuil, crossed that river, and opened the communication with Blucher, while another part of the army advanced upon the city, from the east, by Neuilly. All further resistance, it was now obvious, would prove unavailing. Paris lay at the mercy of the allies. In this state of things, a special commission was directed to proceed to the English and Prussian generals, and treat for the surrender of the city. Commissioners having been appointed by Wellington and Blucher, both parties met at St. Cloud. The conference was carried on in the palace of Bonaparte, and in the chamber in which he held his councils of state. The result was the following Convention, for the surrender of Paris, and a suspension of arms.

"This day, the 3d of July, 1815, the commissioners named

named by the commanders-in-chief of the respective armies, that is to say, the Baron Bignon, holding the portefeuille of foreign affairs; the Count Guilleminot, chief of the general staff of the French army; the Count de Bondy, prefect of the department of the Seine; being furnished with the full powers of his excellency Marshal Davoust, Prince of Eckmühl, commander-in-chief of the French army, on one side; and Major-general Baron Muffling, furnished with the full powers of his highness the field-marshal Prince Blucher, commander-in-chief of the Prussian army; Colonel Harvey, furnished with the full powers of his excellency the Duke of Wellington, commander-in-chief of the English army, on the other side; have agreed to the following articles:

1. There shall be a suspension of arms between the allied armies commanded by the Prince Blucher, and his excellency the Duke of Wellington, and the French army under the walls of Paris.

2. The French army shall put itself in march to-morrow to take up its position behind the Loire. Paris shall be completely evacuated in three days, and the movement behind the Loire shall be effected within eight days.

3. The French army shall take with it all its materiel, field-artillery, military-chest, horses, and property of regiments, without exception.

6. The wives and children of all individuals belonging to the French army shall be at liberty to remain in Paris. The wives shall be allowed to quit Paris for the purpose of rejoining the army, and to carry with them their property, and that of their husbands.

8. To-morrow, the 4th of July, at mid-day, St. Denis, St. Ouen, Clichy, and Neuilly, shall be given up. The day after to-morrow, the 5th, at the same hour, Montmartre shall be given up. The third day, the 6th, all the barriers shall be given up.

9. The duty of the city of Paris shall continue to be done by the national guard, and by the corps of the municipal gens d'armes.

11. Public property, with the exception of that which relates to war, whether it belongs to the government, or depends upon the municipal authority, shall be respected; and the allied powers will not interfere in any manner with its administration and management.

12. Private persons and property shall be equally respected. The inhabitants, and in general all individuals who shall be in the capital, shall continue to enjoy their rights and liberties, *without being disturbed or called to account, either as to the situations which they hold, or may have held, or as to their conduct or political opinions.*

16. The present convention is declared common to all the allied armies, provided it be ratified by the powers on which these armies are dependant.

17. The ratifications shall be exchanged to-morrow, the 4th of July, at six o'clock in the morning, at the bridge of Neuilly.

18. Commissioners shall be named by the respective parties, in order to watch over the execution of the present convention.

Done and signed at St. Cloud, in triplicate, by the commissioners above-named, the day and year before-mentioned.

The Baron BIGNON.

Count GUILLEMINOT.

Count de BONDY.

The Baron de MUFFLING.

F. B. HERVEY, Colonel.

"Approved and ratified the present suspension of arms, at Paris, the third of July, 1815.

DAVOUST, Prince d'Eckmühl."

Notwithstanding the surrender of Paris, and the actual entrance of the Anglo-Prussian armies into the city, the two chambers continued their sittings. The approach of Louis the Eighteenth, whose return to the throne they were sagacious enough to see could not be prevented, appeared to them to require increased diligence, in order to complete in all haste, and before he arrived, the new con-

stitution, expressing the national will, and restraining the hands of absolute power. It was also deemed an act consonant with the majesty of the national representation to issue a solemn declaration, protesting, in anticipation, against any eventual infringement of the French liberties on the part of the allied sovereigns; and against receiving any sovereign, unless he subscribed to some guarantee against exercising arbitrary power. Even the arrival of the king at St. Denis did not disconcert these legislators; they repaired only the earlier in the morning to the hall of assembly; and had very nearly completed this new constitution, (the provisions of which we need not quote, since, like Bonaparte's acte additionel, it was not brought into effect,) when, on the 7th, the chamber received from the provisional government the following message: "M. President, Hitherto we had believed that the intentions of the allied sovereigns were not unanimous upon the choice of the prince who is in France. Our plenipotentiaries gave us the same assurances upon their return. However the ministers and generals of the allied powers declared yesterday, in the conferences they had with the president of the commission, that all the sovereigns had engaged to replace Louis XVIII. upon the throne, and that he is to make, this evening or to-morrow, his entrance into the capital. Foreign troops have just occupied the Tuileries, where the government is sitting. In this state of affairs, we can only breathe wishes for the country; and our deliberations being no longer free, *we think it our duty to separate.*" When the reading of the above message was finished, silence, for a while, ensued, and the members seemed to consult together. Manuel then came forward, and said, that, as they had foreseen that event, he called upon them to remain at their post: "Let us say," said he, "that we are representatives of the people; and that we will not quit the place but at the point of the bayonet." "Bravo! bravo! Yes! yes!" arose from all parts of the assembly. The members then began to disperse, after passing to the order of the day upon the message; the president of the government announcing, at the same time, that the sitting was adjourned till the 8th, at eight in the morning. At eight in the morning they accordingly came, intending to proceed as usual; but, to their utter astonishment, they found, that general Desolles, commander of the national guard, had got up before them, and had, by order of the king, locked the doors and put the keys in his pocket, while his troops kept them from approaching the place. Thus, and by an ordinance of the king previously issued, were the two chambers relieved of their labours. The members repaired to the house of their president M. Lanjuinais, and there drew up a *procès verbal*, or protest.

On the same day, the 8th, Louis entered the capital. Preparations had been made, from the preceding day, to receive his majesty; and great crowds went out to meet him. He was, said the accounts from Paris, welcomed with greater acclamations than on the preceding year. The white cockade was universally hoisted, the white standard displayed, and cries of *Vive le Roi* were now the occupation of the surrounding multitudes. It is needless to repeat more of this mode of reception. The world is sick of French cries of *Vive le Roi, Vive l'Empereur, la Nation, la Liberté*; all equally ready when an occasion presents itself.

The procession moved through the Boulevards to the Tuileries, where the king alighted, and took up his abode in that palace, the scene of so much grief and affliction to his family, and which many had expected he would never again see, and very few that it could take place so soon. In the evening the city was illuminated; and songs, dances, and rejoicings, continued to a late hour. But these things were nothing new in Paris. A change of government seemed indeed to have become necessary, in order to afford them fresh amusement.

As to the members of the *old* government, if a government is to be called old which had subsisted only a fortnight,

night, we have just seen them inform the chambers that they had "thought it their duty to separate" of their own accord. This is not quite correct. "If I may depend upon the assertion of one of the members of the intermediate government, (says Mr. Hobhouse,) what did actually happen was as follows: Lord Castlereagh, on his arrival at head-quarters, imparted to the commission his surprise, indeed his indignation, that Louis was not yet in Paris, and added that he must come in to-morrow, or the next day at furthest. The president of the government replied, that he understood from the allied sovereigns that there was no intention, on their part, to interfere with the inclinations of the French nation, in the election of its monarch; for answer to which remonstrance, his lordship only introduced Mr. Pozzo di Borgo, and the ministers of the other two principal powers, each of whom drew a note from his pocket, stating their respective sovereigns' agreement with the English minister, and their resolution to replace Louis on the throne of France. This was decisive; but the government was still sitting in the Tuileries, when a squadron of cavalry, and two battalions of Westphalian infantry, and several pieces of cannon, marched into the Place du Caroussel, and occupied the inner court of the palace; and an officer, entering the council chamber, told the commissioners that he was ordered to evacuate the apartments, and at the same time presented a paper, which contained a demand of a contribution of a hundred millions, signed by marshal Blücher. The government remonstrated; they contrasted this demand and conduct with the articles of the convention, which secured the public and private property; and which left the service of the interior of the capital to the national guard; (articles 9, 11, 12.) but in vain. The officer did not understand the nicety of the distinction; and the government had no other resource than to resolve upon communicating their forced dissolution to the chambers, and upon retiring each to his own home. As to the contribution, they deposited the paper upon the council-table, where, said the duke of Otranto (Fouche), we will leave it as a legacy for the king. They then dispersed. The government did *not* dissolve itself: it was dissolved by lord Castlereagh."

Of the five members of this provisional government, four retired with the army behind the Loire; but its president Fouche, of whose double dealings we have had ample evidence, and whose folly just mentioned would not have led his colleagues to expect such a thing, preferred staying behind, and assured the king that the government had dissolved itself; a message which was neither authorized by the others, nor true. The event proved the superior prudence of Fouche's conduct: the next day he was admitted to the duke of Wellington's table, and the day after he was made one of the ministry of Louis, the porte-feuille of the police being assigned to him.

Fouche was indeed a perfect diplomatist of the Machiavelian school, always carrying on a double intrigue, and always providing, like Talleyrand, a refuge with either party. Though professedly an enemy of the Bourbons, and a zealous police-minister to Bonaparte, he found means to be received into the cabinet of Louis XVIII. after his second restoration. That he was a man of talent is undoubted. "Few men," says M. Chaboulon, "possess the gift of pleasing and persuading in a higher degree than the duke of Otranto: equally profound and witty, equally endowed with foresight and ability, his mind embraces at once the past, present, and future: he alternately seduces and astonishes by the boldness of his thoughts, the acuteness of his perception, and the solidity of his judgment." Fouche died a few months ago, we believe in January last, (1821.)

Having thus brought our narrative of the momentous events of the last month down to the restoration of Louis we shall briefly advert to the operations of the Austrian, Bavarian, German, and Russian, forces on the Rhine. These had also been important and successful; and at any

other period than after the battle of Waterloo, with the events which we have just related, would have claimed the attention of Europe. Although the whole of the Russian army was not yet arrived and in line, yet the accounts of the battle of Waterloo determined the allies to enter France at this point, and animated them to the utmost exertions. In their advance they had nothing to dread from any force which the enemy could assemble on their right wing, as before the defeat of Bonaparte would have been the case; while, on the other hand, the advance of Blücher and Wellington into France, rendered it necessary that they should advance, in order to draw the attention of any troops which might otherwise assemble on the Moselle and towards Rheims, and prevent these from harassing or endangering the rear of the latter. To this they were solicited by both Blücher and Wellington; who had requested prince Schwartzberg to cause marshal Wrede to advance rapidly. Including all the Russian force, it appears that from the environs of Thionville to Manheim, and from thence to Basle, nearly 470,000 men lined that frontier, ready to pass the Rhine at a moment's notice.

The forces which the French had to oppose these, were, Lecourbe's corps and reserves at Besançon, Rapp's corps complete at Strasbourg, and a corps under Belliard on the Moselle, the strength of which is unknown. The whole was, therefore considerable, amounting to perhaps 80 or 90,000 men, besides strong garrisons in all the fortified towns, such as Huningue, New Brisach, Belfort, Schelestadt, Landau, Strasbourg, Pfalzbourg, Bitsche, Metz, and Thionville, besides numerous free corps and national guards; still, however, these forces were very much inferior to those brought against them.

The immense forces of the allies, collected from the extremities of Europe, passed the Rhine at all points; and, like a mighty wave, swept over the Vosges mountains, inundating the banks of the Marne and the Seine, and defying all resistance. Saarguimines was carried by storm, and with trifling loss. Saarbruck shared the same fate; it was defended by a general Menège, with some cavalry and 400 peasants. The prince-royal of Wirtemberg passed the Queisch, on the morning of the 25th of June, without resistance. The mayors of all the places had orders to cause a general rising of the people, but they refused to resort to a measure which might prove so fatal to them. The fortrefs of Bitsche was summoned, but the governor refused to surrender, being determined to defend the place. Continuing to advance with the utmost rapidity, on the 25th, marshal Wrede received a message from general Belliard, making fresh propositions for an armistice, to which no attention was paid. On the same day he arrived in the neighbourhood of Nancy, when a deputation from the town came to assure the general of their goodwill to the allied troops, and that they were ready to give him the most favourable reception. On the right of Wrede, general Tchernicheff, with 4000 men, communicated between general Lambert, the Bavarians, and marshal Blücher. On the left of the Moselle, between Metz and Lougron, he fell in with a force of 3000 French troops, with some artillery, which he attacked and drove back to Metz; and, pushing on to Chalons, he made himself master of that place after a brilliant affair. One division at first entered the town by consent of the inhabitants, but these were no sooner got in than the enemy closed the gates, and attacked them; whereupon the party dashed forward to the Paris-gate, and succeeded in extricating themselves from the unexpected danger. In the mean time Tchernicheff advanced with the main body of his force, brought forward some cannon, and, battering down the gate, entered at the head of his troops, and dispersed the force assembled in the place, which was treated with great severity. Blockading Toul, and throwing bridges over the Moselle, Wrede continued to advance towards Paris, in the neighbourhood of which he soon afterwards arrived without much further opposition.

The

The prince-royal of Wirtemberg, however, experienced more serious opposition. On the 26th, he forced the French to abandon a position they had taken up between Setz and Sarrbourg, and to retire through the forest of Haguenau. Continuing to press the corps under general Rapp, an obstinate engagement took place on the 29th, in which Rapp was defeated with considerable loss, and pursued under the guns of Strasburgh, into which place he entered, and the blockade of which was quickly begun. Here Rapp was shut up, with a force of at least 35,000 men; and, according to the accounts in the German journals, watched by a force of about 50,000. The French lost many prisoners, and five pieces of cannon. Here, as soon as his corps was relieved by the Austrians, the prince-royal commenced his march upon Luneville and Nancy; and, continuing his advance, came in contact with the army under prince Ferdinand of Austria; their united forces forming a mass of 200,000 men.

It is almost impossible to detail, or to bring into any connected form, the numerous skirmishes which took place between the advance of the allied armies and the retreating *enemy* (as the French defending their country were now called), and the different engagements which took place between them and the garrisons of the fortified towns, in which the allies were generally successful, and in which a very considerable loss of men was sustained on both sides. Crossing the Rhine in vast force, and blockading the fortresses of Pfalzbourg, the main body of the allied army pushed on through the defile of the Vosges mountains, on the great road from Strasburgh to Paris; but for some time advanced with great difficulty. To avoid the fortresses, a road was made in the course of a few hours, and the guns and carriages were dragged by parties of soldiers up rocky steepes that appeared almost inaccessible; after which the army continued its march to Paris, without meeting with any serious obstacle to oppose its movements.

On the morning of the 26th, the archduke Ferdinand, with the force under his command, amounting, according to accounts from Basle, to 160,000 men, passed the Rhine at Basle; pushing on through the defiles of Porentrui, he succeeded in separating the force under Lecourbe from that under Rapp; and, after numerous engagements, in which the French lost a great number of men, Lecourbe was finally obliged to shut himself up in Besfort. Betwixt Ferdinand's army and Lecourbe's the severest fighting took place. On the 28th of June, count Colloredo attacked the French rear-guard, and drove it before him with much loss, and took many prisoners. The Austrian loss was 300 killed and wounded. On the 2d of July, Colloredo took the town and citadel of Montbeillard by assault; seven guns and a great number of prisoners fell into his hands. A French force of 8000 infantry and 300 cavalry were driven through Chavennes at the point of the bayonet. Chevremont and Besencourt were carried by assault; and 4000 men, with a detachment from the garrison of Besfort under Lecourbe, were driven from the heights of Beaumont. All the fortified towns were immediately invested; and the archduke, with the disposable part of the troops remaining from those duties, continued his march upon Langres.

All the armies continued their march towards Paris, and on the 14th, prince Schwarzenberg had his headquarters at Fontainebleau; the allied sovereigns, viz. the emperor of Russia, the king of Prussia, and the emperor of Austria, having, some days previous to that period, left the army, as soon as they heard of the capture of Paris, and the entry of Louis XVIII. into his capital, and proceeded to that place, where they arrived on the 10th. Some idea may be formed of the vast force of the allies, which entered France in this direction, when it is known that the Austrian force disposable on the Upper Loire, exclusive of the armies from Italy, amounted to 100,000 men. The advance of the main armies gave the numerous free corps, assembled in Alsace and the Vosges moun-

tains, opportunities to attack the line of the allied communication, and carry off the baggage. But the continued advance of fresh troops, gave the allies an opportunity of organizing a sufficient force in moveable columns, which soon cleared the country of these corps.

The disposition of a great part of the people was, and had always been, most hostile and rancorous against the allies; and this hatred now showed itself in numerous instances, which brought down destruction on their heads. The villages of Hogentheim and Mulhausen gave the first example of the most shocking excesses. In the former, a German soldier, after having his eyes put out, was hung up alive: the most dreadful punishment followed upon the instant: the aged, the women, and the children, suffered with the wicked perpetrators. At Mulhausen two soldiers were shot by a clergyman: his house was surrounded, and he was destroyed with it. Wherever the allied troops met with resistance from the country people, every thing was destroyed. "For six days," said accounts from that quarter, "the sky has been red every day with the flames of burning villages. Where a single shot is fired from them upon the allies, all is levelled to the ground. A dreadful judgment hangs over France; the crimes of preceding times are visited upon their descendants, who rival them in the commission of enormities."

On the side of Italy, hostilities had commenced between marshal Suchet and the Austrians in that quarter. On the 14th of June, Suchet attacked and carried the town of Montmelian, situated upon the Isere. According to his account, the allies lost 300 killed and wounded, and 600 prisoners. The French immediately penetrated into Savoy, and overran nearly all that country, where as yet there was but an inadequate force to oppose them. Suchet advanced with part of his army to Geneva, upon the lake of that name, and gained possession of the whole valley of the Arve; but his career was soon stopped by the arrival of the Austrian general Frimont, with the Italian army above 60,000 strong. Passing Mount St. Bernard, he descended the Rhone to St. Maurice; and, pushing forward, soon cleared all the south bank of the Lake of Geneva. Bubna followed with a further force over Mount Cenis, and took the direction of Grenoble; while an army of Austrians, Piedmontese, and some English troops, were preparing to enter France by Nice, upon the shores of the Mediterranean. This completely tied up the hands of marshal Brune, stationed in that quarter, and prevented him from sending any assistance to Suchet. It was at this moment that Suchet communicated to the Austrian general the unexpected news of the abdication of Bonaparte, and solicited an armistice, which was granted for twenty-four hours, upon condition that he should evacuate the whole valley of the Arve. On the same day Geneva was occupied, and the French were driven from the heights of Savonien with considerable loss. At the same time, general Bubna advanced from Mount Cenis, and, on the 29th, attacked the tête-du-pont of Arly, near Conflans, which the French held with 3000 men: it was carried by assault, but the Austrians lost 1000 men. Continuing his advance, the positions of Conflans and l'Hopital were forced, and the French driven out of them. At the latter place, the defence was very obstinate; the allies three times took it by assault, and were three times driven back, but finally succeeded. The position of Aguibella was turned; and, without sustaining any loss, the allied army forced the French to abandon it. Suchet now renewed, with greater earnestness, his desire for an armistice, which general Frimont at last granted for three days, upon condition that the French should give up the position of the Boges, the passage of the Rhone at Seissel, and abandon every post on that side, and retire upon Lyons with his army. Severe and humiliating as these conditions were, Suchet was forced to accept them. The armistice was not renewed, and the Austrian forces immediately advanced upon Lyons, which was surrendered to them on the 17th of July. From Lyons they pushed their advanced divisions.

sions up the Saone, and towards the Upper Loire; and Suchet retired with his army towards Montrefson and Raonne, on the left bank of that river.

While these events were going on, the Swifs had joined the allies; and their army, amounting to 31,000 men, occupied a position from Morteau to Pontarlier, with light troops, advanced on their right and left, to St. Hypolite and Salins. Jourdan, who had been sent by the provisional government to assume the command at Besançon and the troops in that quarter, sent, on the 11th of July, an aid-de-camp to the Swifs general, Castella, to inform him of the submission of Besançon to the king's authority, and requesting, in consequence, a suspension of arms between his forces and the Swifs army. This was granted, upon condition that the French troops stationed at Salins should be withdrawn, in order to allow the Swifs troops to move forward. Accordingly, the Swifs army, amounting to 31,000 men, advanced into France; and, extending themselves, occupied the whole department of the Doubs. General Lecourbe concluded an armistice with the Austrian general Colloredo, by virtue of which he also retired to the left bank of the Loire, and Besort as well as Besançon were occupied by the Austrian troops. The grand army, under Schwartzberg, composed of Russian, Austrian, and Bavarian troops, covered all the country along the Marne, the Seine, and the Yonne; and extending themselves to the Loire, stretched from Orleans along that river, to the point where they came in communication with the Austrian army from Italy. Westward, the Prussian army, extended from Orleans to Tours and Nantz, and on both banks of the Lower Loire; while the British, Hanoverian, and other troops, under Wellington, extended themselves towards Brittany, and the coasts of the channel, and also along the Loire, to its junction with the ocean. Besides these forces, strong divisions of troops of all the allied nations were assembled in and around Paris; while numerous corps kept up the communications with Germany, the Netherlands, Italy, and Swisserland; and formidable divisions blockaded, besieged, or garrisoned, all the fortified places, either in the interior of those parts of France, or on the frontiers.

In the mean time several places acknowledged the authority of the king, though they would not admit the troops of the allies. In the south of France, which contained a great number of royalists, severe commotions, accompanied with bloodshed, took place between them and the soldiers. At Marseilles the people rose upon the garrison, and drove them out of the place, even before they had heard of the capture of Paris. Marshal Brune, however, returned with a stronger force, and again recovered possession of the place. He ordered the tri-coloured flag to be covered with crape, as a mark of the sorrow of the army for the events which had taken place. The arrival, however, of a British force under lord Exmouth and sir Hudson Lowe, consisting of 3000 men from the garrison of Genoa, on the 10th of July, freed Marseilles from all further uneasiness. Marshal Brune, with the force under his command retreated to Toulon. This important place he was also forced to give up, after various negotiations with the British officers and the *marquis de la Riviere*. The garrison of Toulon consisted of six regiments of the line, a regiment of marines, a detachment of three hundred cavalry, artillery, veterans, &c. and a battalion of half-pay officers and federalists, called *le bataillon sacré*, most of whom, with marshal Murat and some of his adherents, were suffered to quit Toulon.

Marshal Brune afterwards delivered himself up to the *marquis de la Riviere*, to be sent to Paris. In his way thither, however, on the morning of the 2d of August, as the marshal and his suite were passing through Avignon, the carriage was stopped and surrounded by a party of royalists. They exclaimed that he must suffer the fate of the dukes of Lamballe, whose head they charged him with having carried on the top of a pike. The civil au-

thorities were unable to protect him. He darted from his carriage, and sought refuge in the Palais Royal Hotel. The populace mounted the roof, and penetrated into the house. Having got a view of the marshal, they fired at him. On the second shot the bullet entered the back of his neck, and passed quite through: he fell dead. It was proposed to bury the body immediately; but the royalists interfered, treated it with the greatest indignity, and at length threw it into the Rhone. A fellow named Guindon, alias Roquefort, one of the most violent among the populace on that day, was tried and found guilty of the murder during the present year, (1821.) but whether he has been punished we have not been able to learn.

At Bourdeaux, general Clausel had a considerable force, with which he was enabled to keep the inhabitants in that part of the country in subjection. He determined to maintain himself as long as he could, in order that he might ensure favourable terms for himself and his troops. But, at length, having learned the events at Paris, and knowing the disposition of the inhabitants of the country around him, and those of Bourdeaux in particular, he entered into negotiations with the French and British officers, which ended in the white flag being hoisted on the castle of Bourdeaux, and over all the surrounding country. The troops under Clausel left the place, and many of them broke up and returned to their homes. The rest proceeded to the Loire.

Still the country remained in a state of alarm and agitation. The army refused to submit for a considerable time; and, even when they did so, they did it in a manner that left their intentions very doubtful, and confirmed the fact that they did it with the deepest regret. Most of the fortified places refused to acknowledge the king's authority; till pressed by the allied arms, and driven to the necessity of either surrendering or of being taken by assault, their commanders then, and only then, hoisted the white flag, pretending they acknowledged the king, and making a merit of saying, they did not give up the place to a foreign enemy. This however had, in most instances, no effect with the allies, but particularly with the Prussians: it was not the hoisting of a flag would satisfy them for their toil, their labour, blood, and danger; and accordingly, they continued the sieges of the various frontier-towns, till they forced them to surrender at discretion.

The French army which retired behind the Loire, was under the command of Davoust, and who also at this time held the supreme command of all the military in France which had not acknowledged the king. The strength of this army was stated at about 70,000 men; for, though desertion had made great ravages in it, it had nevertheless been augmented by corps from different quarters. The officers and men composing this force were decidedly averse to the re-establishment of the Bourbons. With arms in their hands, it could not be expected that such men would at once surrender them without a struggle; or till they had received some terms from the king, in order to ensure not only their personal safety, but also, if possible, their existence as a body. Accordingly, they continued, for some time, to disown the king's authority, and refuse to submit to his sway. The advance, however, of the allied armies against them, and the submission of many places and of a large portion of the inhabitants, left them in a dangerous situation; and, accordingly, after some negotiations, with the nature of which the public are yet unacquainted, they agreed to send in their submission to the king, which was accordingly transmitted by Davoust, but in a manner that it was difficult to say what their intentions were; and, at the same time, proved unequivocally with what reluctance they made any concession or advances towards submission. This submission was announced in the following order of the day, issued by Davoust on the 16th of July: "Soldiers, I communicate to you, by an order of the day, the submission which the generals and officers of the army, of which the command is confided to me, have made to the government

government of Louis XVIII. It is for you, soldiers, to complete this submission by your obedience; hoist the white cockade and colours. I demand from you, I know, a great sacrifice: we have all been connected with other colours for these twenty-five years; but the interest of our country commands this sacrifice. I am incapable, soldiers, of giving you an order not founded on these sentiments, or at variance with honour. Last year, under similar circumstances, the government of our country having changed, I defended Hamburg and Harburg to the last moment, in the name of Louis XVIII. listening then, as I do now, only to the interest of our country. All my countrymen have applauded my conduct; a fine army has been preserved to France; not a soldier has quitted his ranks, knowing that he serves his country, whatever be its government, and that an army cannot deliberate. Soldiers! continue the same conduct; defend our *unhappy country* in the name of Louis XVIII. this monarch, and all our countrymen, will thank us for it. We shall make common cause with those brave Vendéans who have justly given us a touching example, declaring that they would unite with us to combat the enemies of France; and you will have, besides, preserved to your country a numerous and brave army. I expect from you the same spirit of discipline of which you have given proofs since your departure from Paris. Prince d'ECKMÜHL."

The army under Suchet soon followed the example of the army of the Loire; and, lastly, that under Clausel. The white flag now appeared on all the sea-ports and principal towns; the people acquiescing in the change. From this time, therefore, we may consider Louis XVIII. as king of France, though tranquillity was not completely restored for some considerable time afterwards. We shall therefore conclude this part of our subject with a conjectural account, from a respectable periodical publication, of the losses that were sustained in those dreadful conflicts, chiefly of three days' duration, by means of which he was re-placed on the throne.

Prussians, total loss, viz. at Ligny, Waterloo, Wavre, and Namur, in killed, wounded, and prisoners	33,000
British and Hanoverians at Quatre Bras and Waterloo	13,700
Belgians and Dutch at Quatre Bras and Waterloo	4,100
	50,800
Computed loss of the French at Quatre Bras and Ligny	15,000
Ditto at Waterloo, on the part opposed to the British	25,000
Ditto on the part opposed to the Prussians and in the pursuit	20,000
Fugitives dispersed throughout the country, who never resumed service	15,000
Remainder who were rallied at Laon and elsewhere, but not in a state to face an enemy	20,000
	95,000
Total	145,800

Though the government of France were anxiously watching the motions of Napoleon, the fickle Parisians seemed to have forgotten him, or to remember him only to deride him. As soon as he was gone, there appeared as many pamphlets against him as had before been published against the king. The public partiality distinguished *L'Histoire des Quinze Semaines*: this little performance was read with such avidity as to run through seven editions in a month. A work equally remarkable was the *Dictionnaire des Girouettes*, or Dictionary of Weathercocks, an alphabetical list of persons in France who had been notorious for their contradictory opinions. What a list; and what versatility in France during the last twenty years! What a disgraceful monument for the French is this dictionary! It is a very remarkable work. You there

find three or four discordant opinions expressed by the same man, before all France, in the course of twenty years. Some of them have changed about in less than a month. It gives the orders of the day of several marshals, on the one hand in favour of Bonaparte in the month of March, on the other in favour of the king in the month of April; pieces in verse by a poet in praise of the Republic, the King of Rome, and the Dukes of Angoulême. Quotations are made from a journalist who loudly declared that he would acknowledge no other ruler than Napoleon the Great, who a fortnight afterwards proved that this Napoleon was a traitor; and a year later staunchly maintained him to be a great man again, and the only legitimate sovereign. Bonaparte himself is introduced into this Dictionary among the weathercocks, for abdicating in 1814, asserting, in March 1815, that he had never abdicated, and for abdicating a second time in June; but the author might have cited many other inconsistencies and contradictions of this too-celebrated man.

He had left Malmaison on the 29th of June, under the protection or surveillance of general Becker, with a numerous retinue, and much property; and, taking the road by Tours, he directed his route to Rochefort. It was evident he travelled quite at his ease; and not only so, but that every facility was afforded him. Every where he was welcomed with acclamations, and treated with the same respect as if he had been still emperor. He reached Rochefort on the 3d of July, in safety; and immediately began to make preparations for his departure, in two frigates, *la Suale* and *la Meduse*. Every thing was embarked, and ready for a start; but, unfortunately, every avenue for escape was closed against him. Already eleven British ships of war lined the coast, in such a manner that no vessel of any description could put to sea without being brought-to by them. This vigilant force was under the command of captain Maitland, of the *Bellerophon*, of 74 guns. Bonaparte remained at the house of the prefect, general Becker, till the 8th, when he went on-board the *Suale*, at ten o'clock in the evening. He, however, durst not venture to put to sea. Next day he landed, and inspected the fortifications of the *Isle d'Aix*, probably with the intention of defending himself there against any immediate attack. On the 10th the winds were favourable; but the short night, and it also being moonlight at the time, left the frigates no hope to escape. He had sent on-board the *Bellerophon* to solicit permission to pass, as he said he was only waiting for his passports from England. This was, however, refused; and he was informed, that the moment the frigates attempted to come out they would be attacked. Bonaparte next proposed to escape in a Danish ship, but this would have been equally impracticable; and an attempt in two *chasse-marees*, of about twenty tons each, which had come from Rochelle on the night of the 12th, and in which he was to embark, and to be carried to the Danish vessel, waiting for him at a distance, seemed to promise no better hopes of success. These plans also were abandoned. From the 11th to the 12th Bonaparte learned from his brother Joseph, the entrance of the king into Paris, and the dissolution of the chambers. To the last moment, it is said, he cherished the idea that they would recall him; but he was disappointed.

Two more days were passed in undetermined projects for escaping by sea. At length, on the 14th, generals Becker and Savary, count Las Cases, and general Lallemand, were sent on-board the *Bellerophon*, to inform Capt. Maitland of his desire of throwing himself on the protection of England. But Maitland, with cautious prudence, made those gentlemen clearly understand, that he could engage for nothing more than simply to convey Bonaparte to England, there to be received as it might seem best by his majesty's government. With this intimation, the ex-emperor was received on-board the *Bellerophon* on the following morning, the 15th of July. The persons who accompanied Bonaparte on-board the *Bellerophon*

rophon consisted of Bertrand, grand marshal of the palace, his lady and three children, Savary duke of Rovigo, general Lallemand, baron Gourgaud, aide-de-camp to Bonaparte, count Moutholon Semonville, his lady and child, Las Cafas, counsellor of state, and his son, several other officers, a surgeon, and a suite of about forty persons.

On mounting the deck of the Bellerophon, Bonaparte said to the captain, "Sir, I come to claim the protection of your prince and of your laws."

Previously to his going on-board, he had addressed the following letter to the prince-regent.

Altesse Royale, En butte aux factions qui divisent mon pays, et à l'animosité des plus grandes puissances de l'Europe, j'ai terminé ma carrière politique; et je viens, comme Themistocle, m'asseoir sur les foyers du peuple Britannique. Je me mets sous la protection de ses lois, que je réclame de V. A. R. comme le plus puissant, le plus constant, et le plus généreux, de mes ennemis.

NAPOLÉON.

"Royal Highness, Exposed to the factions which divide my country, and to the enmity of the greatest powers of Europe, I have terminated my political career; and I come, like Themistocles, to throw myself upon the hospitality of the British people. I put myself under the protection of their laws; which [protection] I demand of your Royal Highness, as the most powerful, the most constant, and the most generous, of my enemies.

Rocheport, July 13."

Bonaparte has always been remarkable for expressing himself in classical language; nor does the present letter yield to any of his former compositions in that characteristic attribute. When embarked on-board the Bellerophon, by his constant affability he made a very favourable impression on all who approached him; and this was, as it ought to be, more than repaid by the condescensions which he received in return. Marshal Bertrand waited upon the first lieutenant and captain of marines with Napoleon's compliments, requesting their company at dinner. At dinner he took his seat in the middle of the table, with the captain on the right hand. The whole dinner was dressed in the French style, and served in silver. Nothing was carved at table, the servants removing each dish for the purpose. Some English midshipmen, of the Bellerophon, were permitted, at Bonaparte's request, to perform a play before him.

True to his old system of enquiring into and understanding every thing, Bonaparte had scarcely been five minutes on-board, before he sent his compliments, and requested that the officers of the ship might be introduced to him. This was done by captain Maitland. He bowed severally to each, and, smiling, enquired how each of them ranked. When they were about to leave the cabin, he said to them in French, "Gentlemen, you have the honour of belonging to the bravest and most fortunate nation in the world." Having arranged his dress, he shortly afterwards came upon deck. He asked several questions of the officers, took particular notice of the sights on the guns; and begged the boatswain might be sent to him, of whom he made many enquiries respecting the ship, and his length of service.

At two in the afternoon, the Bellerophon (accompanied by the Myrmidon corvette, which had part of his suite on-board) weighed, and made sail for England. Calms and contrary winds made the voyage long and tedious. They reached Torbay only on the 24th. Captain Maitland immediately made a signal for general orders, the telegraphic answer to which was; "to prohibit all communication with the shore, and to stand out three leagues to sea, and await the orders of the admiral."

As soon as the arrival of the Bellerophon at Torbay was publicly announced, it became the centre of attraction; and every one manifested an anxiety to behold the first general of the age, and the most extraordinary man of modern times. In consequence numerous parties re-

paired in boats, but were not permitted to come alongside: notwithstanding this, their number so increased, that it was calculated not less than a thousand put off daily.

During the time necessarily occupied by official discussion, as to the disposal of Bonaparte, and due preparation, Bonaparte continued to reside on-board the Bellerophon, around which a proper guard was very prudently established. The number and eagerness of spectators remained unabated during the whole of this period; and, as every one saw with his own eyes, and formed his own conclusions, the accounts thus furnished are interesting, though sometimes various. From these we shall select the following:

"Persons from London, and from other parts, are flocking down to Plymouth, though they know that Bonaparte is not expected to land, and that they cannot go on-board the Bellerophon; but they can row in boats round the vessel, and can occasionally catch a glimpse of him. He is the greater part of the day in the stern-gallery, either walking backwards and forwards, with his hands behind him, as he is represented in some of the pictures in the print-shops, or surveying the shipping and the shore through a glass. In general he keeps alone, Bertrand and Lallemand remaining at some distance behind him. Occasionally he beckons to one of them to point out something to him, or to make some observation; he then walks on alone. Captain Maitland is more frequently with him than any of his suite; and he pays him great attention. He is in good health. He passes but a short time at his meals, and drinks but little wine. Coffee is frequently served up to him on the deck. When he first came near the land about Torbay, he is reported to have exclaimed, *Enfin, voilà ce beau pays!* "At length, here is this fine country!" adding, that he had never seen it, except from Calais and Boulogne.

"On Tuesday, August 1, he was seen the greatest part of the morning at the windows of the cabin, generally in conversation with Bertrand, and occasionally looking at the gazing groups crowded in the vessels below, of all ages and all occupations, and sometimes appeared reading a newspaper; but he had none of the usual French gesticulation, and his countenance seldom altered. He is now very corpulent; and, annexing that idea with the print of him, full length, as taken standing with his arms across on the parade, or the older print of him, as musing in the gardens of Malmaison, will give the best idea of his person. He was dressed in a very plain green coat, with a red collar, also perfectly plain, coming close round his neck, the coat buttoned close on the breast, and cut back in the usual French fashion, showing a white waistcoat and pantaloons; a silver star on the left breast, two large gold epaulets, a low cocked hat, perfectly plain, and high boots. His complexion is a clear uniform brown, no mustachios or whiskers, only his jet-black hair appearing before the ear and a little behind. His eye is black, rather small; a steady fixed look. The most remarkable feature is the chin, which is very prominent; lips small, forming altogether a handsome and pleasing countenance; he is rather bald on the top of the head. Soon after five o'clock he appeared walking steadily the length of the quarter-deck, on the starboard side, with Lallemand. Bonaparte kept next the side of the ship, with his hat on, rather attending to his companion's conversation than taking much part in it himself. He frequently used his handkerchief, and otherwise had generally his right hand in the pocket of his pantaloons, and his left just throwing back his coat; sometimes his hands crossed behind. He paused, more or less, at the end of each turn, occasionally noticing some others of his suite, who all seemed to keep at a certain distance, with their hats off. Captain Maitland was standing at the gangway with some of his officers, and a French officer dressed in blue, covered with silver lace and embroidery, said to be Savary. There were two or three ladies (Mad. Bertrand and others) much dressed,

in

in the French fashion. All seemed to treat Bonaparte as the emperor; who appeared as one in thought, walking a very steady pace, quite upright, now and then stooping a little to look through the port-holes at the vessels alongside. His person altogether gives one the idea of a strong man. At six o'clock the bell rang, dinner was announced, and he went below, followed by his attendants. Our jolly tars, with their usual good humour, put out a board, chalked 'He's gone to dine.' He remained, however, not much above half-an-hour, when another board announced his re-appearance on the deck; where he resumed his walk in the same spot, occasionally with a child, and conversing with Bertrand or the ladies; he continued walking till dusk, when the view of this extraordinary man was closed to our countrymen, for the ship sailed at five next morning for Plymouth."

The conduct to be observed with respect to a prisoner such as Bonaparte, was an important subject of consideration for the British cabinet. His rank and character were equivocal, for he had been left by the treaty of Paris an emperor in title, and the sovereign of Elba in fact; so that he might (as he did) lay a plausible claim to the rights of an independent prince, conquered in a lawful war. It was, however, determined in the councils of the confederate sovereigns, that the island of St. Helena should be his place of exile, where he was to reside under their joint inspection.

The following are the instructions given by the British government to the admiral with whom Bonaparte was to sail.

"When GENERAL BONAPARTE leaves the Bellerophon to go on-board the Northumberland, it will be the properest moment for Admiral Cockburn to have the effects examined which General Bonaparte may have brought with him.

"The admiral will allow all the baggage, wine, and provisions, which the general may have brought with him, to be taken on-board the Northumberland. Among the baggage, his table-service is to be understood as included, unless it be so considerable as to seem rather an article to be converted into ready money than for real use.

"His money, his diamonds, and his valuable effects (consequently bills of exchange also), of whatever kind they may be, must be delivered up. The admiral will declare to the general, that the British government by no means intends to confiscate his property, but merely to take upon itself the administration of his effects, to hinder him from using them as means to promote his flight. The interest on the principal (according as his property is more or less considerable) shall be applied to his support; and, in this respect, the principal arrangements be left to him. For this reason he can from time to time signify his wishes to the admiral till the arrival of the new Governor of St. Helena, and afterwards to the latter; and, if no objection is to be made to his proposal, the admiral or the governor can give the necessary orders, and the disbursement will be paid by bills on his majesty's treasury.

"In case of death, he can dispose of his property by a last will, and be assured that the contents of his testament shall be faithfully executed.

"As an attempt might be made to cause a part of his property to pass for the property of the persons of his suite, it must be signified that the property of his attendants is subject to the same regulations.

"The disposal of the troops intended to guard him must be left to the governor. The latter, however, has received a notice, in the case which will be hereafter mentioned, to act according to the desire of the admiral.

"The general must be constantly attended by an officer appointed either by the admiral or the governor. If the general is allowed to go out of the bounds where the sentinels are placed, one orderly man at least must accompany the officer.

"When ships arrive, and as long as they remain in

fight, the general must be confined to the limits where the sentinels are placed. During this time, all communication with the inhabitants is forbidden. His companions in St. Helena are subject during this time to the same rules, and must remain with him. At other times it is left to the judgment of the admiral or governor to make the necessary regulations concerning them.

"It must be signified to the general, that if he makes any attempt to fly he will be put under close confinement; and it must be notified to his attendants, that, if it should be found that they are plotting to prepare the general's flight, they shall be separated from him, and likewise put under close confinement.

"All letters addressed to the general or to persons in his suite must be delivered to the admiral or governor, who will read them before he suffers them to be delivered to those to whom they are addressed. Letters written by the general or his suite are subject to the same rule. No letter that does not come to St. Helena through the secretary-of-state must be communicated to the general or his attendants, if it is written by a person not living in the island. All their letters, addressed to persons not living in the island, must go under the cover of the secretary-of-state.

"It will be clearly expressed to the general, that the governor and admiral have precise orders to inform his majesty's government of all the wishes and representations which he may desire to address to it; in this respect they need not use any precaution. But the paper on which such request or representation is written, must be communicated to them open, that they may both read it, and, when they send it, accompany it with such observations as they may judge necessary.

"Till the arrival of the new governor, the admiral must be considered as entirely responsible for the person of General Bonaparte; and his majesty has no doubt of the inclination of the present governor to concur with the admiral for this purpose. The admiral has full power to retain the general on-board his ship, or to convey him on-board again, when, in his opinion, the secure detention of his person cannot be otherwise effected.

"When the admiral arrives at St. Helena, the governor will, upon his representation, adopt measures for sending immediately to England, the Cape of Good Hope, or the East-Indies, such officers or persons in the military corps of St. Helena, as the admiral, either because they are foreigners, or on account of their character or their dispositions, shall think it advisable to dismiss from the military service in St. Helena. If there are strangers in the island whose residence in the country shall seem to be with a view of becoming instrumental in the flight of General Bonaparte, he must take measures to remove them.

"The whole coast of the island, and all ships and boats that visit it, are placed under the *surveillance* of the admiral. He fixes the places which the boats may visit; and the governor will send a sufficient guard to the points where the admiral shall consider this precaution to be necessary. The admiral will adopt the most vigorous measures to watch over the arrival and departure of every ship, and to prevent all communication with the coast, except such as he shall allow. Orders will be issued to prevent, after a certain necessary interval, any foreign or mercantile vessel from going in future to St. Helena.

"If the general should be seized with a serious illness, the admiral and the governor will each name a physician who enjoys their confidence, in order to attend the general in common with his own physician; they will give them strict orders to give in every day a report on the state of his health. In case of his death, the admiral will give orders to convey his body to England. Given at the War-office, July 30, 1815."

In the ensuing session of the British parliament, it was thought proper to introduce two bills; one, "for the more effectually detaining in custody Napoleon Bonaparte;" the other, "for regulating the intercourse of

neutral ships with the island of St. Helena during the time Napoleon Bonaparte shall be detained there, &c." 56 Geo. III. c. 22, 23.

The papers of Sunday, July 30, announced the determination of sending Bonaparte to St. Helena; and, as he regularly inquired for them, that part did not long escape his notice. Indeed, it was now publicly spoken of by every person. In the evening, he had the marks of much agitation in his countenance; but some of his suite were more seriously affected. About nine o'clock, as marshal and madame Bertrand were walking on the deck in earnest conversation, suddenly madame rushed into the emperor's cabin, threw herself at his feet for about half a minute, then, flying below to her own cabin, threw herself nearly out of the stern window, when she was fortunately caught by general Montholon. She continued delirious the whole night.

On the following morning, lord Keith and general sir H. Bunbury waited upon Bonaparte, informing him it was the determination of the allied sovereigns to send him to the above place, and granting permission to take with him part of his suite. It was said that he assured the admiral and the general, it was his fixed resolution never to quit the shore alive.

Notwithstanding the news had greatly affected him, he continued to show himself for about twenty minutes every evening, to the really-astonishing number of people, which daily increased. It was with great difficulty the men-of-war's boats could prevent the crowd approaching too near the ship. The last evening that he made any conspicuous appearance on the gang-way was on Tuesday the 1st of August, when he showed himself only for a short time on each side. On Wednesday he did not show himself at all. On Thursday he came on deck again, and twice looked out at the starboard gangway, and that was only momentary. On Friday the Bellerophon got under weigh about one o'clock; and, not having had a satisfactory view of him, "I went in a boat with a few other gentlemen, and followed the ship till she was some distance outside of the breakwater. All this time he did not show himself; and, as the ship was working out, I take it for granted he was not on the quarter-deck. However, as there was but one guard-boat rowing a-stern, the others being employed in towing the ship, there being but a light air, we frequently ran up pretty near to her; and, in consequence of two ladies, who had embarked on-board a shore-boat under the idea that having no gentlemen with them they would be suffered to approach nearer the vessel, and who seemed most anxious to see the renowned prisoner she had on-board, they frequently standing on the thwarts of the boat, and waving their handkerchiefs, he at last made his appearance at the stern-window of his cabin, evidently for the purpose of satisfying their curiosity. He held his head out of the window, and inclined it downwards, as if he was resting on his elbows, without his hat being on, which gave us a complete view of his face and head, which is very bald on the top, but, the hair on the side being suffered to grow long, we could perceive it was combed across. He staid about a minute, and then retired. We followed him till we got within a short distance of Penlee Point; but he did not show himself again. Indeed I did not expect it; for, in a short time after he looked out at the window, he drew the curtains of the cabin-windows; when I remarked that it was decidedly done to let us know that the lion was no more to be seen."

It is asserted, and we believe with truth, that Bonaparte possesses the art of pleasing in a high degree, and is a perfect master in flattery, the kinds of which he adapts with the greatest skill to the persons whom he addresses; his manner is consequently fascinating; and he is said, by his attentions in a single week, to have gained the goodwill of the whole ship's company on-board which he had embarked. The government therefore determined that another vessel should convey him to the place of his desti-

nation; and accordingly the Northumberland received orders to prepare for that service. Every possible precaution was deemed necessary to prevent the recurrence of those contrivances which have so frequently been exhibited. The vessels employed were therefore intrusted to fail off the Start, and to transfer the person of Bonaparte from one ship to the other at a distance from the shore.

On the 6th, sir Henry Bunbury, accompanied by the Hon. Mr. Bathurst, charged with the communication of the result of the government to Bonaparte, were conveyed on-board the Bellerophon by lord Keith's yacht. Sir Henry was introduced to the ex-emperor; and, after mutual salutation, he read to him the resolution of the cabinet, by which he was informed of his intended transportation, *in a different ship*, to the island of St. Helena, with four of his friends, to be chosen by himself, and twelve domestics. He received this intimation without any mark of surprise, as he said he had been apprised of the determination, but he protested against it in the most emphatic manner; and in a speech of three quarters of an hour, delivered with great coolness, self-possession, and ability, reasoned against the proceeding. He recapitulated the circumstances under which he had been forced, he said, by the breach of the treaty made with him by the sovereigns of Europe, to quit the island of Elba; that he had exerted himself to prevent the renewal of hostilities; but that, when they became unavoidable, and that the fortune of war decided against him, he yielded to the voice of his enemies, as they had declared in the face of the world that it was against *him only* that they had taken up arms; he abdicated the imperial crown of France, in the full confidence that the allies would be faithful to their solemn declaration, and leave his country to the settlement of its own affairs; then, unarmed, and with a view of seeking an asylum as a private individual in England, he had first sought to be received under the king's allegiance, and under the protection of our laws, and had finally voluntarily put himself into the British power. In this predicament he felt himself entitled to protest against the measure now announced to him; and in a long argument, in which he showed himself to be well versed in our laws, he reasoned against the act. Sir Henry Bunbury and Mr. Bathurst say, that his manner was temperate, his language eloquent, and that he conducted himself throughout in the most prepossessing way. Sir Henry could only answer, that he had no commission but to make known to him the resolution of his majesty's ministers; but said that he should faithfully report the reasons that he had stated against the proceeding.

The Bellerophon and Tonnant put to sea from Plymouth Sound, on Friday, the 4th of August; and here we must explain the statement, that they failed to avoid the service of a writ of *habeas corpus*. The facts of the case are, that the concourse of boats in Plymouth Sound, and the loss of some lives which had already taken place, induced the government to remove the Bellerophon to a greater distance; and the writ which is spoken of was a subpoena from the court of king's-bench, obtained by Mr. Mackenrot, who had a cause pending in that court, in which he wanted the evidence of Napoleon and Jerome Bonaparte, and admiral Villamez. Now a writ of *habeas corpus*, it is well known, is, in England, a very imperative and important document; and though, no doubt, in the present circumstances, some means would have been found to render it ineffective, yet it was thought best to avoid it by a side-wind. The ships were ordered away; and the officer arrived with his subpoena at the house of Sir John Duckworth a few minutes after the Bellerophon had sailed.

The Northumberland failed from Portsmouth on the same day; and, on nearing Torbay on Sunday the 6th, perceived two line-of-battle ships approaching her, which proved to be the Bellerophon with Bonaparte on-board, and the Tonnant with lord Keith. In a few hours the Northumberland hailed them, and asked after Bonaparte, who,

who, she was informed, had not come out of his cabin for some days. The ships came to an anchor off Torbay.

General Bertrand went first on-board the *Tonnant*, where he dined with lord Keith and sir George Cockburn. He is a man of about fifty years of age, and extremely well behaved. At dinner, sir George gave him a general explanation of his instructions with respect to Bonaparte; one of which was, that his baggage must be inspected before it was received on-board the *Northumberland*. Bertrand expressed his opinion strongly against the measure of sending the emperor (as he and all his suite constantly styled him) to St. Helena, when his wish and expectation were to live quietly in England, under the protection of the English laws. Lord Keith and sir George Cockburn did not enter into any discussion upon the subject.

After dinner, lord Keith and sir George Cockburn, accompanied by Bertrand, went in the admiral's yacht toward the *Bellerophon*. Previously to their arrival, Bonaparte's arms and pistols had been taken away from him; not without considerable altercation and objections on the part of the French officers. Those who were not to accompany him, were ordered on-board the *Eurotas* frigate. They expressed great reluctance at the separation, particularly the Polish officers. Bonaparte took leave of them individually. A colonel Pistowski, a Pole, was peculiarly desirous of accompanying him. He had received seventeen wounds in the service of Bonaparte; and said he would serve in any capacity, however menial, if he could be allowed to go with him to St. Helena. The orders for sending off the Polish officers were peremptory, and he was removed to the *Eurotas*. He was, however, afterwards permitted to go to St. Helena.

When lord Keith and sir George Cockburn went on-board the *Bellerophon* on Sunday afternoon, Bonaparte was upon deck to receive them, dressed in a green coat with red facings, two epaulets, white waistcoat and breeches, silk stockings, the star of the legion of honour, and a chapeau bras with the three-coloured cockade. After the usual salutations, lord Keith, addressing himself to Bonaparte, acquainted him with his intended transfer from the *Bellerophon* to the *Northumberland*, and conveyance in that ship to St. Helena. He appeared very uneasy at the communication; and, after a long expostulation, sternly refused to go; but, on lord Keith's observing that such was the order of his government, and that he hoped he should not be under the necessity of resorting to coercive measures, Bonaparte replied, "Oh! no, no! You command! I must obey! You may take me: but recollect, I do not go with my own free will." He then formally protested in writing against the act before witnesses. He asked numerous questions of lord Keith, which his lordship very properly declined answering.

Sir George Cockburn said, "At what hour to-morrow morning shall I come, General, and receive you on-board the *Northumberland*?"

Bonaparte, with some surprise at being styled General, replied, "At ten o'clock."

Marshal Bertrand, madame Bertrand, Savary, Lallemand, count and countess Montholon, were standing near Bonaparte. Sir George Cockburn asked if they wanted any thing more before they put to sea. Bertrand replied, fifty packs of cards, a backgammon and a domino table; and madame Bertrand desired to have some necessary furniture, which it was said should be furnished forthwith. One of Bonaparte's officers, the nephew of his first wife, complained that faith had not been kept with the emperor, who expected to reside with his suite in Great Britain. Bonaparte asked lord Keith's advice. His lordship merely replied, that he had to obey the orders he had received from his government. Bonaparte then desired another interview with his lordship. Lord Keith declined it, alleging that it could only be unsatisfactory; he had no discretion—his fate could not be altered.

An officer who stood near him said, "You would have been taken if you had remained at Rochefort another hour,

and sent off to Paris." Bonaparte turned his eye upon the speaker, but did not say a word.

Bertrand asked, what we should have done, had we taken them at sea? "As we are doing now," was the reply.

Bonaparte then addressed himself to sir George Cockburn, and asked several questions about St. Helena: "Is there any hunting or shooting there? Where am I to reside?" He soon abruptly changed the subject, and burst into more invectives against the government, to which no answer was returned. He then expressed some indignation at being styled General; saying, "You have sent ambassadors to me as a sovereign potentate; you have acknowledged me as first consul." He took a great deal of snuff whilst speaking.—After reminding him that the *Northumberland's* barge would come for him at ten on Monday morning, lord Keith and sir George Cockburn retired.

Early on Monday morning, sir George Cockburn went on-board the *Bellerophon*, to superintend the inspection of Bonaparte's baggage. It consisted of two services of plate, several articles in gold, a superb toilet of plate, books, beds, &c. They found but 4000 gold Napoleons, and these were sealed up and detained. They were all sent on-board the *Northumberland* about eleven o'clock.

Bonaparte had brought with him from France about forty servants, amongst whom were a groom, postillion, and lamplighter. Two-thirds of these were sent on-board the *Eurotas*. As soon as his baggage had been removed from one ship to the other, the parting scene commenced, which was truly affecting. Previous to the moment of separation, Bonaparte gave some of his officers who were to be left behind a certificate to the following effect, which had been first drawn up, at the general request, by general Gourgaud, and then altered by Bonaparte himself. "Circumstances prevent my retaining you any longer near me. You have served me with zeal. I have always been satisfied with you. Your conduct on this last occasion deserves my praise, and confirms me in what I had reason to expect from you. On-board the *Northumberland*, 7th August, 1815. NAPOLEON."

At half past eleven, lord Keith, in the barge of the *Tonnant*, went on-board the *Bellerophon* to receive Bonaparte and those who were to accompany him. Bonaparte, before their arrival and afterwards, addressed himself to captain Maitland and the officers of the *Bellerophon*. After descending the ladder into the barge, he pulled off his hat to them again. Lord Keith received in the barge the following personages: BONAPARTE; General Bertrand and Madame Bertrand, with their children; Count and Countess Montholon and child; Count Las Cases; General Gourgaud; nine men and three women servants. Bonaparte's surgeon refused to accompany him; upon which the surgeon of the *Bellerophon*, Mr. O'Meara, offered to supply his place. Bonaparte was this day dressed in a cocked hat, much worn; with a tricoloured cockade: his coat was buttoned close round him; a plain green one, with a red collar; he had three orders, two crosses, and a large silver star, with the inscription *Honneur et Patrie*; white breeches, silk stockings, and gold buckles.

The barge slowly approached the vessel which was prepared to receive Napoleon on-board; and lord Keith, as it may be presumed, from a noble delicacy to his situation and feelings, declined receiving the usual compliments attendant on his rank, that they might, according to their settled form, devolve on the ex-emperor, whose founding titles had passed away with the power that bestowed them. A captain's guard of marines was arranged on the poop to wait his arrival, with orders to present arms, and the drum to beat the roll thrice; the usual salute to a general officer in the British service.

When the barge of the *Tonnant* reached the *Northumberland*, the quarter-deck was covered with officers; and there were also some individuals of rank, who had come

round, from motives of curiosity, to view the passing scene. The marines occupied the front of the poop, and the officers kept the quarter-deck. An universal silence prevailed when the barge reached the side; and there was a grave but anxious aspect in all the spectators, which was no small addition to the solemnity of the ceremonial. Count Bertrand ascended first; and, having bowed, retired a few steps to give place to him whom he still considered as his master, and in whose presence he appeared to feel that his most respectful homage was still due. The whole ship's company seemed at this moment to be in breathless expectation. Lord Keith was the last who quitted the barge; and we cannot give a more complete idea of the wrapt attention of all on-board to the figure of Napoleon, than that his lordship, high as he is in naval character, admiral also of the channel-fleet, and arrayed in the full uniform of his rank, and with the decorations of his order, did not seem to be noticed, nor scarcely even to be seen, among the groupe which was subject to him.

With a slow step Bonaparte mounted the gangway; and, on feeling himself firm on the quarter-deck, he raised his hat, when the guard presented arms, and the drum rolled. The officers of the Northumberland, who were uncovered, stood considerably in advance. Those he approached, and saluted with an air of the most affable politeness. He then addressed himself to sir George Cockburn, and said "*Je suis à vos ordres.*" After taking leave of the officers who had accompanied him from the Bellerophon, and embracing the nephew of Josephine, who was not going to St. Helena, he went into the after-cabin, where, besides his principal companions, were assembled lord Keith, sir George Cockburn, lord Lowther, Mr. Lyttleton, &c.

In the afternoon lord Keith took leave of Bonaparte, and returned on-board the Tonnant. Lord Lowther and Mr. Lyttleton then entered into very earnest conversation with him, which continued for two hours. As he was very communicative, and seemed desirous of a free conversation with these two young gentlemen, they availed themselves of the opportunity, and entered into a review of much of his conduct. To all their questions he gave full answers, not avoiding, but rather encouraging, discussion. A long account of this conversation was presently given in the London papers, the greater part of which was soon after contradicted in the Worcester Herald; so our safest way is to say nothing about it. In all probability, nothing very important was extracted from Bonaparte by these young men. They, however, returned ashore highly gratified at having had two hours' conversation with so great a personage.

The state-cabin for the fallen hero, on-board the Northumberland, was fitted up with great elegance; his bed was peculiarly handsome, and the linen upon it very fine; the toilet is of silver. Among other articles upon it is a magnificent snuff-box, upon which is embossed, in gold, an eagle, with a crown, flying from Elba to the coast of France; the eagle just seeing the coast of France, and the respective distances, are admirably executed. The valets-de-chambre were particularly fine men; they, and all about him, always addressed him by the title of Emperor; one of them was formerly a servant of the duke of York, and perhaps fixed there as a spy.

After waiting for the Weymouth store-ship, and some other vessels destined to compose the little squadron, the whole finally sailed on the 11th of August, bearing Cæsar and his fortunes to a different sphere from that to which he had hitherto been accustomed.

The conduct and conversations of this extraordinary personage and his suite, during the voyage and first months of his residence at that island, have been very fully related by Mr. Warden, surgeon of the Northumberland, in a series of Letters written by him to a friend in England, and published in the following year, 1816. These Letters were read with great avidity in London,

because, being the result of personal interviews with the ex-emperor, and familiar conversations with his suite, it was concluded that they must contain correct accounts of various important particulars which had been hitherto imperfectly understood, or misrepresented. But these conversations have now become less interesting, and the public admiration has passed away. The Quarterly Review for Oct. 1816. exposed some inconsistencies in the work, and should be read in conjunction with it. Mr. Warden confesses, that "a certain delicacy was maintained" in communicating to Napoleon the contents of our public journals; in short, that they told him lies. And the following passage is still more plain to the purpose: "That truth is not to be spoken, or in any way imparted, at all times, is a proverb which was now faithfully adhered to on-board the Northumberland." In the communications, therefore of these persons, and of Napoleon himself, to Mr. Warden, it is obvious to remark, that, instead of a *correct* account of certain particulars, these persons would only give to them that *colouring* which best suited their own purpose; for few will give credit to their constant and repeated declarations, "that Napoleon's political life was terminated." That had been the declaration after the first abdication. We do not believe that *even now* they think it terminated. With these cautions as to the perusal of Mr. Warden's Letters, we still think they contain much interesting matter; and shall therefore make a few extracts; but they will not relate, we believe, to any controverted points.

"Bonaparte, previous to his leaving the Bellerophon, was, it seems, recommended to select three of his suite to accompany him to St. Helena. Bertrand was, at that time, supposed to be particularly proscribed; but it is understood, that lord Keith took upon himself the responsibility of including such an attached friend in the number of the exiled general's attendants. The others were the count de las Cafes, who had been a captain in the French navy, and is a man of literary attainments; general count Montholon, and lieutenant-general Gourgaud, his two aides-de-camp, who were devoted to his fortunes. The latter officers served him in the Russian campaign, and describe the winter which they encountered there in all its horrors. The Russian cavalry they extol; but represent the Cossacks as easily dispersed. They do not appear to hold the Prussians in very high estimation; but consider them, at the same time, as superior to the Austrians. The English infantry, at the battle of Waterloo, filled them with absolute astonishment; but they represent our cavalry as much too impetuous; they probably found them so on that glorious day. In a conversation with Count Bertrand, which happened to glance on that subject, he could not hide his sensations. The little he said was in a plaintive tone, though expressed with candour, and accompanied with expressive shrugs of lamentation. We fought that day, he said, for the crown of France; but you gained the battle, and we are undone.

"From the information I received in my conversation with our French guests, it appears, that the emperor's abdication, in favour of his son, is a matter which, as far at least as my knowledge extends, has been altogether misconceived in England; I mean as to the immediate and proximate causes of it. If the communications made to me were correct, (and I am not willing to imagine that they were invented merely to impose upon me,) a grand political scheme was contrived by Fouché to out-wit his master, and it proved successful. The name of that crafty politician and ready revolutionist is never mentioned by the members of our little cabin Utica without the accompaniment of execrations, which it is not necessary for you to hear, as it would be ridiculous for me to repeat. (See p. 534, 550.) Not Talleyrand himself is so loaded with them as the arch-betrayer who has been just mentioned. It was, indeed, a decided opinion of the moment, among our exiles, that Fouché would contrive to hang Talleyrand, or that the latter would provide an equal fate for the former;

former; and that, if they both were suspended from the same gibbet, it ought to be preserved as an object of public respect for the service it had done to mankind. The *livrette* to which I have alluded, was thus related.

"On Napoleon's return to Paris, after his disastrous defeat at Waterloo, and when he may be supposed to have been agitated by doubt and perplexity as to the conduct he should pursue, a letter was offered to his attention by the duke of Otranto, as having been received by the latter from prince Metternich, the Austrian minister. It was dated in the *preceding April*; and the diplomatic writer stated the decided object of his imperial master to be the final expulsion of Napoleon the First from the throne of France; and that the French nation should be left to their uninterrupted decision, whether they would have a monarchy under Napoleon the Second, or adopt a republican form of government. Austria professed to have no right, and consequently felt no intention, to dictate to the French nation. The final and ratified expulsion of the traitor, (such was the expression,) is all the Austrian emperor demands of France. Napoleon seized the bait; and immediately abdicated in favour of his son: but he had no sooner taken this step, than he discovered the double game that Fouché was playing. The letter was a forgery; and it soon appeared, that the emperor of Austria had it not in his power, if he had ever indulged the contemplation, to clothe his grandson with a political character.

"The name of Talleyrand happening again to occur in the course of conversation with our French shipmates, the high opinion entertained of his talents by the Bonapartists was acknowledged without reserve. On my asking at what period he was separated from the councils and confidence of Napoleon, it was replied, at the invasion of Spain. I then observed, that the reports in England respecting that circumstance were correct as to time, and I presumed were equally so as to the cause; his unreserved disapprobation of that bold and adventurous enterprise. This met with an instant contradiction; which was followed by a most decisive assertion, that the prince of Benevento approved of the Spanish war, and founded his recommendation of that measure on his unalterable opinion, which he boldly communicated to the emperor, that his life was not secure while a Bourbon reigned in Europe.

"I entered further on this subject with madame Bertrand; and she actually and most unequivocally asserted, that Talleyrand was in secret communication with Napoleon when they were last at Paris, and that he would have joined them in a month. His proposed departure from Vienna to take the waters at Aix-la-Chapelle was under the cloak of indispotion, to conceal his duplicity. 'Can you persuade yourself, madame,' I said, 'that Talleyrand, if he had the inclination, possessed the power to influence the court of Vienna in favour of his son-in-law?'—'The court of Vienna!' she exclaimed, 'O yes, yes: he has the capacity to influence all the courts in Europe! If he had but joined the emperor, we should at this instant have been in Paris, and France would never more have changed its master.'—Of this man's virtues I heard no eulogium; but you will now be a competent judge how his political talents were appreciated in the French circle on-board the Northumberland. See *MALEVENTUM*, vol. xiv. p. 194.

"Every one remembers the threatened invasion of England in 1805, and the various conjectures which were formed on this momentous subject. It was not, according to my recollection, by any means generally considered as practicable; nor did any very great apprehensions prevail that it would be attempted. I will, however, give you my authority for the actual intention of carrying it into execution. Bonaparte positively avers it. He says, that he had two hundred thousand men on the coast of France opposite to England, and that it was his determination to head them in person. It was hinted to him, however, that his flotilla was altogether insufficient; and

that such a ship as the Northumberland would run down fifty of them. This he readily admitted: but he stated that his plan was to rid the channel of English men-of-war; and for that purpose he had directed admiral Villeneuve, with the combined fleets of France and Spain, to sail apparently for Martinique, for the express purpose of distracting our naval force, by drawing after him a large portion, if not all, of our best ships. Other squadrons of observation would follow; and England might, by these manœuvres, be left sufficiently defenceless for his purpose. Villeneuve was directed, on gaining a certain latitude, to take a baffling course back to Europe; and, having eluded the vigilance of Nelson, to enter the English channel. The flotilla would then have sallied forth from Ostend, Dunkirk, Boulogne, and the adjoining ports. The intention was to have dashed at the capital, by the way of Chatham. He well knew, he added, that he should have to encounter many difficulties; the object, however, was so great as to justify him in making the attempt. But Villeneuve was met on his return by sir Robert Calder; and, having suffered a defeat, took refuge in Ferrol. From that harbour he was peremptorily ordered to sea, according to his original instructions; but, contrary to their most imperative and explicit intent, he steered his course for Cadiz: 'He might as well,' exclaimed Napoleon, raising his voice, and increasing his impetuosity, 'he might as well have gone to the East Indies.' Two days after Villeneuve had quitted his anchorage before Cadiz, a naval officer arrived there to supersede him. The victory of Trafalgar soon followed; and the French admiral died a few days after his arrival in France: report says, by his own hand.

"On our approach to Madeira, the hazy state of the atmosphere precluded the possibility of seeing the island, until we got close between Puerto Santo and the Deserts. The latter rocky island is almost perpendicular; and has some slight resemblance to St. Helena. This circumstance I mentioned to Las Cafes, and he instantly communicated it to Napoleon, who had quitted the dinner-table sooner than usual, and joined a few of us on the poop: but the comparison of what he now saw with his gloomy notions of the place where he was shortly to abide, produced not a single word: he gave an energetic shrug, and a kind of contemptuous smile; and that was all. The sloping front and luxuriant aspect of the island of Madeira could not but excite an unpleasant sensation, when contrasted with the idea he had entertained of the huge black rock of St. Helena. I had presented Johnson's work on the influence of Tropical Climates on European Constitutions to his perusal. That writer has been very lavish of his encomiums on St. Helena; but he acknowledges that he only lay at anchor off it for three days; and its acute reader ridiculed the glowing descriptions which were founded on such a transient and imperfect view of the place.

"The name of the empress Josephine happening to occur, she became the spontaneous subject of very animated eulogiums; when she was represented as possessing a sweetness of disposition, an elegance of manners, and a certain melody of voice, that irresistibly charmed every one, without any exception as to situation or capacity, who were admitted to her presence. The sudden death of this excellent lady was generally lamented, and is attributed to a very extraordinary circumstance, and a very exalted personage. I will relate the events to you in the words, as far as memory serves, in which the count de las Cafes conveyed it as an undeniable fact to me. Josephine, it seems, had so far won the admiration and high esteem of the emperor Alexander, that his imperial majesty used to dedicate many of his leisure hours to the pleasure of her fascinating conversation: his visits were not only frequent, but continual, during his stay at Paris. Her state of health was but indifferent; and, on some particular occasion, her physician had prescribed medicines of a nature that required the utmost care and precaution,

and

and an absolute confinement to her chamber: but, at this time, the emperor paid one of his visits, when her respect for him rendered her incautious, and she received the imperial guest in the usual manner: they walked, during the time of his stay, in the gardens of Malmaison; and the consequence of this promenade was fatal: she was seized with a violent inflammation in the lungs, which defied all medical assistance, and in a few days she was no more.

"Count Bertrand, in the history which he gave of the German campaign in 1807, took occasion to observe that Bonaparte had very seldom employed spies. (See p. 534, 5.) He appeared, in the course of his warfare, to know but one instance of a person being engaged by his master in that capacity, which was in Italy; at the same time he acknowledged that the services performed by that person were of considerable importance. In speaking also of Napoleon's talents, for which he uniformly avows the most profound admiration, he expressed himself to the following effect: 'When I was first admitted to the emperor's confidence, he employed me on a particular service, and no zeal was wanting, on my part, to execute it; but I found it impracticable; and I did not hesitate to submit my opinion to him that it was absolutely so. It may be so to *you*, he replied; but in what manner did you proceed? I accordingly explained the means I had pursued. You have failed, he said, in following your own plans: now see what success you will have in pursuing mine. These he explained; I adhered to them of course, and succeeded. I then determined never again to suppose that any commands of his could fail of being fulfilled; and, in any future operations which he entrusted to me, the idea of impossibility never occurred to my thoughts.'

"Having crossed the line, the south-west winds occasioned our making a sweep off the gulf of Guinea, before we were enabled to shape a course for our destined port. The declining sun of the 14th of October, 1815, shot out a parting ray e'er it sunk beneath the horizon. Under this small illumined space was obscurely perceived the lofty peak of Saint Helena. The memorable morning soon dawned which was to usher in the commencement of Napoleon's exile.

"The sensation excited in the little colony of St. Helena, on the arrival of this extraordinary guest, may be more easily imagined than described. Curiosity, astonishment, and interest, combined to rouse the inhabitants from their habitual tranquillity, into a state of busy activity and inquisitive solicitude.

"The morning was pleasant, and the breeze steady. At dawn we were sufficiently near to behold the black peak of St. Helena: between eight and nine we were close under the Sugarloaf-hill. The whole of the French party had quitted their cabins, with the exception of Napoleon, and taken their respective stations. On the right stood madame Montholon, with her arm entwined in that of the general, her husband; on the poop sat madame Bertrand, and the marshal stood behind her. I was the only unoccupied person belonging to the ship; and could therefore, undisturbed, contemplate the scene around me. I was afraid to approach madame Bertrand, for I was near enough to perceive an action in the muscle of her throat which betokened a sob. Las Cafes, resting his arm on the shoulder of his son, was stretching his little figure on tip-toe, but in vain, to look over the gangway; for all his exertion would not enable him to see more than half-way down the mountain. General Gourgaud endeavoured, by a smile, to suppress what he felt; for he had no female to console him. The servants were gazing with open mouths, and all their eyes; while the children, unconscious of island or rock, prison or palace, were performing their little evolutions as usual; and the Newfoundland dog would occasionally break in upon their hollow squares. We did not see Napoleon till the ship had anchored in front of the town. About eleven he made his appearance; he ascended the poop-ladder, from which he could

examine every gun that bristles at the mouth of James's Valley, in the centre of which the town of that name, and the only one in the island, is situate. While he stood there, I watched his countenance with the most observant attention, and it betrayed no particular sensation: he looked as any other man would look at a place which he beheld for the first time. I shall also take this opportunity to mention that, during the whole voyage, from the moment the Northumberland set sail from England to its arrival at St. Helena, I never saw any change in the placid countenance and unassuming manners of our distinguished shipmate; nor did I hear of a discontented look, or a peevish expression, being remarked by any other person in the ship. The ladies, indeed, discovered some distress on the first view of their rocky cage; but their general conduct on the occasion, displayed a degree of self-possession which was not expected of them.

"The first object of the admiral was to make the necessary arrangements for the accommodation of Napoleon and his suite; and the lieutenant-governor's house was appropriated for that purpose, till a proper place could be prepared for his fixed residence. It was not, therefore, till the 17th, that they disembarked. After sun-set on that day, when the inhabitants of the town, wearied out in waiting for the spectacle of Bonaparte's landing, had retired to their homes, he, according to the wish he had expressed, went unobserved to the house where he was to pass the first night as an inhabitant of St. Helena. At an early hour of the following morning, the general was on horseback, accompanied by sir George Cockburn. They ascended the mountain to *Longwood*, which was to be the residence of a man, on an isolated rock in Africa, who had possessed gorgeous palaces in so many of the splendid cities of Europe.

"About a mile from the town, and midway up the mountain, stands the country-house of a most respectable man, and a merchant of the island, Mr. Balcombe; it is named the Briars, and is situated on a level spot, which might almost be imagined to have been formed by art in the steep ascent. It occupies about two acres, and is bountifully supplied with water, by whose irrigating influence a pleasing and contrasted scene of vegetation, enriched by fruit-trees, has been produced; and seems, as it were, suspended between the heights above and the depths below. Here Napoleon, on his descent from Longwood, was induced to call; and such was the hospitable importunity of the amiable master of the mansion, that he relinquished his intention of descending to the valley, and thereby avoided the public gaze that was waiting his appearance.

"On an elevated mound, about fifty yards from the house, is a gothic building, having one room below, and two small apartments above. This maisonette Napoleon chose for his residence, till Longwood could be completed. There was no choice in the arrangement of this confined abode: the ground-floor was, of course, occupied by him, while Las Cafes, with his son, who was a page, and the valet in waiting, were to possess the upper story.

"The *Briars* had derived, and will ever retain, a certain degree of celebrity, from its having been the unexpected residence of Napoleon; and this circumstance will, I doubt not, bring to your recollection, the various instances where remote and obscure situations, which never formed the smallest speck on a map, have, by accidental events, become important points in the geography of the historian. Napoleon frequently makes one of Mr. Balcombe's family-parties, where he is neither troublesome nor intrusive, but conducts himself with the manners of a gentleman, and a lively demeanour that promotes the general vivacity of the domestic circle.

"On his removal to Longwood, certain limits were assigned him for exercise, around which a cordon of sentinels were stationed. While he continues within the circle, he experiences no additional vigilance; but, when he ventures beyond, an officer is on duty to attend him. The

latter circumstance, which he considers as irksome, disposes him to confine himself in a great measure to the grounds of his mansion.

"I observed to him, that, considering the active life he had led, it did not appear that he took sufficient exercise to preserve himself in a right state of health. He replied, 'My rides, indeed, are too confined; but the being accompanied by an officer is so very disagreeable to me, that I must be content to suffer the consequences of abridging them. However, I feel no inconvenience from the want of exercise. Man can accustom himself to privations. At one period of my life I was many hours on horseback every day for six years; and I was once eighteen months without passing from the house.' He often returned to the grievance of being watched by an officer. 'You are acquainted,' he said, 'with the island of St. Helena; and must be sensible that a sentinel, placed on either of these hills, can command the sight of me from the moment I quit this house till I return to it. If an officer or soldier placed on that height will not satisfy your governor, why not place ten, twenty, or a troop of dragoons. Let them never lose sight of me; only keep an officer from my side.'

"The arrival of a fleet at the island from India, crowded the little town with passengers, who were all, as usual, eager to see Bonaparte. The countess of Loudon disembarked from this fleet; and, during her stay at St. Helena, was accommodated at Plantation-house, the residence of the governor. In compliment to this lady, a dinner of ceremony was given on the following day, by Sir Hudson Lowe; and an invitation was dispatched through general Bertrand to general Bonaparte, so arranged in point of politeness and etiquette, as to justify an expectation that it would be accepted. Count Bertrand delivered the governor's card, which was read and returned without a word of observation. 'Sire,' said Bertrand, 'what answer is it your majesty's pleasure that I should return?' — 'Say, the emperor gave no answer.' — Napoleon afterwards, in conversation with Mr. Warden, said, 'What! go to dinner, perhaps, with a file of soldiers to guard me! After all, they could not, I think, expect me to accept the invitation. The distance is considerable, and the hour unreasonable; and I have almost relinquished the idea of exceeding my chain, accompanied as I must be by an officer.'

Mr. Warden quitted St. Helena in June 1816. He says at parting, "I had been uniformly treated with such respectful kindness, and, in some degree, with such partial confidence, by Gen. Bertrand, Mons. de las Cases, and, indeed, by every one of the suite, that I could not take leave of them without a considerable degree of sensibility. A more amiable, united, and delightful, family, than that of Gen. Bertrand, I never yet saw: nor is his affection as a husband, and his fondness as a father, less striking than his fidelity to his master."

About the time that Mr. Warden arrived in England, (probably in the same ship or fleet,) there came also from St. Helena a Mons. Santini, who called himself Napoleon's usher of the cabinet. On his arrival, he immediately published a pamphlet, containing a narrative of the ill-treatment which, he said, his master had received since his arrival on that island. In this narrative, which he entitled, "An Appeal to the British Nation on the Treatment experienced by Napoleon Bonaparte in the Island of St. Helena," was an official Memorial or Remonstrance, (dictated by Napoleon,) from count Montholon to Sir Hudson Lowe, the governor of the island. As this Memorial was discussed in the British senate, its authenticity being acknowledged by the government, we shall lay some parts of it before our readers.

Letter, by order of the Emperor Napoleon, addressed, by General Count Montholon, to Sir Hudson Lowe, British Governor of the Island of St. Helena.

"General; I have received the Treaty of the 2d of Vol. XVIII. No. 1265.

August, 1815, concluded between his Britannic Majesty, the Emperor of Austria, the Emperor of Russia, and the King of Prussia, which accompanied your letter of the 23d of July.

"The Emperor Napoleon protests against the contents of that Treaty; he is not the prisoner of England. After having placed his abdication in the hands of the representatives of the nation, for the advantage of the constitution adopted by the French people, and in favour of his son, he repaired voluntarily and freely to England, with a view of living there, as a private individual, under the protection of the British laws. The violation of every law cannot constitute a right. The person of the Emperor Napoleon is actually in the power of England; but he neither has been, nor is, in the power of Austria, Russia, and Prussia, either in fact or of right, even according to the laws and customs of England, which never included, in the exchange of prisoners, Russians, Prussians, Austrians, Spaniards, or Portuguese, though united to these powers by treaties of alliance, and making war conjointly with them.

The Convention of the 2d of August, concluded fifteen days after the emperor was in England, cannot have, of right, any effect. It exhibits only a spectacle of the coalition of the four greatest powers of Europe, for the oppression of a single man! a coalition which the opinion of every nation, and all the principles of sound morality, equally disavow.

"The Emperors of Austria and Russia, and the King of Prussia, having, neither in fact, or in right, any claim over the person of the Emperor Napoleon, could decide nothing respecting him.

"Had the Emperor Napoleon been in the power of the Emperor of Austria, that prince would have recollected the relations which religion and nature have formed between a father and a son; relations which are never violated with impunity. He would have recollected that Napoleon had four times restored to him the throne; viz. at Leoben, in 1797; at Luneville in 1801, when his armies were under the walls of Vienna; at Presburg, in 1806; and at Vienna, in 1809, when his armies had possession of the capital and three-fourths of the monarchy! That prince would have recollected the protestations he made to Napoleon, at the bivouac in Moravia in 1806, and at the interview in Dresden in 1812.

"Had the person of the Emperor Napoleon been in the power of the Emperor Alexander, he would have recollected the ties of friendship contracted at Tilfit, Erfurth, and during twelve years of daily correspondence. He would have recollected the conduct of the Emperor Napoleon the day after the battle of Austerlitz, when, though he could have made him, with the wreck of his army, prisoner, he contented himself with taking his parole and allowed him to operate his retreat. Assuredly, that prince would never have violated the duties of friendship and gratitude towards a friend in misfortune.

"Had the person of the Emperor Napoleon been in the power of the King of Prussia, that sovereign could not have forgotten that it depended on Napoleon, after the battle of Friedland, to place another prince on the throne of Berlin. He would not have forgotten, in the presence of a disarmed enemy, the protestations of attachment, and sentiments of gratitude, which he testified to him in 1812, at the interviews in Dresden.

"It accordingly appears, from articles two and five of the treaty of the 2d of August, that these princes, being incapable of exercising any influence over the disposal of the emperor, who was not in their power, accede to what may be done thereon by his Britannic majesty, who takes upon himself the charge of fulfilling every obligation. These princes have reproached the Emperor Napoleon with having preferred the protection of the English laws to theirs. The false ideas which the Emperor Napoleon had formed of the liberality of the laws of England, and of the influence of the opinion of a great, generous,

nerous, and free, people, over their government, decided him to prefer the protection of these laws to that of a father-in-law, or an old friend.

"The Emperor Napoleon had it in his power to secure, by a diplomatic treaty, whatever was personal to himself, by putting himself either at the head of the army of the Loire, or at the head of the army at the Gironde commanded by General Claufel; but wishing, henceforth, for nothing but retirement, and the protection of the laws of a free state, either English or American, all stipulations appeared to him unnecessary. He conceived that the English people were more bound by a conduct which was, on his part, frank, noble, and full of confidence, than they would have been by the most solemn treaties. He has been deceived; but this error will for ever cause true Britons to blush, and will, in the present as well as future generations, be a proof of the bad faith of the English administration.

"The English ministers have caused the Emperor Napoleon to be transported to St. Helena, at the distance of 2000 leagues from Europe! This rock, situated within the tropics, and 500 leagues from any continent, is subject to the devouring heats of these latitudes. It is covered with clouds and fogs during three-fourths of the year, and is at once the most arid and most humid country in the world. Such a climate is most inimical to the health of the emperor; and hatred must have dictated the choice of this residence, as well as the instructions given by the English ministry to the officers commanding in the island.

"They have even been ordered to call the Emperor Napoleon *General*, as if it were wished to oblige him to consider himself as never having reigned in France.

"The treaty of the 2d of August, and the act of the British parliament, called the emperor *Napoleon Bonaparte*, and gave him only the title of *General*. The title of *General Bonaparte* is doubtless eminently glorious: the emperor bore it at Lodi, at Castiglione, at Rivoli, at Arcole, at Leoben, at the Pyramids, at Aboukir; but for seventeen years he has borne that of First Consul and Emperor, which proves that he has been both first magistrate of the republic, and sovereign of the fourth dynasty.

"It is in the same hateful spirit that orders have been given that the Emperor Napoleon shall not be allowed to write or receive any letters, unless they are opened and read by the English ministers and the officers at St. Helena. They have interdicted to him the possibility of receiving intelligence from his wife, his mother, his son, or his brothers; and when, in order to avoid the inconvenience of having his letters read by subaltern officers, he wished to send letters sealed to the prince-regent, he was told that the order could not be departed from, and that the letters must pass open, such being the instructions of the ministry. This conduct needs no observation; it gives rise, however, to strange ideas as to the spirit of the administration which could dictate what would be disavowed even at Algiers. Letters have arrived at St. Helena, for the officers in the suite of the emperor; they were broke open and transmitted to you, but you have not communicated them, because they did not come through the channel of the English ministry. Thus they had to go back four hundred leagues; and these officers had the grief of knowing that there was intelligence on the rock from their wives, their mothers, their children, and that they could not know the nature of it for six months.

"You have interdicted all correspondence between us and the inhabitants of the island; you have, in fact placed the house at Longwood *au secret*; you have even prevented any communication with the officers of the garrison; it seems, therefore, to be your study to deprive us of the little resource which this miserable territory affords, and we are here just as we should be on the insulated and uninhabited rock of Ascension. During the four months that you have been at St. Helena, you have, sir, rendered the situation of the emperor much worse. Count Bertrand has observed to you, that you violate even the laws of your legislature,

and that you trample under foot the rights of general officers, prisoners of war. You have replied, that you act according to the letter of your instructions, and that your conduct to us is not worse than is dictated by them. I have the honour to be, &c. MONTHOLON."

All these expressions look very well upon paper, and read very smooth. But, when we come to consider the facts of the case, we shall be convinced, that they have no foundation whatever; and that Bonaparte very well knew that no nation he could have submitted to, was likely to treat him with such humanity as the English. He therefore acted wisely in submitting to them. Let the reader look back to pages 535, 42, 4, 5, 53. and to various other passages in the course of this article; and, when he notices there, the extreme bitterness of the Prussians, and particularly of Blucher, against the French, let him judge what would have been the treatment of their chief, had he fallen into their hands. Had he given himself up to the magnanimous Alexander, he would most likely have been banished to Siberia, a climate not quite so congenial to the constitution of an Italian as that of St. Helena. By his father-in-law his treatment might perhaps have been more tolerable; but in no respects equal to that which he now continually laments and complains of. And indeed, when the matter was brought before the upper house of parliament, by lord Holland, on the 18th of March, 1817, lord Bathurst, after replying to various particulars, very justly observed, "that sir Hudson Lowe had only acted up to his instructions, and imposed such restrictions as were necessary to the secure keeping of the prisoner; that Bonaparte had expressed the belief that a change of government, in this country or in France, would be the means of his release; and that all his complaints had arisen from not being allowed to ride out without an attendant officer."

The narrative of M. Santini contained a variety of interesting particulars; and he endeavoured to prove that the ex-emperor had not only been ill-treated in regard to his rank, &c. but that he was absolutely exposed to a state of starvation. "It is to be recollected," says he, "that the governor took upon himself the entire charge of the maintenance of Napoleon and his suite; but the provisions he furnished were always in too small a quantity, and also very often of bad quality. In the latter case, when the emperor's house-steward (Cipriani) has found himself under the necessity of sending back the provisions, the articles were never replaced by others more fit for use, and it has been necessary to wait until the following day for a fresh supply. It has often happened that, on finding himself without any butcher's meat for the emperor's table, the steward has sent me to purchase a sheep, for which I paid four guineas; and often could only procure pork for making soup. Captain Poppleton of the 53d regiment, appointed to guard the emperor, if he is the man of honour I believe him to be, will not fail to bear witness that he has often lent candles to light this abode of desolation, as well as bread, butter, poultry, and even salt. I was even, from necessity, in the habit of repairing secretly to the English camp to purchase butter, eggs, and bread, of the soldiers' wives; otherwise the emperor would often have been without breakfast, and even without dinner. There is no water fit for cooking at Longwood: very good water may, however, be procured at a distance of 1200 yards, which might be conveyed to the emperor's barracks at an expense of 12 or 1500 francs. The house is supplied by the water which is brought from this fountain; but it is open only once during the day; at all other times it is locked. It is guarded by an English officer, who is scarcely ever present when water is wanted. There is a conduit for conveying water to the English camp; but it was thought unnecessary to do as much for the unfortunate Napoleon."

We have not room to notice any further particulars in the statement of M. Santini; but have now to observe, that it must be extremely vexatious to the bulk of the English

English nation, to hear, on the one hand, that the most miserable economy was practised towards Bonaparte and his suite; and, on the other, that the expenses of keeping them were beyond measure extravagant. Mr. Hume, on the 29th of March last (1821), moved in the house of commons, for accounts of the total expenditure incurred by this country, for the detention of Napoleon Bonaparte, since his surrender to the British. He believed that no account of that expenditure had been published since Bonaparte was first sent to St. Helena. Whatever opinions might prevail on the subject of his being detained in custody it might, in the present financial difficulties of this country, become a subject of very serious consideration, how far England should have to pay the whole of an expenditure, arising solely out of that detention. On the calculation of the expense, he thought he might say, that, should it be deemed necessary to keep Bonaparte a prisoner at St. Helena, it might be effectually done for one-tenth of the expenditure at present incurred for that purpose. It was, however, a very serious question, why England should incur the whole of an expense, for an object in which other countries had an equal, or indeed a greater, interest. At all events, if the expenditure were to be continued, it ought to be laid before parliament in the annual accounts. He had seen what he believed to be correct estimates of the expenses in 1819; and he had not heard that since that any great reduction had taken place in the amount of the accounts. The house would judge of the importance of the subject, when he stated the following items as forming a part of the expense of Bonaparte's detention: For the staff alone, there was an expenditure of nearly 24,000*l.* for military establishment, 193,674*l.* other incidental and contingent expenses at the Longwood establishment, 57,000*l.* vessels for provisioning the island, exclusive of the navy, he had heard estimated at 3000*l.* 4000*l.* or 5000*l.* naval expenses of one 74-gun ship, and nine smaller vessels, 160,000*l.* making a total considerably exceeding 400,000*l.* per annum, for the sole purpose of keeping Bonaparte a prisoner. If it should be deemed advisable to detain Bonaparte, the country was entitled not only to inquire into the expenditure which would be necessary for such a purpose, but more particularly into the circumstance of who should pay it. He concluded by moving for the following series of papers: Copies of all correspondence or contracts between government and the East India Company, relating to the detention of Bonaparte at the island of St. Helena; also accounts of the pay, allowance, contingencies, extraordinary, &c. of the military establishment kept up on that island, distinguishing the number and pay of the troops, accounts of the number and expenditure of all ships of war, and other vessels on that station, and of all expenses paid in England, and to whom paid, relating to Bonaparte's detention, distinguishing the respective amounts, and for what and to whom paid, as well as out of what source, and whether any and what part was defrayed by other powers. These accounts to comprise the annual and total amount since Bonaparte's detention. Mr. Hume, after moving for these accounts, said that government had hitherto laid no accounts of this expenditure on the table of parliament; and he thought it quite time, now in the sixth year of peace, that not only these accounts should be forthcoming, but also that it should be known whether there was any secret understanding with other powers, and to what extent, for meeting the expense.—The papers were ordered.

From the first arrival of Bonaparte at St. Helena, it was acknowledged that the house at Longwood was not a residence fitted to a personage of his high rank; and another was ordered to be erected for him, the framework and materials of which were sent from England. After being five years in hand, it has at length been completed; and the latest news from the island, which are dated the 2d of March, state, that Bonaparte was in good health, had taken possession of it, and was very much pleased with it. The circuit to which the ex-emperor was formerly limited,

has recently been extended; and he is permitted to ride and walk in a space of not less than fourteen miles.

The general tone of English sentiment, since the surrender of this extraordinary man, affords a very striking instance of the involuntary homage paid by mankind to exalted talent. He is considered as merely the vanquished sovereign of a martial people, obliged by force of arms to yield to a competitor, which competitor can only remain secure by his captivity. This view of the case leaves the point of policy entirely open as it regards his safe disposal; but it clearly absolves him from the odium attached to him as a tyrannic ruler of France: he is a dethroned potentate and prisoner of war, and nothing more. As to the commanding qualities which render him an object of dread, let us dread them if we please, but let us not degrade ourselves by abusing the man because he possesses them. They have been mischievous, no doubt, as great energies uniformly are when they assume a military aspect; but we are quite at a loss to know in what respect they have been more so than those of other conquerors; or why he is peculiarly entitled to the hatred from which the spoliators of Poland, of Turkey, of Hindoostan, and so recently of Naples and Piedmont, have been permitted to escape.

Of the propriety of banishing this important captive to St. Helena, we profess to give no opinion: the cold will call it prudent, and the warm ungenerous: it may be disagreeable, but it is any thing but dishonourable to the individual himself. Our lighter task shall be to convey a few of the impressions they have made upon us, with respect to the character of the man, and of the nature of the qualities which give their possessor so much influence over mankind. There never was a man who obtained equal elevation that was less a king Arthur, less the king of a coronation, than Bonaparte, when at the pinnacle; and certainly there never was a man who endured overwhelming adversity with more dignity and composure. Wherever he sets his foot, his ascendancy is manifest; and yet it seems acquired without any extraordinary effort on his own part, by a deportment which, while it evinces his quick observation, his intuitive sagacity, and his mental decision, is both natural and unconstrained. Doubtless many who have seen him, and who even expected to see a great man, made up their minds to behold a very different personage. Some were probably prepared to witness a ferocious-looking man, with tremendous whiskers; others, a stalking elevated species of hussar, like the hero of a German tragedy. In Napoleon they see neither one nor the other, and yet they feel him superior: how is this? are there nobles of Nature's creation? We suppose there are; and that this man, although he has lost his throne, preserves his birth-right. In the mean time, his banishment to St. Helena seems, for the present, to divorce his fortune from that of the world, although many expect that the separation will not be eternal. With respect to *himself* we think it is; but, as it may regard his *descendants*, we are inclined to think otherwise.

The greatest of conquerors, in an age when great conquests appeared no longer possible; the most splendid of usurpers, when usurpation had not been heard of for centuries; who entered in triumph almost all the capitals of continental Europe, and led at last to his bed the daughter of her proudest sovereign; who set up kings and put them down at his pleasure; and, for sixteen years, defied alike the swords of foreign enemies, and the daggers of domestic factions;—this is the man on whom posterity must yet sit in judgment, but the evidence by which they are to judge must be transmitted to them by his contemporaries.

REIGN OF LOUIS THE EIGHTEENTH.

While we have been detailing (under FRANCE, as well as in the present article) the “acts and gestes of that horrid monster,” Napoleon Bonaparte, the reader will start at being reminded that all these things were done in the reign of Louis the Eighteenth, and that we are now arrived

rived at the twenty-first year of that mild and paternal reign. It will be fit, therefore, that we now bring our readers to a better acquaintance with him, by the insertion of a few biographical anecdotes.

Louis Stanislaus Xavier was born on the 17th of November, 1755, being the second son of the then Dauphin of France. From a long line of ancestors he inherited the name of *Louis*; that of *Stanislaus* was derived from his great grandfather, Stanislaus duke of Lorraine and king of Poland, whose only daughter, Maria Leczinski, was queen to Louis XV. whilst that of *Xavier* was taken from the electoral family of Saxony, his own mother, Maria Josepha, being daughter to the duke of that ancient division of the German empire. Whilst yet a child, he was designated by the title of Count de Provence, which he changed for Monsieur, when the death of his grandfather, Louis XV. left the throne for his elder brother, the late unfortunate monarch.

Monsieur appears not to have taken any active part in the politics of his native land until the year 1787, when, in the Assembly of the Notables, then first called together by Calonne, he declared himself hostile to all interference with noble and ecclesiastical privileges; but, at the same time, he was not forgetful of the welfare of the people, steadily maintaining that there was no necessity for any additional taxes to be laid on their industry, and always expressing his conviction that a few years of peace, of economy, and of regularity, would remove every financial difficulty; and it is generally believed, that the minister was induced, by the force of his reasoning, to lay aside much of the speculative and visionary part of his plans. Calonne, however, went out; and the succeeding ministers did not choose to pay attention to the modest advice of the unostentatious prince, who mixed but little either with the gay or the political world.

Hitherto Monsieur had resided some distance from Paris; but no sooner did the horrors of the revolution commence, in 1789, by the personal insults to the king obliging him to remove from Versailles to the capital, than he gave up his retirement, and became a resident in the Luxembourg palace, where he was, perhaps, the only real friend left to the unhappy Louis, as the Count d'Artois, now Monsieur, was then in Germany, whither he had emigrated with several others of the blood-royal.

The conspirators little knew the real spirit and resolution of the late unfortunate monarch; and, supposing that the advice of Monsieur alone had prompted him to the conduct of the moment, they used every means in their power to separate them, or at least to destroy the mutual confidence which subsisted between the two brothers. For that purpose, it is said, La Fayette and his party trumped up a plot about a marquis de Favres, in which they boldly asserted that Monsieur was implicated. Favres was tried; and, as Monsieur knew his innocence, he actually attended upon his trial to give evidence in his favour: but the municipal judges paid no attention to his protestations, and the unfortunate Favres fell a victim to the ambitious plans of La Fayette and Mirabeau, who, by this first revolutionary measure, this first revolutionary trial and condemnation, succeeded in imposing such a belief on the people as they wished, and raised such an odium against the unfortunate prince, that a regard to his own personal safety, when his exertions could no longer be of use to his brother, forced him to emigrate, which he was only able to do through the assistance of a friendly Swede, the count de Fersen, passing by the way of Valenciennes into Brabant; but not until he had actually heard the act of accusation against himself and all the Bourbons publicly cried about, having been printed at a jacobin press, evidently for the purpose of infusing his and their condemnation. Nor did he even then desert his brother; for the escape of the royal family was at the same time concerted, though it did not finally succeed.

No sooner did Monsieur arrive at Coblenz, where he found his now-surviving brother, and the other Bourbon

branches, than he immediately applied himself to the military arrangements necessary for raising and organizing an emigrant force under the auspices of the German emperor and other friendly monarchs; a force which he took under his own immediate command.

No sooner was it known that Monsieur had emigrated, than the new legislative government decreed that he had forfeited his eventual right to the regency, if he did not return within two months: but he knew too well the character of those he had to deal with, to trust to their mercy.

It is unnecessary to recapitulate the events of the period between that and the year 1795, (being already recorded in this work,) when the death of the Dauphin, or rather of Louis XVII. presented the distant view of a throne to the subject of our biography; a throne to which he was proclaimed the rightful heir, not only amongst the loyal emigrants in Germany, but even in La Vendée, in the west of France itself.

Little prospect, however, appeared of his being able to recover the throne of his ancestors; and accordingly he made no serious attempts for it, but resided quietly at the court of Turin, having been for some years married to the daughter of the Sardinian monarch. But even from this retreat he was driven by the advance of the republican armies; when he retired, in 1796, to Verona, a city in the Venetian territories, where he lived *incognito*, as Count de Lille: here, indeed, his residence was of very short duration, as Bonaparte quickly demanded his dismissal from the Venetian protection. To this demand the senate of that ancient and once-powerful state was obliged to agree; but not until the unhappy yet spirited prince had demanded admission to the Golden Book of the senate, which contained the names of all the Venetian nobles. In that book his great ancestor the gallant Henry IV. had once inscribed his name, and the name of Bourbon; and these the insulted monarch disdainfully erased from their records.

Even in his retreat from Verona he seems to have been followed by republican vengeance; for we have seen it recorded, that in the summer of 1797, whilst on his route through Germany, a foreign assassin, or a female regicide, watched for him there; and, whilst standing at the window of an inn in an obscure village, a shot was fired, which wounded him slightly in the head. His conduct on this occasion was most magnanimous, forbidding all search to be made after the villain, and saying, that "it must either be a mistake or a premeditated crime: in the former case, it would be cruel to pursue; and in the latter, as I have done no harm to any human being, the person who would murder me has punishment enough in his own bosom, and wants my forgiveness more than I do his death."

In the contest which Russia had with France, in 1798, the late emperor Paul found it expedient to acknowledge Louis XVIII. as the just claimant to the throne of that country; and it was his intention to assist him in recovering the throne of his ancestors; he offered him an asylum at Mittau, in Livonia, a proposal which the unhappy prince gladly accepted, his health being considerably impaired by the privations, distresses, fatigues, and even the penury and want, which he experienced in his noble adherence to the unfortunate loyalists of the Condéan army, at whose particular request it was that he was persuaded to indulge in a temporary repose.

The conduct of Paul was, at first, magnanimous and generous in the extreme, as his royal guest was received and treated with all the honours which a sovereign in his situation could possibly wish for, having not only a guard of native Russians appointed to attend upon him, but also one formed from the French noblesse; besides being permitted to draw around him as many of his loyal countrymen as he pleased, with whom the generous prince shared, in the most bounteous manner, the liberal allowance which Paul had appropriated to his use. Indeed, so

LOUIS XVIII.

Engraved for the Encyclopædia Londinensis 1820.

anxious, was the emperor to make every arrangement for his comfort and influence, at the place of his residence, that the governor of Mittau was actually placed under his orders; and he was even encouraged to assume so much of the personal functions of royalty, as to have regular levees, at which the noblesse of the neighbouring provinces were proud to attend. But such events could not long remain unknown to the French republicans, who were successful, at length, in acquiring an undue influence over the councils of Paul, whom they persuaded, first, to distress the unhappy monarch by withholding the payment of his pension, and afterwards to send him orders to depart from the Russian dominions; a journey for which they allowed him only a week's preparation. All this was done at the instigation of that man whose recent downfall has restored Louis to the throne of his ancestors.

The duchess of Angoulême, his niece, resided with him at Mittau, accompanied by her husband. To her he explained his sad situation; and assured her, that, as he had not the means of travelling as he had formerly done, and as the little that he possessed would be necessary for the daily maintenance of those attached to him, so he would himself set them an example how to bear misfortune, and would the next day leave Mittau with them *on foot*.

However the duchess might venerate the magnanimity of her uncle, yet she dutifully determined to save him, if possible, from personal inconvenience; and sold to a Jew a valuable bow of diamonds, presented to her as a nuptial gift by her imperial relations at Vienna; by which means she raised a sum that enabled her uncle to travel comfortably.

In Prussia, Louis was treated rather as an enemy than as a friend: in fact, the Prussian cabinet were afraid to show him protection; and it was only, at length, by the forbearance of Napoleon Bonaparte, that the king of France was permitted to reside for some time at Warsaw, in the habitation of a monarch who had also been driven from his throne.

While residing at Warsaw, in 1804, Napoleon had the audacity to send several messengers to him with proposals for a formal abdication of his claims to the French crown; but the prudent and virtuous indignation of Louis guarded him from so mean a compliance: and when Meyer, the Prussian resident, repeated the same proposal on the part of the Corsican, it has been well observed, that the dignified answer of Louis was sufficient to convince the world, that, though fortune may desert virtue, and render it distressed or miserable, yet still she is unable to degrade or dishonour it.

After the accession of the present Russian monarch to the throne of his ancestors, an agreeable change took place in the situation of the French king, as ample and liberal allowances were made for the support of his household, but of which Louis availed himself very sparingly with respect to his own accommodation.

But even at Warsaw he was not permitted to remain undisturbed; for, in the month of July, 1805, a plot was formed by the now-degraded Napoleon, to get rid of those fears which hung about his usurped throne. A man of the name of Coulon, the keeper of a billiard-table at that place, was offered a large sum if he would take an opportunity, in consequence of his intimacy with the cook of the royal kitchen, to throw some poison into one of the culinary vessels. To detail all the particulars of this plot would far exceed our limits; but those who are curious about it will find a long and interesting detail in the third volume of the Revolutionary Plutarch, where a system of premeditated murder against every legitimate prince in Europe is disclosed upon authority which can scarcely be doubted. Nay, such was Napoleon's determination to get rid of all the members of the house of Bourbon, that Coulon was offered additional rewards in case the duchess of Angoulême and her husband should also fall victims to the same treachery.

Subsequent political events rendered it unsafe for
Vol. XVIII. No. 1265.

Louis to reside upon the continent; and his only resource was the *land of real liberty*, where he arrived in October 1807, (see LONDON, p. 158.) and where he continued to reside till the counter-revolution in 1814, (p. 389.) gaining the esteem of all ranks and parties in the state: for, though political reasons, and the uncertainty of the issue of the war, rendered it prudent that our government should not ostensibly sanction the Bourbon claims, nor that the princes of that house should be received at court on public days, yet a great degree of private friendship subsisted between the princes of these two once-rival houses.

We have already noticed that Louis XVIII. whilst Monsieur, was married to a daughter of the king of Sardinia: a match, however, which was not blessed with any issue. Since his majesty's taking up his residence in this country, he had the misfortune to lose this very estimable woman, who bore the misfortunes both of her paternal and maternal family with a degree of fortitude honourable to her rank, and to the sex of which she was an ornament.

Louis XVIII. being at length seated, for the second time, on the throne, and the warlike operations of prominent importance being brought to a conclusion, we shall offer but one remark on the manner in which that restoration was effected. Our readers will recollect, that Great Britain did not sign the Treaty of the 25th of March, 1815, without annexing to it a declaration that, as it was directly repugnant to the principles of the British constitution to force a sovereign upon any nation, Britain joined the alliance, not for the purpose of forcing Louis on the people of France. (See p. 514.) The allies also acceded to this. What was the fact? The French were defeated at the battle of Waterloo: the conquerors marched to Paris, with Louis in their train. Paris submitted under a Convention; the chambers called upon the allied sovereigns to remember their Declaration, when they insisted Louis should be restored. It cannot be denied that Louis was replaced on the throne without ascertaining the wishes of the nation, and merely in consequence of the victories of the allies. If the allies concurred that it was necessary for the repose of Europe, not only that Bonaparte should be again driven from France, but also that Louis should be again placed on the throne of that kingdom, they should have clearly said so: at least they should not have disclaimed all intention of interfering with the internal government of France, and with the right of the French to choose their own sovereign, and then have acted directly contrary to their declaration.

A strong curiosity and interest were naturally excited to learn on whom Louis would fix for his ministers. In his former reign he was thought to have acted imprudently, by selecting, as his advisers, some of Bonaparte's oldest and staunchest adherents but it was believed that, taught by experience, he would, on this occasion, make a different selection. This idea, however, proved to be ill-founded, by an official declaration of the 9th of July 1815, from which it appeared that his majesty decided on having an administration composed of the following persons: Prince Talleyrand, peer of France, president of the council, and secretary-of-state for the department of foreign affairs; Baron Louis, secretary-of-state for the finances; Fouché duke of Otranto, for the department of general police; Baron Pasquier, for the department of justice, and keeper of the seals; Marshal Gouvion St. Cyr, peer of France, for the department of war; the Count de Jaucourt, peer of France, for the marine department; and the duke de Richelieu, peer of France, for the department of the household. Of those appointed to inferior posts were also several who had been in office under Bonaparte; a proof that it was thought necessary to conciliate a party which still remained numerous and powerful.

On the 13th, the king published another ordinance announcing the dissolution of the chamber of deputies, and regulating the mode of election for a new one. By these

these rules the candidates were declared eligible at the age of twenty-five (instead of forty); the deputies were to be persons paying at least 1000 francs (90l.) in taxes; and the whole number was augmented from 258, as fixed by the Constitutional Charter, to 420.

Bonaparte was much blamed for proscribing, or excepting from the general amnesty, eleven persons, not one of whom, however, he ever punished, or intended to punish. (See p. 516.) Louis acted in a different manner: we shall soon see his list of proscriptions followed by the trial and execution of the parties.

On the 24th of July, the king published two ordinances, or decrees. By the first, the following were declared no longer to form part of the chamber of peers: Dukes of Dantzic, Prassin, Plaifance, Elchingen, Albufera, Corneghiano, Trevifo, and Cadore; Counts Clermont de Ris, Cornudet, d'Aboville, de la Croix, d'Agier, Déjean, de l'Ande, Gaffendi, Lapede, Latour Maubourg, Canclaux, Cafabianca, Montequieu, Pontecoulant, Rampon, Segur, Valence, Belliard, and Bural, archbishop of Tours. We are not aware if these persons were deprived of their titles and all the privileges of nobility, so as to be reduced to the rank of private citizens, or whether they were only, as we should say, "expelled the house" of lords. But, at any rate, there was a saving-clause, of which some of them, we believe, have availed themselves, by which "those of the above named may be excepted from this arrangement, who shall prove that they have neither sat nor wished to sit in the self-styled chamber of peers to which they were summoned, they being bound to prove this within a month after the publication of the present ordinance."

The second decree consisted of two principal articles. By the first, the following nineteen generals and other officers were ordered to be arrested and brought before courts-martial, in their respective divisions:

Marshal Ney	Grouchy
Labeodyere	Clausel
Two brothers Lallemand	Laborde
Drouet d'Erlon	Debelle
Lefebvre Desnouettes	Bertrand
Ameilh	Drouet
Brayer	Cambrone
Gilly	Lavalette
Mouton Duvernet	Rovigo

By the second article, the following thirty-eight individuals were ordered to quit Paris within three days, and to retire into the interior of France, to the places which the minister of general police shall indicate to them, there to remain under his superintention, until the chambers decide as to which of them ought either to depart the kingdom, or be delivered up to prosecution before the tribunals.

Marshal Soult	Bassano
Alix	Felix Lepelletier
Excelmans	Mehée
Boulay de la Meurthe	Thibaudeau
Fressinet	Vandamme
Carnot	Lamarque (General)
Lobau	Le Lorgne-Dideville
Harel	Pire
Barrere	Arnault
Pommereuil	St. Jean d'Angely
Arrighi (of Padua)	Dejean, jun.
Garran	Real
Bouvier Dumolard	Durbach
Merlin of Douay	Dirat
Defermont	Felix Desportes
Bory St. Vincent	Meillinet
Garnier de Saintes	Cluys
Hullin	Forbin-Janson, the elder
Courtin	Marbot

While France was bleeding at every pore from the effects of foreign invasion and internal commotion, the spirit of revolt had spread to her colonies in the Caribbean ocean. The promptitude and decision, however, of the

British officers commanding in that station, with the loyalty and firmness of count Vaugirard, governor of Martinique, saved that fine colony from any convulsion. The inhabitants of Martinique, from being so long in the possession of the British, were, in general, well-affected to Louis XVIII. but the garrison, who were newly arrived from France, were not. To a man, they were for their former master; on which account they were, no doubt, selected for that employment. No sooner was the arrival of Bonaparte in France known, than the governor, arming the militia, on whom he knew he could depend, placed them in the forts; and, assembling the troops, he informed them of what had taken place in the mother-country, and declared his intention to remain faithful to Louis XVIII. He called upon the garrison to do so also, which they refused; and, to a man, shouted out for their beloved Napoleon. Count Vaugirard then informed them, that, so situated, they had but one course left to choose, which was to return to France in vessels which he had provided for that purpose; as he was determined, with the aid of the inhabitants, to preserve the colony to the king, till the assistance which he was certain he should receive from the British put it in his power to do so with safety. This expected assistance soon appeared, under sir James Leith and admiral Durham. The British general landed on the island, with a body of troops, on the 5th of June, 1815; and, occupying all the strong positions, kept the refractory soldiery in awe. The whole of the French troops, with the exception of part of a regiment, were afterwards permitted to depart from the island unarmed, in order to return to France. The terms on which this succour was afforded by the British commander was perfectly liberal. The sovereignty of the island was to remain entire with the king of France; the British troops, which were to act as auxiliaries to the governor, were to be maintained at the expense of the British government, and to preserve strict discipline; and the persons and properties of the inhabitants were to be fully respected by them.

In the island of Guadaloupe the revolutionary cause obtained a temporary triumph. A vessel having arrived from France, after a short passage, an insurrection broke out on the 18th of June, in which both the military and citizens declared for Bonaparte. The governor, admiral count de Linois, was placed under arrest; but the next day he was set at liberty, and immediately issued a proclamation, acquainting the inhabitants and soldiers that Napoleon had been received in France without resistance; that the tri-coloured flag was every-where waving, and that the colonists were expected to concur in this change of government. He concluded with *Vive l'Empereur!* On the same day, Napoleon was proclaimed in grand ceremony at Point-à-Petre, under the direction of the commandant, Fromentin, acting for general Bowyer, and with every display of enthusiastic joy. It was not, however, by a sudden effervescence of this kind that a durable revolution was to be effected; and, as soon as the affairs of Martinique were settled, preparations were making by the British commanders to wrest Guadaloupe from the imperial usurper. Sir James Leith, having collected troops from the Windward Islands and the continent of America, and made arrangements with sir Charles Durham, sailed, on the 31st of July, from Carlisle-bay in Barbadoes, whilst the land-force from St. Lucie, Martinique, and Dominica, was ordered to rendezvous at the Saintes. On the 7th of August, the whole force being assembled there, it was resolved to lose no time in making the attack, expedition being rendered necessary, as well by the approach of the hurricane-season, as by the internal state of Guadaloupe, in which the sanguinary scenes of the French revolution were about to be renewed. The 15th of the month, being Napoleon's birth-day, was, according to report, to have been solemnized by the execution of a number of royalists already condemned to death; and their rescue was an object of interest to the British commander.

Sir James Leith having made the necessary arrangements with

with the naval commander-in-chief, the whole fleet got under weigh at break of day on the 8th, and stood towards the Ance St. Sauveur, where the landing most to windward was to be effected. The British general received information that the troops of the line, and militia under arms, in the island, all together amounted to 6000. He determined, therefore, to throw his principal force between that of the French in Grande-terre and Basse-terre, where it was their intention to have assembled nearly the whole of their force, immediately after the demonstration of the British to windward had of necessity terminated. It was the plan of sir J. Leith to attack in three columns; the scarcity of boats and the surf required that the whole should assist in each disembarkation, which was therefore effected successively. The first was made at the Ance St. Sauveur, where a detachment of the French about 500 strong, moving from Grand-terre to join admiral Linois and general Bowyer, showed a disposition to oppose the landing. The brigs of war and gunboats, however, soon scoured that point, and 850 of the Royal York rangers, under lieutenant-colonel Stark, disembarked (notwithstanding a heavy surf) without the loss of a man. Meanwhile the fleet dropped down to Grande Ance, to effect the principal landing, where the enemy was in force, and possessed a strong position, with batteries commanding the landing-place, which was susceptible of obstinate defence. The brigs of war and a gunboat, placed to enfilade, soon obliged the French to abandon their guns, one of which only, a long twelve-pounder, was found mounted. The 15th and 25th regiments, with the remainder of the first and second brigades, were safely disembarked.

At the time of landing, the British general and admiral circulated a long proclamation, of which the following are the material parts.

"Inhabitants of Guadaloupe; The misrepresentations and artifices which have been employed to deceive you with regard to the true situation of Europe, and the principles resulting from despotism and anarchy by which your revolutionary chiefs have conducted you to the brink of a precipice on which you stand, can no longer prevail.

"It is necessary to make known to you the situation of Europe and France, which has, no doubt, been concealed from you by your revolutionary chiefs. Bonaparte has been defeated by the duke of Wellington and prince Blucher in a great and decisive battle, fought on the 18th of June; his army annihilated, and all his artillery and baggage taken. The usurper fled with some of his persecuted generals, and reached Paris, where, knowing how desperate was his situation, he abdicated the pretended imperial crown. The allies were at La Fere and Laon on the 24th of June, in full march on Paris, where they would arrive on the 26th; there was nothing to oppose them. The Austrians and Russians were penetrating into France, in mass, by Italy, Switzerland, and Alsace. At the same time, his most Christian majesty had re-entered France, and by the latest accounts was advancing from Cambray.

"The terms upon which we propose to receive the colony, and the consequences which will result from a refusal, are briefly these: As there is reason to believe that many officers and soldiers of the line have only yielded to circumstances, and serve under the tri-coloured flag merely with the hope of seizing the first favourable opportunity to evince their loyalty; those who shall immediately so declare themselves, shall be admitted to the protection of the British flag, and shall be recommended in the strongest manner to count Vaugiraud, governor-general of the French islands, and representative of his most Christian majesty. All officers and soldiers of the line actually serving under the tri-coloured flag, who shall so declare and separate themselves from the partisans of Napoleon Bonaparte, and who shall surrender, with their arms to the British forces, shall be sent to France as

prisoners of war, to be disposed of according to the orders of the duke of Wellington: the officers and soldiers who shall thus surrender themselves shall preserve their baggage. The militia and other inhabitants in arms under the tri-coloured flag, who shall immediately separate themselves from the troops of the line serving under the revolutionary banner, and lay down their arms, shall be permitted to return immediately to their respective homes, where they shall be protected as well as their property.

"Every officer or soldier of the line who, after the publication of this notice, shall continue to oppose the arms of his Britannic majesty, shall be sent a prisoner of war to England. Every officer or soldier of militia, and every other inhabitant, who, after this proclamation, shall be found in arms, shall be treated as a prisoner of war, and sent immediately out of the colony to be placed in confinement.

"Provided Guadaloupe shall immediately submit to his Britannic majesty's forces, and its inhabitants shall take an oath of fidelity for the time the colony may remain under British dominion, the inhabitants and their private property shall be protected, and the commerce of the colony shall be placed upon a more advantageous footing than during the last war. Every person who shall not immediately avail himself of this proclamation shall be treated, as well as his property, according to the laws of war, and the right of conquest.

JAMES LEITH.

P. C. DURHAM."

At break of day on the 9th, the troops were put in motion in two columns; the first brigade moved upon, and occupied, Dolé; the second marched upon the left of the Morne Palmiste, by Pautrizel. It appeared, that Linois and Bowyer had evacuated Dolé in the night. The French, however, showed themselves in considerable force on the left of the Morne Palmiste, and on the face of that mountain, commanding the main road to Basse-terre: Captain Leith Hay, sir J. Leith's aide-de-camp, was ordered to gain the top of Morne Boucanier, by a difficult detour, with a rifle-company of the royal West-India rangers and a light company of the 6th West-India regiment, to alarm the enemy's right flank and rear, which, being accomplished, obliged him to withdraw; his posts were every where driven, and he retreated to the Morne Palmiste.

A heavy cannonade now announced the disembarkation of the third brigade, under major-general Douglas, in the vicinity of Bailiff and to leeward of Basse-terre. He had been instructed to seize the Batterie des Trois, to occupy the capital, to mask, or, if practicable, to take, Fort St. Charles by a coup-de-main, to open his communication with the columns moving to the attack of Morne Palmiste, and to menace his retreat from thence to Morne Houel.

The French, who had been driven by the vessels covering the landing, collected on the heights, and attacked the light company of the 63d regiment, who were advanced. They gallantly maintained their ground against upwards of 300 of the French, who came down to attack them, till major-general Douglas, in person, supported them with part of the York chasseurs.

While this operation was going on, the columns of the first and second brigades gained the heights of Morne Palmiste, from whence the French were driven at all points, and were now retiring to Morne Houel, which they had fortified with eight pieces of artillery. This was the position where Linois and Bowyer had professed their determination of ultimately disputing the superiority in the field.

Sir James Leith received information, that the commandant of Grande-terre, with the whole armed force, was, as he expected, moving in his rear to form a junction with the main body at Morne Houel. He accordingly reinforced the rear-guard to protect his communications, and occupied in force all the passes of the Gallion, a river running through a formidable ravine at the foot of Morne

Morne Palmiste. Thus the troops from Grande-terre were completely cut off from forming their junction, which they attempted without success by paths through the wood, late in the afternoon, but with light sufficient to point out to comte Linois and general Bowyer that all their plans of concentration were defeated.

After these laborious movements, which the British troops executed in the most creditable manner, there was only time before night to place the columns in readiness to attack the formidable position of Morne Houel at day-break in the morning. The troops accordingly took up their bivouacs. It rained heavily. At eleven o'clock in the night of the 9th, the commanding French engineer came to the British general on the top of Morne Palmiste verbally to propose a capitulation in the name of comte Linois; to which he replied, that the only terms he ever would accede to were already published in the proclamation issued on landing, and that he would not delay the attack on Morne Houel to wait for any farther communications. Accordingly the troops were put in motion at day-break. An officer soon after met the British general with written proposals, which he positively refused. A white flag was displayed on Morne Houel; but sir James Leith sent major-general Murray (who had joined the army from Demerary the preceding night), and his aide-de-camp, captain Leith Hay, with the British flag, to say, that the only signal which should stop the troops would be to see it displayed on the parapet. He had the satisfaction immediately after to see the British standard flying on Morne Houel, and thereby to ascertain that all the troops were prisoners of war, and all the forts and the colony in his possession. (London Gazette, Sept. 16, 1815.)

This conquest was obtained with a small loss, and by it an end was put to revolutionary attempts in the West Indies. Guadeloupe, however, though completely in the martial possession of Great Britain, was not reduced to a state of tranquillity. A number of French soldiers, who had deserted previously to the surrender of the island, took refuge in the woods, where they carried on a desultory and precarious war against the posts of the English, several of whom were killed in their desperate sallies. Many of the inhabitants of Point-à-Petre, who formerly pursued the trade of privateering, were suspected of holding correspondence with them, and supplying them with provisions and ammunition. Measures were, however, taken to prevent this intercourse, and a force was sent against the insurgents. About 300 of Bonaparte's adherents in the island were afterwards apprehended, who were sent to Europe. An exact police was maintained in the capital, by which order was perfectly preserved, though it was evident that the French inhabitants looked upon their conquerors with great aversion. These islands were retained by the English till all the conditions of the peace were fulfilled, which was a considerable time afterwards: they were then formally delivered over to the new French governor appointed by Louis.

The situation of Louis, although surrounded with the legal authority of the nation, was at this time peculiarly hard and difficult. His obligations, on one hand, to the allied powers, who had placed him and still maintained him on the throne; and, on the other, to his own people, now galled and bound down under the yoke of those allies; produced a conflict of feelings and duties which must have proved extremely harassing. A transaction, which exposed him to particular mortification, was passing directly in his view: the Museum of the Louvre, rendered by a long series of French conquests the richest receptacle of the arts in Europe, was completely stripped of its fruits of conquest by the allies. For the circumstances attending this interesting event, we are indebted to the narratives of Mr. Scott (late killed in a duel), and of Miss Helen Maria Williams, who were both on the spot at the time.

It appears that the allied powers, amidst those rapid and brilliant successes, which, in the year 1814, had ren-

dered them masters of the capital, had not overlooked the *chefs-d'œuvre* of art which had been wrested from their respective countries by the right of conquest. The allied sovereigns, when they visited the gallery of the Louvre, beheld pictures and statues once their own, and saw them noted, in the Preface of the Catalogues sold at the door, as the fruit of French victories. The Prussians had not failed to observe, that pictures, which had decorated the bed-chamber of their beautiful and lamented queen, were then placed in the royal apartments of the palace of St. Cloud. There was also a statue in the Museum which was known by the name of the Ganymede of Sans Souci. This statue was of bronze, and of the most beautiful workmanship; it was no less perfect than the Belvidere Apollo, and held that reputation in the north. It was erroneously called a Ganymede; the pose of the arms leading to this mistake; but it is a Gladiator, giving thanks to the gods for a victory just obtained. The Prussians demanded, in 1814, the restoration of this statue, of two pieces by Correggio, and the pictures of St. Cloud, which had been taken from the apartment of their queen. The restitution of these objects became a subject of a most fastidious negotiation between M. Blacas and the ministers of Austria and Prussia. It had been agreed at the peace of Paris, that nothing should be touched that was then exhibited in the Museum, and M. Blacas contrived to extend this article to all the paintings in the royal palaces. Paris, therefore, preserved its statues and pictures; and the Prussians their regrets, at not having regained the trophies stripped from their queen's apartments.

The allied armies, in 1815, again crowned the hills around Paris, and a capitulation was asked and granted. The provisional government demanded that the Museum should remain untouched. The allied generals wrote with a pencil, on the margin of this article, *Non accordé*, "Not granted." This refusal, it appears, did not arise so much from any decision taken with respect to the Museum by the duke of Wellington, who would not prejudice the question, but because Blucher, supported by the public opinion of his country, had, in his own mind, determined upon taking all. The article on the respect to be paid to public and private property was loosely worded. The allies assert, that their respect for the monuments of the arts could never be justly applied to the retaking of objects which had at first been seized by violence.

General Blucher, immediately upon his entrance into Paris, sent a letter to M. Denon, the director of the Museum, demanding not only the objects of the last year's negotiation with M. Blacas, but what was also in the Museum. M. Denon answered, that it was an affair which must be negotiated with his government, and that he would not give them up. M. Denon was arrested during the night by twenty men, and was threatened to be sent to the fortrefs of Graudentz in West Prussia.

From this argument there was no appeal. The objects demanded were delivered. This surrender was made in due order; and the Gladiator, the two pictures of Correggio, and some valuable pieces of the old German school, were carefully packed up by the persons employed at the Museum. This would have been but a trifling loss, had not the king of Prussia taken not only what belonged to Potsdam and Berlin, but also to Cologne and Aix-la-Chapelle, countries on this side of the Rhine, and therefore not in his possession at that period, on the pretext that these objects belonged to the cathedral, and the municipality of those towns.

The following is an accurate translation of a letter of Blucher to general Muffling (the Prussian governor of Paris), in justification of his conduct.

"Paris, Oct. 19, 1815.

Sir; As my conduct has been publicly animadverted upon, for not having allowed the property plundered from Prussia by a banditti, to remain in the Museum of the Louvre, I have only to remark, that, ably supported by

by the illustrious Wellington, I pursued the THIEVES who had despoiled many of the nations of Europe of their inestimable monuments of the fine arts; I attacked and dispersed them, and restored to my country the plunder they had unjustly taken, spurning the idea of negotiating with the French commissioners on that subject. They may now thank Providence for our not following their base example.

BLUCHER."

Still, however, though the brutal activity of Blucher was sufficiently evident by the melancholy blanks on the walls of the Museum; the whole amount of his spoliation would have been as nothing to the remainder of the collection, if the other members of the alliance could have been induced to forbear; and it was thought, by those who were interested in the retention, that the best way would be to keep quiet as to the proceedings of Prussia, to affect to take no notice of them whatever, hoping that silence might cause the affair to die away after the first removals were over; and that either the indifference or the singular good-nature of the states of Europe, might yet leave to Paris the darling boast of being the capital of the world as to fine art. For some time there was reason to hope that this manœuvre would be successful. Indeed no Frenchman permitted himself to entertain the slightest doubt of the consciousness of the allies, when first masters of the French capital, that they were far too weak to repossess themselves of what was held in it as trophies of their defeat. "You knew well, that we should have arisen as one man to destroy you, if you had dared to lay hands on what every inhabitant of France feels to be his honour, his pride, his delight, his existence."

It certainly seemed, however, as if the allies at least hesitated very much to mortify this offensive vanity. Every day new arrivals of strangers poured into Paris, all anxious to gain a view of the Louvre before its collection was broken up. It was the first point to which all the British directed their steps every morning, in eager curiosity to know whether the business of removal had commenced. The towns and principalities that had been plundered were making sedulous exertions to influence the councils of the allies to determine on a general restoration; and several of the great powers leaned decidedly towards such a decision. Much discussion took place; many notes were exchanged; and the French conceived some hopes of forbearance from the liberal ideas of the emperor of Russia. In a note, which was given in by M. Nefflerode on the part of the emperor, the justice or injustice of the measure was less insisted on than its expediency. It represented the painful situation in which it placed Louis with regard to the public; and that, if the allies forebore retaking, last year, what they deemed their property in the museum, from their respect for the king, this motive ought to operate with double force at the present period. It was for a short time believed that the Russian note had produced some effect; but, whether Alexander relaxed in the energy of his representations, or because the Russian troops had withdrawn from the capital, this hope proved delusive. The war of diplomacy ceased; and sentence was passed upon the gallery.

Before actual force, however, was employed, representations were repeated to the French government: but the ministers of the king of France would neither promise due satisfaction nor uphold a strenuous opposition: they showed a sulky disregard of every application. A deputation from the Netherlands formally claimed the Dutch and Flemish pictures taken during the revolutionary wars from these countries; and this demand was conveyed through the duke of Wellington, as commander-in-chief of the Dutch and Belgian armies. About the same time, also, Austria determined that *her Italian* and German towns, which had been despoiled, should have their property replaced; and Canova, the anxious representative of Rome, after many fruitless appeals to Talleyrand, re-

VOL. XVIII. No. 1266.

ceived assurances that he, too, should be furnished with an armed force sufficient to protect him in taking back to that venerable city what lost its highest value in its removal from thence.

Conflicting reports continued to prevail among the crowds of strangers and natives as to the intentions of the allies; but on Saturday, the 23d of September, all doubt was removed. On going up to the door of the Louvre, (says Mr. Scott,) I found a guard of 150 British riflemen drawn up outside. I asked one of the soldiers what they were there for? "Why, they tell me, sir, that they mean to take away the pictures," was his reply. I walked in amongst the statues below. In one of the halls, I found two brown-complexioned, stout, good-natured looking, women, the wives of English soldiers, examining, very curiously, the large reclining figure of the Tiber; one of them exclaimed with a laugh, "See how the young devils run over his body!"—On going to the great staircase, I saw the English guard hastily tramping up its magnificent ascent: a crowd of astounded French followed in their rear; and, from above, many of the visitors to the Gallery of Pictures were attempting to force their way past the ascending soldiers, catching an alarm from their sudden entrance. The alarm, however, was unfounded; but the spectacle that presented itself was very impressive. A British officer dropped his men in files along this magnificent gallery, until they extended, two and two, at small distances, from its entrance to its extremity. All the spectators were breathless, in eagerness to know what was to be done; but the soldiers stopped as machines, having no care beyond obedience to their orders.

The work of removal now commenced in good earnest: porters with barrows, and ladders, and tackles of ropes, made their appearance. The collection of the Louvre might from that moment be considered as broken up for ever. The sublimity of its orderly aspect vanished: it took now the melancholy, confused, air of a large auction-room after a day's sale. Before this, the visitors had walked down its profound length with a sense of respect on their minds, influencing them to preserve silence and decorum, as they contemplated the majestic pictures; but decency and quiet were dispelled when the signal was given for the break-up of the establishment. It seemed as if a nation had become ruined through improvidence, and was selling off.

The guarding of the Louvre was committed by turns to the British and Austrians, while this process lasted. The Prussians said that they had done their own business for themselves, and would not now incur odium for others. The workmen being incommoded by the crowds that now rushed to the Louvre, as the news spread of the destruction of its great collection, a military order came that no visitors should be admitted without permission from the foreign commandant of Paris. This direction was pretty strictly adhered to by the sentinels as far as the exclusion of the French; but the words *Je suis Anglais*, were always sufficient to gain leave to pass from the Austrians: our own countrymen were rather more strict; but, in general, foreigners could, with but little difficulty, procure admission. The Parisians stood in crowds round the door, looking wistfully within it, as it occasionally opened to admit Germans, English, Russians, &c. into a palace of their capital from which they were excluded. I was frequently asked by French gentlemen, standing with ladies on their arms, and kept back from the door by the guards, to take them into their own Louvre, under my protection as an unknown foreigner! It was impossible not to feel for them in these remarkable circumstances of mortification and humiliation; and the agitation of the French public was now evidently excessive. Every Frenchman looked a walking volcano, ready to spit forth fire. Groups of the common people collected in the space before the Louvre; and a spokesman was generally seen exercising the most violent gesticulations, sufficiently indicative

7 H

dicative

dicative of rage, and listened to by the others with lively signs of sympathy with his passion. As the packages came out, they crowded round them, giving vent to torrents of *pestes, diables, sares*, and other worse interjections.

No description can convey an exaggerated idea of the distress of the Parisians at the removal of their favourite monuments. The duke of Wellington, hitherto the theme of their incessant praise, was now destined to become the object of all their sarcasms, and the burden of every idle tale current in that credulous metropolis. England, they said, was to have the choicest statues, the Venus and the Apollo! The French would not hear a doubt whispered on this head: for what other reason should she, who had lost nothing, interfere to break up the collection? The females, accustomed to hold a prominent place in all matters of business in France, made themselves conspicuous also on this occasion; and the British general, when looking around him in a drawing-room, was said to have been told by a young lady, *Ne regardez pas, milord, il n'y a rien à prendre ici*; "You need not look round, my lord; there is nothing here to be taken away."

Wherever an Englishman went in Paris, at this time, whether into a shop or a company, he was assailed with the exclamation *Ah! vos compatriotes!* "Your vile countrymen!" and the ladies had always some wonderful story to tell him, of an embarrassment or mortification that had happened to his duke; of the evil designs of the prince regent, or the dreadful revenge that was preparing against the injuries of France. The great gallery of the Louvre presented every day a more and more forlorn aspect; but it combined a number of interesting points of view, and for reflection. It seemed to be the abode of all the foreigners in the French capital: and it was easy to distinguish the last comers from the rest. They entered the Louvre with steps of eager haste, and looks of anxious enquiry: they seemed to have scarcely stopped by the way, and to have made directly for the pictures on the instant of their reaching Paris. The first view of the stripped walls made their countenances sink under the disappointment, as to the great object of their journey. Crowds collected round the *Transfiguration*, that picture which, according to the French account, *destiny* had always intended for the French nation: it was every one's wish to see it taken down; for the fame which this great work of Raphael had acquired, and its notoriety in the general knowledge, caused its departure to be regarded as the consummation of the destruction of the picture-gallery of the Louvre. It was taken away among the last.

Students of all nations fixed themselves round the principal pictures, anxious to complete their copies before the workmen came to remove the originals. Many young French girls were seen among these, perched up on small scaffolds, and calmly pursuing their labours in the midst of the throng and bustle. A melancholy air of utter ruin mantled over the walls of this superb gallery; the floor was covered with empty frames. A Frenchman, in the midst of his sorrow, had his joke, in saying, "Well, we should not have left to them even these!" In walking down this exhausted place, I observed a person, wearing the insignia of the legion of honour, suddenly stop short, and heard him exclaim, "Ah! my God, and the Paul Potter too!" This referred to the famous painting of a bull by that master, which is the largest of his pictures, and is very highly valued. It belonged to the Netherlands, and has returned to them. It was said that the Emperor Alexander offered fifteen thousand pounds for it.

The Spaniards claimed their share in this general distribution, and succeeded. In the latter times of Bonaparte, in the year 1814, an exhibition had been made of the subjects of the Spanish school; of the Italian, before the time of Raphael; and of the German school. Some French marshals, to please their master, had sent their Morellos to swell this exhibition; which pieces had, by chance, been left during the reign of the Bourbons, the short invasion of Bonaparte, and to the present period. The Spanish am-

bassador would not have demanded the Morellos, had they remained in the houses of those who had taken them; but, as he found them collected in an exhibition, he took advantage of the negligence of their fresh owners, and sent them back into Spain.

And, lastly, presented themselves the commissaries of the king of Sardinia. They came at an unlucky moment. The Austrian guard at the museum had been called away to assist in the removal of the horses at the Tuileries. The guardians of the museum, roused into indignation at the attack of these new commissaries, collected their forces, consisting of numerous workmen, and with brush and broom swept the Sardinians out of the gallery.

An attack meanwhile was directed against the National Library. Among the manuscripts of the Vatican, which was ceded by the peace of Tolentino, were those which had been pillaged from the library of Heidelberg, in the Palatinate, during the thirty-years war, by the soldiers of General Tilly. These spoils were at that period given to the pope. The commissaries of the Margrave of Baden laid violent hands on those manuscripts, as the original property of their master, now sovereign of Heidelberg. These manuscripts, both Greek and Latin, amounted to 4000; and had been taken from Rome, Venice, and the Ambrosian library at Milan. It would have been happy if all had gone that road, since the Vatican is the grave of manuscripts. Whatever appertains to the sciences and literature is there lost to the world.

The duke of Wellington may perhaps be taxed with remissness, for having overlooked, in this hour of retribution, certain property that belonged to England. When Bonaparte, some years since, was on the point of executing his threatened invasion of England, it was deemed expedient to excite the Parisians to sympathy with such an heroic enterprise. Volumes of the history of fifteen or twenty invasions were circulated; but nobody read or believed them. On the maxim of Horace, that what is seen with the eyes produces much greater effect than what passes through the ear; the walls of the museum were covered with pictures, proving that the measure was not only possible, but had really been executed. The history of this marvellous transaction was impressed on Parisian incredulity by the display of Matilda's tapestry, worked by the queen and her ladies of honour, representing, in worsted epic, the heroic feats of her husband, William the Conqueror. Hume, in his History, refers to this tapestry, to authenticate some incident of that period. The duke of Wellington, it appears, had made no inquiry after this historical furniture; which was evidently the property of the prince-regent, (now George IV.) as heir-at-law to William the Conqueror, to whom it originally belonged, as the husband of Matilda. The duke might, however, from a sentiment of generosity, have left it to adorn the now-naked walls of the Museum, and to console the French that their ancestors had once conquered England, and taken London, though it were nearly a thousand years since.

The removal of the statues was longer in commencing, and took up more time; they were still packing these up when Mr. Scott quitted Paris. I saw (says he) the Venus, the Apollo, and the Laocoon, removed: these may be deemed the presiding deities of the collection. The solemn antique look of these halls fled for ever, when the workmen came in with their straw, and plaster of Paris, to pack up. The French could not, for some time, allow themselves to believe that their enemies would dare to deprive them of these sacred works: it appeared to them impossible that they should be separated from France; from *la France*, the country of the Louvre and the Institute; it seemed a contingency beyond the limits of human reverses. But it happened nevertheless: they were all removed. "One afternoon, before quitting the palace, I accidentally stopped longer than usual to gaze on the Venus; on the following morning I returned, and the pedestal on which the Venus had stood for so many years, the

the pride of Paris, and the delight of every observer, was vacant! It seemed as if a soul had taken its flight from a body."

On the subject of the statues, we must now listen to Miss Williams: "A chill sensation came across my heart when I descended to the halls of the sculpture, and saw the vacant pedestal on which had stood the statue that enchants the world. I gazed on the pedestal. One of the old liveried attendants of the hall, interpreting my looks, said to me, in a sorrowful tone, 'Ah! madam, she is gone; I shall never see her again!'—'Gone!' said I.—'Yes, madam, she set out this very morning, at three o'clock; *et sous bonne escorte*.' The old man seemed to mourn over the Venus as if he had been his daughter."

"The adjoining hall presented, a few days after, a most melancholy spectacle. There lay the Apollo on the floor, in his coffin. The workmen were busied in preparing him for his journey, by wedging him in his shell; and an artist was tracing his celestial features, when the trowel, with its white paste, passed across his divine visage. His arm was still majestically stretched out. The French artists, who were present, wept over it; they pressed his hand to their lips, and bade him a last adieu! The scene was now closed on that perfect image, worthy of almost divine honours. He was going to add a new glory to Rome, and draw new pilgrims to his shrine; but to Paris he was lost for ever, and the might well deplore her calamity. She had indeed seized him as her captive, but she had gazed on him with unwearied admiration; she had hailed him as the most splendid trophy of victory; and she would have purchased his stay with her treasures, even with her blood, had not resistance been unavailing."

"In the package of these divinities much apprehension was felt of their sustaining some injury. The necessary aid and tools were wanting. No rewards, no menaces, however, could prevail on the French *crocheteurs*, porters and labourers, plying in the streets for employment, to lend their aid. The French, of the lowest class, were too indignant to be the abettors of such spoliation. The ladders of the master of an exhibition of *singes savans*, "learned monkeys," in the neighbourhood of the Louvre, were at length put in requisition to unhang the pictures. The Pythian divinity of Olympus lay in the streets all night, and might have suffered from any accidental tumult; and the Venus de Medicis was fated, like an abandoned female, to take up her abode for some hours in a common guard-house."

But the bitterest mortification of the people of Paris yet remains to be described. The well-known horses, taken from the church of St. Mark in Venice, had been peculiarly the objects of popular pride and admiration. Being exposed to public view on the Triumphal Arch in the Place du Caroufel, which is one of the most public situations of Paris, this was esteemed the noblest trophy belonging to the capital; and there was not a Parisian vender of a pailful of water, who did not look like a hero when the Venetian horses were spoken of. "Have you heard what has been determined about the horses?" was every foreigner's question: "Oh! they cannot mean to take the horses away," was every Frenchman's remark. On the morning of Thursday the 26th of September, however, it was whispered that they had been at work all night in loosening them from their fastenings. It was soon confirmed that this was true; and the French then had nothing left for it, but to vow, that, if the allies were to attempt to touch them in the *day-light*, Paris would rise at once, exterminate its enemies, and rescue its honour. On Friday morning, (says Mr. Scott,) I walked through the square: it was clear that some considerable change had taken place; the effect of the forms of the horses was finer than I had ever before seen it. While looking to discover what had been done, a private of the British staff corps came up: "You see, sir, we took away the harness last night," said he. "You have made a great improvement by so doing," I replied: "but are the Bri-

tish employed on this work?" The man said that the Austrians had requested the assistance of our staff-corps, for it included better workmen than any they had in their service. I heard that an angry French mob had given some trouble to the people employed on the Thursday night, but that a body of Parisian gendarmerie had dispersed the multitude. The Frenchmen continued their sneers against the allies for working in the dark: fear and shame were the causes assigned. "If you take them at all, why not take them in the face of day? But you are too wise to drag upon yourselves the irresistible popular fury, which such a fight would excite against you!" On the night of Friday, the order of proceeding was entirely changed. It had been found proper to call out a strong guard of Austrians, horse and foot. The mob had been charged by the cavalry; and it was said, that several had their limbs broken. I expected to find the place on Saturday morning quiet and open as usual; but, when I reached its entrance, what an impressive scene presented itself! The delicate plan, for such in truth it was, of working by night, was now over. The Austrians had wished to spare the king of France the pain of seeing his capital dismantled before his palace-windows, where he passed in his carriage when he went out for his daily exercise. But the feelings of the people rendered severer measures necessary. My companion and myself were stopped from entering the place by Austrian dragoons: a large mob of Frenchmen were collected here, standing on tip-toe to catch the Arch in the distance, on the top of which the ominous sight of numbers of workmen, busy about the horses, was plainly to be distinguished. We advanced again to the soldiers: some of the French, by whom we were surrounded, said, "Whoever you are, you will not be allowed to pass." I confessed I was for retiring; for the whole assemblage, citizens and soldiers, seemed to wear an angry alarming aspect. But my companion was eager for admittance. He was put back again by an Austrian hussar: "*What, not the English!*" he exclaimed in his own language. The mob laughed loudly when they heard the foreign soldier so addressed; but the triumph was ours; way was instantly made for us; and an officer, on duty close by, touched his helmet as we passed.

The king and the princes had left the Tuileries, to be out of the view of so mortifying a business. The court of the palace, which used to be gay with young *gardes du corps* and equipages, was now silent, deserted, and shut up. Not a soul moved in it. The top of the Arch was filled with people; and the horses, though as yet all there, might be seen to begin to move. The carriages, that were to take them away, were in waiting below; and a tackle of ropes was already affixed to one. The small door, leading to the top, was protected by a strong guard: every one was striving to obtain permission to gratify his curiosity, by visiting the horses for the last time that they could be visited in this situation. Permission, however, could necessarily be granted but to few. I was of the fortunate number. In a minute I had climbed the narrow dark stair, ascended a small ladder, and was out on the top, with the most picturesque view before me that can be imagined. An English lady asked me to assist her into Bonaparte's car of victory: his own statue was to have been placed in it, *when he came back a conqueror from his Russian expedition!* I followed the lady and her husband into the car, and we found a Prussian officer there before us. He looked at us, and with a good-humoured smile, said, "The emperor kept the English out of France, but the English have now got where he could not!" This passage reminds us, that, at p. 452, we have erroneously described the triumphal car as having contained the statue of Napoleon: the statue was, certainly intended to be so placed, but it never reached its destination. To the account there given, we will just add, that the Arch is of hard Italian freestone, very fine in the grain; the columns of red marble, the frieze of Italian griote; the inscriptions in letters of gold. The two figures of Victory

tory and Peace, and the Car, are of lead, gilt with dead gold.

The cry of the French now was, that it was abominable, execrable, to insult the king in his palace, to insult him in the face of his own subjects, by removing the horses in the face of day! I adjourned with a friend to dine at a *restaurant*'s, near the garden of the Tuileries, after witnessing what I have described. Between seven and eight in the evening, we heard the rolling of wheels, the clatter of cavalry, and the tramp of infantry. A number of British were in the room: they all rose and rushed to the door, without hats, and carrying in their haste their white table-napkins in their hands. The horses were going past, in military procession, lying on their sides in separate cars. First came cavalry, then infantry, then a car; then more cavalry, more infantry, then another car, and so on till all the four past. The drums were beating, and the standards went waving by. This was the only appearance of parade that attended any of the removals. Three Frenchmen, seeing the groupe of English, came up to us, and began a conversation. They appealed to us if this was not shameful. A gentleman observed, that the horses were only going back to the place from whence the French had taken them: if there was a right in power for France, there must also be one for other states: but the better way to consider these events, was, as terminating the times of robbery and discord. Two of them seemed much inclined to come instantly round to our opinion: but one was much more consistent. He appeared an officer, and was advanced beyond the middle age of life. He kept silence for a moment, and then, with strong emphasis, said, "You have left me nothing for my children but hatred against England; this shall be my legacy to them."—"Sir," it was replied, "it will do your children no good, and England no injury."

The attention of Europe had, for some time, been directed to the meeting of the French new legislature, in order to see what measures they would follow to heal the wounds of a distracted country. Their meeting also was generally understood to be the period intended for disclosing the terms of peace. Every argument had been exhausted, and delay created, in adjusting this important matter. The allied ministers would not listen to any terms till the French army was completely disbanded. When that was accomplished, the negotiations for peace commenced. But we must first explain the position in which France stood by the Treaty of Paris of the 30th of May, 1814, (imperfectly alluded to under the article LONDON, vol. xiii. p. 395.) and by the Act of Congress at Vienna, dated June 1, 1815, before the commencement of the late hostilities.

No person will be of opinion that this Act of the Congress possessed only temporary interest, and therefore might be dismissed with a brief and cursory notice, who reflects that by it the whole aspect of continental Europe is changed; nearly the whole of the smaller states, and some of the larger, being, as it were, cast in a new mould. By the wonderful successes of the French, the old system of continental Europe had been overthrown, and those changes introduced which the successive rulers of France, and especially Bonaparte, thought would most directly and effectually tend to consolidate their power, and to acquire and preserve for France an ascendancy over the continent. As soon as the reign of Bonaparte was at an end, the allied powers resolved to new-model the continent. Their professed object was twofold: in the first place, to do away all vestiges of French revolutionary principles, and their effects; and, in the second place, to arrange the different states of the continent as to make a proper and just balance of political weight.

The official papers, in which the result of the labours of the allied powers is laid before the world, consist of the General Treaty of Congress signed at Vienna, and of seventeen acts of a particular nature. As this Treaty is of the highest importance, we regret that our limits will

not allow us to insert it entire in this place; but the mode we have pursued has been this, to copy certain parts of it under the geographical articles to which they apply, a particular instance of which will be found under the article NETHERLANDS, vol. xvi. p. 742, 3, 4. We shall, however give an outline, though a very imperfect one, of the chief provisions of these two treaties, as they applied to other countries besides France.

1. France was confined within the limits which bounded her territories on the 1st of January, 1792, with the addition of part of Savoy, which however was relinquished in 1815 to the king of Sardinia.

2. Austria recovered Lombardy, and added to it Venice with its adjacent territory; possessing thus a population (29 millions) equal, or very nearly so, to that of France under Napoleon, and considerably greater than she has now, or had in 1792.

3. To supersede the confederation of the Rhine, which was dissolved by the downfall of Napoleon, a Germanic Confederation was projected. A general assembly, or federative diet, is to meet occasionally at Frankfurt, to pass, in the first instance, fundamental laws, and afterwards particular regulations as occasion may require. At these meetings the plenipotentiary of Austria is president. The leading feature of the Confederation, like that of the Holy Alliance, is "to defend each other from all attack." For this purpose, the military contingent, during peace, is to be 120,000 men; viz. 96,000 infantry, 18,000 cavalry, 6000 artillery, &c. In case of war, the cavalry will be doubled, and the artillery tripled. The Generalissimo to have the title of Field-Marshal of the Germanic Confederation.

4. Russia had suffered no reduction of her territory, but had proceeded in a regular course of acquisition. Her power, though less colossal than is vulgarly supposed, had received a substantial addition by the acquisition of Finland and of the chief part of Poland. Two thirds of what once was Prussian Poland, and a part of Galicia, were formed in 1815 into a kingdom, the crown of which is worn by the czar.

5. Prussia, on the other hand, has exhibited a striking example of the mutability of political greatness. Raised by the talents of Frederic II. to a rank above her real strength, but making, after his death, successive additions to her territory by the dread of her arms and by diplomatic combinations, she saw the whole overturned by Bonaparte in one fatal campaign. From 1807 to 1813, her dominions continued circumscribed, and her population hardly exceeded six millions. But the arrangements of 1814 restored to her a third of Russian Poland, and a valuable tract of country on the Lower Rhine; and her population is now, as in 1806, above ten millions.

6. Of colonial conquests from France, England retained Tobago, St. Lucie, and the Isle of France. The peace confirmed also our possession of Malta and the Cape. Of the other Dutch settlements, Surinam and Java were restored; but Demerara, Berbice, and Essequibo, containing a number of British settlers, were retained; the merchants of Holland, however, enjoying certain privileges of trade with these colonies. On the continent of Europe, we effected an important and long-desired measure, the union of the seven Dutch and ten Belgic provinces into one kingdom. The latter, in their detached state, presented too tempting an object for France; and would have proved the cause of repeated wars, in which England, from her interest in the independence of Holland, and her dread of invasion, could hardly fail to participate. See NETHERLANDS.

7. The losses of Denmark rank among the most painful consequences of the wars of the French revolution. To strip that pacific and inoffensive kingdom, first of its navy, and next of a kindred country, governed by the same sovereign during 400 years, were acts that called for the regret and condemnation of every unprejudiced observer. The transfer of Norway was opposed by the inhabitants; and

and we add with regret, that our navy was ordered to take part against them by blockading their ports. At last all was terminated by a Convention (October 20, 1814), pronouncing the union of Sweden and Norway under the same sovereign, the latter retaining her separate constitution. Pomerania was transferred from Sweden to Prussia; and Denmark received a small territory to the south of Holstein.

8. Sweden had enjoyed during many years the advantage of neutrality, and, like Denmark, increased gradually her shipping and trade. Deviating from this in 1805, and becoming a party to the coalition against France, she was saved from hostilities by the rapid overthrow of Austria; and Pomerania was not attacked until 1807, when Gustavus IV. chose to refuse peace at the time when he had not the support of a single continental ally. This and other acts of madness led to his deposition in 1809; and the year after, Europe saw with surprise the nomination of Bernadotte as the efficient head of the Swedish government; and there he remains.

10. Spain and Portugal preserved their territory unaltered. Both had received rude shocks from the invader; but in both the reign of superstition and indolence seemed so firmly fixed as to bid defiance to political change, whether introduced by mild or harsh means. Recent events, however, have shown, that both these nations are capable of better things. A liberal constitution is already (we hope permanently) established in SPAIN; and we trust that those attempts which have proved abortive in Naples and Piedmont, will yet be successful in PORTUGAL. See those articles.

11. Switzerland, without being made a province of France, had been obliged to furnish a military contingent in the wars of Bonaparte. The arrangements of 1814 maintained her as a federal state, but with 19 cantons instead of 13; an increase derived, not from extended territory, but from the independent form acquired by certain districts (such as the Pays de Vaud) incorporated formerly with the original cantons.

12. The King of Sardinia was restored to Piedmont; and his other continental possessions, with the addition of the territory of Genoa.

13. Italy was the country of all Europe the most likely to profit by the occupancy of the French. The substitution of an efficient government for the feeble administration of Naples and Rome; the diminution of superstition, the increase of industry, the extirpation of robbery on the highways, and the new modelling of the military establishment; were all objects of the highest importance. To these was added a hope of blending all the states of the peninsula into a common union; a union most ardently desired by the Italian nation, and calculated, above all things, to preserve their country from war and the intrusion of foreigners. The selfish policy of Bonaparte, whose object was merely to extract from every country the utmost possible supply of revenue and recruits, prevented the adoption of this grand measure, until the re-assumed sway of foreigners, in particular of the Austrians, removed it to an indefinite distance, and reinstated the territorial divisions of Italy on the footing of 1792, with the exception of the republics of Venice and Genoa.

14. Turkey was no party to the treaty of 1814, but remained on the footing on which the treaty of 1812 with Russia had placed her. Stationary in an age of change, and inflexible in her adherence to traditional usages, she saw the French revolution pass without hurt; or rather was indebted to it for a relaxation in the shocks to which the European part of her empire is exposed from Austria and Russia. The peace of 1790 had been preserved uninterrupted by Austria; that of 1791 was infringed by Russia by only one war, viz. from 1807 to 1812. The temporary occupancy of Egypt by the French, and the more permanent establishment of England in the Ionian

Islands, have had no effect on the interior of the Turkish empire.

Such was the situation of Europe, and of France in particular, at the commencement of the hundred days. The events of that short but important period occasioned the allies to insist upon terms of peace which France thought very hard and degrading. The first proposals were delivered in by the allied ministers on the 20th of September; and the French government, notwithstanding that they "stood prostrate," were very unwilling to "turn their backs upon themselves." They resisted with all their might; and delivered, next day, a *contre-projet*. But the allies were firm, and they had the power in their own hands. They declared, that "that which was sufficient to satisfy them in 1814, cannot content them in 1815; and that the line of demarcation, which appeared to guarantee the security of the states bordering on France at the epoch of the treaty of the 30th of May, can no longer satisfy the just pretensions which they now prefer."

The ministers of Louis, finding the allied powers resolute in enforcing their demands, determined to retire rather than sign a degrading peace. This event was hastened, in a great measure, through the intrigues of the king's brother, the duke and dukes of Angoulême, and the duke of Berri. The conduct of these branches of the Bourbon family had done no good to the cause of Louis during his former reign; and they seemed not disposed to change that conduct. As these princes naturally regarded the ministry of Louis with abhorrence, they had used their utmost endeavours to bring about a change; and this they soon effected. Fouché and Talleyrand were dismissed: the former was sent to Dresden, as ambassador; and the latter had some trifling situation given him, which permitted him to be near the king's person. The new ministry consisted of the following persons: The Duke of Richelieu, minister for foreign affairs, and, of course, prime-minister; the Duke of Feltre, minister of war; the Viscount Dubouché, minister of the interior; Monf. (now Duke) de Cazes, for general police; and M. Barbé Marbois, keeper of the seals. The following character of some of them appears to be just, and may therefore be acceptable.

The Duke de Richelieu, grandson of the celebrated marshal of that name, emigrated at the beginning of the revolution, and entered into the Russian service, in which he acquired general esteem. For some years he held the government of Odesa, much to the satisfaction both of the sovereign and the people.—Clarke duke of Feltre was an aide-de-camp of the late duke of Orleans, at his entrance into public life; he served the republic most zealously under Carnot, with whom he was intimately connected. He evinced equal devotion to the imperial government; and, embarking in the royal cause, after the landing of Bonaparte, he sustained it with that ardour which forms the leading feature of his character. In all stages of his political career, he proved himself both able and incorruptible.—M. de Vaublanc was a distinguished member, and one of the most conspicuous orators of the first legislative assembly. Among other speeches of his, there exists a very eloquent one in favour of general La Fayette, who was accused by the jacobin-party, shortly before the catastrophe of the 10th of August. M. de V. was violently persecuted during the reign of terror, and, by flight, he escaped the fate of his colleagues, on the 18th Fructidor. Since that period his opinions have become highly royalist. His probity has never been questioned by any party. He was a member of the legislative body under Bonaparte, and also prefect of Metz. There are several speeches of his, at that period, which attested his devotion to the imperial throne.—M. Barbé Marbois was secretary of legation, and afterwards chargé d'affaires, to the United States. Soon after the treaty which France made with that republic, he was intendant of St. Domingo. On the 18th Fructidor he was banished to Cayenne, from

whence, in consequence of that stoicism which marks his character, he refused to escape with Barthélemy and Pichegru. He was minister of finance under Bonaparte, and also president of the chamber of accounts; but, having made a speech very offensive to the latter during his residence at Elba, Bonaparte dismissed him, on his return from that island. M. Barbé Marbois is a man of talents, and of the most austere virtue.—M. de Cazes (since created a duke) was attached to the family of Bonaparte, and counsellor of the imperial court, where he merited consideration. He strongly espoused the part of the king, and was, in consequence, dismissed by Bonaparte on his return. He is much esteemed both for virtue and talent.—M. Corvetto was counsellor of state under Bonaparte, and was considered as one of the most upright and enlightened of that body.

In consequence of the protracted delay of the negotiations, the allied troops, which were evacuating France, were commanded to halt; but, on the entrance of the new ministers into office, matters were soon brought to a conclusion, and the treaties were at length concluded and signed on the 20th of November. They consisted of a Definitive Treaty between France and the Allied Powers, signed at Paris on the 20th of November, 1815; an Additional Article to the preceding treaty, relative to the abolition of the slave-trade; a Convention relative to the payment of the pecuniary indemnity to be furnished by France to the allied powers; a Convention relative to the occupation of a military line in France by the allied army; a Note from the Ministers of the Allied Powers to the Duke of Richelieu, on the nature and extent of the powers attached to the command of the Duke of Wellington; a Convention between Great Britain and France, relative to the Claims of the British Subjects on the French Government; and a Note from the Ministers of the Allied Cabinets to the Duke of Richelieu, communicating a Copy of a Treaty of Alliance between Great Britain, Russia, Austria, and Prussia; besides other documents of less importance.

Of these papers, which are all of high and permanent interest, we can find room for only the

DEFINITIVE TREATY OF PEACE between FRANCE and the ALLIED POWERS.

In the name of the Most Holy and Undivided Trinity.—The Allied Powers having, by their united efforts, and by the success of their arms, preserved France and Europe from the convulsions with which they were menaced by the late enterprise of Napoleon Bonaparte, and by the revolutionary system reproduced in France to promote its success; participating at present with his most Christian Majesty in the desire to consolidate by maintaining inviolate the royal authority; and by restoring the operation of the constitutional charter, the order of things which had been happily re-established in France; as also in the object of restoring between France and her neighbours those relations of reciprocal confidence and good-will which the fatal effects of the revolution and of the system of conquest had for so long a time disturbed; persuaded, at the same time, that this last object can only be obtained by an arrangement framed to secure to the allies proper indemnities for the past, and solid guarantees for the future;—they have, in concert with his majesty the King of France, taken into consideration the means of giving effect to this arrangement; and, being satisfied that the indemnity due to the allied powers cannot be either entirely territorial or entirely pecuniary without prejudice to France in the one or other of her essential interests, and that it would be more fit to combine both the modes, in order to avoid the inconvenience which would result were either resorted to separately, their imperial and royal majesties have adopted this basis for their present transactions; and, agreeing alike as to the necessity of retaining, for a fixed time, in the frontier provinces of France, a certain number of allied troops, they have determined to

combine their different arrangements, founded upon these bases, in a definitive treaty. For this purpose, and to this effect, his majesty the King of the United Kingdom of Great Britain and Ireland, for himself and his allies on the one part, and his majesty the King of France and Navarre on the other part, have named their plenipotentiaries to discuss, settle, and sign, the said definitive treaty; namely, his majesty the King of the United Kingdom of Great Britain and Ireland, the Right Honourable Robert Stewart, Viscount Castlereagh, &c. &c. and the most illustrious and most noble Lord Arthur, Duke, Marquis, and Earl, of Wellington, &c. &c. and his majesty the King of France and Navarre, the Sieur Armand Emanuel du Plessis Richelieu, Duke of Richelieu, &c. &c. who, having exchanged their full powers, found to be in good and due form, have signed the following articles.

Art. I. The frontiers of France shall be the same as they were in 1790, save and except the modifications on one side and on the other, which are detailed in the present article.

First, on the northern frontiers, the line of demarcation shall remain as it was fixed by the Treaty of Paris, as far as opposite to Quiverain; from thence it shall follow the ancient limits of the Belgian provinces, of the late bishopric of Liege, and of the duchy of Bouillon, as they existed in the year 1790, leaving the territories included (*enclavés*) within that line of Philippeville and Mariembourg, with the fortresses so called, together with the whole of the duchy of Bouillon, without the frontiers of France. From Villiers, near Orval, upon the confines of the department of the Ardennes, and of the grand duchy of Luxembourg as far as Perle, upon the great road leading from Thionville to Treves, the line shall remain as it was laid down by the Treaty of Paris. From Perle it shall pass by Lauenfдорff, Walwich, Schardorff, Neidervelling, Pelweiler, (all these places, with their *banlieues*, or dependencies, remaining to France,) to Houvre; and shall follow from thence the old limits of the district (*Pays*) of Sarrebruck, leaving Sarrelouis, and the course of the Sarre, together with the places situated to the right of the line above described, and their *banlieues*, or dependencies, without the limits of France. From the limits of the district of Sarrebruck, the line of demarcation shall be the same which at present separates from Germany the departments of the Moselle and of the Lower Rhine, as far as to the Lauter, which river shall, from thence, serve as the frontier until it falls into the Rhine. All the territory on the left bank of the Lauter, including the fortress of Landau, shall form part of Germany. The town of Weissenbourg, however, through which that river runs, shall remain entirely to France, with a rayon on the left bank, not exceeding 1000 toises, and which shall be more particularly determined by the commissioners, who shall be charged with the approaching designation of the boundaries.

Secondly, leaving the mouth of the Lauter, and continuing along the departments of the Lower Rhine, the Upper Rhine, the Doubs, and the Jura, to the Canton de Vaud, the frontiers shall remain as fixed by the Treaty of Paris. The Thalweg of the Rhine shall form the boundary between France and the states of Germany; but the property of the islands shall remain in perpetuity as it shall be fixed by a new survey of the course of that river, and continue unchanged, whatever variation that course may undergo in the lapse of time. Commissioners shall be named on both sides, by the high contracting parties, within the space of three months, to proceed upon the said survey. One half of the bridge between Strasbourg and Kehl shall belong to France, and the other half to the grand duchy of Baden.

Thirdly, in order to establish a direct communication between the canton of Geneva and Switzerland, that part of the Pays de Gex bounded on the east by the lake Leman, on the south by the territory of the canton of Geneva, on the north by that of the canton de Vaud, on the west by

by the course of the Verfoix, and by a line which comprehends the communes of Collex, Boffy, and Meyrin, leaving the commune of Ferney to France, shall be ceded to the Helvetic Confederacy, in order to be united to the canton of Geneva. The line of the French custom-houses shall be placed to the West of the Jura, so that the whole of the Pays de Gex shall be without that line.

Fourthly, from the frontiers of the canton of Geneva as far as the Mediterranean, the line of demarcation shall be that which, in the year 1799, separated France from Savoy, and from the county of Nice. The relations which the Treaty of Paris, of 1814, had re-established between France and the principality of Monaco, shall cease for ever, and the same relations shall exist between that principality and his majesty the King of Sardinia.

Fifthly, all the territories and districts included within the boundary of the French territory, as determined by the present article, shall remain united to France.

Sixthly, the high contracting parties shall name, within three months after the signature of the present treaty, commissioners to regulate every thing relating to the designation of the boundaries of the respective countries; and, as soon as the labours of the commissioners shall have terminated, maps shall be drawn, and land-marks shall be erected, which shall point out the respective limits.

II. The fortresses, places, and districts, which, according to the preceding article, are no longer to form part of the French territory, shall be placed at the disposal of the allied powers at the periods fixed by the ninth article of the Military Convention annexed to the present Treaty; and his majesty the King of France renounces for himself, his heirs and successors for ever, the rights of sovereignty and property which he has hitherto exercised over the said fortresses, places, and districts.

III. The fortifications of Huningue, having been constantly an object of uneasiness to the town of Basle, the high contracting parties, in order to give to the Helvetic Confederacy a new proof of their good-will, and of their solicitude for its welfare, have agreed among themselves to demolish the fortifications of Huningue; and the French government engages, from the same motive, not to re-establish them at any time, and not to replace them by other fortifications at a distance of less than that of three leagues from the town of Basle. The neutrality of Switzerland shall be extended to the territory situated to the north of a line to be drawn from Ugene, that town being included to the south of the lake of Annecy, by Faverge, as far as Lecheraine, and from thence, by the lake of Bourget, as far as the Rhone, in like manner as it was extended to the provinces of Chablais and of Faucigny by the ninety-second article of the final Act of the Congress of Vienna.

IV. The pecuniary part of the indemnity to be furnished by France to the allied powers, is fixed at the sum of 700 millions of francs. The mode, the periods, and the guarantees, for the payment of this sum, shall be regulated by a Special Convention, which shall have the same force and effect as if it were inserted, word for word, in the present treaty.

V. The state of uneasiness and fermentation which, after so many violent convulsions, and particularly after the last catastrophe, France must still experience, notwithstanding the paternal intentions of her king, and the advantages secured to every class of his subjects, by the constitutional charter, requiring, for the security of the neighbouring states, certain measures of precaution, and of temporary guarantee; it has been judged indispensable to occupy, during a fixed time, by corps of allied troops, certain military positions along the frontiers of France, under the express reserve, that such occupation shall in no way prejudice the sovereignty of his most Christian majesty, nor the state of possession, such as it is recognized and confirmed by the present treaty. The number of these troops shall not exceed 150,000 men. The commander-in-chief of this army shall be [the Duke of Welling-

ton] nominated by the allied powers. This army shall occupy the fortresses of Condé, Valenciennes, Bouchain, Cambrai, Quesnoy, Maubeuge, Landrecies, Avesnes, Rocroy, Givet, with Charlemont, Mezieres, Sedan, Montmedy, Thionville, Longwy, Bitsche, and the tête-du-pont of Fort Louis. As the maintenance of the army destined for this service is to be provided by France, a Special Convention shall regulate every thing which may relate to that object. This Convention, which shall have the same force and effect as if it were inserted word for word in the present treaty, shall also regulate the relations of the army of occupation with the civil and military authorities of the country. The utmost extent of the duration of this military occupation is fixed at five years. It may terminate before that period, if at the end of three years the allied sovereigns, after having, in concert with his majesty the King of France, maturely examined their reciprocal situation and interests, and the progress which shall have been made in France in the re-establishment of order and tranquillity, shall agree to acknowledge that the motives which led them to that measure have ceased to exist. [In point of fact, the army of occupation was reduced in 1817 to 120,000 men, and was totally withdrawn at the end of 1818.]

VI. The foreign troops, not forming part of the army of occupation, shall evacuate the French territory within the term fixed by the 9th article of the military convention annexed to the present treaty.

VII. In all countries which shall change sovereigns, as well in virtue of the present treaty as of the arrangements which are to be made in consequence thereof, a period of six years, from the date of the exchange of the ratifications, shall be allowed to the inhabitants, natives or foreigners, of whatever condition and nation they may be, to dispose of their property, if they should think fit to do so, and to retire to whatever country they may choose.

VIII. All the dispositions of the Treaty of Paris, of the 30th of May 1814, relative to the countries ceded by that treaty, shall equally apply to the several territories and districts ceded by the present treaty.

IX. The high-contracting parties have caused representation to be made of the different claims arising out of non-execution of the 19th and following articles of the Treaty of the 30th of May, 1814, as well as of the Additional Articles of that Treaty, signed between Great Britain and France, desiring to render more efficacious the stipulations made thereby, and having determined, by two separate conventions, the line to be pursued on each side for that purpose, the said two Conventions, as annexed to the present treaty, shall, in order to secure the complete execution of the above-mentioned articles, have the same force and effect as if the same were inserted, word for word, herein.

X. All prisoners taken during the hostilities, as well as all hostages which may have been carried off or given, shall be restored in the shortest time possible. The same shall be the case with respect to the prisoners taken previously to the Treaty of the 30th of May, 1814, and who shall not already have been restored.

XI. The treaty of Paris, of the 30th of May, 1814, and the Final Act of the Congress of Vienna, of the 9th of June, 1815, are confirmed, and shall be maintained in all such of their enactments as shall not have been modified by the articles of the present treaty.

XII. The present Treaty, with the Conventions annexed thereto, shall be ratified in one act, and the ratifications thereof shall be exchanged in the space of two months, or sooner if possible. In witness whereof, the respective plenipotentiaries have signed the same, and have affixed thereunto the seals of their arms. Done at Paris, the 20th day of November, in the year of our Lord 1815.

CASTLEREAGH.

RICHELIEU.

WELLINGTON.

Similar Treaties were signed, on the same day, by the Plenipotentiaries

Plenipotentiaries of France, with those of Austria, Russia, and Prussia.

The French legislature met on the 25th of November, when the king, with a heavy heart, communicated to them that this important document was ratified, and wanted only some diplomatic formalities to enable him to lay before them the extent of the sacrifices demanded of them. His majesty having taken his seat on the throne, with the princes on his right, and the members of the two chambers, uncovered, placed in a circular manner; his majesty then took off his hat, put it on again, and delivered the following speech:

"Gentlemen; When last year I assembled the two chambers, for the first time, I congratulated myself upon having, by an honourable treaty, restored peace to France. She began to taste the fruits of it; all the sources of public prosperity were re-opening, when a criminal enterprise, seconded by the most inconceivable defection, arrested their course. The evils which this ephemeral usurpation caused our country deeply afflicted me. Yet, I ought to declare here, that, had it been possible to affect none but myself, I should have blessed Providence. The marks of affection which my people have given me, in the most critical moments, have consoled me in my personal sufferings; but those of my subjects, of my children, weigh upon my heart; and, in order to put a period to this state of affairs, more burthenome even than the war itself, I have concluded with the powers which, after having destroyed the usurper, still occupy a great part of our territory, a convention which regulates our present and future relations with them. It will be communicated to you without any restriction, as soon as it has received its last formality.

"You will know, gentlemen, and all France will know, the profound grief I must have felt; but the very safety of my kingdom rendered this great determination necessary; and, when I took it, I felt the duties it imposed upon me. I have ordered that there should, this year, be paid from the treasury of my civil-list, into the treasury of the state, a considerable portion of my revenue. My family were no sooner informed of my resolution, than they offered me a proportionate gift. I have ordered similar diminutions in the salaries and expenses of all my servants, without exception. I shall always be ready to share sacrifices which imperious circumstances impose upon my people. All the statements shall be submitted to you; and you will know the importance of the economy which I have commanded in the departments of my ministers, and in all parts of the government: happy if these measures shall suffice for the burthens of the state. In all events I rely upon the devotedness of the nation, and the zeal of the two chambers. But, gentlemen, other, sweeter, and not less important, cares, unite you at present; it is to give more weight to your deliberations, it is to collect more lights myself, that I have created new peers, and that the number of the deputies of departments has been increased.

"I hope I have succeeded in my choice; and the eagerness of the deputies, at this difficult conjuncture, is also a proof that they are animated by a sincere affection for my person, and an ardent love for the country. It is, then, with sweet satisfaction, and full confidence, that I have assembled you about me, certain that you will never lose sight of the fundamental basis of the happiness of the state, a frank and loyal union of the chamber with the king, and respect for the Constitutional Charter. That Charter, which I weighed before I gave it, to which reflection attaches me more and more dearly, which I have sworn to maintain, and to which all of you, beginning with my family, are about to swear obedience, is, without doubt, susceptible, like all human institution, of being more perfect; but none of us ought to forget, that the danger of innovation is not far remote from the advantage of melioration.

"Many other objects of importance require our labours to make religion re-flourish, purify morals, found liberty

upon respect for the laws, render them more and more analogous to these great views, give stability to credit, re-compose the army, heal the wounds that have but too deeply torn the bosom of our country; in fine, insure internal tranquillity, and thereby make France respected without: such are the objects that our efforts ought to lead to. I do not flatter myself that so much good can be the work of one session; but if, at the close of the present legislature, it is seen that we are approaching it, we ought to be satisfied with ourselves. I shall leave nothing undone; and, in order to arrive at it, I rely, gentlemen, upon your most active co-operation."

After the speech, the Duke of Angoulême, Duke of Berri, and the Duke of Orleans, took the oath which follows: "I swear fidelity to the king, and obedience to the constitutional charter, and the laws of the kingdom."—The names of the peers were afterwards called over, who individually took the following oath: "I swear fidelity to the king, obedience to the constitutional charter, and the laws of the kingdom; and to conduct myself in every thing which appertains to my situation as a good and loyal peer of France."

In communicating the documents to the chambers, the Duc de Richelieu explained to them the motives of the government in accepting terms, which he acknowledged to be the most disadvantageous ever signed by France. The motives assigned by him for their acceptance may be summed up in one word of powerful import; *Necessity*. "After long and continued discussions, (said he,) in which demands still more important had been produced against us, and at length withdrawn, those which have been communicated to you, were presented as an *ultimatum*. The most urgent and imperious considerations imposed it on us a law to subscribe to them; and it is enough to know that they have been proposed to *Frenchmen*, to be justified in the conclusion, that indispensable necessity alone could induce them to subscribe to them. After having exhausted all the means of discussion and resistance which could be suggested by reason, and by that political foresight which in good as well as in bad fortune ought to be the constant guide of the conduct of cabinets; seeing on the one part, in the disposition of the ministers of the powers, a determination irrevocably fixed; seeing, on the other hand, that the present crisis brought incessantly into action, in the whole extent of France, the principle of an oppression, of an impoverishment, of an irritation, and, in short, a series of devastations, which seemed daily to increase and to acquire new strength;—we judged, that, if we suffered this crisis to be indefinitely prolonged, the fate of France was at stake, even the fate of those who have imposed upon us such great sacrifices, and perhaps the destiny of social order in Europe. And it was in the prospect of so many dangers, that sacrificing, without hesitation, all our repugnance, we accepted, in the name of the king, in the name of the country, the conditions which have been laid before you." The minister, on ending his discourse, observed for the information of the chamber, that there were no secret conditions accessory to those which he had just communicated.

The speech of the duke de Richelieu seems to have been received with less resignation by the Chamber of Deputies than by the other branch of the legislature. "It was heard," says the Gazette de France, "with profound attention, and the silence of grief. The President, with a faltering voice, acknowledged the receipt of the communication which the minister had made to the chamber, and ordered the printing of the speech, the Treaty, and the Conventions which had been read. The chamber then formed itself into a secret committee, probably to prepare an address of condolence to the king. This purpose, however, was not effected; both chambers resolved, that the usual mode of presenting addresses by deputation should be deviated from in this instance, and that the presidents should be charged to present the thanks of the chambers. On Monday the 27th, the President of the Deputies

ties rendered an account to the chamber, of his mission to the king for that purpose. The President of the Chamber is stated to have said to the king: "Sire; Your faithful subjects of the Chamber of Deputies thank you for not having despaired of the safety of the state; they are sensible, that your magnanimous virtues have saved the country from the greatest calamities. Sire, the chamber participates in your profound grief; but, encouraged by your royal resignation, it feels itself strong enough to encounter so much adversity; its unchangeable confidence in your majesty, its love for your sacred person, and the union of Frenchmen, of which it will furnish the example, will alleviate the weight of the sacrifices that are imposed on us. France, faithful to the word of the king, and aided by Providence, will prove to the world, at what price she is capable of guarding the faith of treaties."

To which his majesty replied; "King of any other country, I might have abandoned hope; but the King of France never despairs of Frenchmen; let them form but one falces, and our misfortunes will be repaired." The chamber, it is said, immediately arose; and cries of "Long live the King" resounded through the hall.

France complained loudly and bitterly of the conditions of peace, which she termed harsh and severe. Galling and humiliating it no doubt was, to a nation which, only three years before, with her arms threatened the confines of Asia, not only to have lost every thing, but thus to have the bridle of Europe placed in her jaws, in order to curb her future motions. This short revolution was certainly most fatal to France; and the expenses which she incurred, in consequence, were immense. We shall here put into a short compass what it has cost her, in consequence of the return of Bonaparte from Elba.

Her own expenses estimated at	-	-	1,500,000,000
Contributions to the allies	-	-	700,000,000
Requisitions, food, clothing, &c. &c.	-	-	690,000,000
Maintenance of 150,000 men, 3 years	-	-	650,000,000
Total			3,540,000,000

or about 148,000,000l. sterling, in money; and at least 150,000 lives in France, and 50,000 in Italy. Such was the bitter cup of humiliation which she was doomed to drain, after so many triumphs over her neighbours, enjoyed with so little moderation. As she had risen higher under Napoleon than at any former period, so was she called upon to submit to a greater abasement.

The most important of all the Treaties, (except the principal one which we have given,) is that between the allies themselves, guaranteeing to each other the performance of the conditions exacted from France. By renewing the exclusion of Bonaparte and his family from the throne, they have extinguished the last hope of the intriguers in the name of Napoleon II. and, by engaging to support the foreign troops left in France against any attack, the allies guarded the throne itself against the possible influence of evil ministers, who might not hesitate to plunge their country into new wars.

During this session, a very important temporary law passed both chambers and received the royal sanction. Its object was to suppress seditious practices and demonstrations, for which various degrees of punishment are provided. It bears some resemblance to our suspension of the *habeas-corpus* act, and arms the executive with almost arbitrary power; but its duration was limited to the commencement of the next session of the chambers.

For some time after the second restoration of the Bourbons, it seemed as if the king was disposed to pass over the offences mentioned in his proclamation (p. 556.) and in his decrees (p. 574.) and so content himself, as Napoleon did, without "bringing up for judgment" those who had betrayed him. But, at length, measures were taken for punishing the principal offenders; and a commission was authorised to examine "the conduct of officers who had served during the usurpation."

VOL. XVIII. No. 1266.

Colonel Labedoyere, having been arrested soon after the French army was disbanded, was tried on the 15th of August. M. de Sauvigny was president of the court. The charges against him were "treason, rebellion, and seducing his troops from their duty." His offences were clearly proved; and he was found guilty, and sentenced to suffer death. It appears that, on the news of Bonaparte's landing, he was ordered with his regiment, by general Devilliers, from Chambéry to Grenoble, where some troops were assembled to stop the progress of the usurper. He was placed in bivouac on the ramparts; but he incited his soldiers to revolt, and led them out to join the invader. He had scarcely left the town, when he drew his sword, and cried out, *Vive l'Empereur*. He then broke open a chest, whence he took an Eagle, placed it at the top of a branch of a tree, marched under it to join Napoleon, and returned with him the same evening to take military possession of Grenoble. His superior officer, general Devilliers, followed, and tried in vain to bring him back, though he persuaded about a hundred of the soldiers to return to their duty. In the preliminary proceedings of the trial, he admitted these facts, but denied having taken the oath of allegiance to the king; saying, that he had not joined his regiment when the oath was administered to that corps. After the ruin of Bonaparte's cause, Labedoyere joined Excelman's corps, which had hoisted the white flag. He did not himself hoist a white cockade, but joined it as a simple citizen. He wished to escape to America; but found it impossible to embark, or even to proceed to Switzerland. He then returned to Paris, and surrendered himself. The counsel against the accused remarked in aggravation, that Labedoyere had given the first signal of revolt; it was to his defection that all other defections were owing.

M. Labedoyere read his defence, which appeared to be written in haste and without method, upon slips of paper. He declared that he had no intention, nor the possibility, of denying facts public and notorious; he was ready to sign the act of accusation drawn up against him; but he would justify himself from the charge of having been concerned in any plot that preceded the return of Bonaparte; and he protested that he was convinced no relation ever existed between the isle of Elba and Paris. He then took some objections to the form of the proceedings. He observed, that the law ordained, that military prisoners should be tried by the councils of war of their respective divisions, in order to facilitate to them the means of moral justification in the very places where the crime imputed to them may have been committed: the last ordonnance of his majesty appears to deprive prisoners of the benefit of the law; can they demand it? this is the question which he wished to submit to council. He was answered in the negative.

The court, after long deliberation, found him guilty of treason and rebellion. They also declared, that he had not profited of the delay of eight days granted by the ordonnance of the king, to all the abettors of Bonaparte to return to their duty. In consequence, they condemned him to the pain of death, to degradation from the rank of colonel, and from the title of commandant of the legion of honour, and to the payment of the expenses of the trial.

After sentence of death had been pronounced, he was informed that he could appeal to the Court of Cassation; he did so, and, amongst other grounds, very justly urged the 12th article of the Convention of Paris, (see p. 557.) but this and every other plea was rejected. The court delivered its confirmation of the judgment on Saturday afternoon, at three o'clock; it was communicated to him, and he was required to prepare for instant execution.

When the family of Labedoyere heard that the council of revision had confirmed his sentence, his wife, clad in deep mourning, appeared before the king as he was getting into his carriage, and, falling at his feet, exclaimed, "Pardon, pardon, sire!"—"Madame," said the king, "I know

your sentiments and those of your family; and never was it more painful for me to pronounce a refusal. If M. Labedoyere had only offended me, his pardon should be granted; but all France demands the punishment of the man who has brought upon her all the scourges of war. I promise my protection to you and to your child." The mother of the unfortunate man was prevented from seeing the king, by those around him.

Col. Labedoyere in the mean time was hurried off to the Plain of Grenelle, where two lines of gendarmes were drawn up, to carry the sentence into effect. He refused to have his eyes bandaged; and, taking off his hat, said to the soldiers, "*Surtout ne me manquez pas—tirez!*" They fired, and in an instant he was no more; this was at half-past five o'clock, Aug. 19, 1815; two hours and a half after the confirmation of the sentence.

The next trial of importance that took place was that of Marshal Ney. This officer, on the return of Louis to Paris, left that capital with the intention of retiring to a foreign country; but was arrested near Aurillac, in Auvergne, on the 25th of August. After various delays, it was determined that his case should be submitted to a court-martial of the first military division, composed of Marshal Jourdan as president, Marshals Massena, Angereau, and Mortier; Lieutenant-generals Counts Villatte, Claparede, and Maifon. Massena, at the opening of the proceedings on the 9th of November, urged, as a ground for declining the judicial office, an old grudge, originating in some differences which had taken place between Ney and himself in Spain. This conscientious scruple being overruled by his colleagues, the trial began with the reading of some examinations of the prisoner by the prefect of the police, the depositions of witnesses who had already been examined, and a mass of papers relative to the conduct of the accused. The reading of these documents being finished on the 10th, Ney was brought before the court, but refused to answer any questions, on the ground of the incompetency of that tribunal. His advocate, to whom he left the exposition of the grounds of his protest, rested his arguments of incompetency on three positions: 1. That, by the charter, all crimes of high treason must be tried by the peers of the accused. 2. That peers cannot be tried criminally except by peers. 3. That, even supposing a marshal to be amenable to military law, the composition of that tribunal was not legal, because marshals, as grand dignitaries of the empire, bear no analogy to commanders-in-chief, who must be tried by officers of the same rank. The members of the court retired to consider these objections, and on their return, in half-an-hour, stated, that by a majority of 5 to 2 they declared themselves incompetent to try Marshal Ney.

This unexpected decision, although extremely mortifying to the king and his ministers, produced no hesitation as to the farther steps which ought to be taken. On the 11th the ministers, with the duke of Richelieu at their head, repaired to the Chamber of Peers to communicate a royal ordinance, directing the chamber, in conformity to the 33d article of the Charter, to proceed immediately to the trial of Marshal Ney. The duke, in an energetic speech, in which he did not disguise the disappointed feelings of his majesty's government, conjured the chamber to crush the hopes of a malevolent faction, to act with promptitude, and not to suffer a longer impunity of crime to engender new miseries. This was a pretty good hint as to what the king, in his paternal goodness, expected and wished should be the issue of the trial. The chamber accordingly determined on the 13th to proceed to the trial, and fixed the opening of it for the 21st.

Ney meanwhile, "in his last extremity," as he expresses himself, addressed a memorial to the ministers of the four great allied powers; demanding from them and their courts the protection which he claimed under the 12th article of the Military Convention of July, before referred

to. By that article, "the lives and properties of the inhabitants, and all persons in general who were then in Paris, were secured from all molestation on account of the functions which they held, or their political conduct or opinions." He contends, that, as this Convention was signed by the British and Prussian generals on the part of the allied powers, of whom Louis XVIII. was one, the King of France is equally bound to the observance of its conditions with every other member of the confederacy; and that, independently of this virtual assent, the Convention afterwards received the express sanction of his majesty on entering the capital. He concludes with declaring, that, had it not been for his implicit reliance on the word of so many sovereigns, he would have retired to some country where he was unknown, to bury himself in obscurity. To this memorial the duke of Wellington briefly answered, that the Convention related merely to the military occupation of Paris; that it was designed for the protection of the inhabitants from any measures of severity under the military authority of those who concluded it; but was never intended to tie up the hands of the then existing French government or any other which might succeed it, from acting as it might think fit.

The chamber of peers met on the day appointed; and, after about a fortnight's delay allowed for the summoning of witnesses, Ney was brought, on the 4th of December, before that tribunal. As the fact of his treasonable conduct in deserting the cause of the king, and joining Bonaparte with the force under his command, could not be controverted, the defence of his counsel principally aimed at a palliation of his guilt, founded on the alleged difficulty of the situation of the marshal, who was hurried away by the force of circumstances. It was also urged at the trial, as it had previously been in a note addressed to the duke of Wellington, that the Convention concluded for the surrender of Paris held out security to the persons and property of its inhabitants, whatever might have been their political conduct anterior to that event. The ministers shamefully contended that this convention had no reference to the king's dispositions and rights as sovereign of the country, that he never acceded to it, and that consequently he could not be bound by any of its provisions.

M. Dupin, his advocate, then attempted another mode of defence, which will appear rather singular: "The marshal (said he) is not merely under the protection of the French laws; he is under the protection of the law of nations. I speak not now of the Convention, but of the limits traced by the Treaty of the 20th of November, which certainly is an act solemn and legal, which we may invoke, since it is to that we owe the happy peace we now enjoy. The Treaty of the 20th of November, in tracing a new line round France, has left on the right Sarrebruck, the country of the marshal. The marshal, Frenchman as he is in heart, is no longer a Frenchman since the treaty." Here the accused with great vehemence interrupted his advocate: "*I am a Frenchman! I will die a Frenchman! I thank my counsel for what they have done, and are ready to do; but desire them rather to cease defending me at all than to defend me in this way. I forbid my counsel from saying a word more.*"

M. Bellart, after a conference with the king's ministers, said, "Since the marshal renounces all further defence, we renounce the right of reply. I shall now present the requisition, upon which the chamber will retire to deliberate." The chamber having deliberated six hours, brought in the expected verdict, declaring the unfortunate marshal guilty of high treason, and condemned him to suffer death. There were 160 peers present: 139 voted for the punishment of death; 17 for banishment, (deportation); 4 refused to vote at all; three upon the principle that it is not lawful for one man to decide upon the life of another, and one (the duke de Choiseul) said that, having himself been more than once condemned to death during the revolution,

volution, the horror of that situation was so strong upon his mind, he could not bring himself to place any other human being in a similar one.

This was on the 6th; and the promptness of the execution after sentence put folks in mind, as in the case of Labedoyere, of the good times of the republic; for at nine o'clock on the following morning he was put to death. The expression used at the time was, that he was "put to death *clandestinely*;" by which, however, nothing more is meant, than that he was executed at an earlier hour, and on a different spot, from what was expected; and hence the multitude, who intended to witness his death, were disappointed. The coach which conveyed him, traversing the garden of the Luxembourg, proceeded to the end of the grand walk that leads to the observatory, which was the spot fixed on for the execution. On finding the coach stop, the marshal, who thought they were going to carry him to the Place de Grenelle, expressed some surprise. Asking if that was the place of execution, he was answered in the affirmative; and immediately alighted. After embracing his confessor, to whom he gave his snuff-box for his wife, and some pieces of gold to be distributed to the poor, he proceeded with a quick step to within eight paces of the wall: he then faced the detachment of veterans who were to fire: he took off his hat to them, crossed his arms, and said, "Soldiers, I am innocent, I die innocent; and I appeal from this iniquitous judgment to God and to posterity." He then immediately unfolded his arms, and exclaimed, "Do your duty!" The volley was fired, and he fell: two balls struck him in the head, four in the body, and one passed through his heart. Conformably to military regulations, the body remained exposed on the place of execution for a quarter of an hour. There were but few persons, however, present; for the populace, believing that the execution would happen on the Place de Grenelle, had repaired thither. The body was placed upon a litter, covered with a cloth, and carried by the veterans to the Hospital of the Foundlings. All this was over before half-past nine; and, at ten, madame Ney, ignorant, like the people, that the execution had taken place, went to the Tuileries to implore the king's clemency; but the duke of Duras, to whom she addressed herself in order to be introduced, was obliged to inform her that the marshal no longer existed!

The next trial of importance which took place in Paris, after that of marshal Ney, was that of general Lavalette, the director-general of the post-office, who was accused of high-treason, in taking possession of the post-office on the 20th of March, before the arrival of Bonaparte. Lavalette was related to the Bonaparte family, having, in 1802, married a niece of the empress Josephine. He served as aide-de-camp to Bonaparte in his Italian campaigns, partook of his fortune in Egypt, and continued to serve under him till the peace of Luneville, in 1801, when he was appointed counsellor-of-state, and director-general of the posts, which place he occupied till the restoration of the Bourbons in 1814, when he was dismissed, and his place given to M. Ferrand. His trial commenced on the 20th of November, before the court of assize for the department of the Seine.

It is to be observed, that a post-master, in Paris and other great towns of France, is an officer of great importance; for he not only directs the conveyance or detention of letters, but has also all the inn-keepers under his jurisdiction, so that no traveller can obtain post-horses without his consent. Lavalette, having gone to the post-office, and displaced M. Ferrand, immediately circulated the following order:

"March 20, 1815. The post-master must give horses to no person who does not produce an order signed by me, or the emperor's ministers.

LAVALETTE."

It is not necessary for us to enter into the particulars of the trial, which occupied two days. About twelve o'clock at night, on the 21st, he was brought in guilty,

and sentence of death was pronounced upon him. He appealed, in the usual manner, against the sentence; but the attempt proved unavailing; and, on the 15th of December, he received a notification which confirmed the decision of the court of assize.

As he was not executed on the following day, according to the promptitude used in the two former instances, an idea went abroad that it was intended to commute his punishment; and madame Lavalette, whose health had been dreadfully impaired by her sufferings since the arrest of her husband, resolved, with the assistance of marshal Marmont, to endeavour to throw herself into the way of the king, and implore his mercy. The following is a short account of this affair. It is to be understood that, just previous to the king's going to mass, no person is permitted to enter from the great staircase into the Salle des Marechaux, through which he passes from his own apartments to the chapel. At this moment, however Marmont with madame Lavalette on his arm, both in deep mourning, contrived to pass the national guard who was on duty at the door; and, as the king, monsieur, madame, and the usual escort, entered the hall in their way to the chapel, madame Lavalette suddenly and unexpectedly rushed forward, seized the hand of the king, and, falling at his feet, exclaimed, "Pardon, pardon, fire!" The king could not refrain from tears; but, after looking very severely towards Marmont, he said to madame Lavalette, "I had hoped, madame, to have been spared this painful scene. In thinking you could save your husband, you have done your duty; but I must also do mine as a king." He then disengaged himself, and passed on, evidently much distressed. Madame Lavalette then attempted to get to the duchess d'Angouleme to intercede; but, overcome by the poignancy of her feelings, she fainted on the floor, and was carried out of the hall.

Notwithstanding the ill-success of this attempt, however, Lavalette escaped the infliction of the sentence passed upon him, by a stratagem which reflects everlasting honour upon the affection, constancy, and fortitude, of his wife. It has been already stated, that her health had been seriously impaired; in fact, she had been delivered of a dead child; and therefore, for several weeks, in order to avoid the motion of her carriage, she had made use of a sedan-chair. She was accustomed to be carried in this vehicle into the prison, when it was constantly deposited in the passage of the under-turnkey's room; thence passing through a door, the yard, and corridor, leading to the prisoner's apartments. At four o'clock on the afternoon of the 20th, madame Lavalette arrived, as usual, with a great French bonnet and a large veil, accompanied by her daughter, a young lady about eleven years of age. She was assisted up-stairs, and dined with her husband. About half-past five, M. Lavalette, arrayed in his wife's clothes, taking his daughter by the arm, and supported by one of the turnkeys, slowly descended the stairs. Nothing occurring to excite suspicion, he passed before all the inspectors and guardians of the prison, and, at the unbarring of the last gate, was restored to his friends and liberty. In the mean time, madame Lavalette, who had thrown over her the large cloak of her husband, was seated, almost breathless, in his arm-chair, with a book in her hand, and the candle burning behind her on the table. At half-past six, the gaoler, entering the room, spoke to her, but met with no reply; he repeated the question, and, astonished at the continued silence, he approached nearer to the lady, when with a smile, succeeded by strong convulsions, she exclaimed, "He is gone!" The confusion may be easily imagined. The prefect of police was acquainted with the fact at a quarter before seven; estafettes were dispatched in every direction, and the barriers were instantly closed.

The police traced the chair two streets distant; there, it appears, M. Lavalette alighted, and stepped into a carriage that was waiting for him. This well-conducted plan

was

was executed with peculiar facility, and at the decisive moment; for M. Barbe Marbois, after several requests, was reluctantly obliged to send, on the evening of the day before, to his majesty's attorney-general, the papers which passed through his hands from the court of cassation. It was even rumoured that he, in some degree, committed himself, by keeping those important documents two days longer in his possession than the law authorises. The attorney-general, had he received these papers before, must have done his duty immediately, and Lavalette would have been no more.

It is necessary here to observe, that the king of Bavaria on hearing of the conviction of Count Lavalette, to whom he was nearly related, demanded, through his minister, his full and entire acquittal, in virtue of the 12th article of the Convention of the 3d of July, which guaranteed the lives and property of all those who had taken any part in the revolution. This positive and well-timed demand staggered not only the French ministers, but the king himself; nay, it staggered even the duke of Wellington, who made that convention. The fact is, that the duke, in that very act, solemnly guaranteed the lives and properties of the individuals in question; and, in his letter to marshal Ney, it is plain that he shrunk from his duty in maintaining them. The trials of these men was a mere farce; for their condemnation was previously determined upon by the king and his ministers. In the trial of Ney, whenever his advocate urged a point of law in his favour, he was hissed and coughed down; and the president of the chamber of peers, who was a violent ultra-royalist, authoritatively dismissed, but without attempting to find even the shadow of an argument, the important plea which resulted from the 12th article of the capitulation of Paris, although the chief of Davoust's staff swears, that "his orders were to break off the conferences, had a refusal of it been made." The French attorney-general, however, objected to the article, as being "the work of foreigners," when, at the same time, he must have known, that, had it not been for "*the work of foreigners*," his master would not then have been in the Tuileries.

The circumstances we have mentioned being combined together, namely, the protest of the king of Bavaria, and the detention of the papers, &c. caused it at first to be very generally surmised that the king, or at least some of his ministers, had connived at the escape of this culprit. But it has since been discovered that he was assisted in his plans by three English gentlemen of some distinction: Sir Robert Wilson, who, as a soldier and a writer, had strongly manifested his antipathy to Bonaparte; Capt. Hutchinson, of the guards, nephew to lords Hutchinson and Donoughmore; and Mr. Bruce, son of Crawford Bruce, esq. banker.

These gentlemen were acquainted with the intended escape of Lavalette, and took measures to conceal him. Mr. Bruce procured the measure of his person, which Hutchinson transmitted to a French tailor, informing him that it was for an English general who had already left Paris, but wished the clothes to be sent after him without delay. On the 7th of January, 1816, in the evening, all matters being previously arranged, Bruce and Wilson met at Hutchinson's rooms, under pretence of taking a bottle together. Between seven and eight o'clock, Lavalette was brought thither by a Frenchman. He seemed at first in great emotion, and was so disguised that they did not know him. However, he was soon disembarrassed of his masquerade dress, furnished with a pair of pistols, and left to the care of Bruce for that night. The next morning, at half-past six, Sir Robert Wilson was at Hutchinson's door with a cabriolet and two saddle-horses, as if he was going to inspect some troops at a distance from the capital. Bruce and Lavalette entered the cabriolet. Sir Robert and Hutchinson rode near it, occasionally conversing with the persons within, one of whom, of course, contrived to keep his features concealed. On one occasion, they changed horses in the presence of

four gendarmes, whose suspicions were lulled by telling them the party were going to look out cantonments for a division of the English army. When they reached Compeigne, they found a serjeant ready to conduct them to the aide-de-camp's lodgings, where they took some refreshment, the latter having unsuspectingly sent a note beforehand for that purpose. They met with no obstacle whatever, except at Cambrai, where they were detained three hours at the gates. On their progress to Valenciennes, they were three times examined, and their passports carried to the respective commandants. They made no stop until they had crossed the Meuse, when they dined, and made arrangements for the ulterior destination of Lavalette; and, having taken leave of him, returned by Maubeuge and the Porte St. Martin.

On the return of Sir Robert Wilson and his companions to Paris, they were arrested in their beds early in the morning of the 13th of January, by an order from the minister of police, and carried to the prefecture, and from thence to the prison of the Abbaye, where they were confined in separate apartments. They demanded to be admitted to bail; but that was refused. After various examinations and considerable delays, they were brought to trial before the assize-court of the department of the Seine; together with Jacques Eberle, turnkey of the house of justice; Jean Baptiste Roquette de Kerguifec, head-gaoler of the same prison; Guerin, *alias* Marengo, Mad. Lavalette's chairman; and Benoit Bonneville, valet of M. Lavalette; charged respectively with having taken a part, more or less direct, in the escape of Lavalette.

On the facts charged against the accused, after their frank avowals, corroborated by the fullest proof, documentary and parole, no possible doubt could remain: and, at half-past five in the afternoon of the next day, the jury delivered their verdict into court. It was read by their foreman, and contained an acquittal of all the Frenchmen, except the turnkey, Eberle, who, as well as Sir Robert Wilson, Mr. Bruce, and Mr. Hutchinson, were found guilty. The president then proceeded to read the penal code, applicable to the convicted persons. Eberle was sentenced to two years' imprisonment. The article applicable to Sir Robert Wilson, and his friends, prescribes imprisonment for a term not exceeding two years, nor less than three months, at the discretion of the judge; and the president, without hesitation, pronounced for the shortest allowable period.

The French government were not deterred by the defence which was made founded on the 12th article of the Convention of Paris, from prosecuting and bringing other generals to trial, many of whom were condemned and shot. These measures, however, created general dissatisfaction throughout the kingdom. At Lyons, this spirit actually burst forth about the end of January 1816, in which generals Meunier and Lagrange were implicated. This attempt against the government, however, failed; the former was killed, and the latter afterwards secured a few leagues from the city. An insurrection of a more alarming nature took place at Grenoble, in May. This city is situated to the south-east of Lyons, and was the first great town that opened its gates to Bonaparte on his march, after landing from Elba. An attempt was made to take it by surprise, on the night between the 4th and 5th of May. The insurgents at first met with some success; but they were at length defeated with the loss of about 200 killed, wounded, and taken prisoners. Their force amounted to nearly 2000 men; and, as they consisted chiefly of half-pay officers and disbanded soldiers, they made a most desperate resistance to the troops opposed to them. This conspiracy was of a very general character, and its ramifications extended to the remotest parts of the country. Of those taken prisoners in this affair, thirty-eight were tried on the 9th of May, and fourteen shot on the following day. Didier, the leader, was subsequently secured, tried, and executed. Another set of conspirators were discovered at Paris, twenty-eight of whom were arrested

rested and brought to trial. The three principals, named Pleignier, Carbonneau, and Tolleron, were declared guilty of high-treason, and condemned to suffer death accordingly; seven were sentenced to transportation, and seven to solitary confinement for different periods, from five to ten years. This plot was connected with that discovered at Lyons, and even reached Brussels, which city was full of French refugees. Another revolt took place at Toulon, but was suppressed, though attended with the effusion of blood. Disturbances were continually breaking out in some parts of France, which, at one time, assumed such an alarming character, that the duke of Wellington was on the point of marching with his army to put it down.

This spirit of discontent was augmented, in a great measure, by the impolitic proceedings of the chamber of deputies; and the king was at length advised to close their sittings till the latter part of the year. So long, however, as these men continued to have any influence, prosecutions, trials, and executions, were the order of the day in France. General Mouton Duvernet, who surrendered himself, was tried and condemned to death on the 19th July, and shot on the 27th. Five persons were executed at Montpellier, on the 22d, for political offences, and great numbers were executed in other places. The prevotal court at Grenoble, which few would suspect of too much indulgence, recommended to the royal clemency eight individuals. This was not only withheld, but some disapprobation manifested to the members. For their own justification, they gave publicity to the motives which guided them. It appears, the greater part of the delinquents, for whom they invoked the king's mercy, were youths under eighteen, and that none of them were taken in arms; but it did appear that some of them were possessors of national property, and they had declared their resolution of defending it to the last drop of their blood. A youth of eighteen, who had inherited, a few months before, an estate of 500,000 francs, being captured in the ranks of the insurgents, was tried and shot. This refusal by Louis of an unanimous recommendation to mercy, will show the spirit of the court at this time, or rather of the ultras by whom the unfortunate monarch was influenced. We now proceed to the trials of the generals.

General Debelle was tried and found guilty upon two charges; namely, for assuming, without authority, the command of the department of the Drome, and for carrying arms against the king. Sentence of death, and degradation from the legion of honour, was passed upon him by the court; who, however, recommended him to mercy. Lieutenant-general Travot was also condemned to death, at Rennes, for rebellion, and exciting the citizens to arm against the legitimate authority. The sentence of death on Debelle was commuted for ten years' imprisonment; and he afterwards, at the intercession of the duke d'Angoulême, received a free pardon from the king. The sentence on General Travot was annulled by the tribunal of revision. The sentence of death pronounced against Col. Boyer, for his treasonable conduct at Guadaloupe was commuted to imprisonment for twenty years:—Admiral Linois was acquitted, and afterwards made a peer.

General Bertrand, who is with Bonaparte at St. Helena, was tried by a council of war at Paris, and condemned to death. General Lefebvre-Desnouettes, another of the principal agents in the usurpation of Bonaparte, was tried in his absence as *contumacious*; and, being found guilty, sentenced to death. He is the same person that was taken prisoner in the peninsula, and broke his parole in England.

General Rigault and Captain Thomassin were tried by the second council of war of the first military division; the former was absent and contumacious, the latter appeared. They were charged with using the public funds at Epervay, for the purpose of corrupting the troops and the inhabitants in favour of the return of Bonaparte. The total sum so applied by them was stated at 27,400

francs. General Rigault was found guilty, and sentenced to death; Thomassin was acquitted.

Marshal Gruyer was condemned to death by the council of war sitting at Strasburg; but his sentence has been commuted to imprisonment for twenty years.

General Chartrand was shot at Lille, in pursuance of his sentence, for having joined Bonaparte. Among other charges, he was accused of stopping the progress of the levies which were making in the south of France for the royal cause; and of rallying the general officers and troops in favour of Bonaparte, to oppose the duke of Angoulême, and to cut off his retreat. He was brought before the council of war on the 24th of December 1815; condemned to death on the 9th of May 1816, and shot on the 22d.

The trial of General Bonnaire, and Lieutenant Mieton, his aide-de-camp, for the murder of Colonel Gordon at Condé, terminated at half-past eight o'clock on the 8th of May. The council of war then withdrew to deliberate upon the sentence, and continued shut up until nine o'clock the next morning, when they pronounced their judgment: Mieton was condemned to death, and Bonnaire to transportation. Soon after the battle of Waterloo, Gordon, who was in the service of the king of France, was sent to the garrison of Condé, then in a state of revolt, to summon it to surrender. Bonnaire, the commander of the place, not only refused to recognize the orders of his sovereign, but caused Colonel Gordon to be put to death.

But the most interesting of all the trials for high treason was that of General Drouet, who accompanied Bonaparte to Elba after the treaty of Fontainebleau, and afterwards returned with him to France. The trial took place on the 6th of April. Drouet's case had many features of interest attached to it. After the treaty of Fontainebleau, by which Bonaparte was made independent sovereign of Elba, Drouet, who had served him long in the capacity of aide-de-camp, accompanied him to that island, and renounced his rights of Frenchman. He was, consequently, in the full sense of the word, the subject of Napoleon; and, as such, was bound to obey his orders. Actuated by "fidelity to his oaths and attachment to his sovereign," he refused many splendid offers of advancement in France, to accompany the fallen fortunes of his master, though he afterwards disapproved of his conduct. He stated, that Napoleon appeared to have no intention of ever returning to France till his pension was stopped, and he heard of the propositions made at the Congress of Vienna regarding himself; that France was unhappy, and loudly called for the restoration of her former government. This decided Napoleon, and he informed Drouet of his intention to give himself again to the wishes of the French people. Drouet was thunder-struck at his resolution, and opposed it with all his power, but in vain; and he had only to perform the duty of his functions by attending his sovereign. The march to Paris, and the triumph of the returning emperor, were described in glowing colours by Drouet. He partook in all the dangers of the succeeding events, and contributed with the army to the preservation of Paris. He withdrew with the troops to the Loire; where, on the re-establishment of the king's government, he gave the first example of submission to the king, and induced the corps he commanded, consisting of 16,000 men, to follow his example. Marshal Macdonald (duke of Tarentum) gave on the trial the highest testimony of his exemplary conduct on that occasion. He was, notwithstanding, included in the ordinance of proscription. On hearing this, he immediately repaired to Paris, where he surrendered himself, and demanded a trial. When the proceedings were concluded, the members of the council of war were divided in opinion, four for finding him guilty, and three for acquitting him; but, the law requiring that no condemnation shall take place except by a majority of at least five to two, he was acquitted.

General Cambronne was likewise brought to trial, and acquitted on the same principle as Drouet was. He

pleaded that he acted under the orders of Bonaparte; who was then Emperor of the isle of Elba, and his sovereign. General Cambronne, like Drouet, had gone with Napoleon to Elba. The acquittal of this latter officer added to the disappointment of the king and the ultra-royalists, and Louis insisted on the court revising the acquittal of Cambronne, which they did; but, to his great astonishment, they confirmed their former decision.

The result of these two trials gave considerable satisfaction to the inhabitants of Paris; and it was now evident, that the influence of the ultra-royalists was on the decline. They consoled themselves, however, for the present, with the foolish mummery of digging up the remains of the duke d'Enghien out of the fosse on the south side of the castle of Vincennes. The first object which caught attention was a boot, in tolerable preservation, in which were found the bones of the leg and foot; the skull was then found; the face was downwards; one leg had remained in an almost vertical position, and the arms were bent towards the back; a rather large stone appeared to have been designedly thrown upon the head, the bones of which were fractured. Some of the hair was still in preservation. The various fragments of the body, thus collected; were placed in a sheet. There were also found seventy-three German ducats; a leathern purse, in which there were a louis and some pieces of silver, a ring, and a gold chain which the prince was in the habit of wearing round his neck. There was remarked the perforation made by a ball in the shoulder-blade, and in the small casque which the prince wore at the time of execution. His hussar-boots were in tolerably good preservation. The sheet, containing the fragments, was placed in a leaden coffin.

The most important event in France this year was the dissolution of the chamber of deputies, by a royal ordinance of September the 5th. In the preamble, his majesty says, "We are convinced that the wants and wishes of our subjects concur in preserving untouched the Constitutional Charter, the basis of public law in France, and the guarantee of general tranquillity. We have, in consequence, judged it necessary to reduce the chamber of deputies to the number determined by the charter, and not to call to it men under forty years of age. But, to effect this reduction legally, it becomes indispensable to convoke anew the electoral colleges, in order to proceed to the election of a new chamber of deputies." The ordinance then declares, that "none of the articles of the constitutional charter shall be revised;" dissolves the chamber; reduces the number of deputies from 420 to 258; convokes the electoral colleges for the election of a new chamber, to meet on the 4th of November. Another ordinance, appointing the presidents of the electoral colleges, was remarkable for the exclusion of all members of the royal family from this important office, and the nomination of several of those members of the late chamber who supported the constitution against the party known by the appellation of ultra-royalists. It cannot be denied, that this measure was eminently calculated to inspire confidence in all classes, as evincing a determination, on the part of the king, to maintain the inviolability of personal property and private property, including the national domains, the restitution of which was manifestly a great object of the late chamber.

We shall take this opportunity of stating a few particulars relative to the chambers of parliament as at present constituted, after the various modifications the Charter has undergone in that respect. Under the article LONDON, vol. xiii. p. 382, 3, we gave a copy of the Constitutional Charter of the 6th of April, 1814, which was to be presented to Louis; and his acceptance of it was to constitute him king of France. He did not become king by accepting it, but was brought in by the victorious armies, and declared himself to be in the twentieth year of his reign. However, he promised to admit the chief articles,

as the basis, or foundation, of a Charter which *he* was to give them; and, accordingly, the particulars we shall give are chiefly to show the variations between that document and the present Charter, which is now appealed to by all parties as the safeguard of French liberty.

1. All ranks are equally admissible to public employments, whether civil or military.

2. The Catholic is the state-religion; but all other religions may be openly professed, and none imply political disqualification.

3. All sales of national property during the Revolution are confirmed to the purchasers.

4. The person of the king is inviolable; the responsibility rests with his ministers.

5. The executive power is vested in the king; the legislative, in the two houses of parliament as in England, with the distinction, that no bill can be brought in but by a minister of the crown, parliament having the right only of praying the king to bring in any particular bill.

6. The house of peers cannot be lawfully assembled except at the same time as the house of commons.

7. The members of the commons house are elected for five years, the house being renewable by a fifth annually.

8. The sittings of the house of commons are open to the public; those of the peers are private; all money-bills must originate with the commons.

9. The judges are named by the king; and, when appointed, are not removable. Juries are employed in criminal cases only.

The house of peers in France is, in many respects, on the same footing as in England, their number being unlimited; their nomination vested in the king; their dignity hereditary. Like our peers, they meet every session on the same day as the commons; and their proceedings, unless accompanied by simultaneous proceedings of the lower house, would be void. Like our peers also, they take cognizance of charges of treason and of high political misdemeanours; but they do not form a court of judicial appeal. All bills, with the exception of money-bills, may originate in either house; but the degree of public interest excited by the debates of the peers is not so great as by those of the lower house. The restrictions as to attending the debates, and printing the speeches of the peers, though not absolute, are greater than in England.

10. The king's brothers and nephews, with the princes of the blood (Orleans, Bourbon, Condé), are peers in right of their birth.

The number of peers in France is at present (1820) nearly 280: a number comprising two very distinct classes; the old nobility of France, stripped of the greater part of their paternal estates, but dignified by such names as Montmorency, Tremouille, Luxembourg; and the senators or generals of the revolution, who can boast of no ancestry; and who, in point of property, are, in general, very limited, but who lay claim to public regard for their personal exertions; such are Lanjuinais, Pastoret, Barthélemy, Macdonald, &c. Those who were members of the senate on the abdication of Bonaparte were made peers, and had their life-pension (1500*l.* a-year) confirmed to them by Louis XVIII. but the constitution requires that all future peers shall possess a certain entailed property, the amount of which, evidently adapted to the levelling effects of the revolution, is only 1250*l.* of clear income for a duke, 800*l.* for a marquis or earl, and 400*l.* for a viscount or baron.

The French house of commons also is in many respects similar to the British; each being the arena in which political parties try their strength, and in which the support or the overthrow of a ministry is decided. The nature of the subjects discussed, the privileges of the house, the admission of the public to the debates, are all similar to our usages; but there are some important differences as to the legal qualifications of the members, and the constitution of the body. The number of deputies or members is regulated by the amount of population. This, however,

however, has nothing in common with universal suffrage, for the basis of the qualification of a voter is property; it being an indispensable requisite that every voter shall pay 12l. a-year in direct taxes. This sum seems a very proper medium. From the nature of French taxation, it comprises a vast number of petty proprietors worth from 60l. to 150l. a-year. In like manner, the payment of 40l. the qualification for a member, implies only the possession of 200l. or 300l. a-year.

The right of voting for members of parliament in France was long exercised by delegation, the voters choosing a committee (*college électoral*) composed of persons paying 40l. in taxes, with whom rested the choice and nomination of the member; but this cold and indirect course was abrogated by the law of 5th February, 1817; since which the voters have made a direct nomination of their members, as in England. In this manner took place the two elections (each of a fifth of the house) in 1817 and 1818. The predilection shown in them to the *libéraux*, or moderate revolutionists, excited the fears of the royalists; but the king resisted all attempts to modify the established law, until a third trial in 1819, which, by giving another powerful addition to the *libéraux*, induced both him and his counsellors to project a change. In 1820, therefore, it was again proposed to extend the number of members to 430, and to confine the election of the additional number (172) to electoral committees on the old plan. Another part of the change was to dispense with annual elections, and to declare the whole house of commons entitled to sit for five years, as it is in England for seven.

The new law proposed no change in the qualification of voters. The number of the latter is of course very different in different departments; the medium is from 1500 to 2500; but in the department of Paris they exceed 10,000. The king is bound to convoke the chamber annually; he has, as in England, unlimited power to prorogue or dissolve; but, in that case, a new chamber must be called in the course of three months.

Hitherto, as we have before noticed, the members have always delivered written speeches; but they are coming to a sense of the inconvenience of that practice; and the count de Polignac has given notice of a proposition for the abolition of the use of written speeches, (Mar. 1821.) except on matters of finance, where numerical calculations must necessarily occur. But a similar proposition was rejected in the chamber of peers, Nov. 5, 1816, by a majority of 87 to 50.

Connected with this subject, a curious ordinance appeared in July, 1816, which tends to show the very different notions of liberty that exist in that country and in England. Many of the deputies having, by their patriotic and loyal conduct, obtained the applause and admiration of their constituents, the latter thought fit to testify their esteem by various honorary presents, such as a piece of plate, a sword, or the like; while the ministerial members had not been very fortunate in obtaining these marks of public esteem. A decree was promulgated, prohibiting any such presents being received in future, without the king's consent previously obtained!

And in November last (1820), a *royal proclamation* appeared, addressed to the electors throughout France, recommending to them such a choice of deputies at the present election "as shall best preserve the monarchy from the assaults of faction, and secure to France the continuance of freedom, peace, and prosperity." In short, a direct instruction, from the king himself, to influence the election of members devoted to the court and ministry. In England, we have not yet seen such open and direct interference in elections; but in France, though their representative constitution is so recent, the practice we have alluded to is not so new as to have been then resorted to for the first time: for on the 23d of November, 1816, at a dinner at the British ambassador's, where M. Pasquier, president of the chamber of deputies, was present, Talleyrand declared, that the influence employed in elections was an affront offered to the nation, and that the minister of the

interior should be the only medium through whom the king should communicate his sentiments. M. Pasquier grew warm in his reply; and the end of the affair was, that the next morning Talleyrand received a note forbidding him, in the name of his majesty, from appearing at court. This certainly smacks a little of the old French school, where every thing was *de par le roi*.

About this time, the king acknowledged, or adopted, the order of the legion of honour; ordering, however, that it should be called *royal*, and that its anniversary should be kept on the 15th of July, the birth-day of Henry the Fourth.

On the 22d of November, 1817, the minister of the interior presented to the chamber of deputies the projet of a law for carrying into effect a Concordat which had been entered into between the Pope and the Gallican church. By this Concordat, seven new archiepiscopal and thirty-five episcopal sees are established in France. In the French newspapers a list is given of the archbishops and bishops instituted by his holiness on the nomination of the king. Of these the most conspicuous is Talleyrand Perigord, grand almoner; who, having obtained a cardinal's hat, is promoted to the rank of archbishop of Paris. M. de la Luzerne, formerly bishop of Langres, and M. de Beauffet, formerly bishop of Alais, have also been created cardinals.

The duke of Berry, in whom the hopes of Louis for the long continuance of his dynasty seemed to be centered, was married to the princess Caroline, grand-daughter of the king of Naples, on the 16th of May, 1816. On the 13th of July, 1817, she was delivered of a daughter, which died the next day; and in September 1818 she miscarried of a male infant, after only four months' pregnancy; and thus for the second time disappointed the hope of seeing a Bourbon heir to the throne. The duke of Bourbon, at that time the last male of his illustrious branch, and the father of the late duke d'Enghien, was born in 1756. Ever since the murder of the duke d'Enghien, the existence of the duke de Bourbon has been a scene of unvaried melancholy; and the recent death of his venerable parent, the prince de Condé, in necessitating his return to France, did but vary the objects, without diminishing the weight, of his sorrow; and he has hitherto declined assuming the title of his deceased father, the Prince of Condé. The reason assigned for his refusal is so honourable, that it ought to be generally known: being, by the murder of the duke d'Enghien, the last of his illustrious race, he modestly holds himself unworthy of being called The Last of the Condés, and lets the name rest with his noble father lately deceased, who, as he says, had so long commanded the French nobility in their glorious exertions to defend the cause of the monarchy.

On the 21st of September, 1819, the duchess was safely delivered of a princess. This was a third disappointment, as a female cannot inherit the crown of France. But the greatest shock was to follow. On the 14th of February, 1820, at eleven o'clock at night, his royal highness the duke de Berry was assassinated on leaving the opera-house, by one Louvel, a journeyman saddler, formerly a soldier in the old imperial guard, who appears to have been impelled to this dreadful act by political fanaticism. He was immediately arrested; not having, indeed, made any effort to escape. He declared that he had meditated the crime for four years. The duke was immediately carried into one of the saloons of the opera-house, where all the assistance the medical art could supply was administered to him, but without effect, the weapon having penetrated too deep not to inflict a mortal wound, and he expired at six o'clock in the morning; all the princes of the royal family, and even the king himself, being present with the duke in his last moments.

Political fanaticism armed the hand of this wretched assassin, as formerly religious fanaticism armed that of Ravallac. When examined by interrogatories in the usual manner, he at once confessed the assassination, of which indeed there was overwhelming evidence. He did not evince the least appearance of regret.

When asked what induced him to commit this crime, he answered, "Because I think the Bourbons are tyrants, and the most cruel enemies of France."

"In that supposition, why did you attack the duke de Berry in preference to the rest?"—"Because he is the youngest prince of the royal family, and seemed to be destined to perpetuate that race hostile to France."

When he was told that his name would be for ever execrated, he answered, "You cannot be sure of that; wait till fifty years have passed. Brutus's name is not execrated." His trial did not begin till the 5th of June; and he was executed on the 7th.

The duchess was again pregnant at the death of her lord; and on the 6th of May, while Louvel was still in prison expecting his fate, an attempt was made upon her life, and, through her, upon the existence of the reigning house of Bourbon. It is stated, that soon after twelve o'clock a man made his appearance very silently at the wicket of the Rue de l'Echelle, near the windows of that part of the Tuileries where the duchess resides, and placed there a petard containing two pounds of gunpowder, the match of which he ignited by means of a lighted fegar. He was then immediately seized by the police-agents, placed in concealment near the spot by the prefect of police; who, it appears, had previous information of what was to take place. The name of the man thus taken into custody is Graviers, and he was formerly an officer in the 5th regiment of lancers. He made some disclosures, in consequence of which three other individuals were arrested early next morning. One of these was discharged; and the other three, Graviers, Bouton, and Legendre, were found guilty of "exploding a petard under the windows of the duchess de Berri, during her late pregnancy, in order to cause her to miscarry." Graviers and Bouton were condemned to death; but the king signified his intention, to remit the capital punishment.

Before the trial, however, namely, on the 29th of September, 1820, the duchess de Berri was safely delivered of a son. Her royal highness was almost alone when she gave birth to a prince, presumptive heir to the throne, in ample gratification of the anxious wishes of the royal family. The event was announced by the firing of artillery; and in the morning the king received the congratulations of the princes and princesses of his family, the ministers, marshals, &c. The young prince was christened, with great rejoicings and feasting, on Tuesday the 1st of May, 1821.

The baptismal ceremony took place in the cathedral of Notre Dame at eleven in the morning. The king went in great pomp from the Tuileries, having in the carriage with him all the members of his immediate house, except the child who was the principal actor, and who, with the ladies in attendance on him, occupied the carriage next to that of his majesty. The streets were lined with troops; and, crowded as was the church with spectators, the members of the legislative body and of the municipal corps of Paris attended. The young prince was named Henry-Charles-Ferdinand; and he had previously been created duke of Bourdeaux. After the ceremony, the clergy harangued the king, and were answered by him. The royal cortege was met and followed by loud applause; and the day closed with magnificent fire-works, while the palace-gardens and public offices were brilliantly illuminated.

The rejoicings continued for three days. On the second day there was a grand ball at the Hotel de Ville, at which all the royal family, with the exception of the king, were present. On the third day balls were given at the public expense to the different trading bodies of the metropolis. Illuminations, fireworks, dancing, music, and distributions of wine and victuals, took place on all three days. More than 30,000 papers of sweetmeats, such as are given to school-girls at their breaking-up, were thrown among the mob; and wine was poured out in abundance. One of our newspapers (the Traveller) says, "This series of fêtes will, perhaps, more effectually endear

the Bourbons to the people than whole years of wise and temperate government."

In the mean time, it cannot be disguised that the public mind in France is very much agitated, that the people are discontented with their present rulers, and that several members of the royal family are personally disliked. We have omitted the detail of recent insurrections in various parts of France, and even in La Vendée, which stood so high in the annals of loyalty, or rather of royalty; and we have also passed over sundry attempts to terrify or destroy the royal family, because we had become tired of such details, and because we wished to close our article with peace and friendship. In fact, while the public mind in France is discontented, the quiet and peace of the rest of Europe cannot be secure. It perhaps is impossible exactly and fully to point out what line of conduct Louis ought to pursue, in order to fix his throne on a firm and permanent foundation. The military spirit and habits which the people of France have acquired, will not soon wear away: their late disasters, their country twice conquered, a sovereign twice placed over them by these conquests, will not soon be forgotten; but, undoubtedly, their oblivion will be accelerated if Louis gains over the mass of the population, by securing to them all the benefits which the revolution produced, and by protecting them from the evils which it engendered. If, on the contrary, he has not learnt wisdom from experience; if it be true that he, as well as the rest of his family, have "forgotten nothing which they ought to have forgotten, and have learnt nothing which they ought to have learnt," during their misfortunes; then, not all the force of Europe can, or ought, to keep him on the throne of France. But let us hope better things: let us hope that these princes who lived so long in Britain did not shut their eyes to the facts which there surrounded them; from which they might have drawn this lesson: that the most lawful as well as the most happy, sovereign, is he who is powerful and happy in the affections and happiness of his subjects.

The following are the works from which this long article has been compiled.—Heylin's *Microcosmus*, 1621. Howel's *Letters*, 1620-40. Paris as it was, and as it is, 1802. Carr's *Stranger in France*, 1802. Holcroft's *Travels from Hamburgh to Paris*, 1802. Mercier's *Paris delineated*, and *New Picture of Paris*. Eustace's *Letter from Paris*. Sundry volumes of the *Monthly Review*.

PAR'IS, a town of Prussia, in the province of Bartenland: eight miles north-north-east of Rastenburg.

PAR'IS, in Wales. See PARYS.

PAR'IS, a thriving post-town of America, in the state of New York, and county of Oneida, incorporated in 1792, and containing 4721 inhabitants. Iron-ore is found in its vicinity; and the land is excellent. It has an academy and a parish-church; and its progressive improvements are rapid.—Also, the county-town of Bourbon-county, in Kentucky: eighteen miles north-east of Lexington. It has a court-house and gaol, a presbyterian church, and several mills in its vicinity. Its houses are principally constructed of brick and stone. The town is pleasant and thriving, and contains 377 inhabitants.—A town of London-county, Virginia; fifty-nine miles from Washington.—A town in Oxford-county, state of Maine; containing 844 inhabitants.—An island on the coast of South Carolina.

PAR'IS (Francis), a French priest and writer of esteemed pious and practical treatises, was born in an unknown year of the seventeenth century, at Chatillon in the vicinity of Paris. He was of obscure birth; and, when young, served as a domestic in the family of MM. Vazet, who had a house at Chatillon. Pleased with his behaviour, and the inclination which he showed for acquiring knowledge, those gentlemen, one of whom was grand-vicar and archdeacon of Sens, took upon themselves the care of his education; and, when he was properly qualified, obtained for him admission into holy orders. Some time afterwards, he was presented to the living of St. Lambert, near the monastery of Port-Royal in the Fields; which he served for some years with great zeal and fidelity, much to the satisfaction as well as edification of his parishioners. At length he resigned that benefice, and removed into the province of Maine, to the lordship of M. le Vayer, the chapel of whose family-mansion served as a church to the parish in which it was situated: in this chapel M. Paris officiated for a considerable time, to crowded audiences from the neighbouring country; and diligently discharged, at the same time, the other functions of a parish-priest. His last removal was to Paris, where he died sub-vicar of the parochial church of St. Stephen of the Mount, in 1718, at a very advanced age.

As he was a person of great industry, and fond of retirement whenever his ministerial duties permitted it, he found time to compose a number of works, which are said to be equally solid and edifying. The principal of them are, 1. Forms of Prayer, founded on a Paraphrase of the Psalms, first published in 1690, 12mo. and afterwards frequently reprinted. 2. Prayers founded on a Paraphrase of various Passages of the sacred Scriptures, 12mo. 3. Martyrology; or, general View of the Lives of the Saints, of their Virtues and principal Actions, 1691, 8vo. 4. On the Benefit of the Sacraments of Penance and the Eucharist, according to the Sentiments of the Fathers, the Popes, and the Councils, 1673. 5. Familiar Instructions founded on the Gospels for all the Sundays and Festivals throughout the Year, 1699, 12mo. and often reprinted. 6. The Gospel explained, according to the Fathers, ecclesiastical Authors, and the Harmony of the four Evangelists, in 4 vols. 8vo. the two first published in 1693, and the two last in 1698. 7. Prayers and divine Aspirations, extracted from the Confessions of St. Augustine, 1698. 8. Christian Regulations for the Conduct of Life, taken from the sacred Scriptures and the holy Fathers, 1673, 12mo. 9. A French version, rather paraphrastic, of Thomas à Kempis's four books On the Imitation of Jesus Christ, 1705, 12mo. to which is prefixed a concise and well-written view of the principal foundations of Christian morality; and other pieces, for an account of which, as well as of the author's inedited manuscripts, we refer to *Moreri*.

PAR'IS (Francis), generally known by the name of the *Abbé Paris*, and rendered famous for a time by the

impostures and delusions which were practised at his tomb, was the eldest son of a counsellor to the parliament, and born at Paris in the year 1690. Had he chosen to follow the profession of the law, he would have succeeded to his father's appointment; but he preferred embracing the ecclesiastical life, and was admitted to deacon's orders. For some time he instructed the catechumens in the parish of St. Como, and had the conduct of the conferences attended by the young candidates for the clerical order. In the disputes occasioned by the bull *Unigenitus*, he attached himself to the Jansenist party; on which account the cardinal de Noailles was desirous of presenting him to the living of St. Como, but was prevented from that design by unforeseen obstacles. Upon the death of his father, the abbé Paris renounced all claim to his patrimonial inheritance in favour of a younger brother, and devoted himself to a life of poverty. Having made trial of different solitudes, he at length fixed upon a house in the suburb of St. Marcel, where he spent his time in prayer, and the most rigorous acts of penance, supporting himself by making stockings for the poor, with whom he divided the earnings of his labour. By this course of life he acquired a character for extraordinary sanctity with the superstitious populace, and pious old women, whose ignorance and credulity led them to ascribe such mortifications to the perfection of virtue. He died, most probably owing to the severity of the discipline which he observed, in 1727, when he was only thirty-seven years of age. He was the author of A Commentary on the Gospel of St. Matthew; An Explication of the nine first Chapters of the Epistle of St. Paul to the Romans; An Explication of the Epistle to the Galatians; and An Analysis of the Epistle to the Hebrews; which are very indifferent performances, and have had few readers.

He was buried in the church-yard of St. Medard at Paris, where his brother erected a monument to his memory, which the great reputation of his sanctity drew many people to visit, who paid their devotions to him as to a saint. This concourse gradually increasing, he was soon considered to be a subject proper to revive the credit of the Jansenist party, which was now depressed by the Jesuits, who were supported by the authority of the court. Within five years, therefore, after his death, the confident report of miracles wrought at his tomb, was propagated not only in the city of Paris, but through the whole kingdom. In consequence of this, infinite crowds were perpetually pressing to the place, who were duped by the artifices of crafty impostors, and went away proclaiming the benefits received from the saint, in the cure or relief of the most desperate diseases. In vain did men of sober sense endeavour to disabuse the multitude; nor could all the power of the government give a check to the rapidity of this superstition, till, by inclosing the tomb within a wall, all access to it was effectually obstructed. This step gave occasion to the following epigram, which was fixed upon the inclosure, in the style of the royal edicts:

*De par le Roy. Défense à Dieu
De faire miracles en ce lieu.*

But, though this expedient put an end to the external worship of the saint, it did not for some time shake the credit of his miracles, distinct accounts of which were drawn up and dispersed among the people. One collection of them was made by M. de Montgeron, as we have seen under his article, (vol. xv.) and presented to the king: and several other collections of them were published, containing in the whole above a hundred miracles. The reality of these wonders was attested by clergy of the first dignity, who presented a verbal process of each to the archbishops, with a petition, signed by above twenty of the beneficed clergy of Paris, desiring that they might be authentically registered, and solemnly published to the people as true miracles. There can be no doubt but many of the persons concerned were imposed upon

by their own superstitious credulity; but, on behalf of others, whose sagacity, learning, and good sense, were abundantly discovered in other matters, no such plea can be admitted. With Dr. Mosheim we say, that "we can easily account for the delusions of weak enthusiasts, or the tricks of egregious impostors; but, when we see men of piety and judgment appearing in defence of such miracles as those now under consideration, we must conclude, that they look upon fraud as lawful in the support of a good cause, and make no scruple of deceiving the people, when they propose, by this delusion, to confirm and propagate what they take to be the truth."

PAR'IS (Matthew). See MATTHEW, vol. xiv. p. 545. PARISCAT'TY, a town of Hindoostan, in Oude: twenty-five miles east of Goorackpouur.

PARISH, *f.* [*parochia*, low Lat. *paroisse*, Fr. from the Greek *παροικια*, habitation; of *παρα*, with, and *οικω*, to dwell.] The particular charge of a secular priest.—Our realm was first divided into *parishes* by Honorius, archbishop of Canterbury, in the year of our Lord 636. *Covell.*—By the catholic church is meant no more than the common church, into which all such persons as belonged to that *parish*, in which it was built, were wont to congregate. *Pearson.*

The tythes his *parish* freely paid he took;
But never su'd, or curs'd with bell or book. *Dryden.*

In the ancient church there was one large edifice in each city for the people to meet in; and this they called *parochia*, parish. But the signification of the word was afterwards enlarged; and by a parish was meant a diocese, or the extent of the jurisdiction of a bishop, consisting of several churches, unless we will suppose, as some do, that those bishops were only pastors of single churches. Dupin observes, that country parishes had not their origin before the 4th century; but those of cities are more ancient. The city of Alexandria is said to have been the first that was divided into parishes.

Of the first division of parishes, indeed, there is no certain information; for, in the early ages of Christianity in this island, parishes were unknown, or at least signified the same that a diocese now does. There was then no appropriation of ecclesiastical dues to any particular church, but every man was at liberty to contribute his tithes to any priest or church he pleased; but he was obliged to do it to some; or, if he made no special appropriation thereof, they were paid to the bishop, whose duty it was to distribute them among the clergy, and for other pious purposes, according to his own discretion. Camden says, England was divided into parishes by archbishop Honorius about the year 630. Sir Henry Hobart maintains that parishes were first erected by the council of Lateran, held A.D. 1179. But Selden proves, that the clergy lived in common, without any division of parishes, long after the time mentioned by Camden; and it appears from the Saxon laws, that parishes were in being long before the council of Lateran. The distinction of parishes occurs in the laws of king Edgar, about the year 970. It seems pretty clear and certain, says Blackstone, (1 Com. 112.) that the boundaries of parishes were first ascertained by those of a manor or manors; because it very seldom happens that a manor extends itself over more than one parish, though one parish often includes many manors. The lords, he adds, as Christianity spread, began to build churches upon their own demesnes or wastes, in order to accommodate their tenants in one or two adjoining lordships; and, that they might have divine service regularly performed therein, obliged all their tenants to appropriate their tithes to the maintenance of the one officiating minister, instead of leaving them at liberty to distribute them among the clergy of the diocese in general; and this tract of land, the tithes of which were so appropriated, formed a distinct parish. And this accounts for the frequent intermixture of parishes one with another: for, if a lord had a parcel of land detached from the main of

his estate, but not sufficient to form a parish of itself, it was natural for him to endow his newly-erected church with the tithes of such lands.

Camden reckons 9284 parishes in England; and Chamberlayne makes 9913. They are now generally reckoned about 10,000.

Extra-parochial wastes and marsh-lands, when improved and drained, are, by 17 Geo. II. cap. 37. to be assessed to all parochial rates in the parish next adjoining.

PARISH, *adj.* Belonging to the parish; having the care of the parish.—The *parish* allowance to poor people, is very seldom a comfortable maintenance. *Law.*

A *parish* priest was of the pilgrim train,
An awful, reverend, and religious, man. *Dryden.*

Maintained by the parish.—The ghost and the *parish* girl are entire new characters. *Gay.*

PARISH-CLERK, *f.* See vol. iv. p. 665. The following description of a parish-clerk, which appeared in the Examiner of Sunday, August the 22d, 1819, we think sufficiently witty without being offensive. "The office of parish-clerk is one of extreme venerableness and antiquity. Next in dignity to the clergy, faith Leland; semi-ecclesiastic, according to Camden. Witty Fuller likeneth him, in his Church History, to the bat, half-bird half-beast, yet so as there is more in him of the former than of the latter; his clergy wings do outweigh the laic or mouse part of him. He is the mouth-piece of the congregation, faith Hooker. Mouth of mouths, according to bishop Bull; the connecting link between the minister and people. Cousin, twice removed, to the vicar, faith another; note, that the curate is betwixt. Bell-weather to the flock, faith bishop Andrews, speaking it in honour. Spelman doubteth whether he be not entitled to a portion of the lesser tythes, say a tenth. From all which expressions, though some of them seem run up into a height of metaphor and allegory greater peradventure than the matter soberly considered will bear, we may yet gather in what kind of estimation antiquity hath held the function."

The COMPANY of PARISH-CLERKS is the most ancient in the city of London; yet they stand at the bottom of the list, we cannot tell why; (see vol. xiii. p. 602, 615.) and have neither livery, nor the privilege of making their members free of the city.

PARISH-OFFICERS, *f.* Churchwardens, overseers, and constables. Divers persons are exempted from serving parish-offices on account of their professions; viz. physicians, surgeons, and apothecaries; dissenting teachers; persons having prosecuted certain felons to conviction, &c.

PARISH PRIEST, *f.* The parson or minister who holds a parish as a benefice. If the predial tithes are appropriated, the parson is called *rector*. If they are impropriated, he is called *vicar*.

As to the situation and emoluments of the parish-priests in the city of LONDON, see that article, p. 600, 1.

PARISH-REG'ISTERS, *f.* See BILLS of MORTALITY, vol. xvi. p. 18 & seq.

PARISH'IONER, *f.* One that belongs to the parish.—I praise the Lord for you, and so may my *parishioners*; for their sons are well tutor'd by you. *Shakespeare.*

Hail bishop Valentine, whose day this is.

All the air is thy diocese;

And all the chirping choristers

And other birds are thy *parishioners*.

Donne.

PARISHIONERS are a body politic to many purposes; as, to vote at a vestry if they pay scot and lot; and they have a sole right to raise taxes for their own relief, without the interposition of any superior court; may make bye-laws to mend the highways, and to make banks to keep out the sea, and for repairing the church, and making a bridge, &c. or any such thing for the public good; and, by stat. 3 & 4 W. III. c. 11, to tax and levy poor-rates,

and to make and maintain fire-engines; and, by 9 Geo. I. c. 28, for purchasing workhouses for the poor.

PARISIAN, *adj.* Belonging to Paris.

PARISIAN, *f.* A native of Paris, an inhabitant of Paris.

PARISIAN ISLAND, an island of North America, in Lake Superior, near the south-east coast. Lat. 46. 30. N. lon. 85. W.

PARISII (Ptolemy), a people of Britain, having the Brigantes to the north and west, the German Sea to the west, and the Coritani to the south, from whom they were separated by the Humber; and occupying that district which is called Holderness, or, as Mr. Camden imagines, the whole east riding of Yorkshire. The Parisii are supposed to have derived their name from the two British words *Paur Iſa*, which signify Low Pasture, and which are descriptive of the situation and use of their country. However this may be, it is evident that our Parisii never attained to any great degree of power or consequence, but were always subject to the authority, and followed the fate, of their more powerful neighbours, the Brigantes. Their only town was *Pituaria*, probably Patrington in Holderness.

PARISIS, *f.* A French money of account, formerly a real coin struck at Paris, at the same time with the Tournois struck at Tours. The Parisis exceeded the Tournois by one-fourth; so that the livre or pound Parisis was twenty-five sols, and the livre Tournois twenty. The sols and deniers Parisis, &c. were in proportion.

PARISO'T, a town of France, in the department of the Aveyron: ten miles south-west of Villefranche, and twenty-one west of Sauveterre.

PARISYLLABLE, *f.* [from the Gr. *παρὰ*, with, and *συλλαβή*, a syllable.] A word that has an equal number of syllables in all its cases. *Cole.*

PARISYLLABIC, or PARISYLLABICAL, *adj.* Having the same number of syllables in all its cases.

PARITA, a town of South America, in the province of Panama: five miles north of Santos.

PARITEE HO'TUN, a town of Chinese Tartary: 445 miles east-north-east of Peking. Lat. 42. 28. N. lon. 125. 16. E.

PARITI, *f.* in botany. See *HIBISCUS*.

PARITOR, *f.* [for *apparator*.] A beadle; a summoner of the courts of civil law.—You shall be summoned by a host of *paritors*; you shall be sentenced in the spiritual court. *Dryden.*

PARITY, *f.* [*paritas*, Lat.] Equality; resemblance.—Survey the total set of animals; and we may, in their legs or organs of progression, observe an equality of length and *parity* of numeration; not any to have an odd leg, or the movers of one side not exactly answered by the other. *Brown.*—Their agreement in essential characters makes rather an identity than a *parity*. *Glanville.*—By an exact *parity* of reason, we may argue, if a man has no sense of those kindnesses that pass upon him from one like himself, whom he sees and knows, how much less shall his heart be affected with the grateful sense of His favours whom he converses with only by imperfect speculations, by the discourses of reason, or the discoveries of faith? *South.*

PARIUM, in ancient geography, a town situated in the Propontide, between Lampacus and Priapus. Its territory was fertile, and produced excellent wines; and it had a good port. This town was founded by the Milesians, the Erithræans, and the inhabitants of the isle of Paros, from which it took its name. Augustus established a colony in this place; and, like many others, it was governed by a senate or council composed of decurions. The worship of Apollo and Diana was transported from Adratia to Parium, where a large and splendid altar was erected, the work of the celebrated Hermocreon. *Strabo.* Pliny also mentions a statue of Cupid, belonging to this city, the production of Praxiteles, and not inferior in beauty to the Venus of Cnidus.

Parium was ravaged in the year 267 by the Heruli, a

German nation; but these barbarians were defeated and driven into their own country by the emperor Gallienus, in consequence of which a triumphal arch was erected; which arch consisted of three arcades, upon which the emperor appeared in a car drawn by two elephants, between two Victories, which presented to him a crown of laurel. When the government of proconsular Asia was divided into several provinces, Parium was comprised in the new province of the Hellespont, of which Cyzicus was the metropolis. Now CAMANAR.

PARIVO'A, *f.* in botany. See *DIMORPHA grandiflora*.

PARIYATEKA, *f.* The Sanscrit name of a species of *Nyctanthus*; and in the mythological legends of the Hindoos it is a golden tree, yielding in its fruit whatever the heart can desire. It is fabled to have arisen from the ocean when churned by the gods and demons, as described under the article *KURMAVATARA*, and to have fallen to the lot of the demigod Indra, regent of the firmament, who hence, and from similar possessions, is called the Lord of Wealth. The name is commonly pronounced *parijat*, and it is often alluded to in the holy tales and fables of the Hindoos. There is a treatise on Hindoo music in the Persian language, probably a translation from the Sanscrit, named after this all-yielding tree *Pariyateka*.

PARK, *f.* [*parcus*, Lat. from *parco*, *parcere*, "to spare;" because parks were destined for the safe keeping of deer and other animals, that they might not be exposed to common hunting.] A piece of ground enclosed and stored with wild beasts of chase.—Manwood, in his Forest-law, defines it thus: A *park* is a place of privilege for wild beasts of venery, and also for other wild beasts that are beasts of the forest and of the chase: and those wild beasts are to have a firm peace and protection there, so that no man may hurt or chase them within the park, without license of the owner. *Cowel*.—We have *parks* and inclosures of all sorts of beasts and birds, which we use not only for view or rareness, but likewise for dissections and trials. *Bacon.*

A park differs from a *forest*, in that, as Compton observes, a subject may hold a park by prescription, or the king's grant; which he cannot do with respect to a forest. A park differs from a *chase* also; because a park must be inclosed; if it lie open, it is a good cause of seizing it into the king's hands, as a free chase may be if it be inclosed. Nor can the owner have any action against such as hunt in his park if it lie open.

Du-Cange refers the invention of parks to king Henry I. of England; and the first park in England is said to have been that of Woodstock in Oxfordshire, made by him, which was walled round with stone, and seven miles in circumference: the royal example was first followed by Henry earl of Warwick, to preserve his deer and other animals for hunting; after which the practice of park-making became general among persons of opulence. But Spelman shows it to be much more ancient; and it was in use among the Anglo-Saxons. *Zosimus* assures us also, that the ancient kings of Persia had parks.

The clergy of rank, at all times, had the privilege of hunting in their own parks and inclosures; and accordingly, at the time of the reformation, the see of Norwich only was in the possession of not less than thirteen parks, well stocked with deer and other animals for the chase.

No man can now erect a park without a license under the broad seal; for the common law does not encourage matters of pleasure, which bring no profit to the commonwealth. *Wood's Inst.* 207. But there may be a park in reputation, erected without lawful warrant; and the owner of such park may bring his action against persons killing his deer. *Ibid.* See the article *GAME*, vol. viii. p. 233.

To a park three things are required. 1. A grant thereof. 2. Inclosures by pale, wall, or hedge. 3. Beasts of a park, such as buck, doe, &c. and, where all the deer

are

are destroyed, it shall no more be accounted a park, for a park consists of vert, venison, and inclosure; and, if it is determined in any of them, it is a total disparking; and the king may by letters patent dissolve his park. *Cro. Car.* 59, 60.

Parks as well as chases are subject to the common law, and are not to be governed by the forest-laws. 4 *Injl.* 314.

Offenders pulling down park-walls or pales, shall be liable to the same penalty as for killing deer, &c.

The best inclosure for a park is a brick or stone wall; but, as the expense of this is very great, it may be done by paling; the pales must, in this case, be of sound heart of oak; and so close planted, that no animal of prey can make its way in between them; and, for a farther defence, a good quick-set hedge is very proper, and should be kept in good order. Some part of the mountain and high wood may conveniently be made a heronry, and some part of the middle may be a warren for hares and rabbits. Colts and horses may be bred at large in the park; and, in the summer season, it will be proper to have cows in the pasture-ground on the plains.

There should be at least five or six inclosures in the park, that the deer may be shut out or let in as occasion requires. In the coldest seasons, they should always be kept in the high woods, where they have good shelter, and are to be fed constantly by the keepers. In the summer such a number as are intended to be used may also be kept on the best ground, that they may thrive quicker than those intended only for store. Some artificial holes and caverns should also be made for the deer to retire into in the hot weather, as well as in the cold.

It is supposed by Mr. Loudon, in his "Treatise on Country Residences," that parks should be of two kinds; those belonging to small houses, where regard should principally be had to the value of the pasture, and where the pasturing-animals are horses, cattle, sheep, &c. and those where grandeur of character is the main object.

In the former sort, the surface of the ground should be unbroken, but clothed and varied, or characterized chiefly by trees, unless a few shrubs of the lower growths be admitted near the residences, or the walks of the pleasure or more ornamental parts. The apparent extent of this kind of park depends more upon the variety of the grounds, and the manner in which the trees and shrubs are planted, than upon the number of acres. A level or uniform surface, spotted by circular, oval, or even angular, clumps, and surrounded by a compact serpentine belt, as at Duddington and some other places, can never, it is supposed, appear extensive; but a very few acres of varied ground, sprinkled over with light groups, thorns, and hollies, appear boundless. In such a park, every step presents a new composition, arising from the varied herds of cattle intermingling with the trees, &c. and always changing their position: and, as there is no permanent mark by which one scene can be distinguished from another, so as to know it again, a person might wander up and down the extent of a few acres for several days, without being able to say whether he was not traversing a park of several square miles. And this is the case in natural forests, as depending on the same principles.

In the latter kind of park, nothing, it is believed, can contribute so highly to the necessary grandeur of effect, as the wild forest-style of breaking the ground, and planting trees, shrubs, low growths of plants, furze, bramble, ferns, &c. and showing roots, decayed trunks, rocks, or stones, where they may appear with propriety, and, as it were, fortuitously. The grazing-animals in this case should be principally deer, a few wild cattle, and horses. It is suggested, that, as parks are the prominent features of all extensive residences, were this appearance of wildness and forest-scenery given to them, words could not convey an adequate idea of the beauty and grandeur that would be communicated to them, and at the same time to the country at large. The materials

by which this is chiefly to be effected are, as has been seen, the proper arrangement of low shrubby growths, wild plants, and forest-trees. Nothing can, however, give an idea of what these effects might be, except looking at the finest ranges of forest-scenery, few of which now exist in this country. In the New Forest, as well as that of Needwood, it is however supposed, that there are still select ranges or tracts, which the true admirers of nature will view with rapture or enthusiastic delight, and by the imitation of which, vast ornamental advantages might be made to the already beautiful parks of Donnington, Blenheim, and Croom, as well as all those esteemed the finest in the kingdom.

PARK, as signifying an inclosure, is used upon various occasions where another word might do as well, or perhaps better. Thus,

Park is the term for a movable pallisade, set up in the fields, to inclose sheep to feed and rest in during the night. This is to be shifted from time to time, to dung the ground one part after another.

Park is the name given to a very large net, disposed on the brink of the sea, with only one hole, which looks towards the shore, and which becomes dry after the flood is gone off; so that the fish once got in have no way left to escape.

Park of Artillery, a post in a camp, out of cannon-shot of the enemy, and fortified to inclose the train of artillery, and to secure the magazines and ammunition, as well as the battalions of artillery appointed for its service and defence.

The park of artillery should always be placed, if possible, within a short distance of water-carriage; and have the most ready communication with every part of the line of the army. Its form must depend upon its situation. Ten feet are usually allowed in front for one carriage and its interval, and near 50 feet from the hind wheels of the front row to the fore wheels of the second; this interval should allow sufficient room for putting the horses to the carriages, and for a free passage along the line. In parks not on immediate service, it is customary to arrange the guns with their muzzles to the front; but, where the guns are likely to be wanted at a short notice, appearances must not be studied, and the gun-carriages must be parked with the shafts to the front, ready to receive horses to them.

Park of Provisions, a place in a camp, on the rear of every regiment, which is taken up by the sutlers, who follow the army with all sorts of provisions, and sell them to the soldiers. Likewise that place where the bread-waggons are drawn up, and where the troops receive their ammunition-bread, being the store of the army.

TO PARK, *v. a.* To inclose as in a park:

How are we *park'd*, and bounded in a pale!

A little herd of England's tim'rous deer,

Maz'd with a yelping kennel of French curs. *Shakespeare.*

PARK (Mungo), a celebrated traveller, was the son of a farmer on the banks of the Yarrow, near the town of Selkirk, in Scotland; and born on the 10th of September, 1771. After having received the first rudiments of education in his father's family, he was removed to a grammar-school at Selkirk, where he remained for a considerable number of years, and where he was distinguished by his application and improvement. At this early period, though he was sedate, studious, and thoughtful, he manifested traces of that ardent and adventurous disposition which formed his distinguishing character in future life. Preferring the medical to the ecclesiastical profession, for which he was originally designed, he was bound apprentice, at the age of fifteen, to Mr. Anderson, a respectable surgeon at Selkirk; and, after residing with him for three years, he removed in 1789 to Edinburgh, where he attended the usual medical lectures during three successive sessions. He distinguished himself among his fellow-students by ardour and assiduity in the prosecution

tion of his studies, and by particular attention, during his summer-vacations, to botanical pursuits, in which he was assisted by his brother-in-law Mr. James Dickson. Upon his removal to London, this eminent botanist introduced him to sir Joseph Banks, by whose recommendation he was appointed assistant-surgeon to the Worcester East Indiaman. In 1792 he sailed for Bencoolen; and, having availed himself of the opportunities for scientific researches which this voyage afforded him, the result of his inquiries and observations was communicated, after his return, to the Linnæan Society, and published in the third volume of their Transactions. Some years prior to this period, a society had been formed with a view of promoting discoveries in the interior parts of Africa; and several persons had been employed in accomplishing the laudable purposes for which that society was established. Among these, we may reckon Messrs. Ledyard and Lucas, major Houghton, and Mr. Hornemann, who fell sacrifices either to the severity of the climate, the fatigue of the service, or the violence of the natives. The society, though disposed to afford liberal encouragement to any person who was qualified for this undertaking, and who had at the same time resolution sufficient to engage in it with the prospects which past experience presented to view, found themselves at a loss for a person in every respect fit for this hazardous mission. At this interesting period Mr. Park returned from India; and no person could have been found better qualified for such an adventurous office. Sir Joseph Banks, the distinguished patron of genius and science, had been his friend; and with him Mr. Park was in habits of frequent and intimate intercourse. Thus circumstanced, he offered his services, and they were accepted. Having received his final instructions from the Society, he set sail from Portsmouth on the 22d of May, 1795, and on the 21st of June landed at Jillifree, a small town near the mouth of the river Gambia, whence he proceeded to Pisania, where he was hospitably received by Dr. Laidley, to whom he had letters of recommendation. For an account of his progress, see the article AFRICA, vol. i. p. 186. Upon his return, he was received with cordial congratulation, both by his friends and the gentlemen of the African Association; and he was allowed to publish an account of his travels for his own benefit. In the mean while, Mr. Bryan Edwards, secretary of the Association, printed and distributed among the subscribers an abstract of the Travels from Mr. Park's papers. To this abstract was annexed an important Memoir by major Rennell, consisting of geographical illustrations of Park's journey; and this, by Mr. R's permission, formed a valuable appendage to the fourth edition of the Travels.

In the spring of 1798, government having it in contemplation to obtain a complete survey of New Holland, applied to Mr. Park for this purpose; but the proposed plan was never executed. The remainder of this year was spent by Mr. Park in visiting his friends in Scotland, and arranging the materials of his Travels. Towards the close of this year he returned to London, and devoted the principal part of his time to the correction of his MSS. which he committed to the press in the spring of the year 1799. The work, as soon as it was published, commanded an extensive and rapid sale, both on account of the interesting information which it contained, and the general elegance of its composition. An abstract of Mr. Park's discoveries, with regard to the easterly course and magnitude of the Niger, the large and populous towns and villages that occupy the interior parts of Africa, the discriminating character of the Negroes, contrasted against that of the Moors, and the civilization of the inhabitants of the interior, beyond the influence of the slave-trade, compared with that of those who are situated near the coast, and a variety of other particulars relating to the soil and productions of the country, and the manners and habits of its inhabitants, has been already given under the articles AFRICA, MANDINGO, NIGER, &c. so that we need not here enlarge. The curiosity of the public was

VOL. XVIII. No. 1267.

amply gratified, and the name and work of Mr. Park became singularly popular, though neither the one nor the other altogether escaped censure. The slave-trade was at this time a subject of general reprobation, and attempts were repeatedly renewed for the abolition of it. It was therefore natural to imagine, that in a work of this kind, the author would have availed himself of the opportunities which his narrative afforded him, of expressing his decided disapprobation of this nefarious species of commerce; more especially as it was well known to many of Mr. Park's intimate and confidential friends, that in conversation he had frequently declared his abhorrence of slavery and the slave-trade. Nor was it sufficient to allege, as some of his advocates have done, that he considered the abolition of the slave-trade as a measure of state-policy, and that it would be improper for him to give an opinion on a subject which was at this time under the deliberation of the legislature. This neutrality on his part, to say the least of it, led persons, who did not know his real sentiments, to reckon him among those who were hostile to the abolition; and his authority was triumphantly appealed to by the advocates of the slave-trade. Whilst he seems to have studiously avoided giving an opinion on the pernicious influence of this trade, he states facts which have been cited and strongly urged in favour of its abolition. In order to account for this kind of inconsistency without impeaching his integrity, we should recollect how he was circumstanced whilst he was preparing and publishing his narrative. "He was then," says a candid biographer, "a young man, inexperienced in literary composition, and in a great measure dependant, as to the prospects of his future life, upon the success of his intended publication. His friend and adviser, Mr. Bryan Edwards, (a West-India planter, and a systematic advocate of the slave-trade,) was a man of letters and of the world, who held a distinguished place in society, and was besides a leading member of the African Association, to which Mr. Park owed every thing, and with which his fate and fortunes were still intimately connected. It is difficult to estimate the degree of authority which a person possessing these advantages, and of a strong and decisive character, must necessarily have had over the mind of a young man in the situation which has now been described. Suggestions coming from such a quarter must have been almost equivalent to commands; and, instead of severely animadverting on the extent of Park's compliances, we ought, perhaps, rather to be surprised, that more was not yielded to an influence which must have been nearly unlimited." Mr. Park is known to have regretted that some parts of his publication, relating to the slave-trade, had been misunderstood, and applied in a sense which it was not intended they should have been.

After the publication of his travels, Mr. Park returned to Scotland in the summer of 1799; and, on the 2d of August in that year, he married a daughter of Mr. Anderson of Selkirk, with whom he had served his apprenticeship. In the month of October, 1801, he settled at Peebles, with a full purpose of pursuing his medical profession; but, as he devoted much of his time and attention to the poor, the profits of his business were inconsiderable; nor could he forbear wishing for a change of situation that would be more advantageous. His views, however, were directed towards a second African mission. A prospect of this kind was presented to him by a letter from sir Joseph Banks, soon after the signature of the preliminaries of peace with France, in October 1801; but it was not till the autumn of the year 1803, that a specific proposal was made to him for this purpose. Previously disposed to accept it, he did not long hesitate in announcing his purpose; and accordingly he took leave of his friends, and left Scotland in December 1803, confidently expecting that he should soon embark for the coast of Africa. A variety of circumstances occurred which delayed and threatened the total failure of the expedition; however, in a course of time all difficulties were obviated; the ob-

jects and plan of the undertaking were settled to the satisfaction of Mr. Park, and he received a commission from government for conducting and executing it. To himself was granted a brevet-commission of a captain in Africa; and to his friend Mr. Alexander Anderson a similar commission of lieutenant; and Mr. Scott was appointed to attend him as a draftsman. He was empowered to enlist at Goree any number of the garrison that would be necessary for his purpose, not exceeding forty-five, with such bounties as would induce them cheerfully to accompany him. From Goree he was directed to proceed up the river Gambia; and thence, crossing over to the Senegal, to march by such routes as he should find most eligible to the banks of the Niger. The great object of his journey was to pursue the course of this river as far as it could be traced; to establish a communication and intercourse with the different nations on the banks; to obtain all the knowledge in his power respecting them; and to ascertain various points which he had stated in his memoir. Mr. Park was empowered to draw for any sum which he might want, not exceeding 5000*l*.

Every thing being now fixed, and the season already far advanced, Park was extremely anxious to hasten his departure, as the whole success of the expedition depended on its being undertaken a sufficient time before the rains. He was nevertheless detained two months for his official instructions; and one month more elapsed, before he could set sail. As every thing was ready early in October (1804), it is deeply to be lamented, that any accident should have prevented him from sailing in the course of that month. The delay, indeed, proved fatal to the enterprise, which in all probability would have had a different result, had it been undertaken at an adequate distance of time from the rainy season.

The expedition at length failed on the 30th January, 1805; and arrived, after a somewhat tedious passage, on the 8th of March, at Jago, one of the Cape-de-Verd islands, where they purchased the asses requisite for their caravan; and on the 28th they reached Goree in safety.

From Goree they proceeded to Kayee, a small town on the Gambia, a little below Pisania, where Park engaged a Mandingo priest, named Isaaco, who was also a travelling merchant, and much accustomed to long inland journeys, to serve as the guide to his caravan. Here they staid till the 27th of April, arranging matters for the expedition; and here commences Mr. Park's interesting Journal of his last Mission, which includes regular memoranda of his progress and adventures to Nov. 16. so that seven months had not elapsed before his career was for ever arrested. It is very evident that, had he lived to return to his country, these mere hints would never have been laid before the public; but his melancholy fate gives an interest to every scrap of information respecting him. Lieut. Martyn and thirty-five men of the Royal African Corps formed his escort.

On the 27th April, 1805, at ten o'clock in the morning, Mr. Park took his departure from Kayee; and arrived in two days at Pisania, from whence he had set out for the interior of Africa nearly ten years before. Some of the practical difficulties of the march were apparent during this short journey; and he found it necessary to stop at Pisania six days (a delay which must have been highly inconvenient), to purchase additional beasts of burden, and make other arrangements for the expedition.

He quitted Pisania on the 4th of May, and arrived on the 11th at Madina, the capital of the kingdom of Woolli. The effects of the season had already become apparent; two of the soldiers having fallen ill of the dysentery on the 8th. On the 15th he arrived at Kussai, on the banks of the Gambia; and about this time lost one of his soldiers by an epilepsy.

On the 26th, the caravan experienced a singular accident (almost unintelligible to an European) from the attack of a large swarm of bees; in consequence of which, besides that many of the people were most severely stung,

seven of their beasts of burden perished or were lost; and, owing to an accidental fire which was kindled in the confusion, the whole baggage was near being burnt. For half an hour it seemed as if the bees had put an end to the expedition.

At Shrondo, in the kingdom of Dentila, where the caravan shortly afterwards arrived, there are considerable gold-mines; and his journal contains a minute and interesting description both of the manner of collecting the metal, and of the country in which it is found.

After quitting Shrondo, Park mentions, that on the 12th of June, in consequence of a very sudden tornado, they were forced to carry their bundles into the huts of the natives, being the first time that the caravan had entered a town since leaving the Gambia. Considering the climate and season, this slight circumstance is alone a sufficient proof of the hardships which must have been sustained by Europeans during such a journey.

At Dindikoo, beyond Shrondo, Park was much struck with the beauty and magnificence of that mountainous tract of country, as well as with the degree in which it was cultivated, and the comparatively happy condition of the inhabitants. Proceeding a little farther, he quitted the track he had hitherto followed, by which he had formerly returned from Kamalia to the Gambia; and directed his course towards the north-east, with a view probably of avoiding the Jallohka Wilderness. But the difficulties of travelling were now become extreme; partly from the nature of the country, but principally from the increasing prevalence of the disease produced by the continual rains. So rapidly had sickness now extended among the men, that on the morning of the 13th of June, when they departed from Dindikoo, the sick occupied all the horses and spare asses; and by the 15th some were slightly delirious. At Kimbia, the blacks manifested their hostile disposition; and made it very probable that, as soon as the party was so reduced as to be unable to defend themselves, the inhabitants would attack them and seize their property.

July 4. Isaaco, the guide, was nearly demolished by a crocodile. His escape appears scarcely credible. "Our guide, Isaaco, was very active in pushing the asses into the water, and shoving along the canoe; but, as he was afraid that we could not have them all carried over in the course of the day, he attempted to drive six of the asses across the river farther down, where the water was shallower. When he had reached the middle of the river, a crocodile rose close to him, and, instantly seizing him by the left thigh, pulled him under water. With wonderful presence of mind he felt the head of the animal, and thrust his finger into its eye; on which it quitted its hold, and Isaaco attempted to reach the further shore; calling out for a knife. But the crocodile returned, and seized him by the other thigh, and again pulled him under water; he had recourse to the same expedient, and thrust his fingers into its eyes with such violence that it again quitted him; and, when it rose floundered about on the surface of the water as if stupid, and then swam down the middle of the river. Isaaco proceeded to the other side, bleeding very much. As soon as the canoe returned, I went over, and found him very much lacerated. The wound on the left thigh was four inches in length: that on the right not quite so large, but very deep; besides several single teeth-wounds on his back.

It is afflicting to peruse the items of this melancholy journal. Depredations were made on the coffee, or caravan, (as the party is called,) by the inhabitants in one place, and banditti in another; increasing sickness and death prevailed among the small military escort; and the continuance of rain gave little hope of any improvement in the sick-list.

On the 2d of August, they halted at Balanding; on the 3d, at Balandoo; and on the 4th reached Koolihori, a town partly walled, but having the greater part of its huts without the walls. On the 6th, they reached Ganifarra,

Ganiffarra, a small beggarly village. On the 9th, they crossed the Ba Woolli, a very deep river, flowing at the rate of four or five miles an-hour.

They pursued their route, until, on the 13th, those of them who survived reached Koomikoomi, where they halted; lat. 13. 16. 29. N. On the 15th, they reached Doombila, where Mr. Park met with an old friend, Karfa Taura, a worthy negro whom he had known, and whose kindness he had experienced, in his former travels. From Doombila, they proceeded on the 18th to Toniba; and from thence they ascended the mountains south of it, till, having attained the summit of the ridge which separates the Niger from the remote branches of the Senegal, Mr. Park had the satisfaction of once more seeing the Niger rolling its immense stream along the plains. But this satisfaction was accompanied by the mortifying reflection, that three-fourths of the soldiers had died on their march, and that, in their weakly state, they had no carpenters to build the boats in which they proposed to prosecute their discoveries. It was, however, a pleasing consideration, that, in conducting a party of Europeans, with immense baggage, through an extent of more than 500 miles, he had always been able to preserve the most friendly terms with the natives; and hence he was warranted to infer, that, with common prudence, any quantity of merchandise may be transported from the Gambia to the Niger, without danger of being robbed by the natives; and that this journey may be performed, in the dry season, with a probability of not losing more than three or at most four out of fifty. But Mr. Park was unfortunate in undertaking such a journey with the prospect of the rainy season; and the event proved, that this season set in before his journey to the Niger was more than half completed.

When he reached the Niger at Bambakoo, where the river begins to be navigable, on the 19th of August, there remained out of thirty-four soldiers and four carpenters, who left the Gambia, only six soldiers and one carpenter; and the principal persons who composed the expedition, besides Mr. Park himself, were three, viz. Mr. Anderson, Mr. Scott, and lieutenant Martyn, who were more or less affected by the disease of the climate; the two former very seriously, so that Mr. Scott was left behind at Koomikoomi, and died without reaching the Niger. Mr. Park had been slightly affected; and it is wonderful, that the anxiety and fatigue which he must have experienced did not break down both his spirits and his strength.

Having arrived at the Niger, Mr. Park, and the few companions that remained, embarked in a canoe on the 22d of August, and were borne away by the current at the rate of about five knots an-hour. The river is, at the point of embarkation, an English mile broad; and at the rapids, of which there are three principal ones, it spreads out to nearly twice that breadth. On the 23d, they arrived at Marraboo, where they were joined by those who came by land. Isaaco was immediately dispatched to Sego, the capital of Bambara, to negotiate with Mansong, the sovereign, for a free passage through his dominions. Whilst Mr. Park waited for his return, he was seized with a dysentery that threatened the termination of all his projects; but, by the aid of medicine and the advantage of a good constitution, he was soon restored to health. Many difficulties and delays occurred in the negotiation, which was conducted on the part of Mr. Park with singular judgment and address; but at length, after many unfavourable rumours, which kept his mind in a state of distressing suspense, Mansong deputed a messenger to conduct him towards Sego. Under his escort, he left Koolikorro (lat. 12. 52. N.) on the 13th of September, and enjoyed the beautiful views which his voyage afforded him; "the river," as he says, "being sometimes as smooth as a mirror, at other times ruffled with a gentle breeze, but at all times sweeping us along at the rate of six or seven miles an-hour." On the 14th, they

departed from Deena, where they had lodged, and arrived at Yamina, (lat. 13. 15.) where they halted on the 15th; and on the 16th reached Samee, (lat. 13. 17.)

Here a deputation of Mansong's friends visited Mr. Park, in order to hear from himself a statement of his views and purposes in the voyage he was undertaking. His statement was satisfactory to the grandees that had executed this commission; and Mr. Park was assured of permission to pursue his voyage, and of protection from Mansong as far as his power extended. The king and his courtiers were much gratified by the presents which they received on the occasion. Accordingly, on the 26th of September, Mr. Park proceeded from Samee to Sanfanding, which is twenty-five miles north-east of Sego. Here he intended to provide a proper vessel for his further navigation down the Niger; but it was with difficulty that he procured from Mansong and his son, in return for the presents he had given them, two decayed canoes, which merely afforded him materials for constructing, with his own hands, and some assistance from one of the surviving soldiers, a flat-bottomed boat, to which he gave the sounding title of His Majesty's Schooner the Joliba.

In the mean while Mr. Park was informed of the death of Mr. Scott; and he had now occasion to lament the loss of his friend Mr. Anderson, who died, after a lingering attack of four months, on the 26th of October. The sensibility he expressed on this occasion did honour to his feelings; and yet, considering his present perilous situation, and the dreary and discouraging prospects which presented themselves with regard to the prospects of his undertaking, he must have possessed a very high degree of equanimity, firmness, and self-possession. On the 16th of November, the schooner having been completed, and every thing in Mr. Park's power to command being ready for the voyage, he closes his journal; and, in the course of the succeeding days, previous to his embarkation, which was on the 19th, he wrote several letters to his friends and kindred in England and Scotland. In these letters, we discover traces of that deliberate and inflexible resolution, without effort or ostentation, which was a distinguishing feature of his character. From this period, we have no strictly-authentic information concerning Mr. Park, or the progress and termination of his expedition. In the course of the year 1806, conjectures and reports agitated the public mind; and the agitation was aggravated by intelligence communicated by the native traders from the interior of Africa to the British settlements on the coast; whence it was concluded, that Mr. Park and his companions were killed. In consequence of these unsatisfactory and alarming rumours, lieutenant-general Maxwell, then governor of Senegal, obtained permission from government to engage a proper person to investigate and ascertain the truth of these rumours. Accordingly, he engaged Isaaco, Mr. Park's guide, to conduct this business. In January 1810, Isaaco left Senegal; and returned on the 1st of September, 1811, fully confirming the reports of Mr. Park's death. His journal, including another from Amadi Fatouma, the guide who had accompanied Park from Sanfanding down the Niger, was delivered to the governor, and transmitted by him, after having been translated from Arabic to English, to the secretary of state for the colonial department.

From Amadi Fatouma's journal we learn, that the conductors of the expedition went from Sanfanding to Silla, where Mr. Park had ended his first voyage; and that from thence Mr. Park, Martyn, three other white men, three slaves, and Amadi as guide and interpreter, nine in number, proceeded in a canoe to Ginny; and, as they passed Sibby, or Dibbie, they were attacked by an armed force in three canoes, which they repulsed. Again at Rakbara, or Kabra, they repelled another assault; and, in passing Tombuctoo, they resisted another similar attack, escaping by force and by the slaughter of many of the natives. As they

they advanced, the number of hostile canoes increased, till at length it amounted to sixty, and in self-defence they killed a very considerable number of persons; their own number being now reduced, by the death of one of the white men, to eight. At length, having passed Kaffo and Gourmon, and having supplied themselves with provisions, they entered the country of Haoussa. The king of the country, having received information from the chief of Yaour, a village in this district, that the white men had departed without giving them any presents, sent an army to a village called Boussa, near the side of the river, which was posted on the top of a rock that traversed the river, in which rock there was a large cleft or opening that admitted the water to pass in a strong current; and, when Mr. Park arrived at this opening, and attempted to pass, he was attacked with lances, pikes, arrows, and stones; against which he for some time resolutely defended himself, till, at length overpowered by numbers and fatigue, and unable to keep up the canoe against the current, Mr. Park laid hold of one of the white men and jumped into the water; Mr. Martyn did the same, and they were drowned in the stream in attempting to escape. One slave was left, and they took him and the canoe, and carried them to the king. Amadi, after having been kept in prison for three months, was released; and obtained information from the surviving slave, concerning the manner in which Mr. Park and his companions had died. Nothing was left in the canoe but a sword-belt, of which the king had made a girth for his horse; and this belt Isaac afterwards recovered. Amadi, according to Isaac's report, was a good upright man, and delivered the above account to him on oath; nor could he have any interest in deceiving him. From circumstances it is concluded, that Mr. Park died four months after his departure from Sanfanding.

The leading parts of Mungo Park's character must have been anticipated by the reader in the principal events and transactions of his life. Of his enterprising spirit, his indefatigable vigilance and activity, his calm fortitude and unshaken perseverance, he has left permanent memorials in the narrative of his former travels and in the journal and correspondence since published. In these respects few travellers have equalled, none certainly ever surpassed, him. Nor were the qualities of his understanding less valuable or conspicuous: he was distinguished by a correctness of judgment seldom found united with an ardent and adventurous turn of mind, and generally deemed incompatible with it. His talents certainly were not brilliant, but solid and useful, such as were peculiarly suited to a traveller and geographical discoverer. Hence, in his accounts of new and unknown countries, he is consistent and rational; he is betrayed into no exaggeration, nor does he exhibit any traces of credulity or enthusiasm. His attention was directed exclusively to facts; and, except in his opinion relative to the termination of the Niger, (which he supported by very plausible arguments,) he rarely indulged in conjecture, much less in hypothesis or speculation.

In all the relations of private life he appears to have been highly exemplary; and his conduct as a son, a husband, and a father, merited every praise. To the more gentle and amiable parts of his character, the most certain of all testimonies may be found in the warm attachment of his friends, and in the fond and affectionate recollections of every branch of his family. He was a stranger to all vanity and affectation; and, notwithstanding his great popularity and success, appears to have lost no portion of the genuine simplicity of his character and manners. This simplicity originated perhaps in a considerable degree from a certain coldness and reserve, which, as was before remarked, rendered him very indifferent, and perhaps somewhat averse, to mixed or general society. It was probably owing to the same cause that his conversation, for a man who had seen so much, had nothing remarkable, and was rarely striking or animated. Hence,

although his appearance was interesting and prepossessing, he was apt to disappoint the expectations of strangers: and those persons who estimated his general talents from his powers of conversation, formed an erroneous and inadequate opinion of his merits. In his person he was tall, being about six feet high, and perfectly well proportioned. His countenance and whole appearance was highly interesting; his frame was active and robust, fitted for great exertions and the endurance of hardships. His constitution had suffered considerably from the effects of his first journey into Africa; but seems afterwards to have been restored to its original vigour, of which his last expedition afforded the most ample proofs. The second volume of his Travels, entitled "Journal of a Mission into the Interior of Africa in the Year 1805," with his Life prefixed, and from which the above article is collected, was published by the African Institution, in 1815, 4to. and a new edition was published, in 8vo. in 1816.

PAR'K-LEAVES. See HYPERICUM.

PAR'KANY, a town of Hungary, at the conflux of the rivers Gran and Danube: two miles north of Gran, and fourteen east of Comorn.

PAR'KEL, a town of Hindoostan, in Golconda: thirty-two miles south-south-west of Hydrabad.

PAR'KER, *s.* A park-keeper.—To make good such a justification by a *parker*, forester, or warrener, there are these things requisite. *Hale*.

A doe came tripping in at the rere ward;
But, lorde, how the *parker* was wroth with all! *Shelton*.

PAR'KER, a township of Butler county, in Pennsylvania, having 399 inhabitants.

PAR'KER (Matthew), the second protestant archbishop of Canterbury, and a prelate of considerable abilities and learning, was the son of a substantial tradesman of Norwich, where he was born in the year 1504. When only twelve years of age he lost his father; but his mother took care to place him under the instruction of good masters, by whom he was well grounded in grammar-learning. In the year 1520 he was sent to the university of Cambridge, where he entered of Corpus-Christi college; of which house he was chosen a bible-clerk, or scholar, in the following year; in 1523 he was admitted to the degree of B. A. in 1527 he was ordained deacon, and afterwards priest; and in the same year he commenced M. A. and was chosen fellow of his college. In 1533, when he was about nine-and-twenty years of age, he preached his first sermon before the university; and almost immediately became a popular preacher in the neighbourhood of Cambridge. He had by this time imbibed the principles of the Reformation, and showed so much zeal for them, that archbishop Cranmer granted him a licence to preach throughout his province. About this time he was sent for to court, and was made chaplain to queen Anne Boleyn, who appointed him, a short time before her death, to the particular charge of her daughter Elizabeth. About the year 1534 he was presented by the queen to the deanery of the college of Stoke, near Clare, in Suffolk; a preferment of small value in a pecuniary view, but affording him a pleasing place of retirement, when he chose to withdraw from the court, from which it was about twenty miles distance. Here he laboured to reform the popish superstitions; and founded a grammar-school, for the instruction of youth in sound learning, and in the principles of the Christian religion, at which the children of the poor were taught gratis. Mr. Parker still continued to preach assiduously at Stoke, Cambridge, and other places; and sometimes in London, at St. Paul's Crofs.

In the year 1537, after the death of queen Anne Boleyn, king Henry VIII. took Mr. Parker into his own service, appointing him one of his chaplains. In 1538 he was created D. D. in 1541, installed prebendary in the cathedral church of Ely, and in the following year presented

sented to the rectory of Athen in Essex. This living he resigned in 1544; immediately after which he was presented to the rectory of Birlingham All-Saints, in his native county of Norfolk. In the same year, in consequence of the king's letters commendatory, containing a very honourable testimony to his character and worth, he was chosen master of Corpus-Christi college; to which he afterwards became a liberal benefactor, and compiled for it a new body of statutes. In 1545, he was elected vice-chancellor of the university of Cambridge; and in the same year he was presented by his college to the rectory of Landbeach in Cambridgeshire. In 1547, he lost his deanery of Stoke by the dissolution of that college, which he ineffectually exerted himself to prevent: however, from a regard to his merit, he had a yearly pension of forty pounds settled on him in lieu of it, and a promise of the deanery of Lincoln.

After the accession of king Edward VI. matrimony being allowed to the clergy, Dr. Parker married a lady of a good family, who proved an excellent wife, as well as an excellent woman, and contributed materially to his happiness during twenty-three years. Being accidentally in Norfolk, in 1549, during the time of Kett's rebellion, Dr. Parker had the resolution to go to the rebels' camp, where he preached to them under the oak of reformation, taking the opportunity to exhort them to temperance, moderation, and submission to the king. In doing this he ran great hazard, and his life appears to have been in danger from the fury of some of the enraged multitude; however, he happily escaped out of their hands.

In 1551, Dr. Parker was included in a commission for correcting and punishing anabaptists; under which term seem to have been comprehended, not only persons who rejected infant-baptism, but Arians, Pelagians, and others who administered the sacrament in a different way from that prescribed by the Book of Common-Prayer. In 1552, he was presented by king Edward VI. to a prebend in the cathedral church of Lincoln, and a few days afterwards to the deanery of the same church. He had before been nominated a chaplain to his majesty, probably soon after his accession to the crown. Thus he lived in great reputation and affluence, during the reigns of Henry VIII. and Edward VI. and happy in the acquaintance and esteem of some of the greatest men of the time; among whom were the learned Emanuel Tremellius, lord Cromwell, archbishop Cranmer, bishop Ridley, bishop Latimer, sir William Cecil, sir John Cheke, and Mr. Nicholas Bacon, afterwards lord keeper.

After the accession of queen Mary to the throne, Dr. Parker was deprived of all his preferments, under the pretence of his being disqualified for holding them as a married man; but, in reality, on account of the active part he had taken in promoting the principles of the reformation. Upon this, he withdrew privately into Norfolk, with his wife and family, bearing his reverse of fortune with a contented and cheerful mind. The first asylum which he chose was in the house of one of his friends; but, as strict search was frequently made after him, he was obliged to remove from place to place, and proved so fortunate as to escape the vigilant and active persecutors of that bloody reign. Some part of the leisure which his present obscure situation afforded him, Dr. Parker employed in turning the Book of Psalms into English verse, and in writing a defence of the marriage of priests.

Upon the death of queen Mary, and the accession of Elizabeth, in 1558, a very great alteration took place in the circumstances of Dr. Parker; for he not only became free from all fear and danger, but was elevated to the highest dignity in the English church, the archbishopric of Canterbury. For this exalted station he was considered to be the fittest man among the English clergy at that difficult crisis, when the great work of reformation was to be carried on with vigour, on account of his great learning, piety, zeal, courage, and prudence. He was

so far from seeking this dignity, that he appears to have been really averse to the acceptance of it, and sincere in his application to the lord keeper Bacon, to use his interest with the queen that he might be permitted to decline it. Her majesty, however, persisting in her choice, he was obliged to submit, and was consecrated in Lambeth chapel, on the seventeenth of December, 1559, by William Barlow, late bishop of Bath and Wells, and then elect of Chichester; John Scory, late bishop of Chichester, and then elect of Hereford; Miles Coverdale, bishop of Exeter; and John Hodgkin, suffragan bishop of Bedford. We mention these particulars, of which there is the clearest evidence, as affording a decisive confutation of the malignant falsehood that was invented and propagated some years afterwards by the papists, that Parker was consecrated at the Nag's Head inn, or tavern, in Cheapside.

Being thus constituted primate and metropolitan of the church of England, Dr. Parker endeavoured to fill the vacant sees with men of learning and piety, who were zealous for promoting the reformation; and, soon after his own consecration, he consecrated at Lambeth, Grindal bishop of London, Cox bishop of Ely, Sandys bishop of Worcester, Jewel bishop of Salisbury, and several others. He also extended his influence and his concern for the protestant interest to the kingdom of Ireland, sending over proper instructions to Hugh Corwin, archbishop of Dublin, for completing the work of the reformation of the church of Ireland. Accordingly, the Litany was sung in English at the cathedral in Dublin, in the presence of the earl of Sussex, the queen's lieutenant, and his court; which so highly exasperated the popish party, that they had recourse to their old fraud of inventing a miracle, to keep up the reputation of the old superstition. That which they adopted, however, was so indifferently contrived, that it was easily detected, to the shame and disgrace of the parties concerned, and of the cause which it was meant to support. The particulars of this ridiculous story having been transmitted from the archbishop of Dublin to archbishop Parker, he took care that it should be universally circulated, to expose the credulity of those who still retained a veneration for images. This letter was published by him very opportunely in England, as the question whether they should be continued in the churches or not, was now debating by the clergy, and the queen seemed inclined to retain them; but the sight of this letter, backed by several passages produced from Scripture by the archbishop and other divines, produced her consent that they should be taken down throughout the kingdom and demolished.

About this time archbishop Parker received a letter from Calvin, congratulating him on the religious change which had taken place in England, and entreating him to prevail with the queen to summon a general assembly of all the protestant clergy, wheresoever dispersed, for the purpose of agreeing upon one common form of worship and of church-government, to be established not only within her dominions, but also among all the reformed and evangelical churches abroad. This letter was taken into consideration by the queen's council, who requested his grace to return thanks to Calvin for his proposals, which they acknowledged to be candid and desirable; but at the same time to signify to him, that the church of England would still retain her episcopacy, and that the queen would continue to be the head of her own church.

But the queen found it impossible to produce conformity and unanimity even in her own church. Disturbances soon arose on the subject of ecclesiastical habits, which threatened an alarming schism, and could not fail giving cause of scandal to all well-disposed Christians. In consequence of a clause in the act of uniformity, which gave the queen power to add any rites and ceremonies which she thought proper to add to those of the established church, she had issued injunctions, by which particular ecclesiastical habits were ordered to be worn by the clergy,

which

which had been laid aside in the reign of king Edward VI. These injunctions occasioned a great diversity of practice in the church; many conforming themselves implicitly in every circumstance, while others rejected a part of the habits, and not a few the whole, considering them to be relics of popery, and consequently superstitious and sinful. Square caps, copes, and surplices, in particular, were strongly objected to; and many forsook the service of the churches where these habits were used, while others deserted those places where they were rejected. The great majority of the laity, however, who were zealous for the reformation, were against these habits; and the clergy who wore them were subject to the insults of the common people, who believed them to be papists at heart, and conformists to the protestant religion only from interested motives. At length the matter was laid before the queen, who was highly offended at this diversity in the practice of the clergy, and especially that any opposition should be made to laws enacted with her concurrence and authority. She therefore directed a letter to the archbishops of Canterbury and York, reflecting with some acrimony on these diversities, as if they were owing to remissness in the bishops; and requiring them to confer with her ecclesiastical commissioners, "and to take effectual methods that an exact order and uniformity be maintained in all external rites and ceremonies; and that none hereafter be admitted to any ecclesiastical preferment, but who was well disposed to common order, and should formally promise to comply with it." In compliance with this letter, archbishop Parker, together with the bishops of London, Ely, Winchester, and Lincoln, drew up "Ordinances for the due Order in Preaching, and administering the Sacraments, and for the Apparel of Persons ecclesiastical." According to some of these ordinances, all the licences for preaching were to be directly cancelled; but were to be renewed to such of the clergy as their bishops should think worthy of the office. Those who should be licensed, were to preach once in three months; and those who should be unlicensed, were to read homilies. In administering the sacrament, the principal minister was to wear a cope; but, in the other parts of the devotional service, only the surplice. In cathedrals they were to wear hoods, and to preach in them. The sacrament was to be received by every person kneeling. Communion-tables were to be placed in all churches towards the east, and the ten commandments set up on the walls above them. No person was to be ordained without having first taken his degrees; and a subscription was to be required of all who were admitted to any office in the church, that they would observe uniformity, and conform to all the laws and orders already established for that purpose, &c.

These ordinances the archbishop published, under the title of *advertisements*; and soon gave the clergy to understand, that he would enforce them with rigour in the spiritual court. Among those whom he cited before him, were Mr. Thomas Sampson, dean of Christ-church, and Dr. Lawrence Humphreys, regius professor of divinity and president of Magdalen-college, Oxford, who were universally respected for their great learning, piety, and zeal for the reformation, and had been exiles on account of their religion in the reign of queen Mary. These men, together with the rest of their brethren who entertained conscientious scruples about wearing the habits, were now classed under the general denomination of *Puritans*. Upon their appearance before the archbishop, he endeavoured to remove their scruples by arguments, accompanied with menaces of deprivation in case of their refusal to conform; but found them inflexible. After a long attendance, and many checks from some of the high-commissioners for their refractoriness, they were ordered not to depart the city without leave. The commissioners were divided in their opinions how to proceed with them; some being disposed towards a connivance,

and others towards a compromise. But the archbishop, who guided their ultimate determinations, would not grant them the least indulgence; and on their next appearance he peremptorily told them, that they must comply with the *advertisements*, or part with their preferments. Upon their answering that, whatever the event might be, their consciences would not allow them to comply, they were taken into custody, and confined in prison for some time, by way of terror to others; and, when this proceeding was found not to produce the desired effect, they were deprived, and then dismissed. Soon afterwards the archbishop summoned the whole body of the incumbents and curates of the city of London to appear before him and some of the other commissioners at Lambeth; and when, on the appointed day, they appeared in court, the archbishop's chancellor ordered them to declare, by a subscription under their hands, whether they would promise conformity to the habits or not. After much persuasion, and many threatenings, sixty one subscribed, and thirty-seven absolutely refused; in which latter number were some of the best preachers in the city, as archbishop Parker acknowledged. These were immediately suspended from the office of the ministry, notwithstanding their crying out for compassion to themselves and families; and they were assured, that, if they did not conform within three months, they should be deprived. When they offered a paper containing the reasons of their refusal, the chancellor told them, that it was not the business of the commissioners to argue and debate, but to execute the queen's injunctions.

In consequence of these proceedings against the Puritans, many churches in London, and in every part of the kingdom where the queen's injunctions were rigidly executed, were shut up for want of preachers; the serious well-wishers to the reformation lamented to see its progress impeded by such arbitrary and oppressive measures; and the papists rejoiced with inexpressible pleasure to see the protestants thus weakening their own hands by silencing such numbers of their best divines. The sufferers under these persecutions, having been refused a hearing by the archbishop and the rest of the commissioners, thought it their duty to lay their case before the world, and published various books and pamphlets in defence of their nonconformity. To some of these, answers were written on the part of the bishops, either by themselves or their chaplains; which were followed by replies from the Puritans, whose tracts were eagerly sought after, and were widely spread among the people. Provoked at the attention which was paid to them, the archbishop and the other commissioners complained to the privy council, that, notwithstanding the queen's injunctions, the schism in the church was kept open, and increased, by the printing and publication of seditious libels. In consequence of this complaint, they obtained a decree from that arbitrary tribunal the star-chamber, prohibiting all books and pamphlets in which any thing should be advanced against the queen's injunctions, ordinances, or letters patent; and empowering the wardens of the stationers' company to search all suspected places for such books, and to bring the offenders before the ecclesiastical commissioners. This high stretch of tyranny, which took place in June 1566, was a disgrace to the cause in behalf of which it was exerted, and excited against the men who had recourse to such an expedient for silencing their opponents, the detestation of all the consistent friends of truth and liberty.

The Puritans, thus shut out of the church by sequestrations, imprisonments, the taking away of their licences to preach, and the restraints of the press, were at first at a loss how to act, being unwilling to separate from a communion in which they admitted that the faith and essentials of religion were uncorrupted, though they conceived that the administration of the word and sacraments was defiled with popish superstitions. At length, after much serious discussion, they came to this determination,

nation, "that it was their duty, in their present circumstances, to break off from the public churches, and to assemble, as they had opportunity, in private houses, or elsewhere, to worship God in a manner that might not offend against the light of their consciences." It was also debated among them, whether they should use as much of the Common Prayer and Service of the Church, as was not offensive; or resolve at once to set up what they considered to be the purest and best form of worship, most consonant to the holy scriptures, and to the practice of the foreign reformers. The latter of these measures was concluded upon; and accordingly, they laid aside the English Liturgy, and made use of the Geneva Service-Book. Thus commenced the formal separation of the Protestant Nonconformists from the Church of England: "a most unhappy event of this controversy," says Mr. Strype, "whereby people of the same country, of the same religion, and of the same judgment in doctrine, parted communions; one part being obliged to go apart into secret houses and chambers, to serve God by themselves, which begat strangeness between neighbours, Christians, and Protestants." "And not only strangeness," adds Mr. Neal, "but unspeakable mischiefs to the nation in this and the following reigns. The breach might easily have been made up at first, but it widened by degrees; the passions of the contending parties increased, till the fire, which for some years was burning under ground, broke out into a civil war, and with unspeakable fury destroyed the constitution both of church and state. At whose door the beginning of these sorrows are to be laid," the impartial reader will be at no loss in determining.

In the year 1567, the archbishop founded three grammar-schoolships, or exhibitions, in Bennet-college; and two years afterwards, seven more schoolships, and two fellowships, in the same house. In 1568, a new folio edition of the English Bible was published, chiefly under the inspection of archbishop Parker, with a preface written by him. This was commonly called the *Bishops' Bible*, on account of its having been revised and corrected, principally by bishops, from the translation published by Cranmer; and it was made use of in the churches, till the last translation took place in the reign of James I. About the year 1572, archbishop Parker gave handsome presents of plate, and other benefactions, to several colleges in the university of Cambridge; and founded a scholarship for the study of the law, and another for the study of physic. In 1574, he presented many volumes to the library of the university of Cambridge, of which twenty-five were valuable manuscripts; and he gave additional benefactions to Corpus-Christi college.

One of the last public acts in which his grace was employed, was a metropolitanical visitation of the diocese of Winchester, and in particular of the Isle of Wight, in the year 1575, in which he exercised such severities as exposed him to universal odium, and even induced the court to interfere and reverse his proceedings. That island being a place of resort for foreign protestants, and sea-faring persons of all countries and religions, many of whom were Calvinists, it had been judged expedient by government not to be so strict on the subjects of the habits and ceremonies, as in other places, lest the commerce of the country should sustain an injury. But such considerations had no weight with Parker, who was determined to enforce a strict conformity throughout the island. Accordingly, when he came thither, he deprived all the clergy who refused submission, consisting of the greater part of that body, and shut up their churches. The inhabitants, greatly concerned at this display of intemperate zeal, sent a complaint against the prelate to the earl of Leicester, who laid it before the queen. The bishop of Winchester, likewise, transmitted a remonstrance to court, against the inquisitorial proceedings of the archbishop in his diocese. These complaints were investigated

at the council, who declared their disapprobation of the archbishop's conduct, and advised her majesty that ecclesiastical matters should be placed in the Isle of Wight upon their former footing. This was done accordingly; and, when Parker came next to court, the queen not only received him very coldly, but declared her displeasure at his unseasonable severities. Full of resentment at the reception which he had met with, and the interference of the earl of Leicester, and some others, in this business, the archbishop wrote an angry letter to the lord treasurer, in which he expressed his discontent at the opposition made to his measures, disclaimed all concern in the present policy of the court, and declared the church and state to be in danger of dissolution, from the countenance given to the Puritans.

Archbishop Parker now rapidly declined in his health, and suffered much from attacks of the stone and strangury; a violent paroxysm of which carried him off in May 1575, when he was in the seventy-first year of his age. He was buried, with great magnificence and solemnity, in his own private chapel at Lambeth, under a tomb erected by himself; which remained there till 1648, when colonel Scot, having purchased that palace for a mansion-house, pulled down the tomb, and scandalously abused the remains of the prelate, by directing them to be thrown into a hole near an outhouse where poultry were kept, while he disposed of the leaden coffin which had contained them to a plumber. Some time after the restoration they were decently re-interred in the place where the monument had stood, which was again erected to his memory.

Archbishop Parker has the honour to rank among the principal agents in exposing the superstitions of popery, and in placing the protestant religion on a permanent footing in England. It is to be lamented, however, that he sullied this honour, by introducing in protestantism much of the ecclesiastical pride, and tyrannical persecuting spirit, of the church from which he separated. It is justly observed by Dr. Warner, that a general character of him cannot be given, which will accord with the former and latter part of his life, since he was so different a man in those two periods. In the former part of his life, he had behaved with remarkable good temper, as a modest humble man; and the great unwillingness with which he accepted the primacy, shows that he entertained a deep sense of the duties of the episcopal office, and that he was then uninfluenced by avarice or ambition: but, when he was invested with the archiepiscopal dignity, he lost all his former humbleness of mind, and assumed high notions of authority both in church and state: he became as rough and uncourtly in his behaviour towards those who had business with him, as he was slavish in his obedience to the prerogative and supremacy. The queen had once told him, that he had a supreme ecclesiastical authority in himself, which seems to have fired him with ambition, to see what great things he could do for the church; and he appears to have thought, that his best method of rendering service to it, would be by enforcing an uniformity of opinion and worship; forgetting that, upon the same principles, the popish persecutions might have been defended. His religion seems to have almost wholly consisted in a servile submission to the queen's injunctions, and in regulating the public service of the church; for, while he was expending his zeal, and time, and labour, in suppressing Puritanism, he appears to have taken little care to reform the lives and manners of his clergy; of which many complaints were made in parliament, in pamphlets, and in conversation. Neal remarks, that "his grace had too little regard for public virtue; his entertainments and feasts being chiefly on the Lord's day: nor do we read, among his episcopal qualities, of his diligent preaching or pious example. Fuller calls him a *parker* indeed, careful to keep the fences, and shut the gates of discipline, against all such night-stealers as would invade the same; and indeed this was his chief excellence."

excellence." He was naturally of a warm temper; but, till his head was turned by his exaltation, he exhibited no instances of haughtiness and ill-nature. He was to the last hospitable and charitable; and did many kind and benevolent things to private people, as well as for the public benefit. The regulation of his family was extremely laudable: he assigned all his domestics some employment or other, and kept no idle people about him: those who were not occupied in learned pursuits, about the management of his revenues, or the affairs of his household, were variously employed; some in binding books, others in engraving, painting, transcribing manuscripts in fine hand-writing, drawing, or illuminating.

Archbishop Parker was much attached to the study of British and Saxon antiquities; and he spared neither labour nor expense in collecting and preserving whatever manuscripts of this kind could any where be met with, of which a fatal havock and destruction had been made at the time of the dissolution of the monasteries. Mr. Strype says, that one of his agents, in the space of no more than four years, procured for him not fewer than six thousand seven hundred volumes. In 1563, he was the instrument of preserving two volumes of collections in folio, made by archbishop Cranmer. All these valuable MSS. besides a considerable number of printed books, he deposited in a library which he built for Corpus-Christi college in Cambridge. To him literature is indebted for editions of four of our ancient English historians; namely, Matthew of Westminster, Matthew Paris, Thomas Walsingham, and Asser's Life of King Alfred, all in folio. He also published, besides the articles which have already been noticed by us, "a Testimony of Antiquity, shewing the ancient Faith of the Church of England, touching the Sacrament of the Body and Blood of the Lord, here publicly preached, and also received, in the Saxons' Time, about seven hundred Years ago," 1566, 8vo. being a Sermon translated out of Latin into Saxon, by Ælfric abbot of St. Alban's, about the year 996, and appointed to be delivered to the people at Easter, before they should receive the communion. This piece was accompanied with two Letters of Ælfric, which were brought forward to afford additional proof that the doctrine of the real presence was not then admitted by the church. Another considerable work of the archbishop contains the lives of his predecessors in the see of Canterbury, and is entitled, "De Antiquitate Britannicæ Ecclesiæ, et Privilegiis Ecclesiæ, et Privilegiis Ecclesiæ Cantuariensis, cum Archiepiscopis ejusdem LXX." 1572, folio. Most of the copies of this work want the account of Parker's own life, he having caused it to be suppressed while he lived; on which account Mr. Strype has inserted it in the appendix to his Life of our prelate. The materials for this performance were collected from ancient historians, by John Josceline, secretary or chaplain to our prelate, who was himself the digester and compiler of it. The best edition of it was published at London, in 1729, folio, illustrated with excellent engravings. *Strype's Life of Parker. Neal's Hist. Purit. vol. i. Warner's Eccl. Hist. vol. ii.*

PARKER (Samuel), an English prelate, notorious for his temporizing servile spirit, and the scandalous sacrifice of his principles, was the son of John Parker, a serjeant at law under the protectorate of Oliver, and also after the restoration; and born at Northampton in the year 1640. He was educated in grammar-learning among the Puritans at his native place; whence he was sent, in 1656, to the university of Oxford, where he was entered of Wadham-college, and placed under a presbyterian tutor. Here he is said to have led a very strict and religious life, and became a member of a society of young students who met weekly to fast and pray together, and were distinguished by the name of *Gruellers*, from their making water-gruel their principal diet. So constant was he in his attendance upon prayers, sermons, and sacraments, in the meetings of the puritan party, that they esteemed him

as "one of the most precious young men in the university." In 1659-60, he was admitted to the degree of B. A. Upon the restoration of king Charles II. he hesitated for a time what side to take, but still continued freely to talk against episcopacy; on which account, being discountenanced by Dr. Blandford, the new warden of Wadham-college, he withdrew from that house, and became a member of Trinity-college. In this society, by the conversation and arguments of Dr. Ralph Bathurst, then senior fellow, he was prevailed upon to renounce his puritanical opinions, and to become a zealous member of the church of England. He now lost no opportunity of ingratiating himself with his new friends, and of affording proofs of the sincerity of his conversion, by opposing the principles, and by endeavouring to exercise his wit at the expense, of the party which he had quitted. In 1636, he took the degree of M. A. Soon afterwards he entered into holy orders; and, resorting frequently to London, became chaplain to a nobleman, whom he was accustomed to divert by his drolleries and reflections on his old friends the puritans. In 1665, he was elected a fellow of the Royal Society; and about the same time he published some physico-theological essays, entitled, "Tentamina physico-theologica de Deo; five Theologia Scholastica, ad Normam novæ et reformatæ Philosophiæ concinnata," 4to. These essays were attacked in a piece, entitled, "of the Bulk and Selvedge of the World, by N. Fairfax, M. D." and they were severely criticised by the celebrated Andrew Marvel, in his "Rehearsal transposed," who calls them, "a tedious transcript of our author's common-place-book, wherein there is very little of his own, but the arrogance and unparalleled censoriousness that he exercises over all other writers." In 1666, Mr. Parker published, "A free and impartial Censure of the Platonic Philosophy," 4to, in a letter written to a friend; which was soon followed by a second letter, containing "An Account of the Nature and Extent of the divine Dominion and Goodness, especially as they refer to the Origenian Hypothesis concerning the Pre-existence of Souls, &c." 4to. These pieces were written in defence of some passages in his Essays; and the last of them called forth the animadversions of the author of an excellent tract, entitled, "*Deus Justificatus*;" or, the divine Goodness vindicated and cleared, against the Assertors of absolute and inconditionate Reprobation."

The dedication of the author's Tentamina to Dr. Sheldon, archbishop of Canterbury, proved the means of introducing him to that prelate, who was so well pleased with him, that, in 1667, he appointed him one of his own chaplains. Having now the road to preferment opened to him, he quitted Oxford, and went to reside at Lambeth; where his attention to his patron was rewarded, 1670, by his nomination to the archdeaconry of Canterbury. In the same year, having been appointed one of the attendants on William prince of Orange, when he paid a visit to the university of Cambridge, our author was honoured on that occasion with the degree of D. D. Dr. Parker's next promotion was to a prebendal stall in the cathedral church of Canterbury, which was conferred upon him in 1672; and not long afterwards he was collocated by the archbishop to the rectories of Ickham and Chartham in Kent.

He had now been engaged between two and three years in controversy with different writers, which was commenced by a piece of his containing severe reflections upon the presbyterians and other nonconformists, and entitled, "a Discourse of Ecclesiastical Polity, wherein the Authority of the civil Magistrate over the Consciences of Subjects in Matters of external Religion is asserted;" 1669, 8vo. The principal antagonists whom he provoked to enter the lists by this publication, were Dr. John Owen, and Andrew Marvell. In 1678, Dr. Parker published "Disputationes de Deo et Providentia Divina; an Philosophorum ulli, et quanam, Athei fuerint?" &c. which Dr. Henry More highly commends. His next publication

appeared in 1681, and was entitled, "A Demonstration of the divine Authority of the Law of Nature, and of the Christian Religion, in two parts," 4to. in which he attempts to vindicate the genuineness of the famous passage in Josephus concerning our Saviour, from the exceptions of Tanaquil Faber, and other critics; the importance of the testimony of Phlegon, in support of the evangelical narrative concerning the miraculous darkness at the time of our Saviour's crucifixion; and also the genuineness of the Acts of Pontius Pilate, with his Letter to Tiberius, and of the Letter of Abgarus king of Edessa to Jesus, with the Rescript attributed to our Saviour. In the same year he published, "The Case of the Church of England briefly stated, in the three first and fundamental Principles of a Christian Church: the Obligation of Christianity by divine Right; the Jurisdiction of the Church by divine Right; the Institution of Episcopal Superiority by divine Right," 8vo. This attempt to support the exorbitant claims of the church, was followed, in 1683, by another publication, written with the same view, and entitled, "An Account of the Government of the Christian Church in the first six hundred Years, &c." 8vo. At the same time Dr Parker distinguished himself by his zeal in exalting the authority of the crown, and in enforcing the courtly doctrines of passive obedience and non-resistance. In 1684, he published "Religion and Loyalty; or, a Demonstration of the Power of the Christian Church within itself, &c." 8vo. which he dedicated to king Charles II. during whose reign he maintained an unreversed obsequiousness to the court.

Upon the accession of king James II. Dr. Parker continued the same servile complaisance towards the regal power, and in 1685, published the second part of "Religion and Loyalty," intended still further to corroborate his reasonings in defence of high-church politics. By his conduct and writings he had now rendered himself so acceptable to his majesty, that, upon the death of Dr. Fell in 1686, he nominated him to the bishopric of Oxford, with permission to hold the archdeaconry of Canterbury *in commendam*. Soon afterwards he was made a privy-counsellor; and in 1687, by a royal *mandamus*, in an illegal manner, was constituted president of Magdalen-college in Oxford. The particulars of this last-mentioned arbitrary stretch of the regal prerogative, (which had no little influence in determining the clergy to concur in those measures which drove James from his throne,) have been imperfectly related under the article OXFORD, p. 146, 7, of this volume. It should have been added, that, after the college had rejected Anthony Farmer, and elected Dr. Hough, the king's ecclesiastical commissioners deprived him of the presidency, installing Dr. Parker, bishop of Oxford, by proxy, in his room; and, as the fellows refused to sign a submission to their new president, twenty-five of them were immediately expelled the college with Dr. Hough, and declared incapable of being admitted to any ecclesiastical dignity or benefice.

So far did Dr. Parker carry his servile conformity to the royal pleasure, that he appeared ready without scruple to sacrifice his religion to it; and prostituted his pen by writing in defence of transubstantiation, and the worship of saints and images. That the papists regarded him as a proselyte to their faith, appears from two letters which were written about this time. In the first, sent by a Jesuit of Liege to a Jesuit of Fribourg, is the following passage: "The bishop of Oxford himself seems to be a great favourer of the catholic faith. He proposed in council, whether it was not expedient, that one college at least in Oxford should be allowed to the Catholics, that they might not be forced to be at so much charges in going beyond sea to study; but it is not yet known what answer was made. The same bishop having invited two of our noblemen (i. e. Roman-catholics), with others of the nobility, to a feast, drank the king's health, wishing his majesty good success in all his undertakings: adding

VOL. XVIII. No. 1263.

also, that the religion of the Protestants in England did not seem to him in a better condition than Buda was before it was taken; and that they were next to atheists who defended that faith." The other letter, written by father Petre, a jesuit, and privy-counsellor to king James, and directed to father la Chaise, contains these words: "The bishop of Oxford has not yet declared himself openly; the great obstacle is his wife, whom he cannot rid himself of: his design being to continue bishop, and only change communion; as it is not doubted but the king will permit, and our holy father confirm: though I do not see how he can be further useful to us in the religion he is in, because he is suspected, and of no esteem among the heretics of the English church; nor do I see that the example of his conversion is like to draw many others after him, because he declared himself so suddenly. If he had believed my counsel, which was to temporize for some longer time, he would have done better; but it is his temper, or rather zeal, that hurried him on." These two letters were first printed in "A third Collection of Papers relating to the present Juncture of Affairs in England," &c. 1689, 4to. So little decency did bishop Parker observe in his compliance with the most unjustifiable measures of the court, that he rendered himself quite contemptible; and his influence and authority in his diocese became so very insignificant, that, when he assembled his clergy, and desired them to subscribe an address of thanks to the king for his declaration of liberty of conscience, he could only prevail with one clergyman to concur with him in it. The last effort which he made to serve the views of the court, was by publishing "Reasons for abrogating the Test, &c." 1688, 4to. in which he endeavoured to palliate, or represent in false colours, the popish doctrine of transubstantiation, and likewise took great pains to excuse, and explain away, the shameful idolatry practised in the church of Rome. To this piece various able answers soon appeared, and, among others, one by Dr. Burnet, who observes, that Parker's book "raised such a disgust at him, even in those that had been formerly but too much influenced by him, that, when he could not help seeing that, he sunk upon it." "I was desired," says he, "to answer his book with the severity that it deserved; and I did it with an acrimony of style, that nothing but such a time and such a man, could in any sort excuse." At length, the shame and vexation which he felt at being despised by all good men, brought on him a distemper, of which he died unlamented, at the president's apartments in Magdalen-college, in March 1687-8, when he was about forty-eight years of age.

Bishop Burnet's character of him is, that "he was a man of no judgment, and of as little virtue; and as to religion rather impious. He was covetous and ambitious; and seemed to have no other sense of religion but as a political interest, and a subject of party and faction. He seldom came to prayers, or to any exercise of devotion; and was so lifted up with pride, that he was become insufferable to all that came near him." After his death, a piece was published, said to be taken from his manuscripts, and entitled, "A Discourse sent to the late King James, to persuade him to embrace the Protestant Religion; with a Letter to the same Purpose," 1690, 4to. and he left behind him a History of his own Times, in Latin, which was published in 1726, under the title of "Reverendi admodum in Christo Patris Samuelis Parkeri, &c. de Rebus sui Temporis Commentariorum Libri quatuor, &c." 8vo. of which two English versions afterwards appeared.

Our prelate had a son, of his own name, who was a man of learning, and after the revolution adhered to the principles of the non-jurors. He was the author of, 1. An English translation of Tully's five Books *de Finibus*, or moral Ends, 1702, 8vo. 2. An Abridgment of the Ecclesiastical Histories of Eusebius, Socrates, Sozomen,

and Theodoret, 1729, 4to. 3. Bibliotheca Biblica; or, a Commentary on the five Books of Moses, extracted chiefly from the Fathers, 4to. &c. *Gen. Biog.*

PARKER's BA'Y, a bay on the fourth coast of Jamaica, a little to the south of Palmetto Point.

PARKER's CREEK, a river of Maryland, which runs into the Chesapeake in lat. 38. 52. N. lon. 76. 31. W.

PARKER's ISLAND, an island of North America, in the Chesapeake, near the coast of Maryland: fifteen miles south of Annapolis. Lat. 38. 53. N. lon. 76. 41. W.

PARKER's ISLAND, or RUSKOHEGAN, an island on the coast of Maine, in the mouth of the Kennebeck.

PARKER's RIVER, a river of North America, which takes its rise in Boxford, in the Massachusetts, and, pursuing a variable course, at length wanders through the marshes, and enters Plum-island-bound by a mouth about a quarter of a mile wide. It is richly stored with fish; and is navigable for coasting-vessels to the head of the tide, but obstructed by two bridges.

PARKER's TOWN, a town of Kent county, in Vermont, having 100 inhabitants.

PARKGATE, a village and sea-port in the county of Chester, on the north-east coast of the river Dee, from whence packets sail to Ireland: twelve miles north-west of Chester, and 193 north-north-west of London. Lat. 53. 21. N. lon. 2. 3. W.

PARKHURST (John), a learned and pious divine of the church of England was the second son of John Parkhurst, esq. of Cateby in Northamptonshire, where he was born in June 1728. He was educated in grammar-learning at the school of Rugby in Warwickshire. Being a younger son, he was intended for the church; and entered of Clare-hall, Cambridge, where his application and improvement were highly commendable. He proceeded B. A. in 1748; M. A. in 1752; and was many years fellow of his college. Soon after he had entered into holy orders, by the death of his elder brother he became heir to a very considerable estate; though, as his father was still living, it was some time before he came into the full possession of it. When, however, it descended to him at the death of his father, his accession of fortune produced no change in his manners or pursuits. He still continued to cultivate the studies becoming the clerical profession, paying particular attention to that of the original languages of the Jewish and Christian scriptures. From his family-connexions, as well as from his learning and piety, he might have reasonably looked forward to preferment in the church; but he never obtained any. This circumstance some have attributed to his being considered as a disciple of Hutchinson, from his partiality for the writings of that singular character. But might not his fortune, which placed him above the want of preferment, be the reason why none was conferred upon him? Besides, he was so attached to retirement, and a life of close and intense study, that he had no inclination to seek after preferment. Yet he took pleasure in the exercise of the clerical duty, and for a long time officiated in the capacity of curate, with exemplary zeal and diligence, but without any salary, in his own chapel at Cateby, which, after the demolition of the church of the nunnery there, served as a parish-church. When some years afterwards he became possessed of the right of presentation to a living, he considered church-patronage as a trust, rather than a property; and, instead of taking it himself, he bestowed it on a gentleman known to him only by character, from no motive but a persuasion that he would faithfully discharge the duties of his office. The living referred to was Epfom, and the person benefited, the late Rev. Jonathan Boucher.

In the year 1754, Mr. Parkhurst married a lady who brought him a daughter and two sons; and after her death he took a second wife in 1761, by whom he had one daughter, who had a passion for classical learning, and

arrived at a degree of perfection in it which is rarely met with in the female world. He had begun his career of authorship in the year 1753, by publishing "A Friendly Address to the Reverend Mr. John Wesley, in Relation to a principal Doctrine maintained by him and his Assistants," which has had the fate of most controversial treatises, that of being forgotten or uninteresting after the period when it made its appearance. Our author's next work was the result of much labour and application; and was given to the public in 1762, under the title of "An Hebrew and English Lexicon, without Points; to which is added, a methodical Hebrew Grammar, without Points, adapted to the Use of Learners." Independently of numerous etymological and philosophical disquisitions which occur in it, and which are tinged by the author's peculiar opinions, this performance reflects great credit on his learning and patient enquiry; and it deserves to be recommended, as affording valuable assistance to the biblical student in forming an acquaintance with the Hebrew Scriptures. That such was the general opinion of its merits, may be concluded from its favourable reception by the learned world, and the encouragement which was thus afforded the author to correct and improve it. In 1778, he published a second edition of this Lexicon, considerably enlarged; and a third in 1792. In the year 1769, he published "A Greek and English Lexicon to the New Testament; to which is prefixed a plain and easy Greek Grammar." Of this work a second edition made its appearance in 1794; and so desirous was the author of rendering his literary labours more generally useful, that he continued to revise, correct, enlarge, and improve, both his lexicons, till within a few weeks of his death. It was his intention to give new editions of them in octavo, with his last corrections; and he had completed the copies, and received the first proof-sheet of the Greek Lexicon from the press, when the all-wise Disposer of events called him to himself. The subsequent task of editing them devolved on his youngest daughter, the wife of the Rev. Joseph Thomas, to whose qualifications for such an undertaking we have alluded above. They have since been published, each in one large octavo volume. In the year 1787, Mr. Parkhurst published "The Divinity and Pre-existence of our Lord and Saviour Jesus Christ, demonstrated from Scripture; in Answer to the first Section of Dr. Priestley's Introduction to the History of early Opinions concerning Jesus Christ; together with Strictures on some other Parts of the Work, and a Postscript relating to a late Publication of Mr. Gilbert Wakefield."

Mr. Parkhurst died, after a painful and lingering illness of ten months, on the 21st of February, 1797, in the sixty-ninth year of his age, at Epfom in Surrey, where he had resided during the latter part of his days. Throughout the whole of his life he was a most assiduous student: for many years it was his constant practice to rise at five o'clock, and, in winter, to light his own fire. He was always of an infirm and sickly habit of body; yet he was enabled to lead such a remarkably studious and sedentary life, even to an advanced age, by strict temperance and a careful regimen. He also gave less of his time to the ordinary interruptions of life, than is common with most persons in his circumstances. Though he resided in a hospitable, friendly, and pleasant, neighbourhood, he visited little; alleging that such a course of life neither suited his temper, his health, nor his studies. Yet his manners were sociable; and his conversation was always instructive, and often delightful. Like many other men of weak and sickly constitutions, Mr. Parkhurst was naturally irritable, warm, and earnest in his resentments; but he effectually subdued this temper by an attention to the injunctions of religion, and passed through a long life in peace and harmony with all around him, respected by men of learning, beloved by his friends, and highly honoured by his family. *Gent. Mag.* April 1797, and July 1800. *Monthly Mag.* July 1800. *Ency. Brit.*

PARKI,

PARKI, a town of Bengal: thirty-two miles north of Ramgur.

PARKINSON (John), a celebrated old English herbalist, was born in 1567, and bred up as a London apothecary. He is mentioned by his contemporaries as a man of eminence in his profession, and was at length appointed apothecary to king James I. Charles I. afterwards conferred upon him the title of *Botanicus Regius Primarius*. A great share of his attention, during a long life, was devoted to the study of plants. He had a garden well stored with rarities, and he bestowed equal notice upon the curiosities of the flower-garden, in all their luxuriant Proteus-like varieties, and on the native productions of his own and other countries, embracing their literary history, as well as their practical investigation.

His first publication was his "*Paradisi in Sole Paradisus terrestris*; or, a choice Garden of all Sorts of rarest Flowers, &c. to which is annexed a Kitchen Garden, &c." This was printed at London, anno 1629, in a folio of 612 pages. A second edition, "much corrected and enlarged," appeared in 1656, after the decease of the author. Both editions are dedicated "to the Queen's most excellent Majesty," which could hardly have been, as Dr. Pulteney supposed, Queen Elizabeth; but rather the Queen of Charles I. About a thousand plants, either species or varieties, are described in this book, of which 780 are figured in wood-cuts, partly copied from Clusius and Lobel, partly original, but all of them coarse and stiff, though sometimes expressive. Numerous remarks are interspersed, respecting the botanical history or medical virtues of the plants, as well as their culture; but the latter subject is, for the most part, given in the introductory chapters, which display no small degree of intelligence and experience. This book affords a very correct and a very respectable idea of the gardens of our ancestors at the time it was written; and has been considered, by the learned authors of the *Hortus Kewensis*, unequivocal authority as to the time when any particular species was introduced or cultivated among us. The florist and the kitchen-gardener will find some productions recorded which have since disappeared; and, though our kitchen-gardens had not arrived at such luxuriant perfection or variety as they afterwards attained in king William's days, and have since preserved, there is reason to think the science of horticulture declined considerably after the time of Parkinson, previous to its restoration at the end of the 17th century. As to the botanic garden, Dr. Pulteney remarks, from an investigation of the *Paradisi Terrestris*, that "intertropical productions had, at this period, been but sparingly imported. The real stove-plants are very rare throughout the book. There are some American species, and particularly from Virginia, as being a part of that continent with which England had the most frequent intercourse. But the principal productions of the English gardens were exotic European and Grecian plants, some Asiatic, and a few from the northern coasts of Africa." It is no small praise to the work before us, that the late Mr. Curtis held it in particular estimation. He always cites it in his *Magazine* with peculiar pleasure and respect; giving many a specimen of the old writer's amusing quaintness, whilst he enriches us with his information.

In 1640 our author published his principal work, the "*Theatrum Botanicum*; or Theatre of Plants, or an Herbal of large extent; &c." This is a ponderous folio of 1746 pages, with innumerable wood-cuts. This work and the Herbal of Gerard were the two main pillars of botany in England till the time of Ray, who indeed gave them fresh importance by his continual reference to their contents. These volumes were dispersed throughout the country, one or other, or both, being the inexhaustible resource of all who had any love for plants, or any interest in enquiring into their qualities. The benevolent country divine, the lady of the manor, the village-doctor, and the humble herb-gatherer employed in the service of

all the rest, consulted Gerard or Parkinson, as they would have consulted their Bibles, and with little less implicit confidence. Of these two writers it is justly observed, that Parkinson was by far the most original and the most copious; but, his cuts being of vastly inferior merit to those admirable ones, prepared for Conrad Gesner, with which Gerard had the means of adorning his publication, the latter has greatly prevailed in popularity, as a book of reference. It is indeed chiefly for the figures that we now cite these works. Nice distinctions of species, or any discrimination between species and varieties, are not to be expected; still less, any ideas of classification or scientific arrangement worthy a moment's consideration. Parkinson is much more original than Gerard in his descriptions, and more particular in his indications of the places of growth; he is also very learned and critical in his synonymy, and, above all, in the medical part of his subject. It is not to be wondered at if these great works contain some hundreds of repetitions, when we consider how obscurely many plants had been described and figured by previous authors; inasmuch that it was, in many cases, next to impossible to discover whether a given plant had been described before. Parkinson, however, is entitled to superior praise on this head, having taken all possible pains to avoid such mistakes, by his deep study of synonyms. Some papers of Lobel are said to have fallen into the hands of Parkinson, after the death of the former which proved of use to his undertaking; but it does not appear that he implicitly confided in such, any more than in previously-printed authorities, without a due investigation; and therefore they became in some measure his own.

The time of Parkinson's decease is not known; but he appears to have been living when his Herbal was published, in 1640, at which period he was, if Dr. Pulteney's date of his birth be correct, 73 years old. Nothing is recorded of his family. Some copies of his *Paradisus* have an engraved portrait of the author, done in his 62d year, and there is a small oval one in the title-page of his Herbal. *Pulteney's Sketches of Botany in England.*

PARKINSONIA, *f.* [so named by Plumier, in memory of the subject of the preceding article.] In botany, a genus of the class decandria, order monogynia, natural order of lomentaceæ, (leguminosæ, *Juss.*) Generic Characters—Calyx: perianthium one-leaved; at the base bell-shaped flattish, permanent; border five-parted; segments lanceolate-ovate, acute, coloured, reflex, almost equal, deciduous. Corolla: petals five, with claws, almost equal, spreading very much, ovate; the lowest kidney-form; claw upright, very long. Stamina: filaments ten, awl-shaped, villose below, declined. Antheræ oblong, incumbent. Pistillum: germen round, long, declined; style filiform, rising, the length of the stamens; stigma blunt. Pericarpium: legume very long, round, swelling over the seeds, (whence it is necklace-form,) acuminate. Seeds several, one to each joint of the legume, oblong, subcylindric, blunt.—*Essential Character.* Calyx five-cleft; petal five, ovate; the lowest kidney-form; style none; legume necklace-form.

Parkinsonia aculeata, or prickly parkinsonia, a single species. It is a small tree, with a trunk ten or twelve feet high, unarmed, even: branches long, subdivided, flexuose, prickly. Leaves alternate, in fours from the same bud, pinnate, very long, linear; leaflets extremely small, on very short petioles, ovate, smooth. Racemes terminating and axillary, solitary, shorter than the leaves, erect, eight to ten, many-flowered. Flowers alternate, scattered, yellow, on long peduncles; calyx five-leaved, inserted into a bell-shaped receptacle: four of the petals ovate, with short claws; the fifth or uppermost as it were pedicelled, roundish, with blood-red streaks at the base: all waved and curled; antheræ purple: seeds brown, smooth.

Jacquin describes it as a very elegant tree, with the bark both of trunk and branches remaining a long time green

green and shining, but, when the tree grows old, becoming brownish and streaked. The wood is white. The prickles are solitary, awl-shaped, subaxillary, acuminate, slightly recurved, four lines in length; on the older branches frequently by threes, the middle one very strong, and nine lines in length. Leaves shining, three, four, or five, from the same axil, on a mid-rib a foot long, broad and flattened. Leaflets oblong, numerous. Racemes loose, simple, smooth, containing about ten flowers; which smell very sweet, and are yellow with the uppermost petal variegated at the base with scarlet spots. Legumes yellowish brown, containing from one to six shining seeds. Parkinsonia seems to be distinguished from *Poinciana*, Barbadoes flower-fence, merely by the equality of the calycine segments. These two trees sown very thick make most beautiful hedges. Parkinsonia flowers the first year from seed, and grows very fast. In Jamaica, it is called *Jerusalem thorn*. It was first introduced there from the main, but now grows wild in many parts and in the other islands of the West Indies, where it was originally cultivated for inclosures. It seldom rises above eight feet in height, and is well supplied with strong thorns on every part. The branches are flexible and small, and the trunk seldom grows to any considerable thickness. The French, in the West Indies, call it *genet épineux*, way-thorn, or furze. It flowers several times in the year, and at the same time bears ripe fruit. Mr. Miller cultivated it here in 1739. He gives it the height of twenty feet, which is nearly twice as much as authors of the best credit attribute to it. It bears, says he, long slender bunches of yellow flowers, hanging down like those of Laburnum: they perfume the air to a considerable distance, for which reason the inhabitants of the West Indies plant them about their houses.

It is propagated by seeds, which should be sown in small pots filled with light fresh earth early in the spring, and the pots must be plunged into a hot-bed of tanner's bark, where, in three weeks or a month's time, the plants will come up, when they should be kept clear from weeds, and frequently refreshed with a little water. In a little time these plants will be fit to transplant, which should be done very carefully, so as not to injure their roots. They must be each planted into a separate half-penny-pot filled with light fresh earth, and then plunged into the hot-bed again, observing to stir up the tan; and, if it has lost its heat, there should be some fresh tan added to renew it. Then shade the plants from the heat of the sun, until they have taken new root; after which time they should have fresh air admitted to them every day, in proportion to the warmth of the season. With this management they will grow so fast, as to fill the pots with their roots by the beginning of July, at which time they should be shifted into pots a little larger than the former, and plunged again into the bark-bed to forward their taking new root; after which it will be the best way to inure them by degrees to bear the open air, that they may be hardened before winter; for, if they are kept too warm in winter, the plants will decay before the next spring. "The only method (says Miller) by which I have succeeded in keeping these plants through the winter, was by hardening them in July and August to bear the open air; and in September I placed them on shelves in the dry stove, at the greatest distance from the fire, so that they were in a very temperate warmth; and there they retained their leaves all the winter, and continued in health, when those which were placed in a warmer situation, as also those in the green-house, were entirely destroyed; but even these seldom survived the second winter. Jacquin observes, that the seeds continue fertile several years, and germinate readily in the European stoves; that the plants grow luxuriantly to three feet in height the first year, but seldom live through the winter, or, if they do, they die without flowering the second summer. I have not heard that Parkinsonia has ever flowered in Europe."

PAR'KOW, a town of Austrian Poland, in Galicia: thirty miles north-north-west of Chelm.

PAR'KSTEIN, a town of Bavaria, in the principality of Sulzbach: seventeen miles north-east of Sulzbach, and sixteen north of Nabburg.

PAR'LAGOW, a town of Hindoostan, in Candéish: five miles east of Barawnay.

PAR'LANCE, *f.* [from *parle*.] Conversation; talk. *A modern word*.—In common *parlance*, when you speak of criminal actions, no man was ever understood to mean the prosecution of a crime, but the crime itself. *British Critic*, 1793.

PAR'LASCA, a town of Italy: five miles north of Como.

To PAR'LE, *v. n.* [*parler*, Fr.] To talk; to converse; to discuss any thing orally.—Their purpose is to *parle*, to court, and dance. *Shakespeare*.—Knut, finding himself too weak, began to *parle*. *Milton's Hist. of Eng.*

We came to *parle* of the publique weale,
Confirming our quarrell with maine and might,
With swords and no words we tried our appeale,
Instead of reason declaring our zeale. *Mir. for Mag.*

PAR'LE, *f.* Conversation; talk; oral treaty; oral discussion of any thing.—Our trumpet call'd you to this general *parle*. *Shakespeare*.

Why meet we thus, like wrangling advocates,
To urge the justice of our cause with words?
I hate this *parle*; 'tis tame: if we must meet,
Give me my arms.

Roue's Amb. Step-mother.

To PAR'LEY, *v. n.* [*parler*, Fr.] To treat by word of mouth; to talk; to discuss any thing orally. It is much used in war for a meeting of enemies to talk.—A Turk desired the captain to send some with whom they might more conveniently *parley*. *Knolles*.—He *parleys* with her a while, as imagining she would advise him to proceed. *Broom*.

PAR'LEY, *f.* Oral treaty; talk; conference; discussion by word of mouth.—Let us resolve never to have any *parley* with our lusts. *Calamy*.

Force never yet a generous heart did gain;
We yield on *parley*, but are storm'd in vain. *Dryden*.

Yet, when some better-fated youth
Shall with his amorous *parley* move thee,

Reflect one moment on his truth,

Who, dying thus, persists to love thee.

Prior.

PAR'LIAMENT, *f.* [*parliamentum*, low Latin; *parlement*, Fr. from *parler*, to discourse.] In England, is the assembly of the king and three estates of the realm; namely, the lords spiritual, the lords temporal, and commons, for the debating of matters touching the common-wealth, especially the making and correcting of laws; which assembly or court is, of all others, the highest, and of greatest authority. *Cowel*.—The true use of *parliaments* is very excellent; to be often called, and continued as long as is necessary. *Bacon*.

The king is fled to London,
To call a present court of *parliament*. *Shakespeare*.

The origin or first institution of parliaments is one of those matters which lie so far hidden in the dark ages of antiquity, that the tracing of it out is a thing equally difficult and uncertain. The word *parliament* itself (or *colloquium*, as some of our historians translate it) is, comparatively, of modern date; derived from the French, and signifying "the place where they met and conferred together." It was first applied to general assemblies of the states under Louis VII. in France, about the middle of the 12th century. But it is certain, that long before the introduction of the Norman language into England, all matters of importance were debated and settled in the great councils of the realm. A practice which seems to have been universal among the northern nations, particularly the Germans; and carried by them into all the countries

countries of Europe, which they overran at the dissolution of the Roman empire.

In England, however, this general council hath been held immemorially, under the several names of *michel-synoth*, or great council; *michel-gemote*, or great meeting; and more frequently *witena-gemote*, or meeting of wise men. We have instances of its meeting to order the affairs of the kingdom, to make new laws, and to amend the old, or, as Fleta expresses it, *novis injuriis emerfis nova constituere remedia*, so early as the reign of Ina king of the West Saxons, Offa king of the Mercians, and Ethelbert king of Kent, in the several realms of the heptarchy. And after their union, the Mirror informs us, that king Alfred ordained for a perpetual usage, that these councils should meet twice in the year, or oftener if need be, to treat of the government of God's people; how they should keep themselves from sin, should live in quiet, and should receive right. Our succeeding Saxon and Danish monarchs held frequent councils of this sort, as appears from the respective codes of laws; the titles whereof usually speak them to be enacted, either by the king with the advice of his *witena-gemote*, or wise men; or by those sages with the advice of the king; or, lastly, by them both together.

There is also no doubt but these great councils were occasionally held under the first princes of the Norman line. Glanvil, who wrote in the reign of Henry II. speaking of the particular amount of an amercement in the sheriff's court, says, it had never yet been ascertained by the *general assize*, or assembly, but was left to the custom of particular counties. Here the general assize is spoken of as a meeting well known, and its statutes or decisions are put in a manifest contradistinction to custom, or to the common law. And in Edward III's time, an act of parliament, made in the reign of William the Conqueror, was pleaded in the case of the abbey of St. Edmund's Bury, and judicially allowed by the court.

Hence it indisputably appears, that parliaments, or general councils, are coeval with the kingdom itself. How those parliaments were constituted and composed, is another question, which has been matter of great dispute among our learned antiquarians; and particularly, whether the commons were summoned at all; or, if summoned, at what period they began to form a distinct assembly. But, without entering into controversies of this sort, it may be sufficient to observe, that it is generally agreed, that, in the main, the constitution of parliament, as it now stands, was marked out so long ago as the 17th year of king John, A.D. 1215, in the Great Charter granted by that prince; wherein he promises to summon all archbishops, bishops, abbots, earls, and greater barons, personally; and all other tenants in chief under the crown, by the sheriff and bailiffs; to meet at a certain place, with 40 days' notice, to assess aids and scutages when necessary. And this constitution has subsisted in fact at least from the year 1266, 49 Henry III. there being still extant writs of that date, to summon knights, citizens, and burgesses, to parliament. We proceed therefore to inquire wherein consists this constitution of parliament, as it now stands, and has stood for the space of at least 500 years.

The parliament is regularly to be summoned by the king's writ or letter, issued out of chancery by advice of the privy council, at least 40 days before it begins to sit. It is a branch of the royal prerogative, that no parliament can be convened by its own authority, or by the authority of any except the king alone. Nor is it an exception to this rule, that, by some modern statutes, on the demise of a king or queen, if there be then no parliament in being, the last parliament revives, and is to sit again for six months, unless dissolved by the successor: for this revived parliament must have been originally summoned by the crown. Indeed, by statute 16 Car. I. c. 1. it was enacted, that, if the king neglected to call a parliament for three years, the *peers* might assemble and

issue out writs for choosing one; and, in case of neglect of the peers, the constituents might meet and elect one themselves. This act, however, was deemed injurious to the royal prerogative, and repealed by statute 16 Car. II. c. 1.

There are, it must be acknowledged, two capital exceptions to this rule; but they were justifiable on a principle of necessity, that supercedes all law. The convention-parliament, that restored king Charles II. met above a month before his return; the lords by their own authority, and the commons in pursuance of writs issued in the name of the *keepers of the liberty of England* by the authority of parliament; and this parliament sat full seven months after the restoration, and enacted many laws still in force. But the first thing done after the king's return, was to pass an act declaring this to be a good parliament, notwithstanding the defects of the king's writs. And it was thought farther necessary to confirm its acts in the next parliament, by 13 Car. II. cap. 7. and cap. 14. The other exception occurs at the time of the revolution, A.D. 1688, when the lords and commons by their own authority, and upon the summons of the prince of Orange (afterwards king William), met in a convention, and disposed of the crown and kingdom. The throne at this time was vacant by the abdication of king James II. and it was declared by W. & M. stat. 1. cap. 1. that this Convention was really the two houses of parliament, notwithstanding the want of writs, and other defects of form. So that, though we have these two capital exceptions, which were justifiable only on a principle of necessity (and each of which, by the way, induced a revolution in the government), the rule laid down is in general certain, that the king only can convoke a parliament.

'And this, by the ancient statutes of the realm, he is bound to do "every year, or oftener if need be." Not that he is, or ever was, obliged by these statutes to call a new parliament every year; but only to permit a parliament to sit annually for the redress of grievances, and dispatch of business, "if need be." These last words are so loose and vague, that such of our monarchs as were inclined to govern without parliaments, neglected the convoking them, sometimes for a very considerable period, under pretence that there was no need of them. But, to remedy this, by the stat. 16 Car. II. c. 1. it is enacted, that the sitting and holding of parliaments shall not be intermitted above three years at the most. And by the stat. 1 W. & M. st. 2. c. 2. it is declared to be one of the rights of the people, that for redress of all grievances, and for the amending, strengthening, and preserving, the laws, parliaments ought to be "held frequently." And this indefinite frequency is again reduced to a certainty by stat. 6 W. & M. c. 2. which enacts, as the statute of Charles II. had done before, that a new parliament shall be called within three years after the determination of the former. But, as the mutiny-act, and certain acts relating to the revenue, are passed for one year only, the statutes enforcing the meeting of parliament are now of little avail; for the parliament must necessarily be summoned, for the dispatch of business, once every year.

The constituent parts of a parliament are—the king's majesty, sitting there in his royal political capacity; and the three estates of the realm; the lords spiritual, the lords temporal (who sit together with the king in one house), and the commons, who sit by themselves in another. And the king and these three estates together form the great corporation or body politic of the kingdom, of which the king is said to be *caput, principium, et finis*. For, upon their coming together, the king meets them, either in person or by representation; without which there can be no beginning of a parliament; and he also has alone the power of dissolving them. 4 *Infl.* 6. 1 *Comm.* c. 2. p. 153.

On holding a new parliament, the king, the first day, sits in the upper house, and, by himself or the lord chancellor, shows the reason of their meeting; then the commons

mons are commanded to choose their Speaker; which done, two or three days afterwards he is presented to the king, and, after some speeches, is allowed, and sent down to the house of commons; when the business of parliament proceeds. 12 Rep. 115.

A parliament may be holden at any place the king shall assign. 1 Comm. p. 153.

The constituent parts of parliament, next in order, are the *spiritual lords*. These consist of two archbishops, and twenty-four bishops; and, at the dissolution of monasteries by Henry VIII. they consisted likewise of twenty-six mitred abbots, and two priors: a very considerable body, and in those times equal to half the number of the temporal nobility. *Co. Litt.* 97. See 4 *Inst.* 1. by which it appears, that the number of the temporal nobility was one hundred and six. All these hold, or are supposed to hold, certain ancient baronies under the king. But, though these lords spiritual are, in the eye of the law, a distinct estate from the lords temporal, and are so distinguished in most of our acts of parliament, yet in practice they are usually blended together under the one name of the *lords*; and it has been doubted, by Dyer, Selden, and other eminent lawyers, whether the lords spiritual make in themselves a distinct estate of the realm. Whitelock, in his Book on Parliaments, contends, that the lords spiritual and temporal make but one estate. The want of a separate assembly and a separate vote would seem to warrant this opinion; but, in the eye of the law, the estates are certainly distinct, though a singular record upon our statute-books proves the distinction to be merely nominal. The Act of Uniformity, 1 Eliz. chap. 2. was passed with the dissent of all the bishops, and therefore the style of "lords spiritual" is omitted throughout the whole. (Gibson's Codex, 268.) Other instances of bills passing the house of lords, though every lord spiritual voted against them, are cited by Selden and Coke, (Baronage, c. 6. 2 *Inst.* 585, 6, 7.) It is also a curious fact, that in the early part of the reign of Henry VIII. the judges gave it as their opinion, that the king might hold a parliament without any spiritual lords; (Keilwey's Reports, 184.) Their opinion was fully acted up to in a subsequent reign: for the first ten or twelve years no bishops sat in the parliaments of Charles II. in fact, no bishops were summoned to his two first parliaments, nor until after the repeal of the 16th of Charles I. c. 27. which was repealed by virtue of the 13th Car. II. st. 1. c. 2.

The *lords temporal* consist of all the hereditary peers of the realm, by whatever title of nobility distinguished; dukes, marquises, earls, viscounts, or barons. Some of these sit by *descent*, as do all ancient peers; some by *creation*, as do all new-made ones; others, since the union with Scotland and Ireland, by *election*; which is the case of the sixteen peers who represent the body of the Scots nobility, and the twenty-eight temporal lords elected for life by the peers of Ireland. The number of lords temporal is indefinite; and may be increased, at will, by the power of the crown; except that, by the union with Ireland, the number of Irish peers is limited, so that by future creation it cannot exceed one hundred.

The *Commons* consist of the knights, citizens, and burgesses, who are the representatives, in the house of commons, of the various counties, cities, and boroughs, in the united kingdom. The counties are represented by *knights*, elected by the proprietors of lands: the cities and boroughs are represented by *citizens* and *burgesses*, chosen by the mercantile part, or trading interest, of the nation.

The number of English representatives is 513, of Scotch 45, of Irish 100; in all, 658. And every member, though chosen by one particular district, when elected and returned serves for the whole realm; and therefore he is not bound to consult with, or take the advice of, his constituents upon any particular point, unless he himself thinks it proper or prudent so to do. 1 Comm. 157, 9.

It is not to be understood that the number of members

in the house of commons has been always the same; for, since the beginning of the reign of Henry VIII. that number has been more than doubled. In his first parliament, the house consisted only of 298 members: 360 have since been added by acts of parliament, or by the king's charter, either creating new or reviving old boroughs. Under the provisions of the acts 27 Hen. VIII. c. 26. § 29. and 34, 35, Hen. VIII. c. 26. § 27. there were added 29 for Wales; 12 precisely by the first act for the counties, and 12 under the provision of the latter act for the boroughs. Two for the county and two for the city of Chester were added by stat. 34, 35, Hen. VIII. c. 13. Two for the county and two for the city of Durham, by stat. 25 Car. II. c. 9. 45 for Scotland by the Acts of Union with that kingdom; and 100 for Ireland, by the Acts of Union with that kingdom; and the remainder by charter.

The power and jurisdiction of parliament, thus composed, and considered as an aggregate body, is so transcendent, says sir Edward Coke, (4 *Inst.* 36.) that it cannot be confined, either for causes or persons, within any bounds. And of this high court he adds, it may be truly said, *Si antiquitatem spectes, est vetustissima; si dignitatem, est honoratissima; si jurisdictionem, est capacissima.* It hath sovereign and uncontrollable authority in making, confirming, enlarging, restraining, abrogating, repealing, reviving, and expounding, of laws, concerning matters of all possible denominations, ecclesiastical or temporal, civil, military, maritime, or criminal; this being the place where that absolute despotic power, which must in all governments reside somewhere, is entrusted by the constitution of these kingdoms. All mischiefs and grievances, operations and remedies, that transcend the ordinary course of the laws, are within the reach of this extraordinary tribunal. It can regulate or new-model the succession to the crown; as was done in the reign of Henry VIII. and William III. It can alter the established religion of the land; as was done, in a variety of instances, in the reigns of king Henry VIII. and his three children. It can change and create afresh even the constitution of the kingdom and of parliaments themselves; as was done by the act of union, and the several statutes for triennial and septennial elections. It can, in short, do every thing that is not naturally impossible; and therefore some have not scrupled to call its power, by a figure rather too bold, the *omnipotence of parliament*. So that, as Blackstone observes, it is a matter most essential to the liberties of this kingdom, that such members be delegated to this important trust as are most eminent for their probity, their fortitude, and their knowledge; for it was a known apophthegm of the great lord-treasurer Burleigh, "That England could never be ruined but by a parliament;" and as sir Matthew Hale observes, this being the highest and greatest court, over which none other can have jurisdiction in the kingdom, if by any means a misgovernment should any way fall upon it, the subjects of this kingdom are left without all manner of remedy.

In order to prevent the mischief that might arise from reposing such extensive authority with incompetent persons, it is provided by the custom and law of parliament, that no one shall sit or vote in either house, unless he be twenty-one years of age. 7 & 8 Will. III. c. 25. No member shall sit or vote in either house, till he hath, in the presence of the house, taken the oaths of allegiance, supremacy, and abjuration, and subscribed and repeated the declaration against transubstantiation, and invocation of saints, and the sacrifice of the mass. 30 Car. II. stat. 2. 1 Geo. I. c. 13. 6 Geo. III. c. 23. No alien, even though he be naturalized, shall be capable of being a member of either house of parliament. 12 & 13 Will. III. c. 2. As to the qualifications of members of the house of commons, besides the above qualifications, it is declared and required by the law of parliament or special statutes, that they must not be any of the twelve judges, because they sit in the lords' house; nor of the clergy, because they sit in convocation; nor persons attainted of treason

treason or felony, because they are unfit to sit any-where: that sheriffs of counties, and mayors and bailiffs of boroughs, are not eligible in their respective jurisdictions, as being returning officers: that no persons concerned in the management of any duties or taxes created since 1692, except the commissioners of the treasury; nor any of the officers following, viz. commissioners of prizes, transports, sick and wounded, wine-licences, navy and victualling; secretaries or receivers of prizes, comptrollers of the army-accounts, agents for regiments, governors of plantations and their deputies, officers of Minorca or Gibraltar, officers of the excise and customs, clerks or deputies in the several offices of the treasury, exchequer, navy, victualling, admiralty, pay of the army or navy, secretaries of state, salt, stamps, appeals, wine-licences, hackney-coaches, hawkers and pedlars; nor any persons that hold any new office under the crown, created since 1705, are capable of being elected members. That no person having a pension under the crown, during pleasure or for any term of years, is capable of being elected, ("which," says the Hyp-Doctor, Feb. 26, 1731, "was very modestly telling the king, that those whom he judged his best friends deserved to be turned out of the house;") that, if any member accepts an office under the crown, except an officer in the army or navy accepting a new commission, he vacates his seat, but is capable of being re-elected; and moreover, persons in particular circumstances have forfeited the right of choice, and have been declared ineligible for that parliament by a vote of the house of commons, or for ever by an act of the legislature. By 22 Geo. III. c. 45. contractors are ineligible. It has been also required, in strictness, that all members should be inhabitants of the places for which they are chosen; but this is altogether disregarded and repealed by 14 Geo. III. c. 53.

As for the method of proceeding in elections. When the parliament is summoned, the lord-chancellor (or if a vacancy happens during parliament, the speaker, by order of the house) sends his warrant to the clerk of the crown in chancery; who issues out writs to the sheriff of every county, for the election of all the members to serve for that county, and every city and borough in it. Within three days after the receipt of this writ, the sheriff is to send his precept, under his seal, to the proper returning officers of the cities and boroughs, commanding them to elect their members: and the said returning officers are to proceed to election within eight days from the receipt of the precept, giving four days' notice of the same; and to return the persons chosen, together with the precept, to the sheriff. But elections of knights of the shire must be proceeded to by the sheriffs themselves in person, at the next county-court that shall happen after the delivery of the writ. If this court falls upon the day of delivering the writ, or within six days after, the sheriff may adjourn the court and election to some other time, not longer than sixteen days, nor shorter than ten; but he cannot alter the usual place without consent of the candidates; and, in all such cases, ten days' public notice must be given of the time and place of election. In order to prevent all undue influence, as soon as the time and place of election, in counties or boroughs, are fixed, all soldiers quartered in the place are to remove, at least one day before the election, to the distance of two miles or more, and not to return till one day after the poll is ended. By vote of the house of commons, no lord of parliament, or lord lieutenant of a county, hath any right to interfere in the election of commoners; and by statute, the lord warden of the cinque ports shall not recommend any members there. If any officer of the excise, customs, stamps, or other branches of the revenue, presumes to intermeddle in elections, by persuading or dissuading any voter, he forfeits 100l. and is disabled to hold any office.

On the day of election, the returning officer first takes an oath against bribery, and for the due execution of his

office; the candidates, also, if required, must swear to their qualifications; and the electors, both in counties and boroughs, are compellable to take the oath of abjuration, and that against bribery and corruption. When the election is closed, the returning officer in boroughs returns his precept to the sheriff with the persons elected by the majority: and the sheriff returns the whole, together with the writ for the county, and the knights elected, to the clerk of the crown in chancery, before the day of meeting, if it be a new parliament; or within fourteen days after the election, if it be an occasional vacancy; under penalty of 500l. If the sheriff does not return such knights only as are duly elected, he forfeits, by the old statutes of Henry VI. 100l. and the returning officer in boroughs, for a like false return, 40l. and they are besides liable to an action, in which double damages shall be recovered, by the later statutes of king William: and any person bribing the returning officer shall also forfeit 300l. But the members returned by him are the sitting members, until the house of commons, upon petition, shall adjudge the return to be false and illegal.

The lords and commons in their respective houses have power of judicature, and so have both houses together: and in former times, both lords and commons sat together in one house of parliament. The king cannot take notice of any thing said to be done in the house of commons, but by the report of the house; and there is a resolution of the house, on the king's taking notice of a bill in its passage through the house, which they voted to be a *high breach of the privilege of parliament*, and on which they also demanded a conference with the lords. This resolution has not always been acted on, even in the present reign, though it still remains on the journals.

As every court of justice hath laws and customs for its direction, some the civil and canon, some the common law, others their own peculiar laws and customs; so the high court of parliament hath also its own peculiar law, called the *lex et consuetudo parliamenti*; a law which Coke observes is *ab omnibus querenda, a multis ignorata, a paucis cognita*. It will not therefore be expected that we should enter into the examination of this law with any degree of minuteness; since, as the same learned author assures us, it is much better to be learned out of the rolls of parliament and other records, and by precedents and continual experience, than can be expressed by any one man. It will be sufficient to observe, that the whole of the law and custom of parliament has its origin from this one maxim; "That whatever matter arises concerning either house of parliament, ought to be examined, discussed, and adjudged, in that house to which it relates, and not elsewhere." 4 *Inst.* 15. Hence, for instance, the lords will not suffer the commons to interfere in settling the election of a peer of Scotland; the commons will not allow the lords to judge of the election of a burgess; nor will either house permit the subordinate courts of law to examine the merits of either case. But the maxims upon which they proceed, together with the method of proceeding, rest entirely in the breast of the parliament itself; and are not defined and ascertained by any particular stated laws.

The house of lords is a distinct court from the commons, to several purposes: they try criminal causes on impeachments of the commons; and have an original jurisdiction for the trial of peers, upon indictments found by a grand jury: they also try causes upon appeals from the court of chancery, or upon writs of error to reverse judgments in the K. B. &c. And all their decrees are as judgments; and judgments given in parliament may be executed by the lord chancellor. 4 *Inst.* 21. *Finch.* 238. Also the house of commons is a distinct court to many purposes: they examine the right of elections, expel their own members, and commit them to prison, and sometimes other persons, &c. And the book of the clerk of the house of commons is a record. 2 *Inst.* 536. 4 *Inst.* 23. The commons are the grand inquest of the realm; to present public

lic grievances and delinquents to the king and lords, to be punished by them: and any member of the house of commons has the privilege of impeaching the highest lord in the kingdom. *Wood's Inst.* 445.

The *High Court of Parliament* is the supreme court in the kingdom, not only for the making, but also for the execution, of laws; by the trial of great and enormous offenders, whether lords or commoners, in the method of parliamentary impeachment. Acts of parliament to attain particular persons of treason or felony, or to inflict pains and penalties, are new laws made *pro re nata*, and by no means an execution of such as are already in being; but an impeachment before the lords, by the commons of Great Britain, in parliament, is a prosecution of the already known and established law, and has been frequently put in practice; being a presentment to the most high and supreme court of criminal jurisdiction by the most solemn grand inquest of the whole kingdom. 1 *Hal. P. C.* 150. A commoner, it is said by Blackstone, who quotes authorities to prove his position, cannot be impeached before the lords for any capital offence, but only for high misdemeanours: a peer may be impeached for any crime; but it appears that the right of impeaching a commoner even in capital cases, has been claimed and asserted by the lords. See 4 *Comm.* 260. in n.

The privileges of parliament are very large and indefinite; and therefore when, in 31 Hen. VI. the house of lords propounded a question to the judges concerning them, the chief justice, sir John Fortescue, in the name of his brethren, declared, "That they ought not to make answer to that question, for it hath not been used aforetime that the justices shall in anywise determine the privileges of the high court of parliament; for it is so high and mighty in its nature, that it may make law; and that which is law, it may make no law; and the determination and knowledge of that privilege belongs to the lords of parliament, and not to the justices." Seldon's *Baronage*, c. 4.

Inconvenience to the community does undoubtedly arise from these undefined privileges; for how is a man to avoid committing an offence which is not declared to be such by either the common or the statute law? What is called the common law of the land springs out of an early period of our history, the lowest boundary of which, according to Sir Matthew Hale, is the reign of Richard I. But in that reign the house of commons did not exist. It is clear, therefore, that the house cannot claim the power of punishing without trial for what it calls breach of privilege from the *common law*; and it is equally certain that there is no *statute* which confers the power. What right, then, can the house have to say of its own motion, "We will assume and exercise this power, because it is necessary (as was said in the case of the ship-money) for our support, and we are judges of the necessity." It were to be wished (says Dean Swift) the house of commons would form a pandect of their own power and prerogatives, to be confirmed in as solemn a manner as *Magna Charta*. *Free Briton*, Mar. 2, 1731.

There are, however, several privileges of the members of either house, which are sufficiently certain and notorious. These are, privilege of speech, of person, and, before the stat. 10 Geo. III. c. 50. of their domestics, and of their lands and goods. As to the first, privilege of speech, it is declared by the stat. 1. W. & M. ft. 2. c. 2. as one of the liberties of the people, "that the freedom of speech, and debates, and proceedings in parliament, ought not to be impeached, or questioned, in any court or place out of parliament." And this freedom of speech (with other privileges) is particularly demanded of the king in person, by the speaker of the house of commons, at the opening of every new parliament. If any member of either house, however, speak words of offence in a debate, after the debate is over he is called to the bar, where commonly on his knees he

receives a reprimand from the speaker: and, if the offence be great, he is sent to the Tower.

The other privileges, of persons, and heretofore of servants, lands, and goods, are immunities as ancient as Edward the Confessor. And still, to assault by violence a member of either house, or his menial servants, is a high contempt of parliament, and there punished with the utmost severity. It has likewise peculiar penalties annexed to it in the courts of law, by stat. 5 Hen. IV. c. 6. and 11 Hen. VI. c. 11. By this latter statute, assaulting a member coming to or attending in parliament incurs the penalty of double damages. Neither can any member of either house be arrested and taken into custody, unless for some indictable offence, without a breach of the privilege of parliament.

But all other privileges which derogate from the common law in matters of civil right are now at an end, save only as to the freedom of the member's person; which in a peer (by the privilege of peerage) is for ever sacred and inviolable; and in a commoner (by the privilege of parliament) for forty days after every prorogation, and forty days before the next appointed meeting; which is now, in effect, as long as the parliament subsists, its freedom being prorogued for more than four score days at a time. 2 *Lev.* 72. It does not appear that the privilege from arrest is limited to any precise time after a dissolution; but it has been determined by all the judges, that it extends to a *convenient time*. Prynne is of opinion, that it continued for the number of days the member received wages after a dissolution; which were in proportion to the distance between his home and the place where the parliament was held. 4 *Parl. Writs.* 68.

As to all other privileges which obstruct the ordinary course of justice, they were restrained by stats. 12 W. III. c. 3. 2 & 3 Ann. c. 18. 11 Geo. II. c. 24. and totally abolished by stat. 10 Geo. III. c. 50. which enacts, that any suit may at any time be brought against any peer or member of parliament, their servants, or any other person entitled to privilege of parliament; which shall not be impeached or delayed by pretence of any such privilege, except that the person of a member of the house of commons shall not thereby be subject to any arrest or imprisonment. Likewise, for the benefit of commerce, it is provided by stat. 4 Geo. III. c. 33. that any trader, having privilege of parliament, may be served with legal process for any just debt to the amount of 100l. and, unless he makes satisfaction within two months, it shall be deemed an act of bankruptcy; and that a commission of bankrupt may be issued against such privileged traders in like manner as against any other.

As to the special privileges and claims of *peers*; we may observe, that, by the charter of the forest, confirmed in parliament 9 Hen. III. every lord, spiritual or temporal, summoned to parliament, and passing through the king's forests, may, both in going and returning, kill one or two of the king's deer without warrant. They have also a right to be attended by the judges of the court of king's bench and common pleas, and such of the barons of the exchequer as are of the degree of the coif, or have been made serjeants at law, and likewise by the masters of the court of chancery, for their advice in point of law, &c. The secretaries of state, the attorney and solicitor general, and the rest of the king's counsel, being serjeants, were also used to attend the house of peers, and have, to this day, their regular writs of summons issued out at the beginning of every parliament: but, as many of them have of late years been members of the house of commons, their attendance here is fallen into disuse.

Every peer, by license obtained from the king, may make another lord of parliament his *proxy*, to vote for him in his absence, which no member of the house of commons can do, because he is himself but a proxy for a multitude of other people. Proxies cannot be used in a

committee. No lord shall have more than *two* proxies, (i. e. be a proxy for more than two absent lords.) If a peer, after appointing a proxy, appears personally in parliament, his proxy is revoked and annulled. 4 *Infl.* 13.

By the orders of the house, no proxy shall vote upon a question of "guilty or not guilty:" and a spiritual lord shall only be proxy for a spiritual lord, and a temporal lord for a temporal. Two or more peers may be proxy for one absent peer; but Coke is of opinion, that they cannot vote, unless they all concur. 4 *Infl.* 12. 1 *Wood.* 41.

Whenever the senate shall be seriously disposed to reform whatever may be considered as capable of amendment in its own customs or conduct, we trust the voting by proxy will be done away. It is truly painful to reflect, that noblemen should depute others to carry their voice or vote, for or against a measure, before they have heard its merits discussed, or the arguments which other senators may offer for rejecting it. It is not a little surprising, that a well-constructed mind can consent to pin its faith upon the sleeve of another in any case, much more so in what concerns legislation affecting the lives, liberties, and properties, of their fellow-men.

Each peer has also a right, by leave of the House, when a vote passes contrary to his sentiments, to enter his *dissent* in person, on the journals of the house, with the reasons for such dissent, which is usually styled his *protest*. 1 *Comm.* c. 2. All bills likewise that may, in their consequences, any way affect the right of the peerage, are by the custom of parliament to have their first rise and beginning in the house of peers; and to suffer no changes or amendments in the house of commons.

Considered in its judicial capacity, the house of peers is the supreme court of judicature in the kingdom; having at present no original jurisdiction over causes, but only upon appeals and writs of error; to rectify any injustice or mistake of the law committed by the courts below. But this house has original *criminal* jurisdiction in the cases of *impeachment* by the commons, and of the trial of peers. On appeals and writs of error, the house of peers is the court of last resort, from whose judgment no further appeal is permitted; and every subordinate tribunal must conform to their determinations; but in all dubious cases they refer themselves to the opinions of the judges, who are summoned by writ to advise them; since upon their decision all property must finally depend. 3 *Comm.* c. 4.

As the house of lords seems to be politically constituted for the support of the rights of the crown, so the province of the house of commons is to stand for the preservation of the people's liberties. The commons, in making and repealing laws, have equal power with the lords. It is the ancient indisputable privilege and right of the house of commons, that all grants of subsidies, or parliamentary aids, do begin in their house, and are first bestowed by them; although their grants are not effectual, to all intents and purposes, until they have the assent of the other two branches of the legislature. And so reasonably jealous are the commons of this valuable privilege, that herein they will not suffer the other house to exert any power, except that of rejecting. They will not permit the least alteration or amendment to be made by the lords to the mode of taxing the people by a *money-bill*; under which appellation are included all bills by which money is directed to be raised upon the subject, for any purpose, or in any mode whatsoever; either for the exigencies of government, and collected from the kingdom in general; or for private benefit, and collected in any particular district, as by turnpikes, parish rates, and the like. This rule is even extended to all bills for canals, paving, provision for the poor, and to every bill in which tolls, rates, or duties, are ordered to be collected; and also to all bills in which pecuniary penalties and fines are imposed for offences. 3 *Hut.* 110. In any case where a money-bill is remanded to the commons, all amendments in the mode of taxation are sure to be re-

jected. And, even if the commons desire to agree with the amendment, the form is to reject the bill so amended by the lords, and to bring in a *new bill* containing those amendments, solely for the purpose of preserving the privileges of commons.

In the election of knights, citizens, and burgeses, to represent the counties, cities, and boroughs, of the kingdom, consists the exercise of the democratical part of the British constitution: the *sovereignty of the people* being shown in their choice of their representatives.

To consider, therefore, first, the qualifications of electors of Knights of the Shire, or, as they are more commonly termed, Members for the Counties, in Great Britain. By stats. 8 Hen. VI. c. 7. 10 Hen. VI. c. 2. (amended by stat. 14 Geo. III. c. 58, which made the residence of the electors and the elected in their respective counties, cities, and boroughs, no longer necessary,) the knights of the shire shall be chosen by people, whereof every man shall have freehold to the value of 40s. by the year within the county; which, by subsequent statutes, is to be clear of all charges and deductions, except parliamentary and parochial taxes. The stat. 7 & 8 Will. III. c. 25, requires, that every freeholder shall take an oath, that he is a freeholder of the county, and has freehold lands or hereditaments of the yearly value of 40s. lying at such a place, within the said county, and that he hath not before polled at the election. The voter's evidence of the value must, therefore, be received at the poll; but it is not conclusive, and may be contradicted by other evidence, upon a *scrutiny*, or before a committee.

The knights of shires are the representatives of the landholders or landed interest of the kingdom; their electors must therefore have estates in lands or tenements within the county represented; these estates must be freehold, that is, for term of life at least. This freehold must be of 40s. annual value; because that sum would, at the time of passing the statutes, with proper industry, furnish all the necessaries of life, and render the freeholder, if he pleased, an independent man. 1 *Comm.* 172.

The other less important qualifications of the electors for counties in England and Wales, are—That no person under twenty-one years of age shall be capable of voting for any member. This extends to all sorts of members, as well for boroughs as counties, as does also the next; viz. That no person convicted of perjury, or subornation of perjury, or of having asked or received any bribe, shall be capable of voting in any election. 2 *Geo.* II. c. 24. § 6, 7. That no person shall vote in right of any freehold granted to him *fraudulently*, to qualify him to vote. Fraudulent grants are such as contain an agreement to re-convey, or to defeat the estate granted; which agreements are made void, and the estate is absolutely vested in the person to whom it is so granted. And every person who shall prepare or execute such conveyance, or who shall give his vote under it, shall forfeit 40l. 10 *Ann.* c. 23. § 1. To guard the better against such frauds, it is further provided, that every voter shall have been in the actual possession or receipt of the profits of his freehold, to his own use, for twelve calendar months before; except it came to him by descent, marriage, marriage-settlement, will, or promotion to a benefice or office. That only one person shall be admitted to vote for any one house or tenement; to prevent the splitting of freeholds, and multiplying votes for election-purposes. But this does not extend to cases which arise from operation of law, as devises, descents, &c. As, if an estate should descend to any number of females, the husband of each would have a right to vote, if his interest amounted to 40s. a-year. That no estate shall qualify a voter, unless the *estate* has been, at all events, assessed to some land-tax aid for at least twelve months next before the election; and, for six months before the election, either in the name of the voter, or his tenant, or of the tenant actually occupying the same; but, if he has acquired it by marriage, descent, or other operation of law, in that

case it must have been assessed to the land-tax, within two years before the election, either in the name of the predecessor or person through whom the voter derives his title, or in the name of the tenants of such person, or in the name of the tenant actually occupying the same.

In Ireland, the electors of the knights of the shire must have 40s. a-year freehold in the county: and such freehold must be duly registered.

The right of election in *boroughs* is various; depending entirely on the several charters, customs, and constitutions, of the respective places, which have occasioned infinite disputes. In some measure to prevent this evil, the stat. 7 & 8 Will. III. c. 7, enacted, that the determination of the house of commons, as to the right of election, should bind the returning officer in taking the poll. That statute was enlarged by stat. 2 Geo. II. c. 24. by the 4th section of which, the last determination of the house of commons was declared to be final.

By stat. 3 Geo. III. c. 15. no freeman of any city or borough (other than such as claim by birth, marriage, or servitude) shall be entitled to vote therein, unless he hath been admitted to his freedom twelve calendar months before. This is called the Durham-act, and it was occasioned by the corporation of Durham having, upon the eve of an election, in order to serve one of the candidates, admitted 215 honorary freemen. Some corporations have the power of admitting honorary freemen, viz. persons who, without any previous claim or pretension, are admitted to all the franchises of the corporation. The Durham Act is confined to persons of that description solely. It has frequently been contended, that if honorary freemen are created for the *occasion*, that is, merely for an election-purpose, it is a fraud upon the rights of election; and that, by the common law, as in other cases of fraud, the admission and all the consequences would be null and void; that within the year, by the statute, fraud was presumed; but that, after that time, the statute left the necessity of proving it upon those who imputed it.

No length of possession is required from voters in burgate-tenure boroughs. There are about 29 burgate-tenure boroughs in England. 1 *Dougl.* 224. In these the right of voting is annexed to some tenement, house, or spot of ground upon which a house in ancient times has stood. Any number of these burgate-tenure estates may be purchased by one person, which, at any time before a contested election, may be conveyed to so many of his friends, who would each in consequence have a right to vote.

By stat. 26 Geo. III. c. 100, it is enacted, that in boroughs, in England, where the householders or inhabitants of any description claim to elect, no person shall have a right to vote as such inhabitant, unless he has actually been resident in the borough six months previous to the day on which he tenders his vote. By an Irish act, 35 Geo. III. c. 29. § 55, &c. inhabitants of boroughs in Ireland, claiming to vote, must be registered at the sessions of the county twelve months before the election.

As to the qualifications of persons to be *elected* members of the house of commons; every knight of a shire shall have a clear estate of freehold or copyhold, (or mortgage, if the mortgagee has been seven years in possession,) to the value of 600l. per annum; and every citizen and burgess to the value of 300l. except the eldest sons of peers, and except the members for the two universities. 9 *Ann.* c. 5. But this act does not extend to Scotland or Ireland.

If a vacancy happens by the death, &c. of any member during the sitting of parliament, the speaker may, by order of the house, send his warrant to the clerk of the crown; who thereupon proceeds as in other cases where the warrant is sent by the lord chancellor. And, with regard to a vacancy happening by death or peerage during the prorogation or recess of parliament, the stat. 24 Geo. III. ft. 2. c. 26. which repeals the former statutes upon

this subject, provides, that if, during any recess, any two members give notice to the speaker, by a certificate under their hands, that there is a vacancy by death, or that a writ of summons has issued under the great seal to call up any member to the house of lords, the speaker shall forthwith give notice of it to be inserted in the Gazette; and at the end of fourteen days after such insertion he shall issue his warrant to the clerk of the crown, commanding him to make out a new writ for the election of another member. But this shall not extend to any case where there is a petition depending for such vacant seat; or where the writs for the election of the member so vacating had not been returned fifteen days before the end of the last sitting of the house; or where the new writ cannot issue before the next meeting of the house for the dispatch of business.

The place where the parliament meets is wherever the king pleases: of late it has been in the palace of Westminster, the lords and commons each in a distinct apartment. In the lords' house, the princes of the blood are placed in distinct seats; the great officers of state, dukes, marquises, and bishops, on benches, and the viscounts and barons on others across the house; all according to their order of creation, place, &c. The commons sit promiscuously, forty members constituting a house; only the Speaker has a chair at the upper end, and the clerk and his assistant sit at a table near him.

Each house of parliament has its Speaker. The Speaker of the house of lords, whose office it is to preside there, and manage the formality of business, is the lord chancellor, or keeper of the king's great seal, or any other appointed by the king's commission: and if none be so appointed, the house of lords (it is said) may elect. The Speaker of the house of commons is chosen by the house; but must be approved by the king. And herein the usage of the two houses differs, that the Speaker of the house of commons cannot give his opinion, or argue any question in the house, unless the house is in a committee; or when the house is equally divided, and the casting vote of the Speaker is requisite to determine a question; but the Speaker of the House of Lords, if a Lord of Parliament, may, in all cases speak and argue.

The salary of the Speaker of the House of Commons is now settled at 1500l. a-quarter, or 6000l. a-year, under stat. 30 Geo. III. c. 10. which prohibits his holding any office under the crown during pleasure. Forty members are requisite to make a house of commons for dispatch of business.

When a member of the house of commons speaks, he stands up uncovered, and directs his speech to the Speaker only. If what he says be answered by another, he is not allowed to reply the same day, unless personally alluded to: but when the commons, in order to have a greater freedom of debate, have resolved themselves into a committee of the whole house, every member may speak to a question as often as he thinks necessary.

In the house of lords they vote, beginning at the puisne or lowest baron, and so up orderly to the highest, every one answering, *Content* or *Not content*. In the house of commons they vote by *ayes* and *noes*; and, if it be dubious which are the greater number, the house divides. If the question be about bringing any thing into the house, the *ayes* go out; but, if it be about any thing the house already has, the *noes* go out. In all divisions the Speaker appoints four tellers, two of each opinion. In a committee of the whole house, they *divide* by changing sides, the *ayes* taking the right and the *noes* the left of the chair; and then there are but two tellers.

In the house of commons, the Speaker never votes (unless in committee), except when there is an equality without his casting vote, which in that case creates a majority of the house; but the Speaker of the house of lords has no casting vote, his vote being connected with the rest of the house; and, in the case of an equality, the *Non contents*, or negative voices, have the same effect and operation

operation as if they were in fact a majority. *Lords' Journ.* 25 June, 1661. Hence the order in putting the question, on appeals and writs of error, is this "Is it your lordships' pleasure, that this decree or judgment should be reversed?" for, if the votes are equal, the judgment of the court below is affirmed.

The Speaker of the house of commons is not allowed to persuade or dissuade in passing a bill, only to make a short narrative of it; opening the parts of the bill, so that all may understand it; if any question be upon the bill, he is to explain, but not enter into argument or dispute. When Mr. Speaker desires to speak, he is to be heard without interruption; and, when the Speaker stands up, the member standing up is to sit down: if two stand up to speak to a bill, he who would speak *against* the bill, if it be known, is to be first heard; otherwise he who was first up, which is to be determined by the Speaker.

To bring a bill into the house, if the relief sought by it is of a private nature, it is first necessary to prefer a petition; which must be presented by a member, and usually sets forth the grievance desired to be remedied. This petition (when founded on facts that may be in their nature disputed) is referred to a committee of members, who examine the matter alleged, and accordingly report it to the house; and then (or, otherwise, upon the mere petition) leave is given to bring in the bill. In public matters, the bill is brought in upon motion made to the house, without any petition at all. Formerly, all bills were drawn in the form of petitions, which were entered upon the parliament-rolls, with the king's answer thereunto subjoined; not in any settled form of words, but as the circumstances of the case required: and at the end of each parliament the judges drew them into the form of a statute, which was entered on the statute-rolls. In the reign of Henry V. to prevent mistakes and abuses, the statutes were drawn up by the judges before the end of the parliament; and, in the reign of Henry VI. bills in the form of acts, according to the modern custom, were first introduced.

Any member may move for a bill to be brought in, except it be for imposing a tax, which is to be done by order of the house; and, leave being granted, the person making the motion, and those who second it, are ordered to prepare and bring in the same.

Public bills, or acts of parliament, are commonly drawn, such as relate to taxes, or other matters of government, by the several public boards, according to their respective jurisdictions; others by such members of the house of commons as are most inclined to effect the good of the public, particularly in relation to the bill designed, taking advice thereupon; and acts for the revival, repeal, or continuance, of statutes, are penned by lawyers, members of the house, appointed for that purpose.

The persons directed to bring in the bill, present it in a competent time to the house, drawn out on paper, with a multitude of blanks, or void spaces, where any thing occurs that is dubious, or necessary to be settled by the parliament itself; (such, especially, as dates, the nature and quantity of penalties, or any sums of money to be raised;) being indeed only the skeleton of the bill. In the house of lords, if the bill begins there, it is (when of a private nature) referred to two of the judges; to examine and report the state of the facts alleged, to see that all necessary parties consent, and to settle all points of technical propriety. This is read a first time, and at a convenient distance a second time; and, after each reading, the Speaker opens to the house the substance of the bill, and puts the question whether it shall proceed any farther. The introducing of the bill may be originally opposed, as the bill itself may at either of the readings; and, if the opposition succeeds, the bill must be dropped for that session; as it must also, if opposed with success in any of the subsequent stages.

After the second reading, it is *committed*, that is, referred to a committee; which is either selected by the

house in matters of small importance, or else, upon a bill of consequence, the house resolves itself into a *committee of the whole house*. A committee of the whole house is composed of every member; and, to form it, the Speaker quits the chair; (another member being appointed chairman,) and may sit and debate as a private member. In these committees the bill is debated clause by clause, amendments made, the blanks filled up, and sometimes the bill entirely new-modelled. After it has gone through the committee, the chairman reports it to the house, with such amendments as the committee have made; and then the house re-considers the whole bill again, and the question is repeatedly put, upon every clause and amendment. When the house hath agreed or disagreed to the amendments of the committee, and sometimes added new amendments of its own, the bill is then ordered to be engrossed, or written in a strong gross hand, on one or more long rolls (or presses) of parchment, sewed together. When this is finished, it is read a third time, and amendments are sometimes then made to it; and, if a new clause be added, it is done by tacking a separate piece of parchment on the bill, which is called a *rider*. The Speaker then again opens the contents; and, holding it up in his hands, puts the question, whether the bill shall pass. If this is agreed to, the title of it is then settled; which used in ancient times to be a general one for all the acts passed in the session: distinct titles for each chapter were not, it seems probable, introduced with much regularity before the time of Henry VII. After this, one of the members is directed to carry the bill to the lords, and desire their concurrence; who, attended by several more, carries it to the bar of the house of peers, and there delivers it to their Speaker, who comes down from his woolfack to receive it.

If it there passes through the same forms as in the other house, (except engrossing, which is already done;) and, if rejected, no more notice is taken, but it passes *sub silentio*, to prevent unbecoming alterations. But, if it is agreed to, the lords send a message by two masters in chancery, (or, upon matters of high dignity or importance, by two of the judges,) that they have agreed to the same: and the bill remains with the lords, if they have made no amendment to it. But, if any *amendments* are made, such amendments are sent down with the bill to receive the concurrence of the commons. If the commons disagree to the amendments, a conference usually follows between members deputed from each house; these meet in the Painted Chamber and debate the matter, and for the most part settle and adjust the difference; but, if both houses remain inflexible, the bill is dropped. If the commons agree to the amendments, the bill is sent back to the lords by one of the members, with a message to acquaint them therewith. The same forms are observed, *mutatis mutandis*, when the bill begins in the house of lords. But, when an act of grace or pardon is passed, it is first signed by his majesty, and then read *once only* in each of the houses, without any new engrossing or amendment.

When both houses have done with any bill, it is always deposited in the house of peers to wait the royal assent; except in the case of a bill of supply, which, after receiving the concurrence of the lords, is sent back to the house of commons.

In cases of *private bills*, when the petition is read, and leave given to bring in the bill, the persons concerned and affected by it may be heard by themselves or counsel at the bar, or before the committee to whom such bill is referred; and, in case of a peer, he shall be admitted to come within the bar of the house of commons, and sit covered on a stool, whilst the same is debating. And after counsel are heard on both sides, and the house is satisfied with the contents of the bill, it goes through the several forms.

The *Royal Assent* may be given two ways: 1. In person; when the king comes to the house of peers, in his crown and royal robes, and, sending for the commons to

to the bar, the titles of all the bills that have passed both houses are read; and the king's answer is declared by the clerk of the parliament in Norman French. If the king consents to a public bill, the clerk usually declares, "*Le roy le veut*; The king wills it so to be." If to a private bill, "*Soit fait comme il est désiré*; Be it as it is desired." If the king refuses his assent, it is in the gentle language of "*Le roy s'aviserà*; The king will advise upon it." When a bill of supply is passed, it is carried up and presented to the king by the Speaker of the house of commons; and the royal assent is thus expressed: "*Le roy remercie ses loyals subjects, accepte leur benevolence, et ainsi le veut*"; The king thanks his loyal subjects, accepts their benevolence, and wills it so to be." In case of an act of grace, which originally proceeds from the crown, and has the royal assent in the first stage of it, the clerk of the parliament thus pronounces the gratitude of the subject; "*Les prelates, seigneurs, et commons, en ce présent parlement assemblés, au nom de tous vous autres subjects, remercient tres humblement votre majesté, et prient à Dieu vous donner en santé bonne vie et longue*"; The prelates, lords, and commons, in this present parliament assembled, in the name of all your other subjects, most humbly thank your majesty, and pray to God to grant you in health and wealth long to live."

By the stat. 33 Hen. VIII. c. 21. which was passed to attain queen Katharine of treason, it was enacted, that the king's assent by letters patent under his great seal, signed with his hand, and notified in his absence to both houses assembled together in the lords' house, ever was and should be of like force, as if given by the king in person.

When the bill has received the royal assent in either of these ways, it is then, and not before, a statute or act of parliament; and, being certified into chancery, is placed among the records of the kingdom; and, being printed by the king's printer, copies are distributed among the several courts of justice and magistracy throughout the kingdom at the public expense, and thus promulgated more effectually than heretofore by proclamation made thereof by the sheriffs of counties, &c.

An *act of parliament*, thus made, is the exercise of the highest authority that this kingdom acknowledges upon earth. It hath power to bind every subject in the land, and the dominions thereunto belonging; nay, even the king himself, if particularly named therein. And it cannot be altered, amended, dispensed with, suspended, or repealed, but in the same forms and by the same authority of parliament: for it is a maxim in law, that "it requires the same strength to dissolve as to create an obligation." It was formerly held, that the king might in many cases dispense with penal statutes. But now, by stat. 1 Will. & M. ft. 2. c. 2. it is declared, that the suspending or dispensing with laws by regal authority, without consent of parliament, is illegal.

An *adjournment* of parliament is a continuance of the sessions from one day to another, as the word itself signifies; and this is done by the authority of each house separately every day, and sometimes for a fortnight or month together. But the adjournment of one house is no adjournment of the other.

A *prorogation* is the continuance of the parliament from one session to another, as an adjournment is a continuation of the session from day to day. This is done by the royal authority, expressed either by the lord-chancellor in his majesty's presence, or by commission from the crown, or frequently by proclamation. At the beginning of a new parliament, when it is not intended that the parliament should meet at the return of the writ of summons, for dispatch of business, the practice is to prorogue it by a writ of prorogation.

Both houses are necessarily prorogued at the same time, it not being a prorogation of the house of lords or commons, but of the *parliament*. The session is never understood to be at an end until a prorogation. Formerly the

usage was, for the king to give the royal assent to all such bills as he approved, at the end of every session, and then to prorogue the parliament. Which custom obtained so strongly, that it once became a question, whether giving the royal assent to a single bill, did not, of course, put an end to the session. And, though it was then resolved in the negative, yet the notion was so deeply rooted, that the stat. 1 Car. I. c. 7, was passed to declare, that the king's assent to that and some other acts should not put an end to the session; and even so late as the reign of Charles II. we find a proviso frequently tacked to a bill, that his majesty's assent thereto should not determine the session of parliament.

By prorogation, all orders of parliament determine: and persons imprisoned by order of the parliament, after their prorogation may be discharged on an *habeas corpus*, as well as after a dissolution; but it was long since determined, that the dissolution of a parliament did not alter the state of impeachments, brought up by the commons in a preceding parliament. Cases of appeals and writs of error also shall continue, and are to be proceeded on, in *statu quo*, as they stood at the dissolution of the last parliament. *Raym.* 381.

A *dissolution* is the civil death of the parliament; and this may be effected three ways.

First, By the king's will expressed either in person or by representation. For, as the king has the sole right of convening the parliament, so also it is a branch of the royal prerogative, that he may (whenever he pleases) prorogue the parliament for a time, or put a final period to its existence.

Secondly, A parliament may be dissolved by the demise of the crown. This dissolution formerly happened immediately upon the death of the reigning sovereign: for, he being considered in law as the head of the parliament, that failing, the whole body was held to be extinct. But the calling a new parliament immediately on the inauguration of the successor, being found inconvenient, and dangers being apprehended from having no parliament in being, in case of a disputed succession, it was enacted by stat. 7 & 8 Will. III. c. 15, that the parliament in being should, if sitting, continue for six months after the demise of the crown, unless sooner dissolved, &c. by the successor; and, if not sitting, should meet on the day of prorogation; and that, in case no parliament was in being, the last preceding parliament should convene and sit.

Lastly, A parliament may be dissolved or expire by length of time; and, as our constitution now stands, the parliament must expire, or die a natural death, at the end of every seventh year, if not sooner dissolved by the royal prerogative, as it generally is in the course of every five or six years. See the article LONDON, vol. xiii. p. 320.

We shall conclude this part of the subject with giving a few curious specimens of the ancient orders of the house of commons. They are taken out of a small volume printed in the last century, under the title of "Essential and Fundamental Orders of the House of Commons, collected out of the Journals." To those who are only acquainted with the present practice of the house, and the late hours to which the public business is now protracted, these orders will show how tenacious our ancestors were of the dignity and decorum of parliament, and of enforcing the early and regular attendance of the members; though some of them perhaps may abate a little of the reverence due to the standing orders of the house of commons, which have hitherto been considered as paramount to the law of the land.

1614, May 17.—Ordered, That this house shall sit every day at seven o'clock in the morning, and enter into the great business at eight o'clock; and no new motion to be made after twelve.

1641.—Ordered, That all the members who shall come to the house after eight o'clock, shall pay one shilling; and that, if any member shall forbear to come for the whole day, he shall pay five shillings, to be disposed of as

the house shall think fit; and the serjeant is to gather in the money.

1642.—Ordered, That whosoever shall not be at prayers every morning, shall pay one shilling to the poor; a box to be prepared and set up at the door for this purpose, and the burgeses of Westminster are to take care that the money be duly paid.

1647.—Ordered, That so soon as the clock strikes twelve, Mr. Speaker do go out of the chair, and the house shall rise; and that going forth no member shall stir, until Mr. Speaker go before, and then all the rest shall follow. Whosoever shall go out of the house before Mr. Speaker, shall forfeit ten shillings; but that the reporters may go first.

Ordered, That while any stranger is in the house, no member to stir out of his place, or speak unto another; and, if any member shall whisper, or cross the house, or read any printed book in the house, he shall pay one shilling into the poor's box.

1693.—Ordered, That no member of the house do presume to smoke tobacco in the gallery, or at the table of the house, sitting at committees.

Ordered, That no papists do presume to come into Westminster Hall, the Court of Requests, or lobby of the house, during the sitting of parliament; and that the serjeant at arms do take into custody all such persons as shall offend against this order.

Ordered, That, if any member has a servant that is a popish recusant, or refuses to go to church and hear divine service, he shall presently discharge him, under the penalty of sequestration from the house.

OF PARLIAMENTARY REFORM.—With so deep veneration do we regard our glorious constitution of king, lords, and commons, that we should deem every sacrifice trivial for the restoration of it uncorrupted, and for the preservation of it inviolate. In its original form, it is almost divine: to such a degree, to use the language of sir William Jones, "that no state of Rome or Greece could ever boast one superior to it; nor could Plato, Aristotle, nor any legislator, even conceive a more perfect model of a state. The three parts which compose it are so harmoniously blended and incorporated, that neither the flute of Aristoxenus nor the lyre of Timotheus ever produced more perfect concord. What can be more difficult," he continues, "than to devise a constitution which, while it guards the dignity of the sovereign and liberty of the people from any encroachment by the influence and power of the nobility, preserves the force and majesty of the laws from violation by the popular liberty?" Such was the case formerly in our happy island, and we trust it will be so again: but, if the people of this country are indeed destined to become great and honourable in these latter ages, they must "cast off the old and wrinkled skin of corruption," and, waxing young again, "enter upon the glorious ways of truth, and prosperous virtue."

To perform its duty to the public, the house of commons ought to be so constituted as to give its members a common interest and fellow feeling with every part of the kingdom, and with every class and distinction of persons in the community. No one should be aggrieved or oppressed without finding a defender in that assembly. No interest, however small or local, should be overlooked or neglected for want of an advocate. No measure should be adopted, without weighing maturely, not only the general good it may produce, but the partial evil it may occasion. When conflicting interests are opposed, a fair hearing should be given to all, before any decision is formed. Where relief is wanted, or redress petitioned for, there should be some one present to recommend the one, or enforce the other.

Julius Cæsar acknowledges that the *Commune Concilium* of Britain chose Cassibelanus for their leader; and Pughe, the celebrated Welch antiquarian, has proved from the Tryads, or ancient records of the Britons, that the *Kyfr-y-then*

VOL. XVIII. No. 1269.

of the ancient British was the *Commune Concilium* mentioned by Cæsar, afterwards called the *Witten Gemote* of the Saxons, and which assumed the name of *Parliament* in the reign of Edward the Confessor, who had received his education in France. That this was a representative assembly, elected by the people, is proved by the Saxon View of Frankpledge, so ably demonstrated by that learned and venerable patriot, the late Granville Sharp; and that not only the legislative body, but every executive officer, from the tythingman to the alderman, or chief magistrate of a county, was elected by the respective hundreds *annually assembled*.

The learned Selden also proves from Hoveden, that the Conqueror assembled a parliament in the year 1070, the fourth year of his reign, which was composed of twelve representatives returned out of every county; who confirmed the laws of Edward the Confessor, which the king bound himself to keep, but never adhered to his solemn engagement. Hence, the assembling of a parliament composed of four representatives from each county in the 49th Henry III. was what Carew calls "throwing off the yoke of the Conqueror, and the redemption of the people from slavery." It was the re-establishment of the ancient form of government which existed from the earliest times, but had been wrecked in the same tempest that had overturned the Saxon throne; and it is as absurd to suppose that we had no representative parliament antecedent to the forty-ninth of Henry III. as to assert that we had no king prior to the same period.

That the representation was *equal*, and the right of suffrage *general*, in the housekeepers paying taxes, or, as it is now termed, scot and lot, is proved from the statutes at large, and from the earliest history of every county, city, and borough, in the kingdom. The number of members in the parliament summoned by the conqueror, were twelve for each county, and four in that of the forty-ninth of Henry III. and the electors, till the eighth year of Henry VI. were all those bearing scot and lot. Even freeholders of forty shillings per annum were never known as possessing exclusive rights of election, till the enactment of the famous disfranchising statute of that year. The same right of election continues to this day in all those cities and boroughs where it has not been altered by the acceptance of charters, establishing exclusive privileges, as it is retained in Westminster, Lewes, and many other places, or where they have not been deprived of it by resolutions of committees of the house of commons, who have in general differed with each other in their determinations wherever this right has been disputed, and wherever they have once departed from the ancient letter of the constitution, which says that "Laws, to bind all, must be assented to by all."

The members for the fifty-two counties, as already noticed, are all elected by one uniform right. Except in certain cities and towns having peculiar jurisdictions, every man, throughout England and Wales, possessed of forty shillings per annum freehold, is entitled to vote for the county in which such freehold is situated.

With respect to the different cities, towns, and boroughs, they exercise a variety of separate and distinct privileges, scarcely capable of being classed in any methodical order, and still less of being ascertained by the application of any fixed principle. In the greater part of them, indeed, the right of voting appears to be vested in the freemen of bodies corporate; but, under this general term, an infinite diversity of peculiar customs is to be found. In some places, the number of votes is limited to a select body not exceeding ten; in others it is extended to eight or ten thousand. In some places, the freeman must be a resident inhabitant to entitle him to vote; in others his presence is required only at an election. The right to the freedom is also different in different boroughs; and may, according to peculiar usage, be obtained by birth, servitude, marriage, redemption, &c. &c.

The remaining rights of voting are of a still more complicated description. Burgageholds, leaseholds, and freeholds, foot-and-lot inhabitants, householders, inhabitants at large, potwallopers, and commonalty, each in different boroughs prevail, and create endless misunderstandings and litigation. This arises from the difficulty which is daily found in defining and settling the legal import of those numerous distinctions which, in some places, commit the choice of two members to as many inhabitants as every house can contain; in others, to the possessor of a spot of ground where neither houses nor inhabitants have been seen for years; and which, in many instances, have even baffled the wisdom of parliament to determine who are entitled to vote, or what constitutes their right.

Religious opinions create an incapacity to exercise the elective franchise. All catholics are excluded in England, but not in Ireland; and by the operation of the test-laws, protestant dissenters are deprived of a voice in the election of representatives in all those boroughs where the right of voting is confined to the corporate officers alone.

The representation of the kingdom of Scotland, which contains two millions of inhabitants, is confined to the tenants of the crown in the several counties, to a corporation of thirty-three individuals in the city of Edinburgh, and to sixty-five delegates from the same number of self-elected corporations of the royal burghs of Scotland. The whole number of electors in some of the shires does not exceed *nine*; and the whole constituent body of thirty-three counties is no more than 1368, a number greatly inferior to that of the freeholders in the smallest county of England; while the number of representatives is only *one* more than is furnished from the rotten boroughs of Cornwall. We shall forbear to make any comment where the external evidence of defective representation is so glaring as to set at defiance all sophistry, and impress conviction on the unprejudiced part of mankind; where the represented part of the community does not amount to a hundred in a hundred thousand; and where property, held in tenure from the crown and corporate bodies, deriving exclusive privileges from accident and intrigue, can alone exercise the rights of freemen.

"To restore the ancient right of election, as it was exercised in the tythings of the respective hundreds in each county by the householders in numerical divisions," says Mr. Oldfield, "would at once correct all the existing abuses, and establish a representation of the people perfectly fair and equal; it would extinguish all contentions about elective rights, and save millions of money wasted in expensive contests. The elective franchise ought to be common and personal; and, if not exercised *by all*, which, by the earliest writs of Edward the First, we find to have been the constitutional right of the people, the qualification should be so moderate, that there might be no condition in life in which it should not be in the power of every individual to acquire it by labour, by industry, or by talent.

"If, in the end, this should furnish an election, as we believe it would do, for the whole united kingdom, by nearly a million and half of heads of families, enough would be done to guard the rights of property on one hand, and to satisfy the national claims of personal representation on the other; and, if a constituent power so formed, so extended, and so limited, be not sufficient to create a free and independent house of commons, the case is desperate; the object can never be obtained.

"In support of *personal right* it is contended, that every one has what may be called property; every man has life, personal liberty, character, a right to his earnings, a right to his religious profession and worship according to his conscience, &c. Thus the poor are liable to be injured by the government in a variety of ways. According to the commonly-received doctrine, that servants and those who receive alms have no right to vote for mem-

bers of parliament, an immense multitude of people are deprived of all power to determine who shall be the protectors of their lives, their personal liberty, their little property, (which, though singly considered, is of small value, yet is, in the aggregate, a great object,) and the virtue of their wives and daughters. That which is peculiarly hard upon the poor in this case is that, though they have no share in determining who shall be the lawgivers of their country, they have a heavy share in raising the taxes which support its government. The taxes on malt, beer, leather, soap, candles, and other articles, which are paid chiefly by the poor who are allowed no vote for members of parliament, are equal in amount to a heavy land-tax. The landed interest would complain grievously if *they* had no power of electing representatives; and it is in free states an established maxim, that whoever contributes to the expenses of government, ought to be satisfied concerning the application of the money contributed by him, and consequently ought to have a share in electing those who have power over its application.

"That the collective body of qualified electors should be as numerous as possible is also desirable for many reasons; but principally because a great number of electors, by making each individual vote of no venal value, and hardly worth solicitation, is of itself a better security against corruption than the severest laws against bribery. The security which, on the other side, this would afford against violence and faction, depends on the personal circumstance, character, and situation, of the voters. To exclude the effect of influence and favour on human actions is impossible; but, when the elector has something to give and nothing to sell, it may reasonably be expected that his inclination and his judgment will go together, and determine him in favour of the worthiest candidate. A house of commons thus chosen by the combined operation of property and population, will be free and independent, if any thing can make it so. To maintain it free and independent of any influence or interest but that of its constituents, the choice of new representatives must frequently revert to the people.

"The advocates, however, for *limited right of suffrage* desire to restore the constitution to the state in which it existed from the earliest times to the passing the statute of the eighth of Henry the sixth; and to reinstate *every householder* in Great Britain, paying parish-taxes, in the right of voting for one member of parliament.

"The species of property which constitutes this qualification, has the advantage of being open, ostensible, and incapable of being disputed. It indicates a real residence, and implies a stationary interest in the place for which the vote is given and the representative chosen. But, besides the possession of a competent property, of which the occupation of a house paying taxes is a sufficient presumption, a householder has other qualities, which ought to recommend him to favourable distinction, and particularly to the trust in question. He is necessarily the master, and probably the father, of a family. In the first character, he has personal credit and respect to maintain; in the second, he has given actual hostages to society. He is the natural guardian and virtual representative, not only of his family and servants, but of all those who depend upon him for support, protection, or employment. Such a station deserves confidence, and should be made respectable, that all men may be prompted and encouraged to rise to it. The relations and duties that belong to it are antecedent to all positive institutions, and constitute at once the basis and the security of civil society.

"By the re-establishment of the hundreds and tythings in each county, the system of representation may be renovated, and a reform obtained upon either of these principles. Such a number of the hundreds as would have a right to choose one member of parliament, might be associated into a district for that purpose, and the poll be taken in each hundred before the constable on the same day and hour all over Great Britain and Ireland.

All

All disputes about the right of voting would thus be removed; every man would be known and recognised in his own hundred. All expense of carrying electors from one end of the kingdom to another would be prevented; and all the confusion, tumult, and riot, attending the present mode of election, would be avoided. No individual at present possessing the right of voting would be disqualified; and every man having a claim to that privilege would be restored to it."

Thus far Mr. Oldfield as to the elective franchise. Next as to the duration of parliament. And here, we believe, it must be conceded to the radical reformers, that *annual parliaments* was the ancient practice; i. e. that every parliament, in very early times, was a new parliament; for it no-where appears that prorogations or long adjournments were in use in those days. In a letter of king Edward I. to the pope, there is a testimony to the practice of parliament meeting twice in a year, which is well worthy of our observation. It relates to a yearly tribute of 1000 marks, which the popes, from the time of king John, exacted, and of which there were at this time some arrears. The king's excuse to the nuncio was, that from the pressure of business, and his own sickness, he had not come to any resolution in his parliament which he had accustomed to hold at Easter; but, by common advice, he would give him an answer in his Michaelmas Parliament; thus speaking of them both as customary. "Know for certain, pious Father and Lord, that in our other parliament, which we design to hold at the next feast of St. Michael, with God's permission, we and the prelates and peers aforesaid, in council had thereon, will, by their advice, give you an answer on the premises." (See Clause Rolls, 3 Ed. I. m. 9. Scedula. Prynne, p. 158.) This record is a complete proof that there were two parliaments in that year.

The sitting of parliaments was usually 40 days, so low as king Richard II. and, if they were longer detained, the subject of the wages of the knights and burgesses came into dispute; and Knyghton, p. 2682, has preserved a memorable record of this fact: *Dicunt etiam, &c.* "In short, they say, that they have an ancient statute, whereby, if the king wilfully absent himself from his parliament, not having any infirmity or other cause of necessity, but *per immoderatam voluntatem protervere, &c.* 40 days, and not caring for the vexation of his people and their heavy expense, it shall then be lawful for them all to withdraw from the *dominio regis*, and return to their own homes."

1 Rd. II. Petition was made, That a parliament may be yearly holden in convenient place, to redress delays in suits, and to end such cases as the judges doubt of. To which the king's answer was, "It shall be as it hath been used." And in 2 Rd. II. the reason for opening the parliament was stated to be, "for that it was enacted that a parliament should yearly be held."

This law remained for a space of 262 years, till 16 Car. I. when that king, having discontinued parliaments for 12 years, the nation found a necessity of having a cautionary parliament every third year, to secure their annual parliaments for the two years immediately foregoing. This is said to be the true reason of the act of 1640. This act was afterwards repealed by 16 Car. II. c. 1. which after having enacted, in § 2, the repeal, it proceeds, § 3, to declare the law to be, that because by the ancient laws and statutes of this realm "parliaments are to be held very often," that hereafter the sitting and holding of parliaments shall not be intermitted or discontinued above three years at the most; but that within three years from the determination of that parliament, and so from time to time within three years after the determination of any other parliament, or, if there be occasion, more often, the king and his successors should issue writs for calling, assembling, and holding, another parliament; to the end there may be a frequent calling, &c. once in three years at the least.

Thus the parliamentary law continued until 1694, 6 Will. and Mary, c. 2. when it was further declared, that no parliament whatsoever that should at any time thereafter be called, &c. should have any continuance longer than for three years only at the farthest from the day of meeting specified in the summons; and that that parliament should cease on 1 Nov. 1696, unless sooner dissolved. There was a dissolution, and a new parliament began on 22d of November, 1695, at Westminster. And by an act in 1696, c. 25, for regulating elections, the qualification of voters is, freehold lands or hereditaments of the yearly value of 40s.

The period of parliaments having thus crept on, continued 21 years upon the last statute, when in 1716, 1 Geo. I. it was further extended, ch. 38, to a term of seven years, not only for that but for all future parliaments, unless sooner dissolved. It is stated in the preamble, "that it had been found by experience that the triennial act had proved very grievous and burdensome, by occasioning much greater and more continued expenses in order to elections, and more violent and lasting heats and animosities amongst the subjects of the realm, than were ever known before; and that the provision, if it should continue, might probably at that juncture, when a restless and popish faction were designing and endeavouring to renew the rebellion within the kingdom, and an invasion from abroad, be destructive to the peace and security of the government." This bill originated with the duke of Devonshire in the house of lords, and was much opposed by the earls of Nottingham, Abingdon, and Paulet, on the grounds that frequent parliaments were required by the fundamental constitution of the kingdom, ascertained in the practice of many ages; and that the members of the lower house were chosen by the body of the nation for a certain term of years, at the expiration of which they could be no longer representatives of the people, who, by the parliament's protracting its own authority, would be deprived of the only remedy which they had against those who, through ignorance or corruption, betrayed the trust reposed in them; and that a long parliament would yield a greater temptation, as well as a better opportunity, to a vicious ministry, to corrupt the members, than they could possibly have when the parliaments were short and frequent. The bill passed in the upper house by a majority of 35, there being 96 in the affirmative, and 61 in the negative; and 30 lords entered a strong protest against it. In the house of commons, it encountered great opposition from Mr. Shippen and sir Robert (afterwards lord-chief-justice) Raymond, who declared that, "would the king establish his throne in the hearts of his subjects, the most sure and effectual way would be by frequent appeals to the people. A standing parliament and a standing army are convertible and fit instruments to support each other's power." Zeal and ability, however, were unavailing; and the septennial bill passed by 264 votes against 121.

From these testimonies it appears, that annual parliaments, and sometimes two parliaments within the year, were the custom of the realm; but that the legislature afterwards thought fit to extend their duration to three years; and the same high authority in later times further extended them to seven years. Various efforts have since been made to repeal this act. The first in 1734, when the eloquence of sir William Wyndham was conspicuous; the second in 1742, and the third in 1745, when very vigorous efforts to that effect were made by Mr. Carew and Mr. Sydenham. The former argued, that "the interests of the prince and people cannot really and truly differ; he can be great only in their greatness, and prosperous in their prosperity." The latter observed, "It is to the fatal introduction of long parliaments, that we are to ascribe the extension of ministerial corruption, and the deterioration of public morals. Nothing can so effectually remove this as the restoration of annual parliaments. They will demolish the market of corruption, for ministers

ters will not corrupt where it can be of no avail; and, though contests may occasionally take place, the magnitude of the object will not be such as to occasion either venality or violence." These are the recorded opinions of our great patriots and statesmen, who were the strenuous advocates for short parliaments; and it is curious to observe, that the latest of these speeches have been delivered more than seventy years; and to reflect, if the state of the representation was such as it was described by them so long ago, what it must necessarily be *now*, when corruption is so much more lavish of her rewards, and when the temptations to venality are so much more numerous.

The septennial act has always been considered as a most unconstitutional exercise of parliamentary authority; but was unfortunately supported, in the minds of the people, by the impression produced by the rebellion in Scotland during the preceding year. Now that the danger has long passed away, and that the family of the pretender is extinct, (since the king, while regent, (1816,) erected a monument to the memory of cardinal York, "the last of the Stuarts;") we think it would be very right and reasonable to restore triennial parliaments, as by the 6 W. & M. c. 2. anno 1694. This, with the extension of the elective franchise to housekeepers of a certain rank, would satisfy all reasonable men; for we believe that those who cry out the loudest upon the subject can never expect, or even wish, to restore annual parliaments, which certainly did once prevail, or to establish universal suffrage, which certainly never did.

The minister of the day has always opposed shortening the duration of parliaments, as well as every other species of reform. Yet we have the testimony of one, who longed for arbitrary power as much as any man, that short or new parliaments were in general most complying. The Irish parliament, which was dissolved by lord Strafford in April 1635, had been at first directed by the king (Charles I.) to be dismissed in January 1634. "My reasons," says his majesty, in a letter to the deputy, dated the 22d of January, 1634, "are grounded upon my experience of them [parliaments] here. They are of the nature of *cats*, they ever grow curst with age; so that, if ye will have good of them, put them off handsomely when they come to any age; for young ones are ever most tractable. And in earnest you will find, that nothing can more conduce to the good beginning of a new than the well ending of the former parliament; wherefore, now that we are well, let us content ourselves therewith."

And the Edinburgh Review (June 1816) says, "We doubt whether frequent elections would be favourable to the independence of the house of commons. We fear the tendency of short parliaments would be to increase the power of government, by breaking down and destroying all independent opposition. Let no one imagine that by penal laws, or other devices, he can prevent the expense of elections. While a seat in the house of commons is an object of desire, it will be an object of expense. But the pecuniary cost on such occasions is, in general, greatest on the side of opposition. The friends of ministry have the aid and influence of government-patronage in support of their pretensions; and the more frequently elections are repeated, the greater is the amount of this advantage over their opponents." Lord Lyttelton was of the same opinion near ninety years ago; (See *Perf. Lett.* lxvi.) And accordingly we know that the dissolution of parliament has been sometimes held forth as a threat, as was particularly the case in 1807; in allusion to which the same Edinburgh Review observes, "Short parliaments, it must be owned, would lessen the terrors of a dissolution, which, after the examples of 1784 and 1807, must have great effect in destroying the spirit and independence of the house of commons. The advisers of these two measures may be justly reckoned among the men who, in our times, have done the most irreparable injury to the consti-

tutional liberties of their country." Ed. Rev. vol. xxvi. No. 52, for June 1816.

But other and manifold are the complaints against parliaments, as at present constituted, besides their duration. With regard to *freedom of election*, the following facts demonstrate, that it has scarcely any existence, except in name:

1. In the Journals of the House of Commons (May 1793) it stands recorded, and uncontradicted, that 154 persons, chiefly peers of the realm, return 307 members, forming a decided majority of the members for Great Britain; and that evidence thereof was offered to be given at the bar of the house.

2. In Wakefield's Account of Ireland it is stated, that, of the hundred members for that country, seventy-one are returned, in like manner, by arbitrary control and undue influence.

3. In a recent case of bankruptcy, a seat in the house of commons was returned among the assets, as a commodity saleable, towards the satisfaction of the creditors.

4. A legacy of 5000*l.* was left by the late lord Vernon, towards the purchase of a seat in parliament, and entered upon the Records of Doctors' Commons in the following words: "I hereby declare this to be a codicil to my last will and testament; and I hereby give to my dear son-in-law, the Hon. Edward Harbord, one sum, not exceeding five thousand pounds, towards the purchase of a seat in parliament; as witness my hand, this 22d day of August, 1812. VERNON."

5. In a petition presented to the house, on the 9th of December, 1790, and entered on its Journals, it was averred, that "Seats therein were as notoriously rented and bought, as standings for cattle in a fair;" which assertion was then resented as scandalous and libellous: but when, on the 11th of May 1810, two of his majesty's ministers were accused of being concerned in the sale of a seat, they were screened from punishment, on the plea of the "extreme notoriety of the practice," which many of its members unblushingly justified.

6. A number of places having scarcely any inhabitants, as Dunwich, St. Mawes, Midhurst, Gatton, and Old Sarum, send respectively their two members to parliament; while great commercial towns, contributing immense sums to the national revenue, and containing from sixty to a hundred thousand inhabitants, as Birmingham, Manchester, Sheffield, Leeds, &c. do not possess the elective franchise, and are unrepresented.

7. Rutland the smallest, and Yorkshire the largest, county, return the same number of representatives. Cornwall returns as many members as the counties of York, Rutland, and Middlesex. And Cornwall and Wilts send more borough-members to parliament than Yorkshire, Lancashire, Warwickshire, Middlesex, Worcestershire, and Somersetshire, united.

8. The county of Cornwall contains a population of 216,000 inhabitants; that of Warwickshire, 218,000; while the former sends forty-four members to parliament, and the latter only six. Cornwall's sending forty-four members is in the proportion of one member to every 5000 of its inhabitants. Warwickshire's sending six members is in the proportion of one member to every 36,000 inhabitants. Cheshire sends four members, which is in the proportion of one member to every 56,000. Lancashire sends fourteen members, being in the proportion of one member to every 59,000. But Middlesex is the worst represented of all the counties of England; its proportion for each member being 120,000 persons.

A house of commons thus formed can hardly be considered as the proper guardian of the purses and liberties of the various classes of the British nation; and Rapin observes, "that there is nothing in which we may be more easily deceived, than in judging of the sentiments of the people by those of their representatives."

Various have been the plans of reform that have been successively brought forward in the house of commons; some

some of them, indeed, so wild as to defeat their own end, of which due advantage has always been taken by the enemies of all reform. But the most reasonable plans have hitherto always been negatived; of which we may instance those of sir Francis Burdett and of Mr. Brand; (see the article LONDON, vol. xiii. p. 211, 12. and 287, 8.) Not to attempt to render things more perfect, because they cannot be *quite perfect*, is as absurd as to resolve to be miserable, because no one can be perfectly happy. To the enemies of reform is offered for consideration a short extract from the speech of Mr. Pitt, when Chancellor of the Exchequer, in which, descanting on what the popular branch of the legislature should be, he says, it should be "an assembly freely elected, between whom and the mass of the people there must be the closest union, and most perfect sympathy. Such a house of commons it was the purpose of the constitution originally to erect; and such a house of commons it is the wish of every reformer now to establish." But at the outset of his parliamentary career, and before he got into power, he was a much more bold and decided reformer: "Without a parliamentary reform," said he, "the nation will be plunged into new wars; without a parliamentary reform, you cannot be safe against bad ministers, nor can good ministers be of use to you. *No honest man can, according to the present system, continue minister.*" (Pitt's Speech, 1782.) Mr. Pitt did, however, become minister very soon after; and did continue so, with little interruption, for twenty years.

It is remarked by a sensible barrister, Mr. Stephens, in his Life of Horne Tooke that, "According to the acknowledged principles of the English constitution, taxation and representation are terms relative and inseparable. This doctrine, which seems to be clearly interwoven with the texture of our ancient Gothic polity, is fully established by facts, as well as by analogy. It has been acted upon in two memorable instances, both of which have proved highly salutary and beneficial to the empire, the union with Scotland and Ireland. Soon after the annexation of Wales, that country also was empowered to send knights, citizens, and burgesses, to parliament; and there is a remarkable document still in existence that serves to demonstrate the universality of the position even when applied to *transmarine* dominions recently obtained by conquest; for a writ was issued during the first part of the reign of Edward VI. enjoining the inhabitants to return a member for the town of Calais!" (See the list, farther on.) And a departure from this maxim lost us the American colonies.

On the 31st of May, 1821, Mr. Bennet moved for leave to bring in a bill "for better securing the independence of parliament." Of 51 members of the house who filled places at pleasure under the crown, he proposed to exclude 29, who would vote for any minister or for any measure, and who were in truth retained only upon that condition; and he instanced the recent case of the earl of Fife, who had been dismissed from his situation as a lord of the bed-chamber, (Apr. 6.) in consequence of his having voted against the minister. We need not enter into a farther detail of the intended provisions of the bill (since leave even to bring it in was refused), nor of the arguments used in favour of it. But we shall act so unfairly as to give the reasons urged against it. The Hon. Mr. F. Robinson, the only one of his majesty's ministers who spoke upon the subject, said, that in all governments "there must be a certain degree of influence, for it was impossible that the business of parliaments could be carried on by mere abstract principles of right and wrong." The event justified Mr. Robinson's argument; for, upon a division, that well-disciplined phalanx of placemen, who are ready to vote for the minister of the day without any regard to the "mere abstract principles of right and wrong," left Mr. Bennet in a minority of 24, a smaller number than he had intended, by his bill, to lop off. The numbers were—for the motion 52, against it 76.

On the 8th of June, 1821, a bill passed for disfranchising

the borough of Grampound in Cornwall, in consequence of notorious acts of bribery, and for adding two members to the two now returned by the county of York. 2 Geo. IV. c. 47. It had been proposed to transfer the elective franchise to the unrepresented town of Leeds, and in that state the bill passed the commons, but was altered in the lords, the earl of Liverpool having given it as his opinion, that the creation of a new borough ought only to be done through the medium of the crown.

Mr. Oldfield's plan of reform is to cut off the decayed and rotten boroughs, and to restore those to their rights who have been at various times disfranchised for causes which do not at present exist. We shall therefore transcribe from his Appendix a list of those towns which sent members in different reigns, from that of Edward I. to the present time; describing the different periods at which they sent members, as is proved by the writs still extant; to which we shall also add, the dates of their discontinuance, or disfranchisement.

Calais in France		27 Hen. VIII.	3 Ph. & M.

In all sixty-eight boroughs which sent members to parliament in different reigns, and are now deprived of that right; besides which, we find ninety-seven other boroughs which have charters, and have most probably sent members at some former period since the reign of Edward I. but for which no summonses are to be found, though they were unquestionably parliamentary boroughs in the time of the Saxon monarchy, when every borough in England was represented, as well as the rural tythings, who chose their representatives in the county-courts.

In Berkshire.—Thatcham.

Cambridgeshire.—Wisbeach.

Chester.—Altringham, Congleton, Macclesfield, and Middlewich.

Cornwall.—Botreaux Castle, Crofthole, Kilkhampton, Milbrook, and Padstow.

Derby.—Bakewell, and Chesterfield.

Devonshire.—Biddiford, Bampton, Chadlington, Chalvey, Cholmley, Cornworthy, Denbery, Hartland, Ilford Combe, Keneford, Kingsbridge, Milverton, Newton-Abbas, Pepelford, Sampford Peverel, Seal, Twikebere, and Thalampton.

Dorsetshire.—Bere, Wimburnminster, and Milton.

Durham.—Barnard Castle, Hartlepool, Stockton, and Sunderland.

Essex.—Bradfield, Rawleigh, and Thaxted.

Gloucestershire.—Avening, Berkely, St. Berwald's, Chipping Campden, Cheltenham, Frampton, Letchlade, Newnham, Chipping Sodbury, Tetbury, Thornbury, and Wotton Under edge.

Hampshire.—Porchester, Rumsey, and Westover.

Herefordshire.—Ewias Lacy, Pembridge, and Wigmore.

Huntingdon.—Godmanchester.

Kent.—Deal.

Monmouthshire.—Abergavenny, Caerleon, Chepstow, Newport, and Uske.

Northamptonshire.—Daventry, and Rothwell.

Norfolk.—Bernay.

Northumberland.—Alnmouth, Alnwick, Harbottle, and Warrmouth.

Salop.—Clebury, Lidham, Oswestry, Wortham, and Worthing.

Somersetshire.—Somerton, Wellington, Wincanton, and Yeovill.

Staffordshire.—Betely, Burton-upon-Trent, Tutbury, and Walsall.

Suffolk.—Bungay, Budesdale, Clare, and Mendlesham.

Surrey.—Langhurst

Sussex.—Pevensey.

Warwick.—Birmingham, and Stratford-upon-Avon.

Westmoreland.—Kendall.

York.—Leeds, and Skelton.

Lambert, in his Perambulations of Kent, reckons near forty places in the Lath of St. Augustine, under the denomination of *boroughs*, which, being now villages, we omit, as Brown Willis does several corporations in that and other counties, because he does not meet with them under the style of ancient boroughs. It may be concluded that all corporations or boroughs had an inherent right to representation, if they had been desirous to have ex-

erted it; but, as that franchise was formerly expensive they no doubt industriously declined it.

As Agmondesham, Marlow, and Wendover, in the county of Buckingham, were restored upon petition to parliament, on the 4th May, 1624, to the privilege of sending representatives, after having lost that right from the 2d of Edward II. until the 21st of James I. a period of four hundred years; we conceive the above boroughs to have an equal claim to the same justice.

By the above tables it appears, that a hundred and sixty-four boroughs, exclusive of Calais in France, are now disfranchised; and that boroughs have been created and annihilated from the reign of Edward I. to that of Charles II. inclusive, at the caprice of each successive monarch. We may here be allowed to ask the enemies of reform, whether the constitution would receive a greater injury from the disfranchisement of Old Sarum, Gatton, Castle Rising, or Midhurst, than it has at present sustained from the disqualification of Leeds or Manchester? It surely becomes necessary to abolish the existing rotten boroughs; or, according to the argument of our opponents, to make the constitution complete, by restoring the hundred and sixty-four which have been discontinued. In the commonwealth-parliament, Sept. 3, 1654, all the rotten boroughs were omitted.

PARLIAMENT OF IRELAND.—It appears that, for the space of almost a century and a half after Henry II. had taken possession of Ireland, there was but one parliament for both kingdoms, the laws made in the parliament of England being transmitted to Ireland, under the great seal, to be proclaimed, enrolled, and executed, as the laws of Ireland. The first regular establishment of a parliament in Ireland seems to have been about the end of the reign of Edward II. for the meetings and consultations of the great lords before that period, although in old annals called parliaments, are not, in the proper sense of the word, entitled to that appellation. When Ireland was invaded by the Scots under Bruce, the English government found itself so much embarrassed, that, not being able to afford effectual assistance to its Irish subjects, they were authorized to hold a general council of the kingdom among themselves, in order that they might pursue speedier and more decisive measures for allaying the commotions with which the whole country was then agitated.

In the reign of Henry VII. the parliament of Ireland became, in some measure, dependent on that of England, by an act passed under the direction of sir Edward Poynings, the lord deputy, by which it was provided that "all the statutes lately made in England, of a public nature, should be held effectual and valid in Ireland." It has been erroneously supposed, that this act extended to the whole code of English statutes; for, in reality, it refers only to a certain number, which, however inaccurately stated, were under the eye of the Irish legislature. "From this regulation," says Professor Millar, it may be fairly inferred, that the Irish parliament was at this time understood to possess an independent legislative authority; for, if that assembly was capable of adopting the English laws, it must have possessed the power also of rejecting them: and, as this act of legislature sufficiently testifies the exertion of independence on the part of Ireland, the assent of the governor on the part of the king, leaves no doubt of his majesty's approbation and concurrence."

But to secure the dependence of the Irish parliament, Henry endeavoured to prevent debate, by putting a negative upon all their proceedings. With this intention, he caused another act to be passed, commonly known by the name of Poynings' Law, which declares, "that no parliament should be held in Ireland until the lord deputy and his council should make known to the king and council in England the causes for which the meeting was to be called, and the bills which were to be passed; and that,

that, unless the king's leave were previously obtained, the acts of any parliament should be void." In the reign of queen Mary this law was still further extended, by an act passed under the pretence of "explaining the true meaning and intent" of the former; in which it was enacted, "that no parliament should be held in Ireland until the chief governor and council had certified to the king and council of England not only the measures which were in contemplation at the time when the parliament was called, but those also which might become the subject of its future deliberation." Such was the act which finally established the usage of holding parliaments and enacting laws in Ireland, and by which the proceedings of its legislature were determined till the year 1782, when the Irish Parliament was declared independent of that of England.

Before the 33d year of Henry VIII. it appears that none were admitted into parliament but Englishmen by birth or the descendants of Englishmen, the Irish being entirely excluded, because their lands, being beyond the limits of counties, could send no knights; and, as they contained no cities or towns, they could send no burgesses. But it is not improbable that the chief reason was the jealousy of the English government, which, suspecting their fidelity, did not deem it prudent to suffer them to become members of the great national council.

Before the 34th year of the same sovereign, when Meath was divided into two shires, there were only 12 counties in Ireland, besides the liberty of Tipperary; the number of knights, therefore, must have been few, since there were only four ancient cities, and the boroughs which sent burgesses did not exceed thirty. Hence it appears, that their whole house of commons could not then amount to a hundred persons; and, although queen Mary added two shires, and queen Elizabeth seventeen more, to increase the number of knights, they did not all send members to parliament, for the remote shires of Ulster did not return any. Ireland, therefore, in the reign of king James, contained 33 counties; and, as some of them had no boroughs, it was found necessary to create 40 new ones, by which expedient the influence of the crown acquired a considerable accession of strength. Charles I. exercised this prerogative, but not to so great an extent; and queen Anne added one borough, which appears to have been the last.

In the year 1719, a private law-suit in Ireland, (Sherlock v. Annesley,) gave rise to a controversy about the right of appeal from the Irish tribunals to the house of lords in Britain; and the consequence was, an act of the British parliament, the express object of which seems to have been, to subject Ireland to a state of complete dependency on the crown of Great Britain. By this act it was declared, first, "that the king's majesty, by and with the consent of the lords spiritual and temporal, and the commons, of Great Britain, in parliament assembled, had, hath, and ought to have, full power and authority to make statutes of sufficient force and validity to bind the people and kingdom of Ireland." Secondly, "That the house of lords of Ireland have not, nor of right ought to have, any jurisdiction to judge of, affirm, or reverse, any judgment, sentence, or decree, given or made in any court within the said kingdom."

But, notwithstanding the servile state in which the legislature of Ireland was held, it seems to have preserved its independence in taxation. No British parliament, it appears, ever assumed, or even claimed, the right of imposing taxes on that country; and several instances are recorded, in which it manifested its jealousy on this point with a spirit worthy of the national character. In 1690, the commons of Ireland rejected a money-bill because it had not originated in their house. In 1709, a money-bill was returned from England with alterations, and on this account it was rejected by the commons. A similar circumstance took place in 1768.

Notwithstanding these exertions of the Irish nation in favour of liberty and independence, their efforts were counteracted, and for the most part frustrated, by the indiscreet influence of the crown; and nothing contributed more to render it effectual than the duration of their parliament. According to the early constitution of parliament, both in England and in Ireland, these assemblies could be dissolved at the pleasure of the crown; but, when this prerogative was not exercised, they remained till the death of the king. In England, however, in the reign of William III. the nation becoming jealous of the power which the king had acquired over parliaments, their duration was limited (as we have seen) to three years; which period, in the reign of George I. was extended to seven. But, as no change of the same kind had been introduced into Ireland, the parliament there continued to exist, according to the old plan, with the life of the king, till the year 1768, when, in consequence of a bill brought in by Dr. Lucas, the member for Dublin, its duration was restricted to eight years.

Agreeably to the act of union of 1800, the representation of Ireland consists at present of 28 temporal peers, elected for life by the general body of Irish peers; 4 spiritual ones, consisting of bishops, who are replaced by the same number every two years in rotation; and 100 commoners. Catholics as well as Protestants vote for these members; and the qualification of an elector is the same in Ireland as in England, a clear forty-shillings interest for a life; but, as it is customary in Ireland to insert lives in all leases, freeholders are created without the actual possession of property being considered as necessary, and their votes are regarded as a right of the landlord. This system of creating votes in Ireland, is carried to an extent of which the people in England can have no idea. The passion for acquiring political influence prevails throughout the whole country; and it has an overwhelming influence upon the people. To divide and subdivide, for the purpose of making freeholders, is the great object of every owner of land; and Mr. Wakefield considers it as one of the most pernicious practices that has ever been introduced into the operations of political machinery. It reduces the elective franchise nearly to universal suffrage; to a population who, by the very instrument by which they are made free, are reduced to the most abject state of personal bondage. Mr. Wakefield has known freeholders registered among mountain-tenantry, whose yearly head-rent did not exceed 2s. 6d. but, living upon this half-crown tenure, were enabled to swear to a *derivation-interest* of forty shillings per annum. This right, instead of being an advantage to the freeholder, is an excessive burden, as he is obliged to attend elections at the command of the agent, often with great inconvenience; and is ordered to vote for the object of his landlord's choice, with as little ceremony as the Jamaica planter would direct his slave to the performance of the meanest offices. Of this we have a striking and recent instance, in the case of Mr. Alcock, member for the county of Wexford, who challenged Mr. Colcough. The cause of this unfortunate quarrel was, that the latter refused to relinquish the votes of the tenantry of a Mrs. Cholmondely, who had written to her agent to desire her tenants to vote for the former; but, notwithstanding this mandate, these poor people for once insisted on giving their suffrages to Sheridan and Colcough. Could Addison rise from his grave, what would be his opinion of such *freeholders*? Mr. Wakefield has alluded to the above lamentable transaction; to show what are the common feelings in Ireland on such occasions: and these ideas are not confined to the country where the fatal event took place to which he has alluded; they are universal throughout every part of the island. After this information, the reader will not be surprised to learn that many counties are overruled in their choice by the will of some great territorial possessor; and there are few in which

which a coalition of two or three of the principal landholders will not settle the election according to their own views.

For some farther particulars, omitted or but slightly noticed above, we refer the reader to the articles *ENGLAND*, vol. vi. p. 798. *GOVERNMENT*, vol. viii. p. 745. *KING*, vol. xi. p. 731. and *IRELAND*, vol. xi. p. 300 and 362. See also, Northmore's *Observations on the Natural and Civil Rights of Mankind*, 1781. and Oldfield's *Representative Hist. of Great Britain and Ireland*, 6 vols. 8vo. 1816.

PARLIAMENT-HEEL, *f.* (A sea term.) The situation of a ship when she is made to lean on one side in order to clean the other.

PARLIAMENT-HOUSE, *f.* The house in which the parliament usually meets:

Far be the thought of this from Henry's head,
To make a shambles of the *parliament-house*. *Shakespeare*.

PARLIAMENT-MAN, *f.* A member of parliament; one of the house of commons.—These are mob-readers: if Virgil and Martial stood for *parliament-men*, we know who would carry it. *Dryden*.

PARLIAMENTARIAN, or **PARLIAMENTEE'R**, *f.* One of those who embraced the cause of the parliament against the king, in the great rebellion.—The very *parliamentarians* revered him [bishop Sanderfon] for his learning and his virtue. *Aubrey* ii. 524.—Colonel Bragge, roving about the country very early with a troop of stout horsemen, met with a party of *parliamenters* or rebels, of at least 200, at Long Crendon. *A. Wood's Life of himself*, in 1645.

PARLIAMENTARIAN, *adj.* Serving the parliament in the time of the great rebellion.—He found Oxford empty as to scholars, but pretty well replenished with *parliamentarian* soldiers. *A. Wood's Life of himself*, in 1646.

PARLIAMENTARY, *adj.* Enacted by parliament; pertaining to parliament.—Many things, that obtain as common law, had their original by *parliamentary* acts or constitutions, made in writing by the king, lords, and commons. *Hale*.—Credit to run ten millions in debt, without *parliamentary* security, I think to be dangerous and illegal. *Swift*.

PAR'LIE, a town of Hindoostan, in Guzerat: six miles south of Pernalla.

PAR'LOUR, *f.* [*parloir*, Fr. from *parler*, to talk, or converse.] A room in monasteries, where the religious are permitted to meet and converse with their friends.—A room in houses on the ground-floor, furnished for reception or entertainment; of less importance than the drawing-room or the dining-room.—Can we judge it a thing seemly for a man to go about the building of an house to the God of heaven, with no other appearance than if his end were to rear up a kitchen or a *parlour* for his own use? *Hooker*.—It would be infinitely more shameful, in the dress of the kitchen, to receive the entertainments of the *parlour*. *South*.

Back again fair Alma led them right,
And soon into a goodly *parlour* brought. *Spenser*.

Roof and sides were like a *parlour* made
A soft recess, and a cool summer shade. *Dryden*.

The first, forgive my verse if too diffuse,
Perform'd the kitchen's and the *parlour's* use;
The second, better bolted and immur'd,
From wolves his out-door family secur'd. *Harte*.

PAR'LOUS, *adj.* [this might seem to come from *parler*, Fr. to speak; but Junius derives it from *perilous*, for anciently it was written *parelous*, and used in the sense of dangerous; and from this primary sense, that of dangerous, by way of irony, seems to have been adopted.] Dangerous.—The more part of writers were wholly given to serve antichristes affectes in the *parelous* ages of the church. *Leland's New Year's Gift*.—Keen; threwd.—

Sure some pedagogue stood at your elbow, and made it itch with this *parelous* criticism! *Milton's Animadv. Rom. Defence*.

One must be trusted; and he thought her fit,
As passing prudent, and a *parelous* wit. *Dryden*.

PAR'LOUSNESS, *f.* Quickness; keenness of temper.

PAR'MA, or the **PARMESAN**. Under this name are included the duchy of Parma Proper, the duchy of Piacenza, and the duchy of Guastalla. This country is bounded on the north by the river Po, which separates it from the Cremonese and Lodofan, on the east by the duchy of Modena, on the south by Tuscany and Genoa, and on the west by Genoa and the Pavese; about forty miles from north to south, and from thirty to forty-eight east to west. The soil is fertile in corn, olives, chestnuts, and fruits of various kind. The pastures are excellent; the cheese and wool in great estimation. This country once formed a republic, which, being divided into factions, was the occasion of many battles; it was sometimes subject to the pope, sometimes to the emperors, and afterwards to the dukes of Milan, then to the French, and, when they were expelled out of Italy, it was re-united to the church. In the year 1345, Paul III. granted it to his natural son Peter Aloysius, or Farnese, from whom that family sprung. Elizabeth Farnese, the only heiress of the duke, becoming queen of Spain, contrived to obtain the duchies of Parma and Piacenza for her two sons; and so it was settled at the peace of Aix-la-Chapelle, in the year 1748. Piacenza, which ought to have belonged to the king of Sardinia, and Parma, which had been conquered by the house of Austria, were ceded to the infant Don Philip; on condition, however, that in default of male heirs, the country should return to those by whom they had been abandoned. The pope, however, never consented to this, and every year protested against the investiture.

By the treaty of Luneville in 1801, the duke of Parma was nominated by the emperor and the French republic to the throne of Tuscany, with the title of King of Etruria; of which he soon after took possession. This *kingdom* was not fated to see a long line of princes either good or bad, being totally dissolved in the year 1808. See the articles *HETRURIA* and *ITALY*.

By the 4th article of the treaty of Paris, April 1814, these states were assigned to the empress Maria Louisa, and the right of succeeding to her was, by the same article, secured to her son. (See p. 500 of this volume.) But, after the second expulsion of Napoleon from France, the Act of Congress, (June 1815,) though it still (Art. 99.) recognized her right to the three duchies, yet paved the way for disinheriting the young Napoleon her son, by the following addition to that article: "The reversibility of these countries shall be determined by the common consent of the courts of Austria, Russia, France, Spain, England, and Prussia."

By the same Act of Congress the ex-queen of Etruria, who was an infanta of Spain, and whose original title was Duchess of Parma, was provided for as follows:

Art. 101. The principality of Lucca shall be possessed in full sovereignty by her majesty the infanta Maria Louisa, and her descendants, in the direct male line. This principality is erected into a duchy; and a rent of 500,000 francs is added to the revenue, to be paid regularly by the emperor of Austria and the grand duke of Tuscany, as long as circumstances shall prevent them from procuring for her majesty and her son, and her descendants, some other establishment.

102. The duchy of Lucca shall be revertible to the grand duke of Tuscany, in case of the death of her majesty the infanta Maria Louisa, of her son Don Carlos, and of their descendants; or in case the infanta Maria Louisa, or her direct heirs, shall obtain any other establishment.

Acting upon the spirit of these articles, it was determined

mined by a fresh treaty, in October 1818, that the reversion of the duchies of Parma, Placentia, and Guastalla, shall be taken from young Napoleon, and given to Don Carlos; and the reversion of Lucca goes, of course, at his mother's death, to the grand duke of Tuscany.

Don Carlos is married to a daughter of Victor Emanuel, king of Sardinia, who suddenly abdicated his dignity on the 12th of March, 1821. He will, in all probability, have some time to wait before he enjoys the fruits of this arrangement; as the empress Maria Louisa is only in the twenty-sixth year of her age, and is endowed with an excellent constitution.

There are now *three Princes of Parma*; Napoleon, Don Carlos, and Cambaceres, ex Arch-Chancellor of France!

PARMA, the capital of the above duchy, is divided by the river of the same name, which rises in the south part of the duchy, and runs into the Po near Viadana, in three branches that communicate with each other by two bridges. This city was founded by the Etrurians, taken by a tribe of Gauls called the Boii, and, at length, colonized by the Romans. It is said to have suffered much from the licentious cruelty of Antony; and its sufferings on this occasion are pathetically deplored and immortalized by Cicero, in his 14th Philippic, the last tribute which he paid to Rome and to liberty.

The city is large and populous, airy and clean, though it cannot boast of any very striking or regular buildings. It is surrounded by walls, flanked with bastions, and a ditch filled with water. On the south is the citadel, which is a regular pentagon, and reckoned the best in Italy. The streets are straight and broad, formed by well-built and painted houses, and meet in the centre, constituting a handsome square. The new palace was erected on the ruins of the old, and forms an irregular and huge mass of building. The theatre is represented as one of the most beautiful in Italy, and is said to contain upwards of 12,000 spectators, who, by the structure of the place, are capable of hearing the actor on the stage, without any elevation of voice. Here is also a smaller theatre for the accommodation of the inhabitants. This city is the see of a bishop, suffragan of Bologna. Its university was founded in 1599, and its academy of sciences was instituted in 1601. It has five collegiate and thirty parish churches, besides the cathedral, many of which contain pictures by Corregio and other eminent masters, and forty convents. The cathedral is Saxon, but lined in the interior with Roman architecture: its dome is much admired, on account of Corregio's paintings. The baptistery is an octagon, in the same style with the cathedral, cased with marble, and ornamented with various arches and galleries. The Steccata is the most regular church in Parma, in the form of a Greek cross. The church of the capuchins is only remarkable for being the burial-place of the celebrated Alexander Farneſe. The arts and sciences have by no means been neglected in Parma. An university, two academies, schools of painting, &c. announce the application; and a long catalogue of great names might be produced, to prove the success of the Parmians in every literary pursuit. The dukes have for many years assumed the character of Mæcenas; and, by their judicious encouragement, attracted men of talents, from other countries, to their territories. The public walks on its ramparts are very pleasing. The country round is well wooded; and the town and territory of Parma, on the whole, seemed to have been in a flourishing state till the entrance of the French army. Since that fatal period, its prosperity has been on the decline, its government unsettled, and its inhabitants impoverished and discontented. The contributions raised by the French amounted to five millions of French livres; a sum enormous for so small a territory, and equalling two years of its regular income. The chief trade of the place consists in stockings, and some other articles of silk manu-

VOL. XVIII. No. 1269.

facture. The printing-press, established by Bodoni in 1765, has been distinguished for beautiful publications. The number of its inhabitants is not accurately ascertained; some reckoning them at 45,000, and others at 37,000. It is thirty-two miles south-west of Mantua. Lat. 44. 47. N. lon. 27. 52. E.

PAR'MA, *f.* among antiquaries, a kind of ancient buckler. Polybius describes the parma as very strong, round, three feet in diameter, and big enough to cover the whole body; yet Servius on the *Æneid*, and even Virgil himself, mentions it as a light piece of armour in comparison of the clypeus, though bigger than the pelta.

PAR'MA (Battista da), or *Parmensis*, an Italian engraver, was a native of Parma, born A.D. 1530. He studied at Rome, but under what master it is not known; and practised the art of engraving in a style somewhat resembling that of Cornelius Cort. The time of his death is not known.

PAR'MA (Jacobus), or *Parmensis*, another artist, probably of the same family, from whose hand we have a print executed in the style of Caraglio, of the Martyrdom of St. Peter and St. Paul, and a middling-sized print lengthways, from Parmigiano; it is executed with the graver, in a slight style, and has often been attributed to Caraglio, but the heads and other extremities are not so well drawn as we find them in the works of that artist. The time of his birth is not noted, nor that of his death.

PAR'MA (Julien da), a very distinguished historical painter, was born in 1736, of poor parents, at the village of Carigliana, near the little Swiss town of Locarno, upon the borders of the great lake. His genius surmounted all the obstacles which poverty threw before him in his road to the fine arts. For a considerable time nature was his only guide, because he had not the means to procure any other. At length he set out for Rome, which he reached by means of painting portraits in every town, to defray the expenses of travelling. In the capital, he studied the ancient and modern chef-d'œuvres for the space of twelve years, acquiring at the same time the art of speaking and writing in a masterly manner. It was in that city he first exhibited his picture of Jupiter sleeping in the arms of Juno; the engraving of which is to be seen in every print-shop; all the city of Rome, and every stranger residing there at the time, went to see the great work of Julien. On his arrival at Paris, he exposed the picture a second time, and there he also found a crowd of admirers. This picture, now in the cabinet of the celebrated sculptor Dejoux, his friend, is, above all, remarkable for the nobleness of style and beauty of colouring. There are some other valuable works of his, in the saloon of the hotel de Nivernois. Julien formed, both at Rome and Paris, several distinguished pupils. He died at Paris, June 28, 1799, at the age of 63, and in the greatest indigence.

PARMACITY, *f.* Corruptedly for *sperma ceti*:

Telling me, the sovereign'st thing on earth
Was *parmacity* for an inward bruise. *Shakespeare.*

PAR'MAK DAG'HI, a fortified mountain of Persia, in the province of Schirvan: thirty miles east-north-east of Scamachie.

PAR'MASENT, *f.* Parmesan cheese, or cheese of Parma. See PARMESAN.—My master said, he loved her almost as well as he loved *parmasent*. *Ford's 'Tis pity, she's a Whore.*

PARME'LIA, *f.* [from the Greek *παρμη*, a sort of small shield, and *ελεω*, to surround, inclose.] In botany, a genus of the class cryptogamia, order algae; and of a natural order instituted by Dr. Acharius, professor at Vadstena in Sweden, called *lichenes*. This natural order includes several genera, being allied, on the one hand, to the *Algæ*, in which it was included by Linnæus; and on the other to the *Fungi*, with many of which it nearly agrees

agrees in habit, and with some of them very strikingly in the character and situation of its seeds. Indeed it must include the whole of the Lichens, though under a different arrangement, the name of *LICHEN*, as a generic term, being abolished. See that article.

The genus *Parmelia* swallows up the greater part of this natural order: 204 species are defined in the *Methodus*, besides several in the *Supplementum*, of Acharius. This author is often in doubt to which genus some species belong, for want of knowing them in every state of growth. The true *Parmelia* have an accessory border of the colour and substance of the crust, but no proper border formed of the substance of the disk. The generic essential characters should therefore stand as follows: "Shields orbicular, horizontal, superficial, somewhat elevated, with a cartilaginous accessory border."

The *disk* is sometimes concave, oftener nearly flat, or indeed convex and hemispherical when far advanced in age, of a different substance and colour from the border, and without any border, or separate edge, of its own substance. The texture of the disk is tolerably firm, though occupied with innumerable vertical, parallel cells, each containing about eight minute seeds, placed one above the other. Its external colour is different in different species, most generally brown or reddish, but always totally unlike that of the border; internally it is paler. By age the disk in many species becomes loosened, falling out, and leaving its border in the shape of a small cup, or rather saucer.

The *border* is of the same colour and substance with the frond from which it proceeds, being elevated more or less above the level of that part, and very generally, at least in the more leafy species, attached merely by a central stalk, though its circumference is flat, and clapped, often very closely, to the surface. In the crustaceous kinds the union of the parts is more considerable; in the more filamentous or branched ones it is merely central, by an elongated and obvious stalk. The extreme part of the border is more or less tumid and thick, either smooth or powdery, entire or crenate, rarely fringed or leafy, while the very edge itself is inflexed and even.

The *frond* is various, and of many different shapes and appearances. When crustaceous, leprous, or tartareous, it is either uniform, and limited by a well-marked border, usually blackish; or it is loosely dispersed, without any distinct limitation, frequently in small portions or patches, and then, in many instances, finally disappears by age, leaving the bare and scattered shields, as if growing independently out of the stone or bark. In other cases the frond consists of lobed fragments, assuming a leafy imbricated aspect, and a cartilaginous texture; from which there is an insensible gradation to a truly leafy configuration, which is either membranous or coriaceous dilated and lobed, or narrow and repeatedly branched, round or compressed, erect, horizontal, or pendulous: in all cases it readily imbibes moisture, and by that means becomes instantly soft, flexible, and vegetative, however dry, contracted, and brittle, before. The colour of the frond is commonly very different in its moist and flourishing state to what it is when dry; being, in the latter condition, usually pale and greyish, but assuming a beautiful green when moistened. Yet there are some species always of the same grey hue, whether wet or dry, which by that very circumstance are well distinguished from others.

The male fructification of *Parmelia* is supposed, rather than known, to consist of scattered powdery warts, mostly of a lighter colour than the frond, on whose surface or segments they are situated, bursting, as it were, from under the cuticle. There is perhaps much reason to suppose such efflorescences to be of the nature of buds, or *gemmae*, by which the species may be increased. The great Hedwig however speaks of them as clearly anthers. They are by far most abundant when the shields, which are unquestionably the female parts of fructification, are

sparingly produced; which is rather in favour of their being buds. But the parts of the shield, at the period when impregnation, in whatever mode, must take place, are so minute, homogeneous, and obscure, that, if we still remain in total ignorance of the flowers of ferns, no wonder we are equally in the dark respecting lichens.

To enumerate the species of Acharius or of Hedwig would be, as already noticed, only to repeat our article *LICHEN* under a new arrangement. We shall therefore sufficiently elucidate this genus by a description and figures of four entirely-new species communicated to the Linnæan Society by Dawson Turner, esq. F. R. S. in the year 1806.

1. *Parmelia velata*, or veiled *Parmelia*: crust distinct, wartily membranaceous, wrinkled, and whitish; shields small and clustered; disk flat, of a whitish hue, and veiled or enwrapped in an albescent membrane. The alga, or frond, is arboraceous, irregularly orbicular. The diameter from two to six inches. The crust is limited within an uncommon sort of zone, very thin, smooth, in adult subjects; thicker towards the centre. The shields are so numerous as often to fill up the whole surface of the crust; conglomerated, hardly bigger than poppy-seed, but often of an angular shape, owing to mutual pressure; the margin of the same colour with the crust, thicker, and little if at all elevated. The disk is always flat; the membrane very thin, of the same substance with the margin, and as if originating from it; the inside of a beautiful fawn-tint. Found on ash-trees in Suffex; but rare. This species is exhibited on the annexed Plate, of the natural size, at fig. 1. magnified at fig. 2. a section at fig. 3.

2. *Parmelia carneo-lutea*, or pale flesh-coloured *parmelia*: crust membranaceous, very thin, white; shields flat, yellow, and in young subjects involved in a lacerated margin. The frond is arboresecent, crustaceous, largely and indeterminately diffused.

The crust of this lichen is so exceedingly thin, that its appearance at first sight is nothing more than that of an unusually bare and smooth part of the tree: nor can its fructification be discovered without attentive examination; for even the shields are by no means of a nature, either from their colour or size, to strike a cursory observer. Mr. Borrer therefore suspects, and, as it seems, not without reason, that the grey tinge frequently observable on the bark of old elms belongs in reality to this plant. The nature of the shields is so peculiar, that a few remarks with respect to these is all that it can be necessary to say for the purpose of effectually discriminating this lichen from its congeners. They are very different from those of any other *Parmelia*, and more resemble the *apothecia* of *Urceolaria exanthematica*, being almost wholly immersed in the crust, and in their first stage enveloped by the margin, which soon splits into different segments, though not with the regularity observable in that plant, disclosing the flat yellowish or flesh-coloured disk. In the older shields the margin becomes worn down, so as to be level with the disk, and is in this state thick, obtuse, uneven, and crenulated; it is also sometimes quite obliterated. Found on the bark of old elms about Lewes, Albourne, Steyning, Southwick, and Hastings, in Suffex. Some of this is shown, of the natural size, on a piece of wood, at fig. 4. and magnified at fig. 5.

3. *Parmelia Clementi*: stalk membranaceous and crusty, orbicular, whitish, with a lobated margin; the lobes dilated, short, multifid; shields of a dark livid tint, the margin white. The frond is arboresecent, two inches in diameter, the stalk adhering fast to the tree, undivided towards the centre, strewed over with white dust; the envelope leafy; the lobes flat, dilated, imbricated, and wrinkled; always white on both sides, whether wet or dry. The shields are by no means numerous; they arise from the middle of the *thallus*, or stalk; orbicular, first concave, with a half-closed margin; afterwards open, and flattish. The disk, when wet, is of a black-livid tint, and

1, 2, 3. *Parmelia velata*. 4, 5. *carneo-lutea*. 6, 7. *Clementi*. 8, 9. *Borreri*.

and ragged; when dry, and in the adult subject, it is black. The margin of the same colour with the crust, thin, inwardly inclined, and crenated, (notched.)

The usual abode of this beautiful species is on trees, and roofs of houses, in Suffex, where it is not uncommon; also about Tunbridge Wells, and Southampton. Mr. Turner received specimens of it collected upon the bark of the *Olea europæa*, near Cadiz, from Don Simon de Roxas Clémente, a most acute Spanish botanist, in honour of whom he named it. Dr. Acharius has also received it from France; and, the only places where it has yet been discovered in Britain being three of the most southern counties, it may fairly be presumed to be a native of the warmer climates; so conspicuous a species not being likely to be overlooked. It is only from the younger and barren plants, and especially from those which grow on flat smooth tiles, that any adequate idea of its elegance can be formed, the frond being in all other circumstances disfigured by the powder of the *foredia*, which sometimes wholly cover it. It is quite undivided, and has the appearance of a crustaceous lichen, except immediately at the circumference, never showing towards the centre the slightest tendency to become lobed. It is shown, of the natural size, at fig. 6. the Spanish specimen at fig. 7. parts of which are shown magnified at *b*, more magnified at *c*, and still more at *d*.

4. *Parmelia Borreri*: stalk membranaceous, stellated, greenish above, fawn-colour underneath, and villous; the *foredia* dispersed and white, the *laciniae* lobated and sinuous, subimbricated and rotundated at the margin; frond arboresecent, somewhat orbicular; diameter two or three inches. The *thallus*, or pedicle, is foliaceous, expanded in the form of a small rose, lobated, the lobes distinct, seldom touching each other, hardly divided in the centre; sinuated, expanded, and always rotundated at the margin. The stalk adheres firmly to the tree to which it belongs, (the margins only are free, and a little elevated;) smooth above, even, without reticulation or sinuosity; and, at all periods of its life, with small, white, orbicular *foredia*; bright underneath, and marked with unfrequent black scattered fibres. The colour of the recent thallus is above of a tender green hue, inclining to yellow; when dry, of an ash-coloured glaucescency; beneath dark brown. The shields, hardly perceptible, grow in the centre of the thallus, orbicular and sessile; of the bigness of the seed of the cultivated vetch; the disk brown: the margin of one colour with the thallus; inflexed in young subjects, crenulated in old ones.

This lichen, which, though sufficiently plentiful in many parts of Britain, does not appear to have been noticed by any author, was first pointed out by Mr. Borrer, a very particular friend of Mr. Turner, after whom he has named it. Mr. T. sent it to Dr. Acharius and Dr. Swartz, both of whom acknowledged it altogether new to them, and a very distinct species. Its appearance will be very well understood by an inspection of fig. 8. a magnified view is given at fig. 9. and a small piece more magnified at fig. 10. the edge of the alga, or frond, is shown at *f*.

PARMENALORE, a town of Hindoostan, in Coimbatore: 15 miles south-west of Errood.

PARMENIDES, a celebrated Greek philosopher of the Eleatic sect, flourished about the sixty-ninth olympiad, or the year 504 B. C. He was a native of Elea, who possessed a large patrimony, and lived in much splendour in his earlier years. He also distinguished himself in civil affairs; and is said to have drawn up for his fellow-citizens some excellent laws to which their magistrates obliged them to swear obedience. Having formed an intimacy with Diogenes, a Pythagorean, Parmenides was persuaded by him to withdraw from the concerns of public life, to the silence and leisure of the schools. Here he received the highest satisfaction from the study of philosophy; and he considered himself to be so much indebted to Diogenes, for first introducing him to it, that after his death he consecrated a temple to his memory.

Parmenides became the disciple and successor of Xenophanes, and is also said to have attended the instructions of Anaximander; but, if the latter statement be well-founded, it must have been while he was very young.

According to the testimony of Cebes, in his Allegorical Table, our philosopher was distinguished as an eminent pattern of virtue. He wrote the doctrine of his school in verses, of which a few mutilated fragments only have reached modern times, which were collected together by Henry Stephens, under the title of "*de Poesi Philosophica*," &c. Plato, in the Dialogue to which he gave the name of Parmenides, professed to represent his tenets, but confounded them with his own. The following abstract of his philosophy, as collected by Brucker from the scattered reports of the ancients, we give from Ensfield's abridgment of that author: "Philosophy is twofold; that which follows the report of the senses, and that which is according to reason and truth. The former treats of the appearances of sensible objects; the latter considers the abstract nature of things, and enquires into the constitution of the universe. Abstract philosophy teaches, that from nothing nothing can proceed. The universe is one, immovable, immutable, eternal, and of a spherical form. Whatever is not comprehended in the universe has no real existence. Nothing in nature is either produced or destroyed, but merely appears to be so to the senses. Physical philosophy teaches, that the principles of things are heat and cold, or fire and earth; of which the former is the efficient, the latter the material cause; that the earth is spherical, and placed in the centre, being exactly balanced by its distance from the heavens, so that there is no cause why it should move one way rather than another; that the first men were produced from mud, by the action of heat upon cold; that the frame of the world is liable to decay, but the universe itself remains the same; and that the chief seat of the soul is the heart." Parmenides adhered more closely to the Pythagorean doctrine than Xenophanes, the founder of the Eleatic sect; for, while the latter considered the universe as possessing within itself a divine force, the former supposed the Deity to be an informing principle, or intellectual fire, diffused throughout the universe, but more especially residing in the extreme sphere of the world; on which account he is metaphorically represented by this philosopher as a crown of light, inclosing within its circumference the celestial orb. *Ensfield's Hist. Phil.* b. ii.

PARMENIO, a distinguished Macedonian commander, arose to great reputation under king Philip, who is said to have pronounced him "the only general" he had ever met with. Alexander continued him in his service, and called him more particularly "his friend;" and Parmenio was more attached to his service as a man than as a monarch. He continued to distinguish himself as a general, and as a disinterested adviser of ALEXANDER, sometimes called the Great; and his name of course occurs under that article, and those of GREECE and MACEDON; but an account of the manner of his death has not, we believe, been given. Had Alexander been really Great, he would have cherished a friend who gave him the best advice; but this was not the case. Among other instances that might be mentioned, Parmenio displayed his good sense in endeavouring, though in vain, to divert Alexander from the frantic design of burning the royal palace of Persepolis. This and other interferences were displeasing to the conqueror, and caused Parmenio to be considered by him as envious of his glory. His ruin however, was occasioned by the indiscreet conduct of his own son Philotas. That youth wanted his father's moderation; and, elated by his prince's favour, affected a pomp and splendour which might render him suspected of ambitious views. His father, justly apprehensive of the consequences of this indiscretion, used to say to him "My son, make thyself less." The discontents of the army at the Persian manners assumed by Alexander after the

the death of Darius, having produced a conspiracy against his life, Philotas, on its detection, was involved in the guilt, or at least in the accusation, and was put to the rack. Unable to endure the torture, he named many accomplices, and among the rest his father. Philotas was put to death; but Parmenio, then commanding in Media, was not publicly declared a culprit. Alexander, however, who had now adopted the character and policy of an eastern despot, was resolved to remove the man of whom he stood in awe, and accordingly dispatched a trusty messenger with orders to some officers who served under Parmenio to assist in putting him to death. This was effected in a base and treacherous manner. Approaching the general as he was walking in his pleasure-grounds, they presented him with a letter from the king, and another in which the hand of Philotas was counterfeited; and, while he was intent upon reading them, they stabbed him with repeated wounds. His head was then cut off, and sent to Alexander; whilst the soldiers mournfully interred his remains. Parmenio was in the 70th year of his age, B.C. 330. He died in the greatest popularity; and it has been judiciously observed, that Parmenio obtained many victories without Alexander, but Alexander not one without Parmenio. *Plut. in Alex. Quintus Curtius.*

PARMENTIER (John), a scientific French navigator, was a native of Dieppe, where he was born in the year 1494. He was educated to the mercantile profession; but possessed a love of science, and a spirit of enterprise, by which he acquired celebrity among his contemporaries, and deserved to have his name transmitted with respect to posterity. He also wrote verses on different subjects; of which a collection was published in 1531, quarto, by the author's friend, Peter Crignon, under the title of "Description Nouvelle des Dignités de ce Monde, et de la Dignité de l'Homme, composée en Rithme François, et en Manière d'Exhortation, &c." This volume is extremely scarce, and highly prized by collectors of rare and curious books; but is chiefly valuable on account of the particulars concerning the author, prefixed to it by the editor, which deserve to be extracted. "From the year 1522," says Crignon, "he had applied himself to the science of cosmography, and the study of the wonderful fluctuations of the sea. On these subjects he became profoundly skilled, as he was likewise in the science of astrology. He drew several maps and charts, both spherical and plane, which were of essential service to navigators. He was a man worthy of the esteem of all men of learning, and capable, had his life been prolonged, of reflecting honour on his country by his great enterprises. He was the first pilot who conducted ships to the coast of Brazil, and the first Frenchman who discovered the Indies as far as the island of Samothra or Sumatra, called Trapobane by the ancient cosmographers. It was his intention to have proceeded as far as the Moluccas; and he frequently told me that he was determined, after he should have returned to France, to seek a northern passage, and from thence to pursue his discoveries towards the south." These designs, however, were unhappily frustrated by his death, which took place in 1530, at the island of Sumatra, when he was only thirty-six years of age. *Now. Dict. Hist. Dict. Bibl. Hist. & Crit.*

PARMENTIER (Antony-Augustine), a celebrated French chemist, was born at Montdidier in 1737, of a family long established in that city, various members of which had filled the highest municipal offices.

The premature death of his father, and the smallness of the fortune which he left to a widow and three children of tender years, confined M. Parmentier's early education to a slight knowledge of Latin, which his mother, a woman of spirit and education far above the common, gave him herself. In 1755 he entered upon his apprenticeship with an apothecary of Montdidier; and next year came to Paris to pursue the same business, with a relation who was settled there. Having shown intelligence and

habits of application, he obtained, in 1757, the employment of apothecary in the hospitals of the army of Hanover. The late M. Bayer, one of the most distinguished members of the Institute, then presided over this branch of the service. He was not less commendable for the elevation of his character than for his talents; and, having remarked the regular conduct of young Parmentier, he made him acquainted with M. de Chamousset, intendant-general of the hospitals.

It was from the conversation of these two excellent men, that Parmentier derived the ideas and sentiments which have since given such celebrity to his name. He learned from them two truths, equally despised by those whose duty it is to feel them; namely, the extent and variety of miseries which might be prevented, if the welfare of individuals were more studied; and the number and power of the resources which nature would present against so many scourges, if she was properly questioned and studied on the subject. Accordingly, when his duties fixed him in any town, he visited the manufactories least known in France, and requested permission to work in the laboratories of the most eminent chemists. While in the country, he observed the practice of the German farmers, and even noted down such objects of interest as struck him, when following the army. As it happened, no opportunity was wanting of his viewing all these various objects closely; for he was five times made prisoner, and conveyed to places which he never would have otherwise visited: hence he learned, from his own experience, to what length the horrors of famine were sometimes carried, a course of instruction necessary perhaps to kindle in him that fire of humanity with which he was inflamed during the rest of his long life.

It was prudent, however, that before making public the useful knowledge which he had acquired, or seeking to ameliorate the lot of nations, he should render his own means of existence a little less precarious. He returned therefore at the peace of 1763 to the capital, and resumed, in a more scientific order, the studies connected with his art. The lectures of Nolle, Rouelle, Antoine, and of Bernard de Jussieu, extended his ideas, and assisted him in giving them better method. He acquired in fact a varied and solid intimacy with all the physical sciences; and, the place of inferior apothecary being vacant in the Invalids in 1766, he obtained it after a severe struggle. Means of existence were thus secured to him; and, the administrators of the establishment, observing that his conduct fully justified his recommendations, advised the king in 1772 to make him chief apothecary; a recompence which an unexpected incident rendered more complete than he had even wished or expected. The pharmacy of the Invalids had been managed since the origin of the establishment by the sisters of La Charité; these good ladies, who had cherished young Parmentier so long as he was in a manner their servant, were highly offended when he was placed on a level with them. They teased the king so effectually, and set so many engines at work, that his majesty was obliged to give way; and, after two years controversy, the singular arrangement was made of allowing M. Parmentier to retain all the emoluments of his office, without discharging any of its duties.

This was giving him up entirely to his researches upon subjects of general utility, and from that moment they were uninterrupted. The first opportunity of publishing any results was afforded him in 1771 by the Academy of Besançon. The scarcity of 1769 had directed the attention of statesmen and philosophers to those vegetables which could best supply the place of the ordinary plants; and the Academy made this subject a prize-question, which Parmentier satisfactorily resolved. He endeavoured to prove in his dissertation, that the most useful nutritive substance in vegetables is *starch*; and showed how it might be extracted from the roots and seeds of several indigenous plants, and cleared of the acrid and poisonous principles which accompany it in some vegetables. He also pointed

pointed out the mixtures best calculated to make palatable bread of this starch; or at least a kind of biscuit, adapted for soups. Without doubt, great advantages might be derived from the processes which he suggests; but, as most of these plants are wild and rare, and would cost more than the dearest corn, an absolute famine could alone justify their use. Parmentier was aware that it was much more efficacious to regulate cultivation and domestic economy, so as to render a famine impossible; and with this view he took great pains to recommend the cultivation of the potato, and combated with perseverance the prejudices which opposed the propagation of that beneficial root.

Parmentier, who had become acquainted with the potato in the prisons of Germany, where he frequently had no other food, seconded the views of the ministry by a chemical examination of this root, in which he demonstrated that none of its principles were hurtful. He did more: in order to give the people a taste for it, he cultivated fields of it by the road-side, placing watchmen over them by the day only; thinking himself fortunate when the people were tempted to steal a few of them during the night. He could have wished that the king, as is related of the emperor of China, should have planted the first root in his field: but his majesty did almost as much, for he wore on a full court-day a nosegay of the flowers of the plant on his breast; and nothing more was requisite to induce several great landed proprietors to plant the root.

Wheat itself was the subject of long researches on the part of M. Parmentier; and perhaps he did not render less service by publishing his processes for baking, than by propagating the potato. Chemical analysis having taught him that the bran contains no principle capable of nourishing mankind, he was led to conclude, that to exclude it from bread was to effect a saving; he proved, by experiments, that, by grinding and sifting the flour in such a way as to keep out all the husks, a much whiter, more savoury, and more nutritive, bread was obtained. Previous to these discoveries, this mode of grinding and sifting flour was prohibited under heavy penalties, as being wasteful.

Parmentier studied with scrupulous attention every thing connected with bread; and, as books, he knew, were of little use to millers and bakers, who generally read but little, he prevailed on the government to establish a public baking-school, the pupils of which should propagate the best system in the provinces. He travelled himself, with M. Cadet de Vaux, into Brittany and Languedoc, to propagate his doctrines. He succeeded in dismissing the bran which was mixed with the bread of the army and navy; and, by thus procuring a more wholesome and more agreeable food, he put an end to the multiplicity of abuses of which this mixture was the source. In short, it has been calculated, that, from the progress made in France in the arts of grinding and baking, the quantity of flour now necessary for an individual may be reduced one-third.

Ardent as was Parmentier for the public utility, it may be supposed that he took an active part in the efforts occasioned by the last war to supply the place of colonial produce. It was he, in short, who brought the syrup of raisins to perfection; that preparation, which doubtless cannot be assimilated to sugar, but which nevertheless greatly reduced its consumption, gave a new value to the vineyards, and a new species of luxury to the poor.

These labours, purely agricultural or economical, did not detach Parmentier entirely from those connected more closely with his profession: he had published, in 1774, a translation, with notes, of the "Physical Recreations of Model," a work in which pharmaceutical preparations are more particularly the object; and in 1775 he published an edition of the "Hydraulic Chemistry of Lagaraye," which is merely a collection of receipts for obtaining the principles of medicinal substances without injuring them

by too much heat. Perhaps he would not have remained an indifferent spectator of the great revolution made in chemistry about this time, if the intrigues to which we have alluded had not deprived him of his laboratory at the Invalids; and yet we may venture to say, that the chemical examination of milk and of blood, in which he was assisted by M. Deyeux, is a model of the application of chemistry to the productions of organized bodies and their modifications. In the first of these works the authors compare with the milk of women that of the domestic animals; and in the second they examine the alterations produced in the blood by inflammatory and putrid diseases, and by scurvy; alterations frequently very imperceptible, and far from accounting for the disorders which they occasion, or which they at least accompany.

We have seen how Parmentier's progress was checked, in some measure, by his removal from the Invalids, but he was not forgotten by government; for, when, in 1788, a board of physicians and surgeons was organized for the army, it was wished to place Parmentier there as chief apothecary; but Bayen was still alive, and Parmentier refused to sit above his master. He was, therefore, appointed assistant to Bayen. This institution, like many others, was suppressed by those revolutionists who wished to see no subordination even in medicine: but necessity soon dictated its restoration under the name of the Council of Health for the Armies; and Parmentier, whom the reign of terror had driven from Paris, was recalled to become one of its members. He exhibited, in this career, the same zeal as in every other; and the hospitals of the army were under incalculable obligations to him. But his activity was not confined to the duties of his place: and every thing which was useful called him into action. At the period of the establishment of fire-engines, he assured the public of the perfect salubrity of the waters of the Seine, which has been called in question subsequently. He took an active part in recommending economical soups; he contributed greatly to the propagation of vaccination; it was chiefly he who produced, in the hospitals of Paris, that regularity which now prevails in the apothecary's department; he superintended the great bakehouse where all the bread for the hospitals is baked; the Hospice des Menages was also under his particular superintendence, and he paid the most scrupulous attention to every thing that could better the condition of 800 old persons of both sexes who fill it.

In a word, wherever much labour was wanted for no remuneration, and wherever good was to be done, Parmentier was the first to aid; and his time, his pen, and even his purse, were immediately at the service of the institution. This long and constant habit of watching over the welfare of mankind, actually impressed upon his exterior the character of Benevolence personified. A tall and erect figure, a look at once noble and placid, with locks as white as snow, made this respectable old man the image of goodness and virtue combined. His physiognomy was peculiarly pleasing from the sentiment of the good which he had done. Parmentier was never married: his sister, Madame Houzeau, constantly lived with him, and seconded him in all his labours of benevolence with the zeal of a philanthropist. She died at a period when her affectionate services would have been more necessary than ever to her brother, who began to be seized with a chronic affection of the chest. Grief for her loss aggravated the disorder of this excellent man, and rendered his latter days more painful, but without altering in the least his character or arresting his labours. He was finally removed from life on the 17th of December, 1813, in the 77th year of his age. *Cuvier's Eulogy*, delivered at the Institute. *Monthly Mag.* June 1815.

PARMESAN'. See PARMA.

PARMESAN', *f.* A native of Parma; an inhabitant of Parma.

PARMESAN', *adj.* The name given to a cheese much esteemed among the Italians, and made in that part of Italy

Italy called the Parmesan; the chief place of which is Parma; whence it is conveyed to various parts of Europe. The excellent pasture-grounds of this country are watered by the Po; and the cows, from whose milk this cheese is made, yield a great quantity of it. Of this cheese there are three sorts; the *fromaggio di forma*, about two palms in diameter, and seven or eight inches thick; and the *fromaggio di rabiale* and *di ribolini*, which are not so large. This cheese is of a saffron colour, and the best is kept three or four years.

PARMIGIANO, the usual appellation of FRANCESCO MAZZUOLI, a painter of great and deserved renown, born at Parma in 1505. He acquired the first rudiments of art under the tuition of his two uncles at Parma; and at the age of 16 surprised the partiality of relationship, and even astonished the existing taste of that part of Italy, by the production of a picture of St. John baptizing the Saviour in the River Jordan. But the fame of Raphael and Michael Angelo soon attracted him from his native city to Rome, where he then went; and, taking with him some of his productions, was introduced by their renown to pope Clement VII. who highly honoured and esteemed him. In Rome he attached himself to the study of Michael Angelo and Raphael; and exhibited the loftiness of his mind, by composing a style for himself from the high qualities of those two great men, in conjunction with what he had learned of Corregio. In Rome, and under the immediate influence of this newly-acquired gusto, he painted several pictures, and among them a very fine one which represents the Virgin seated in glory with a book in her hand, and the Infant standing on the clouds, and leaning against her knee; in front is a figure of St. John kneeling upon one knee, pointing with one hand to the Virgin, and turning his face to the observer; and in the background, asleep, is a figure of St. Jerome, who is supposed to have seen this vision, and from which the picture takes its name. Vafari makes especial mention of it; and says that Parmigiano painted it for Donna Maria Bufolino of Citta di Castello, who intended to place it in the church of St. Salvatore del Lauro, in a chapel near the door. In the execution of it, Parmigiano had nearly lost his life; for, notwithstanding the siege of Rome by the Colonnas, he continued working upon it; and some Germans, intent upon plunder, entered his room while he was so engaged. The splendour of the work, however, fortunately so astonished and delighted them, that, though they spared in no excess, but robbed the palaces and churches of every thing they thought worth having, yet they protected the painter, and honoured his abilities. He did not quite complete the picture, and soon after left the city; but not till the soldiers had obliged him to make for them a number of drawings in pen and ink. He was afterwards, in going to see some friends, made a prisoner by other soldiers, from whom he disengaged himself by paying money; and then his uncle, alarmed for his safety, removed him from Rome, and sent him back to Parma. This grand picture was safely lodged in the convent of the Frati della Pace, where it remained in the refectory many years, and was then carried by Julio Bufolino to its original destination, the church at Citta di Castello, where it remained till it was purchased, about the beginning of the present century, by the late marquis of Abercorn: he gave 1500*l.* for it; and sold it, in 1809, to Mr. Davis of Bristol, for 3000 guineas.

Parmigiano, in his return to his native place, stopped at Bologna; and there he painted several pictures, and made a great number of drawings. Among the pictures was a large one for the monks of St. Margaret, of the Virgin, with several saints, which was very highly esteemed by the Caracci, and by Guido was preferred to the St. Cecilia of Raphael. He there also painted a portrait of Charles V. with a figure of Fame crowning him with laurel, which he effected from memory, after seeing the emperor dining in public; and it so gratified his majesty, that he wished to have it; but, Parmigiano stating that it was

not finished, it remained with him, and afterwards passed to the possession of the duke of Mantua.

He at length returned to his native city; and was immediately engaged to paint, in fresco, the vaulted ceiling of the church of Sta. Maria della Steccato; and in the lower part executed six figures; a Moses, three Sibyls, and an Adam and Eve. Of which Mr. Barry, in a letter to Mr. Burke, says, "that they exhibit powers which, if fully displayed, might have exceeded either Raphael or M. Angelo." Unfortunately at this time, when Parmigiano ought to have pursued this great work, and have established his fame upon it, he turned aside to the alluring study of alchemy, and wasted his time and his fortune in vain attempts at transmutations; which only prevented him from exercising his abilities in a more certain mode of obtaining not only gold, but also glory. He died at the age of 35, in 1540.

The ruling features of his style are elegance of form, grace of countenance, contrast in attitude, enchanting chiaroscuro, and blandishment of colour. When these are pure, he is inimitable: but his elegance is often stretched to excessive slenderness, and his grace deformed to affectation. He was a learned designer: to his depth in design, we must ascribe that freedom of execution, those decided strokes of his pencil, which Albano calls divine, and which add grace to the finish of his pictures: they have not indeed all equal impasto of colour, nor equal effect, though some, for the amorè with which they are conducted, have been ascribed to Corregio: such is the Cupid scooping his bow, with the two infants at his feet, one laughing, the other crying, of which there are several repetitions. Such was the delight found in the study of the pictures of Parmigiano, that copies, and excellent ones too, are found all over Italy; and are not unfrequently sold here as originals. The one upon which we have dwelt so minutely above, the Dream of St. Jerome, is of so high a class, that it may rank with the Peter Martyr of Titian, the Transfiguration of Raphael, and the St. Jerome of Dominichino.

The great works of this master are in the churches of Parma, and other towns of Italy, and in the Vatican palace; but they are not numerous. A great number of prints have been engraved from his designs.

It has been stated by some writers, and is generally believed, that Parmigiano, if not the inventor of etching, was the first Italian who successfully practised that art. Strutt says of him, with great justice, that "in the etchings of this great master we discover the hand of the artist, working out a system, as it were, from his own imagination, and striving to produce the forms he wanted to express. We see the difficulty he laboured under; and cannot doubt, from the examination of the mechanical part of the execution of his works, that he had no instruction. It appears to be something entirely new to him, without the knowledge of any thing better. We know that he certainly was not the first inventor of etching, because it was practised in Germany before he was of an age to attempt it; yet it appears as if he had been unacquainted with the prior discovery, or only knew of it imperfectly by report; and in the latter case he might have been nearly as much at a loss as in the former. The spirit and genius which appear through the clouds are such as justly render his etchings exceedingly valuable; and on this account they have been often copied, and sometimes indifferently. The mechanical part of them is scratched in with the point, often badly corroded with the aquafortis, and retouched with the graver, without the least appearance of knowledge as an engraver. But, looking beyond these defects to the sweet characters of the heads, to the elegant turns of the figures, and to the beauty and simplicity of the composition of these rude sketches, what is wanting in the excellency of the mechanical part of the art is abundantly supplied to the judicious eye in the fire and animation of the master. The copies are always better than the originals, with respect

to the regularity of the workmanship; but even the best of them are exceedingly defective in style and spirit, so that they are easily distinguished upon comparison. Good impressions of the originals are very rare; such, I mean, as are not re-touched. From the foulness of the copper upon which he engraved, and the little skill he had in managing the aquafortis, his etchings are seldom clear or perfect in their appearance, though some indeed are greatly superior to others in this respect; and those perhaps he executed in the latter part of his life. It is also said he engraved many prints on wooden blocks in chiaroscuro; but it is much more likely, as Bafau justly observes, that he was only the designer and director of these works, and that they were executed by Ugo da Carpi, Andrea Andreani, and other masters."

Parmigiano's cousin and pupil Giralamo has been already noticed under his proper name MAZZUOLO, vol. xiv. p. 585.

PARMILLIEU', a town of France, in the department of the Isère: twenty-four miles east-north-east of Lyons.

PARMON'CA, a town of Peru, in the audience of Lima, near the sea: thirty-five miles north-north-west of Guaura.

PARNAPIACA'BA, a river of Brasil, which runs into the Atlantic in lat. 24. 12. S.

PARNAS'SA, a town of Hindoostan: fifteen miles south-south-east of Allahabad.

PARNAS'SIA, *f.* [altered by Tournefort from the old name of *Gramen Parnassi*, which has been appropriated to this most curious and elegant plant, because it appears really to be what Dioscorides terms the Grass of Parnassus. Not that it has any thing to do with the grasses, properly so called; but he describes it as "having ivy-like leaves, a white and pleasantly-scented flower, with small not ineffectual seed, five or six roots as thick as the finger, white and soft." This description sufficiently answers to our Parnassia, except that we know of no smell in the flowers.] In botany, a genus of the class pentandria, order tetragynia, natural order campanaceæ, *Lin. MSS.* (capparides, *Juss.*) Generic characters—Calyx: perianthium inferior, in five, deep, elliptic-oblong, spreading, permanent segments. Corolla: petals five, roundish, striated, concave, spreading; nectaries five, opposite to the petals, each a roundish or oblong fleshy scale, fringed with from three to thirteen erect marginal stalks, bearing every one a small globe, shorter than the petals. Stamina: filaments five, awl-shaped, the length of the nectaries, separately inflexed for a time over the germen; antheræ incumbent, depressed. Pistillum: germen superior, ovate, large, sessile; style none, but an aperture in its place; stigmas four, obtuse, permanent, enlarged in the fruit. Pericarpium: capsule ovate, somewhat quadrangular, of one cell and four valves, the partitions from the centre of each valve, each bearing a furrowed parallel receptacle. Seeds several, oblong, ascending.—*Essential Character.* Calyx in five deep segments; petals five; nectaries five, fringed with stalked globules; capsule of four-valves, with many seeds. There are four species.

1. *Parnassia palustris*, common marsh-parnassia, or grass of Parnassus: leaves heart-shaped; petals sessile, emarginate; nectaries with numerous segments. Root perennial, small, whitish, fibrous; putting forth several stems and leaves in tufts. Stems erect, unbranched, somewhat twisted, having five sharp corners, a span high, slender, smooth, having only a single embracing leaf below the middle, and a single flower at the top. Root-leaves petioled, ovate, pointed, quite entire, bright green above, underneath cinereous, smooth, netted, nine lines long, six or seven lines wide. Petioles grooved above, and an inch and half long. Corolla near an inch in diameter: petals a little scalloped at the edges, slightly emarginate, white with semitransparent greyish veins. Nectaries green, the globules yellow, from ten to fifteen, generally thirteen. Stamens only half as long as the petals, at first not longer than the germen, but each in order becomes longer

than the rest, as it sheds its pollen on the orifice of the germen, which closes as soon as all the antheræ have shed their pollen. Linnaeus also observes, that, whilst this plant is in flower, the germen is open at the top, that the stamens lay their antheræ alternately upon the orifice, and, having discharged their pollen, recede to the petals. The elegant nectaries, terminated by threads, each tipped with a little yellow pellucid sphere, sufficiently distinguish this plant. Capsule ovate-globular, terminated by the four reflex stigmas, obsoletely four-grooved, one-celled or incompletely four-celled, four-valved. Receptacles four, spongy, oblong, narrow. Seeds irregular like saw-dust, with an oblong turgid nucleus in the middle, and surrounded with a membranaceous rim at the side, of a russet colour. The nectary of this plant has been shown on the BOTANY Plate VIII. fig. 25. and the fructification on Plate XI. fig. 18-22. of the same article, vol. iii.

Parnassia is a native of most parts of Europe, by the side of bogs and moors, and in wet meadows; flowering in July and August. Dr. Sibthorp gathered it on the Bithynian Olympus; and there is every reason to believe it may grow on Parnassus, and other Grecian hills; whereas *Convallaria bifolia*, which some botanists suppose to be what Dioscorides meant, is not known to be a Grecian plant, but is rather confined to the northern parts of Europe.

2. *Parnassia Caroliniana*, or Carolina grass of Parnassus: leaves almost orbicular; petals nearly sessile; nectaries deeply three-cleft. Discovered by M. Bosc on bogs in North Carolina. It was sent to Kew garden in 1802 (not 1782, as noted in Curtis 1459.) by the late Mr. Masson; and is hardy in our climate, flowering in autumn. This has altogether the habit of the preceding, but is somewhat larger. The leaves are more orbicular; petals more elliptical, entire, not emarginate, the lines green, and very numerous, the whole of the petals of a greenish cast. Nectaries remarkably different, being deeply divided into three awl-shaped segments only, with a yellow ball upon each point. Mr. Aiton mentions this species as flowering in May and June; Dr. Sims from July to September. It is represented at fig. 2. on the engraving with Herb PARIS, p. 443.

3. *Parnassia asarifolia*, or kidney-leaved grass of Parnassus: leaves kidney-shaped; petals with claws; nectaries oblong, with three terminal segments. Native of bogs in North America, flowering in the latter part of summer. M. Ventenat described it from the collection at Malmaison. This differs from both the foregoing in having shorter or kidney-shaped leaves; petals furnished with considerable claws; nectaries of an elongated and linear form, divided, at the upper part only, into three brittle-like segments, tipped with darker-coloured globules. The petals moreover seem to be smaller, and more rounded, than in the *Caroliniana*; entire, and not, as in the *palustris*, emarginate. We have not heard of this any more than the following, in the English gardens.

4. *Parnassia fimbriata*, or fringe-flowered grass of Parnassus: leaves kidney-shaped; petals fringed at the lower part, with entire claws; nectaries palmate, with numerous segments. Gathered by Mr. Archibald Menzies on mountains on the north-west coast of America. This species appears to agree with the last in habit, but the flowers are essentially different. The claws of the petals are smooth and entire, but the base of each petal itself is copiously fringed with fine long capillary segments. The nectaries are palmate, mostly resembling those of the first species, which they seem to approach in the number of their segments, but those segments are of a much shorter proportion. The stem-leaf is much nearer the flower than the root; the radical ones are remarkably hollowed out at their base, close to the lateral ribs, which are connected with one another by a common base, like the divisions of a pedate leaf, and have a very elegant appearance.

Propagation and Culture. The two first species may be taken up from the natural place of growth, with balls of

earth to the roots, planted in pots filled with pretty-strong fresh undunged earth, and placed in a shady situation, where, if they are constantly watered in dry weather, they will thrive very well, and flower every summer; but, if planted in the full ground, it should be in a very moist shady border, otherwise they will not live; and these should be as duly watered as those in the pots in dry weather, to make them produce strong flowers. They may be propagated by parting their roots, which should be done in March, before they put out new leaves; but the roots should not be divided too small, for that will prevent their flowering the following summer. These roots should always be planted in pretty strong fresh earth, for they will not thrive in a light rich soil. In the spring they must be constantly watered, if the season should prove dry, otherwise they will not flower; nor should they be parted oftener than every third year, to have them strong.

PARNASSIAN, *adj.* [from *Parnassus*.] Belonging to mount Parnassus.

PARNASSIDES, *f.* [from *Parnassus*.] The Muses.

PARNASSUS, in ancient geography and mythology, a mountain of Greece, in the Phocide, consecrated by the poets to the Muses, thence called Parnassides, and to Apollo and Bacchus. It was situated to the south-east of the Crisean gulf, and north-west of the river Cephissus; near Delphos, and the mounts Cithæron and Helicon. It had two tops (Ovid, Lucan); the one called *Cirrhæa*, sacred to Apollo; and the other *Nijæ*, sacred to Bacchus (Juvenal). It was covered with bay-trees (Virgil); and was originally called *Larnassus*, from Deucalion's *larnax*, or ark, thither conveyed by the flood (Stephanus on Apollonius); but after the flood *Parnassus*, from *Har Nahas*, changing the *h* into *p*, the Hill of Divination or Augury (Peucerus); the oracle of Delphos standing at its foot.

Chandler, who visited it about the middle of the last century, describes it as follows: Parnassus was the western boundary of Phocis; and, stretching northward from about Delphi towards the Oetæan mountains, separated the western Locri from those who possessed the sea-coast before Eubœa. It was a place of refuge to the Delphians in times of danger. In the deluge which happened under Deucalion, the natives were saved on it by following the cry of wolves. On the invasion by Xerxes, some transported their families over to Achaia; but many concealed themselves in the mountain, and in Corycium, a grotto of the Nymphs. All Parnassus was renowned for sanctity, but Corycium was the most noted among the hallowed caves and places. "On the way to the summit of Parnassus," says Pausanias, "as much as sixty stadia beyond Delphi, is a brazen image; and from thence the ascent to Corycium is easier for a man on foot, and for mules and horses. Of all the caves in which I have been, this appeared to me the best worth seeing. On the coasts, and by the sea-side, are more than can be numbered; but some are very famous both in Greece and in other countries. The Corycian cave exceeds in magnitude those I have mentioned, and for the most part may be passed through without a light. It is sufficiently high: and has water, some springing up, and yet more from the roof, which petrifies; so that the bottom of the whole cave is covered with sparry icicles. The inhabitants of Parnassus esteem it sacred to the Corycian Nymphs, and particularly to Pan. From the cave to reach the summits of the mountain is difficult even to a man on foot. The summits are above the clouds; and the women called *Thyades* madden on them in the rites of Bacchus and Apollo." Their frantic orgies were performed yearly. Wheler and his company ascended Parnassus from Delphi, some on horses, by a track between the stadium and the clefts of the mountain. Stairs were cut in the rock, with a strait channel, perhaps a water-duct. In a long hour, after many traverses, they gained the top; and, entering a plain, turned to the right towards the summits

of Castalia, which are divided by deep precipices. From this eminence they had a fine prospect of the gulf of Corinth, and of the coast; Mount Cirphis appearing beneath them as a plain, bounded on the east by the bay of Asprospitia, and on the west by that of Salona. A few shepherds had huts there. They returned to the way which they had quitted, and crossed a hill covered with pines and snow. On their left was a lake, and beyond it a peak, exceedingly high, white with snow. They travelled to the foot of it through a valley, four or five miles in compass; and rested by a plentiful fountain called Drosogio, the stream boiling up a foot in diameter, and nearly as much above the surface of the ground. It runs into the lake, which is about a quarter of a mile distant to the south-east. They did not discover Corycium, or proceed farther on; but, keeping the lake on the right, came again to the brink of the mountain, and descended by a deep and dangerous track to Racovi, a village four or five miles eastward from Delphi. It was the opinion of Wheler, that no mountain in Greece was higher than Parnassus; that it was not inferior to mount Cenis among the Alps; and that, if detached, it would be seen at a greater distance than even Mount Athos. The summits are perpetually increasing, every new fall of snow adding to the perennial heap, while the sun has only power to thaw the superficies. Castalis Pleistus and innumerable springs are fed, some invisibly, from the lakes and reservoirs, which, without these drains and subterraneous vents, would swell, especially after heavy rain and the melting of snow, so as to fill the valleys, and run over the tops of the rocks down upon Delphi, spreading wide an inundation, similar, as has been furnished, to the Deucalionian deluge. *Chandler's Travels in Greece*, 4to. 1776.

More recently this classical spot has been described by that active and enterprising traveller Mr. Galt.—"We left Livadia after breakfast; and, in the course of the afternoon, arrived at Castri, the ancient Delphi. Our ride, for nearly half the way, was through a valley, wild, romantic, and magnificent, till we reached Rakova, and its fertile environs of cotton-fields and vineyards. From Rakova to Castri, the road, ascending and descending, affords, at every turning, the finest views imaginable of savage scenery. Considering the impressions which the appearance of nature makes here, we could not but assent to the propriety of the ancients in regarding Parnassus as the peculiar region of the Muses.

"The ruins of Delphi consist of mutilated inscriptions, extensive terraces, and a few fragments of pillars. It seems no longer possible to discover the site of the great Temple of Apollo. It was, probably, where there is now a small monastery, in the midst of an olive-grove. In that neighbourhood the niches in the rocks, for votive offerings, are most numerous. It was also generally the custom, after the establishment of Christianity, to appropriate the old consecrated ground to the service of the new religion. The Castalian spring still flows; and we enjoyed a draught, but without any effectual inspiration. A square basin, excavated in the rock from which it issues, is still almost entire. Two wild fig-trees overhang the source, and a drapery of ivy falls over a niche, and partly conceals a small chapel constructed in a hollow of the precipice. In a chasm above the spring, the traces of the stairs remain, by which the priests performed their pantomimes, to overawe the pilgrim as he knelt at the fountain to drink.

"The scenery round Castri is solemn and grand. The village is overhung by lofty grey precipices; a reclusive valley is seen, verdant and rural, far in the hollow below; and the western prospect, diversified by the gulf of Salona, comprehends a long remote range of the mountains of the Morea. When we had reached the bottom of the valley, the sun was on the edge of the horizon; and the effect of his slanting light on the alpine features of Parnassus produced an awful and stupendous effect.

The

The mountain, towards Turco Cori, appears like a cairn, composed of hills instead of stones. The detached form of the *ten principal peaks* probably gave rise to the fable of the Muses and Apollo having made it their seat: and the solemnity produced on the mind, by the impression of the surrounding scenery, tended, no doubt, to sanction the fiction." *Galt's Voyages and Travels*, 4to. 1812.

The Corycian cave, in particular, has been described by other travellers, but no where more perspicuously, or with more felicity, than by Mr. Raikes. "The narrow and low entrance of the cave, spread at once into a chamber 330 feet long, by nearly 200 wide; the stalactites from the top hung in the most graceful forms, the whole length of the roof, and fell, like drapery, down the sides. The depth of the folds was so vast, and the masses thus suspended in the air was so great, that the relief and fullness of these natural hangings were as complete as the fancy could have wished. They were not like concretions or incrustations, mere coverings of the rock; they were the gradual growth of ages, disposed in the most simple and majestic forms, and so rich and large as to accord with the size and loftiness of the cavern. The stalagmites below and on the sides of the chamber were still more fantastic in their forms than the pendants above, and struck the eye with the fancied resemblance of vast human figures. At the end of this great vault, a narrow passage leads down a wet slope of rock; with some difficulty, from the slippery nature of the ground on which I trod, I went a considerable way on, until I came to a place where the descent grew very steep, and, my light being nearly exhausted, it seemed best to return. On my way back, I found, half buried in the clay, on one side of the passage, a small antique patera, of the common black-and-red ware. The incrustation of the grotto had begun to appear; but it was unbroken, and I was interested in finding this simple relic of the homage once paid to the Corycian nymphs by the ancient inhabitants of the country. The stalagmitic formations on the entrance of this second passage are wild as imagination can conceive, and of the most brilliant whiteness. It would not require a fancy, lively, like that of the ancient Greeks, to assign this beautiful grotto as a residence to the nymphs. The stillness which reigns through it, only broken by the gentle sound of the water, which drops from the point of the stalactites, the *υδαρ' αειροισα* of the grotto of the nymphs in the *Odyssey*, the dim light admitted by its narrow entrance, and reflected by the white ribs of the roof, with all the miraculous decorations of the interior, would impress the most insensible with feelings of awe, and lead him to attribute the influence of the scene to the presence of some supernatural being." *Walpole's Memoirs relating to Turkey*, 4to. 1819.

PARNASSUS was also a town of Asia, in Galatia, upon the route from Cæsarea to Ancyra, between Afsona and Nyssa, according to the Itinerary of Antonine.

PARN'DORF, a town of the duchy of Wurzburg: three miles south-west of Königshofen in der Grabfeld.

PARNE', a town of France, in the department of the Mayenne: six miles south-east of Laval.

PAR'NEL, a town of Hindoostan, in Dowlatabad: fifteen miles south-west of Amednagur.

PAR'NEL, *f.* [diminutive of *petronella*, Ital.] A punk; a slut. *Obsolete*.

PAR'NELL (Thomas), a pleasing English poet, was descended from an ancient family in Cheshire. His father, who had followed the parliamentary cause in the civil wars of Charles I. upon the Restoration went to Ireland, where he purchased an estate. His eldest son, Thomas, was born at Dublin in 1679, and received his school-education in that city, whence, at the age of thirteen, he was transferred to the college. Of his progress in that seminary, nothing particular is recorded; but his writings sufficiently show that he laid in a respectable store of classical learning. He was admitted to the degree of M.A. in 1700, took deacon's orders in the same year, Vol. XVIII. No. 1270.

and was ordained priest three years afterwards. In 1705 he was presented to the archdeaconry of Clogher, and about the same time married a lady of great beauty and merit. He now began to make those frequent excursions to England, in which the most desirable part of his life was thenceforth passed. His social qualities caused him to be universally well received; but his first connexions were principally with the Whigs, at that time in power; and he was familiar with their most distinguished men of letters, as Addison, Congreve, and Steele. Towards the latter part of queen Anne's reign, when the Tories were triumphant, Parnell, influenced, it is thought, by Swift, their zealous partisan, deserted his former friends, and joined in close union with that celebrated wit, and his associates, Pope, Gay, and Arbuthnot. Swift introduced him to lord-treasurer Harley; and, with the dictatorial air he was fond of assuming, insisted upon the treasurer's going with his staff in his hand into the anti-chamber, where Parnell was waiting, to welcome him. Yet Parnell could never claim any high rank in literature; nor was there much to be expected from his political services.

Though his biographer, Goldsmith, is disposed to throw all possible lustre on his character, he cannot raise it higher than that of a benevolent good-natured man, pleasant in company when in spirits, much attached to his particular friends, and so much addicted to society that he preferred what was indifferent to solitude. "Every year," it is said, "as soon as he had collected the rents of his estate, and the revenue of his benefices, he came over to England, and spent some months, living in an elegant style, and rather impairing than improving his fortune." He was at one time an assiduous preacher in the London pulpits, with a view of rising to notice; but the change of the ministry at queen Anne's death, destroyed his brilliant prospects in the church, and limited his future advancement to the favour of private friends. By means of Swift's recommendation to archbishop King, he obtained a prebend, and the valuable living of Finglafs. His domestic happiness received a severe shock in 1712, by the death of his beloved wife. The loss is said to have had such an effect upon his spirits, as to lead him into those habits of intemperance in wine which shortened his life; and Goldsmith indulgently represents him as "in some measure a martyr to conjugal fidelity;" but it can scarcely be doubted that his mode of life had already formed in him that convivial disposition which is with so much difficulty kept within bounds. After his wife's death, company grew still more necessary to him; and, when condemned to a retreat into the wilds of Ireland, he could not refrain from frequenting the society he found there, whilst it was the object of his contempt and ridicule in his letters to his English friends. He died at Chester, on his way to Ireland, in July 1717, in the thirty-eighth year of his age; and was buried, without any monumental record, in Trinity-church in that city.

Parnell was the author of several pieces, both in prose and verse. He wrote the *Life of Homer* prefixed to Pope's *Iliad*, which, however, on account of the stiffness of the style, cost that poet much labour in the correction. He likewise wrote a *Life of Zoilus*, meant as a satire against Theobald and Dennis; and some papers in the *Spectator* and *Guardian*. None of these are masterpieces, but they display learning and imagination. It is as a poet that he is now exclusively known and valued. After his death, Pope made a selection of such of his compositions as he thought worth preserving, and published them in one volume 8vo. 1721. They have ever since formed a part of the body of approved English poetry, and have been often reprinted. The characteristics of these pieces are ease, sprightliness, fancy, clearness of language, and melody of versification. Though not ranking among the noblest or most finished productions of the British muse, they claim a place among the most pleasing. Their sentiments are elegant, and their morality pure. Several of them are translations or imitations

tions happily executed. Another volume of posthumous pieces was printed at Dublin in 1758, and its contents have since been added to the former in the collections of English poets. In bulk they much exceed the first publication; but in merit they are so much inferior, that they are rather a drawback from Parnell's reputation than an accession to it. Dr. Johnson has thought it superfluous to enquire into their authenticity, or canvass their merits; and he expressly limits his commendations, which are by no means scanty, to the pieces published by Pope. Of these, the most admired is *The Hermit*; as to the origin of which story, see the *Monthly Magazine* for April 1813. See also Goldsmith's *Life of Parnell*, and Johnson's *Lives of the Poets*.

PAR'NES, in ancient geography, a mountain of Greece, in Attica, on which were a statue of Jupiter Parnetianus in bronze; another of Jupiter and Semelé; and another altar on which the adjacent inhabitants sacrificed to Jupiter, under the appellations of the Beneficent and Rainy, or *Pluvius*. This mountain abounded with bears and wild boars.

PAR'NIPA, a river of Brasil, which runs into the Atlantic in lat. 18. 10. S.

PAR'NON, in ancient geography, a lofty mountain of the Argolide, on which were placed the Hermæan statues of Mercury, which, in the time of Pausanias, indicated the limits of Laconia, and of the territory of the Tagetes, a people of Arcadia.

PAR'NOT, a town of France, in the department of the Upper Marne: five miles north-west of Bourbonne.

PA'RO, a small island near the coast of Nicaragua, in Salinas Bay. Lat. 10. 3. N. lon. 85. 36. W.

PA'RO, or PAROGONG', a town of Bootan, (Thibet,) and capital of a district, with a castle situated at the base of a lofty mountain, in which the governor resides; celebrated for its manufacture of idols, and arms; particularly swords, daggers, and the bars of arrows: twelve miles south-west of Tassafudon. Lat. 27. 43. N. lon. 89. 32. E.

PA'RO HO'TUN, a town of Chinese Tartary: 288 miles north-north-east of Pekin. Lat. 44. 2. N. lon. 118. 47. E.

PARO'CHE, [*parochia*, barb. Lat.] A parish.—Saint Peter is patron of the *parochie* and dedication of Westminster. *Spelman*.

PARO'CHIAL, *adj.* [*parochialis*, from *parochia*, low Lat.] Belonging to a parish.—Every church is either cathedral, conventual, or *parochial*. Cathedral is that, where there is a bishop seated, so called *à cathedra*; conventual consists of regular clerks, professing some order of religion, or of a dean and chapter, or other college of spiritual men; *parochial* is that which is instituted for saying divine service, and administering the holy sacraments to the people, dwelling within a certain compass of ground near unto it. *Cowel*.—The married state of *parochial* pastors hath given them the opportunity of setting a more exact and universal pattern of holy living to the people committed to their charge. *Atterbury*.

PAROCHIALITY, *f.* State of being parochial.—For this especial reason the second rate should be quashed, because in confirming the second rate it would be for the justices to take upon themselves in effect to determine the *parochiality* of colleges. *Dr. Marriott on the Rights of both the Univ.* 1769.

PARO'CHIALLY, *adv.* In a parish; by parishes.—The bishop was to visit his whole diocese, *parochially*, every year. *Bp. Stillingfleet.* 1690.

PARO'CHIAN, *adj.* Belonging to a parish.—A computation is taken of all the *parochian* churches. *Bacon's Confid. on the Ch. of England*.

PARO'CHIAN, *f.* A parishioner.—[They] have incited their *parochians* and their auditories to conceive erroneous opinions. *Strype's Life of Abp. Parker*.

PARO'CHUS, *f.* Among the Romans, one who provided mules, tents, and carriages, with all other necessities, for the provincial magistrates in their journeys, as

also for ambassadors; for, in the early times of the republic, they had their charges borne by the public, that the allies or provincials might not be burdened.

PAROD'IC, or PARODICAL, *adj.* [from the Gr. *παρὰ*, through, and *ὁδός*, a way.] In algebra, regularly ascending or descending; as the indices of the unknown quantity in affected equations.

PAROD'ICAL, *adj.* [from *parody*.] Copying after the manner of parody.—This version is very paraphrastic, and sometimes *parodical*. *Warton's Hist. E. P.*

PAR'ODY, *f.* [*parodie*, Fr. *παρῳδία*, Gr.] A kind of writing, in which the words of an author or his thoughts are taken, and by a slight change adapted to some new purpose.—They were satirick poems, full of *parodies*; that is, of verses patched up from great poets, and turned into another sense than their author intended them. *Dryden's Orig. and Progr. of Satire*.—The imitations of the ancients are added, together with some of the *parodies* and allusions to the most excellent of the moderns. *Pope's Dunciad*.

The parody was first set on foot by the Greeks; from whom we borrow the name. It comes near to what some of our late writers call *travesty*. Others have more accurately distinguished between a parody and burlesque: and they observe, that the change of a single word may parody a verse, or of a single letter a word. Thus, in the last case, Cato exposed the inconstant disposition of Marcus Fulvius Nobilior, by calling him *Mobilior*.

Another kind of parody consists in the mere application of some known verse, or part of a verse, of a writer, without making any change in it, with a view to a different understanding of it. A fourth instance is that of writing verses in the taste and style of authors little approved.

The rules of parody regard the choice of a subject, and the manner of treating it. The subject should be a known and celebrated work: as to the manner, it should be by an exact imitation, and an intermixture of good-natured pleasantry. *Mem. de l'Acad. des Belles Lettres*, tom. viii.

The French term it *parodying an instrumental air* when it is made vocal, by writing or adjusting words to it. In good compositions, the melody is made for the words; but, in parodying an air, the words are set to the melody. In ballads, and songs of many stanzas to the same air, Rousseau observes, that all but the first are parodies, which is easily discovered by the liberties taken with the rhythm by the fingers, and the want of musical knowledge in the poet.

To PAR'ODY, *v. a.* To copy by way of parody.—I have translated, or rather *parodied*, a poem of Horace, in which I introduce you advising me. *Pope*.

PARO'L, *adj.* [from *parole*, Fr.] By word of mouth.—Proofs (to which in common speech the name of evidence is usually confined) are either written or *parol*, that is, by word of mouth. *Blackstone*.—He is tenant by custom to the planets, of whom he holds the twelve houses by lease *parol*. *Overbury's Charact.*

PAROL CONVEYANCES, such as were formerly, in many instances, made by *parol*, or word of mouth only, without writing; but, this occasioning a variety of frauds, the stat. 29 Car. II. c. 3. enacts, that no lease, estate, or interest in lands, tenements, or hereditaments, made by livery of seisin, or by *parol* only, (except leases not exceeding three years from the making, and whereon the reserved rent is at least two thirds of the real value,) shall be looked upon as of greater force than a lease or estate at will: nor shall any assignment, grant, or surrender, of any interest in any freehold hereditaments, be valid; unless in both cases the same be put in writing, and signed by the party granting, or his agent lawfully authorized, in writing.

PARO'LE, *f.* [French, contracted from *parabola*, Lat. *παράβολη*, Gr. whence the Span. *palabra*, and the Ital. *parola*; and from the verb *parabolare*, first the old Fr. *paroler*,

roler, and then *parler*. See *Menage*.] Word given as an assurance; promise given by a prisoner not to go away. —Be very tender of your honour, and not fall in love: because I have a scruple whether you can keep your *parole*, if you become a prisoner to the ladies. *Swift*.

Love's votaries enthral each other's soul,
Till both of them live but upon *parole*. *Cleaveland*.

PAROLE, in a military sense, the promise made by a prisoner of war, when he has leave to go any-where, of returning at a time appointed, or not to take up arms till exchanged. A breach of parole in European armies has always been held to be infamous. A person who has once been guilty of it, has no right to be treated as an officer; or to expect quarter should he again fall into the hands of the enemy.

PAROLE means also a word given out every day in orders by the commanding officer, both in camp and garrison, for the purpose of knowing friends from enemies.

PAROLE *fur* **PAROLE**. A military phrase among the French, meaning the mutual word which is given by two persons who come to a parley, though opposed to one another in the war, whereby they promise not to attack, or take any advantage during the intercourse. *James's Mil. Dict.*

PARONE, a town of Hindoostan, in the country of the Nays: thirty-two miles south of Calicut.

PARONOMA'SIA, *f.* [Gr. formed from *παρ*, near, and *ονομα*, name; q. d. proximity or resemblance of two names.] A pun, or figure, whereby words nearly alike in sound, but of very different senses, are affectedly or designedly used. As, Not *friends* but *fiends* were here. So Tully to Antony, *Cum in gremio mimarum mentem & mentum deponeres*; and to Atticus, *Consil ipse parvo animo & pravo, facie magis quam facetiis ridiculus*. And that of P. Chrysológus, *Monochorum cellula jam non eremiticæ sed aromaticæ*. And, in another place, *Hoc agant in cellis quod angeli in cœlis*. Among the Greeks the paronomasia was very familiar. Thus Herodotus, *Παθημασιν, μαθημασιν, quæ nocent, docent*. And thus that inscription of Apollodorus, a celebrated painter, on one of his pieces: *Μορησείαι τις μάλλον, η μιμησείαι*; "It will be easier to deride than to imitate."

PARONOMASTICAL, *adj.* Belonging to a paronomasy.—*Paronomastical* allusion is sufficient; and Thyatira of itself sounds near enough to Thygatira. *More on the Sev. Churches*.

PARONYCH'IA, [from the Gr. *παρ* and *ονυξ*, the nail.] An abscess towards the extremity of the finger, more commonly known by the name of whitlow.

PARONYCH'IA, *f.* in botany, a name that has been applied to several plants, according as commentators were pleased to conjecture one or other of them to be the *παρωνυχια* of Dioscorides, a point which nobody could ascertain. He describes it as "a diminutive shrub, growing in stony places, and resembling purslane, but of more humble growth, though the leaves are larger. The whole plant bruised is a remedy for whitlows and scald heads." Certain species of the following genera have by different botanists been supposed to be the true paronychchia: *Achyranthes*, *Asplenium*, *Celofia*, *Draba*, *Houstonia*, *Ilcebrum*, *Mollugo*, and *Saxifraga*. Of these, the *Draba verna*, in particular, has most commonly obtained the name of whitlow-grafs.

PARON'YMA, *f.* in grammar, are words which have some affinity in their etymology.

PARON'YMOUS, *adj.* Resembling another word.—Shew your critical learning in the etymology of terms, the synonymous and the *paronymous* or kindred names. *Watts*.

PAROPAM'ISUS, in ancient geography, a province of India, the eastern limit of which, in Alexander's arrangement of boundaries, was the river Cophenes. According to the ideas of Ptolemy, it lay between the countries which the moderns name Khorasan and Cabul; and

answers to the tract between Herat and Cabul. Alexandria was regarded as the capital. This province was separated from Bactria by the chain of mountains called Paropamisus.

PAR'OPAL, a town of Hindoostan, in the Carnatic; fourteen miles north-west of Volconda.

PAR'OPUS, in ancient geography, a town at the north of Sicily. Now *Colifano*.

PAROQUET', *f.* [*perroquet*, Fr.] A small species of parrot. See **PSITTACUS**.—The great, red, and blue, are parrots; the middlemost, called popinjays; and the lesser *paroquets*: in all above twenty sorts. *Grew*.

I would not give my *paroquet*
For all the doves that ever flew.

Prior.

PARORCHID'IUM, *f.* [from the Gr. *παρ*, and *ορχις*, testicle.] A case in which the testicles do not descend into the scrotum, but remain within the ring of the external oblique muscle, or pass no farther than the groin. A little before birth, these bodies usually descend into the scrotum; but it sometimes happens that this occurrence is retarded by causes with which we are not satisfactorily acquainted, and, in particular individuals, the testicles even continue within the abdomen during life. Mr. Pott remarks, that he knows not of any particular inconvenience arising from the detention of a testicle within the cavity of the belly; but its lodging in the groin exposes it to be hurt by accidents. When hurt, it may be mistaken for a different disease, and occasion very improper treatment. See **SURGERY**.

PA'ROS, an island in the Grecian archipelago, and one of those anciently called *Cyclades*; situated south of Delos, north of Ios and Sicinos, west of Naxos and very near it, and east of Olios or Antiparos, from which latter it is separated by a narrow channel. It was known by various names among the ancients; it was called *Minos*, because it was conquered by Minos, the renowned king of Crete; before that time, it was denominated *Paëtia*; and since it has repeatedly changed its name, till it took, and at last retained, that of Paros, either from the name of the son of Jason the argonaut, or of a certain Arcadian, son of Parrhasius. Although it was of small extent, not exceeding 36 miles in circumference, it formerly prided itself on its power and riches, which gave it great influence on the condition of the neighbouring islands. For these it was indebted to the activity of its commerce, and the culture of the arts; its excellent harbours were favourable to navigation and trade; and its quarries of beautiful marble inspired a taste for the arts, of which Phidias and Praxiteles, who were born in this island, eminently availed themselves. We may add that the valour of its inhabitants for a long time maintained its security and its liberty. The Parians, in the time of their prosperity, joined Darius in his expedition against Greece, and assisted him with a considerable squadron; but, after the victory of Miltiades and Marathon, they were reduced to great straits by that general. After the battle of Salamis, Themistocles subjected them to Athens, and exacted from them large contributions by way of punishment for the succours they had given to the Persians. From the dominion of the Ptolemies of Egypt, to which the Cyclades were constrained to submit, Paros reverted to that of the Athenians, till their conquerors were expelled by Mithridates the Great. But, when this prince was forced to submit to Sylla, Lucullus, and Pompey, Paros and the other Cyclades were reduced into a province by the Romans, together with Lydia, Phrygia, and Caria.

Its population was considerable when it was subjected to the Ottoman empire by Barbarossa; but since that epoch it has suffered so much by the pillage of the Turks, by the despotism of the government, and by the stay which the squadron of the captain-pacha makes there every year, that its inhabitants have imperceptibly disappeared, and that at this day it presents scarcely any thing

thing but uncultivated fields and villages partly destroyed. Its quarries of beautiful marble are abandoned, and partly filled up with rubbish; so that the descendants of its celebrated artists, whom misery and slavery have degraded, are no longer acquainted with an art which constituted the glory of their country. At the beginning of the last century, the number of its inhabitants was estimated at 6000; but at the present day they are supposed not to exceed 2000. The European consuls have long since withdrawn from it; the Catholics have fled; and the Greeks, who remain, idle and wretched, find themselves exposed every year to the oppression of the officers of the captain-pacha's Squadron, to the sword of the sailors, and to the rapacity of all. Although its extent is not so considerable as that of Naxos, it has in proportion a much greater quantity of land fit for culture. Its mountains are less elevated, its rising grounds less arid, and its plains would be as fertile, if they were as well watered.

The city of Paros, which was the metropolis of the island, is styled by Stephanus a potent city, and one of the largest in the Archipelago. Paros, or, as the natives call it, *Parechia*, is supposed to have been built upon its ruins; the neighbouring country abounding with valuable monuments of antiquity; the very walls of the present city are built with columns, architraves, and pedestals, mingled with pieces of ancient marble of a surprising bigness. Every one knows that Paros was formerly famous for its fine marble; which was of an extraordinary whiteness, and in such request among the ancients, that the best statues used no other. See *MARMOR micans*, vol. xiv. p. 389. It is also known that the Arundelian or Oxford Marbles, more properly called the Parian Chronicle, were written and preserved here. See vol. ii. p. 245. Pliny tells us, that the Parian marble, and no other, was made use of in adorning the frontispiece of the celebrated Labyrinth in Egypt, which was counted one of the wonders of the world. The best quarries were those of Marpetus, or Marpeffus, mentioned by Virgil, and his interpreter Servius. In this mountain are still to be seen caverns of an extraordinary depth, which the modern inhabitants and travellers take to be the ancient quarries. According to Pliny, these quarries were so uncommonly deep, that in the clearest weather the workmen were obliged to use lamps, from which circumstance the Greeks have called the marble *Lychnites*, "worked by the light of lamps." In one of the quarries, distant about four miles from the present city of Parechia, is still to be seen a basso relievo, cut in the rock, and containing 29 figures of nymphs and satyrs, dancing a kind of brawl. This was done, as appears from the inscription, by one Adamas Odryse, in honour of the nymphs. *Stewart's and Revett's Antiq. of Athens*. vol. iv.

The island is provided with several capacious and safe harbours. It is well cultivated; feeds a great number of sheep; and yields wheat, barley, fruit, legumes, and cotton. Before the war of Candi, the inhabitants made a great deal of oil; but, while the army of the Venetians remained on the island, they burnt all the olive-trees. Paros is likewise famous for the fine cattle which it produces, and for its partridges, and wild pigeons. Archilochus, the inventor of the Iambic verse, was a native of Paros. In this island, besides a great number of churches and chapels, are several considerable villages. A large fleet may lie conveniently and securely in the harbour of St. Maria; but the common anchoring-place for the Turkish navy is Drio, on the west side of the island. Lat. 37.4. N. lon. 25.18. E.

PAR'OTID, *adj.* [from the Greek *παρά*, by, and *ωρα*, the ears.] Salivary; so named because near the ears.—Beasts and birds, having one common use of spittle, are furnished with the *parotid* glands, which help to supply the mouth with it. *Grew*.

PAROTID GLAND, the largest of the salivary glands, situated in front of the ear.

PAROTIS, *f.* [Greek.] One of the glandules com-

monly called the almonds of the ears. A tumour in one of those glandules.

PAR'OXYSM, *f.* [from the Greek *παρά*, by, and *οξύω*, to sharpen.] A fit; periodical exacerbation of a disease.—The greater distance of time there is between the *paroxysms*, the fever is less dangerous, but more obstinate. *Arbuthnot*.

PARPAJAH, a town on the north-east coast of the island of Sumatra, on the river Camfer. Lat. 0. 15. N. lon. 102. 45. W.

PARPASARAT', an island in the straits of Malacca, near the coast of Sumatra, about fifty miles in circumference. Lat. 1. 21. N. lon. 102. 15. E.

PARPOO'LY, a town of Hindoostan, in Concan: twenty-eight miles north-north-east of Goa.

PARPOU'R, a town of Bengal: seventy miles north-west of Midnapour.

PARPOU'R, a town of Bengal: eight miles north of Curruckpoor.

PARPUNCTUM, *f.* An ancient coat of mail; a kind of doublet.

PARR, a town of England, in Lancashire, with 1183 inhabitants, including 431 employed in trade and manufactures: five miles north-west of Warrington.

PARR (Catharine), queen of England, was the eldest daughter of Sir Thomas Parr of Kendall. She was first married to John Nevil, lord Latimer; after whose death, by her marriage with Henry VIII. she was raised to the throne. The royal nuptials were solemnized at Hampton-court on the 12th of July, 1543. Being religiously disposed, she was, in the early part of her life, a zealous observer of the Romish rites and ceremonies; but, in the dawning of the Reformation, she became as zealous a promoter of the Lutheran doctrine; yet with such prudence and circumspection as her perilous situation required. Nevertheless, we are told that she was in great danger of falling a sacrifice to the popish faction, the chief of whom was Bishop Gardiner: he drew up articles against her, and prevailed on the king to sign a warrant to commit her to the Tower. This warrant was, however, accidentally dropped, and immediately conveyed to her majesty. What her apprehensions must have been on this occasion may be easily imagined. She knew the monarch; and she could not help recollecting the fate of his former queens. A sudden illness was the natural consequence. The news of her indisposition brought the king to her apartment. He was lavish in expressions of affection, and sent her a physician. His majesty being soon after also somewhat indisposed, she prudently returned the visit; with which the king seemed pleased, and began to talk with her on religious subjects, proposing certain questions, concerning what he wanted her opinion. She answered, that such profound speculations were not suited to her sex; that it belonged to the husband to choose principles for his wife; the wife's duty was, in all cases, to adopt implicitly the sentiments of her husband: and, as to herself, it was doubly her duty, being blessed with a husband who was qualified, by his judgment and learning, not only to choose principles for his own family, but for the most wise and knowing of every nation. "Not so, by St. Mary," replied the king; "you are now become a doctor, Kate, and better fitted to give than receive instruction." She meekly replied, that she was sensible how little she was entitled to these praises; that, though she usually declined not any conversation, however sublime, when proposed by his majesty, she well knew that her conceptions could serve to no other purpose than to give him a little momentary amusement; that she found the conversation a little apt to languish when not revived by some opposition, and she had ventured sometimes to feign a contrariety of sentiment, in order to give him the pleasure of refuting her; and that she also proposed, by this innocent artifice, to engage him into topics whence she had observed, by frequent experience, that she reaped profit and instruction. "And is it

OLD PARR.

Engraved for the Encyclopædia Londinensis 1728.

it so, sweetheart?" replied the king; "then we are friends again!" He embraced her with great affection, and sent her away with assurances of his protection and kindness.

The time being now come when she was to be sent to the Tower, the king, walking in the garden, sent for the queen, and met her with great good humour; when, lo, the chancellor, with forty of the guards, approached. He fell upon his knees, and spoke softly with the king, who called him "knave, arrant knave, beast, fool," and commanded him instantly to depart. Henry then returned to the queen, who ventured to intercede for the chancellor: "Ah poor soul," said the king, "thou little knowest how evil he deserveth this grace at thy hands. Of my word, sweetheart, he hath been toward thee an arrant knave: and so let him go." These particulars are but slightly hinted at under the article ENGLAND, vol. vi. p. 640, 1. The king died in January 1547, just three years and a half after his marriage with this second Catharine: who in a short time was again espoused to Sir Thomas Seymour, lord-admiral of England; and in September 1548 she died in childbed. The historians of this period generally insinuate that she was poisoned by her husband, to make way for a projected marriage with the lady (afterwards queen) Elizabeth.

That Catharine Parr was beautiful is beyond a doubt: that she was pious and learned is evident from her writings: and that her prudence and sagacity were not inferior to her other accomplishments, may be concluded from her holding up the passion of a capricious tyrant as a shield against her enemies; and that at the latter end of his days, when his passions were enfeebled by age, and his peevish austerity increased by disease. She wrote, 1. *Queen Catharine Parr's Lamentations of a Sinner*, bewailing the ignorance of her blind life; Lond. 8vo. 1548, 1563. 2. *Prayers or Meditations*, wherein the mynd is stirred patiently to suffer all afflictions here, to set at nought the vaine prosperitee of this worlde, and always to long for the everlastynge felicittee. Collected out of holy workes, by the most virtuous and gracious princeesse Katherine, Queen of Englande, France, and Irelande. Printed by John Wayland, 1545, 4to. 1561, 12mo. 3. *Other Meditations, Prayers, Letters, &c.* unpublished.

PARR (Thomas), or OLD PARR, a remarkable Englishman, who lived in the reigns of ten kings and queens; married a second wife when he was 120, and had a child by her. He was the son of John Parr, a husbandman, of Winnington, in the parish of Alderbury, in the county of Salop, where he was born in the year 1483. Though he lived to the vast age of upwards of 152 years, yet the tenor of his life admitted but of little variety; nor can the detail of it be considered of importance, further than what will arise from the gratification of that curiosity which naturally inquires after the mode of living which could lengthen life to such extreme old age. Following the profession of his father, he laboured hard, and lived on coarse fare. Taylor the water-poet says of him:

Good wholefome labour was his exercise;
Down with the lamb, and with the lark would rise;
In mire and toiling sweat he spent the day,
And to his team he whistled time away:
The cock his night-clock; and, till day was done,
His watch and chief sun-dial was the fun.
He was of old Pythagoras' opinion,
That green cheefe was most wholefome with an onion;
Coarse messin-bread; and, for his daily swig,
Milk, butter-milk, and water, whey and whig:
Sometimes metheglin; and, by fortune happy,
He sometimes sipp'd a cup of ale most nappy;
Cyder or perry, when he did repair
T'a Whisfun-ale, wake, wedding, or a fair,
Or when in Christmas-time he was a guest
At his good landlord's house among the rest:
Else he had little leisure time to waste,
Or at the ale-house huff-cap ale to taste.

VOL. XVIII. No. 1270.

Nor did he ever hunt a tavern-fox;
Ne'er knew a coach, tobacco, or the ———.
His physick was good butter, which the foile
Of Salop yields, more sweet than Candy oil;
And garlic he esteem'd above the rate
Of Venice treacle, or best mithridate.
He entertained no gout, no ache he felt:
The air was good and temperate where he dwelt;
While mavises and sweet-tongu'd nightingales
Did chant him roundelays and madrigals.
Thus living within bounds of Nature's laws,
Of his long lasting life may be some cause.

And the same writer describes him in the two following lines:

From head to heel, his body had all over
A quick-set thick-set natural hairy cover.

The manner of his being conducted to London is also noticed in the following terms: "The right honourable Thomas earl of Arundel and Surrey, earl marshal of England, on being lately in Shropshire to visit some lands and manors which his lordship holds in that county, or for some other occasions, the report of this aged man was signified to his honour, who hearing of so remarkable a piece of antiquity, his lordship was pleased to see him; and in his innate, noble, and Christian, piety, he took him into his charitable tuition and protection, commanding a litter and two horses (for the more easy carriage of a man so feeble and worn with age) to be provided for him; also, that a daughter of his, named Lucy, should likewise attend him, and have a horse for her own riding with him; and, to cheer up the old man, and make him merry, there was an antique-faced fellow, with a high and mighty no-beard, that had also a horse for his carriage. These were all to be brought out of the country to London by easy journeys, the charge being allowed by his lordship; likewise one of his lordship's own servants, named Bryan Kelly, to ride on horseback with them, and to attend and defray all manner of reckonings and expences. All which was done accordingly as follows: Winnington is a parish of Alderbury, near a place called the Welch Pool, eight miles from Shrewsbury; from whence he was carried to Wem, a town of the earl afore-said; and the next day to Shiffnall, a manor-house of his lordship's, where they likewise stayed one night: from Shiffnall they came to Wolverhampton, and the next day to Birmingham, and from thence to Coventry. The next day they passed to Daintree, to Stony Stratford, to Radburne, and so to London; where he was well entertained and accommodated with all things, having all the afore-said attendance at the sole charge and cost of his lordship." When brought before the king, his majesty, with more acuteness than good manners, said to him, "You have lived longer than other men, what have you done more than other men?" He answered, "I did penance when I was a hundred years old."

This journey, however, proved fatal to him; owing to the alteration in his diet, to the change of the air, and his general mode of life, he lived but a very short time, dying the 5th of November 1635, and was buried in Westminster Abbey. After his death, his body was opened; and an account was drawn up by the celebrated Dr. Harvey, part of which we shall lay before our readers. "He had a large breast; lungs not fungous, but sticking to his ribs, and distended with blood; a lividness in his face, as he had a difficulty of breathing a little before his death, and a long lasting warmth in his armpits and breast after it; which sign, together with others, were so evident in his body as they use to be on those that die by suffocation. His heart was great, thick, fibrous, and fat. The blood in the heart blackish and diluted. The cartilages of the sternum not more bony than in others, but flexible and soft. His viscera were found and strong, especially the stomach; and it was observed of him, that

7 Z he

he used to eat often by night and day, though contented with old cheese, milk, coarse bread, small beer, and whey; and, which is more remarkable, that he ate at midnight a little before he died. His kidneys were covered with fat, and pretty sound; not the least appearance there was of any stony matter either in the kidneys or bladder. His bowels were also sound. His spleen very little, hardly equalling the bigness of one kidney. In short, all his inward parts appeared so healthy, that, if he had not changed his diet and air, he might perhaps have lived a good while longer. The cause of his death was imputed chiefly to the change of food and air; forasmuch as, coming out of a clear thin and free air, he came into the thick air of London; and, after a constant plain and homely country diet, he was taken into a splendid family, where he fed high, and drank plentifully of the best wines, whereupon the natural functions of the parts of his body were overcharged, his lungs obstructed, and the habit of the whole body quite disordered; upon which there could not but ensue a dissolution. His brain was found, entire, and firm; and, though he had not the use of his eyes, nor much of his memory, several years before he died, yet he had his hearing and apprehension very well; and was able, even to the 130th year of his age, to do any husbandman's work, even thrashing of corn."

The following summary of his life is copied from Oldys's MS. notes on Fuller's Worthies: Old Parr was born 1483; lived at home until 1500, æt. 17, when he went out to service. 1518, æt. 35, returned home from his master. 1522, æt. 39, spent four years on the remainder of his father's lease. 1543, æt. 60, ended the first lease he renewed of Mr. Lewis Porter. 1563, æt. 80, married Jane, daughter of John Taylor, a maiden; by whom he had a son and a daughter, who both died very young. 1564, æt. 81, ended the second lease which he renewed of Mr. John Porter. 1585, æt. 102, ended the third lease he had renewed of Mr. Hugh Porter. 1588, æt. 105, did penance in Alderbury church, for lying with Katharine Milton, and getting her with child. 1595, æt. 112, he buried his wife Jane, after they had lived 32 years together. 1605, æt. 122, having lived ten years a widower, he married Jane, widow of Anthony Adda, daughter of John Lloyd of Giffells, in Montgomeryshire, who survived him. 1635, æt. 152, he died; after they had lived together 30 years, and after fifty years possession of his last lease.

PARR's POINT, a cape on the north-east coast of the island of St. Christopher.

PAR'RA, a town of Persia, in the province of Segestan: sixty miles north of Zareg.

PAR'RA, *f.* the JACANA; in ornithology, a genus of birds of the order grallæ. Generic characters—Bill tapering, somewhat obtuse; nostrils oval, in the middle of the bill; front covered with lobate caruncles; the wings are spinous, or spurred. Sixteen species are enumerated by Gmelin, which are as follow.

1. Parra Dominica, the St. Domingo jacana; so called from its being found in that island, as also in the island whence it derives its specific name, and in almost all the warm parts of America. Specific character, claw moderate, legs yellow. The bill is yellow; the caruncle lax, and of a pale-yellow colour; the head and body above are of a pale-yellow, beneath it is ochry, inclining to rosy.

2. Parra Ludoviciana, the Louisiana jacana: bill and caruncle tawny; crown black; body above grey-brown, beneath ochry. It is about eleven inches long, and is found in the country whence it takes its name. The quill-feathers are black, mixed with a little grey; the tail is of a pale yellow, tipped with black; the legs are red; claws black.

3. Parra Cayanensis, the Cayenne jacana: legs reddish; hind-head brown, with a blackish crest. It inhabits Cayenne, feeds on insects, and is about eight inches and a half in length. The bill is red, tipped with black; front

and chin black; middle of the crown cinereous; breast with a broad black band; belly and vent white; back greenish-purple; wings white without; tail from the base to the middle white, the rest black, the tip edged with white.

4. Parra Goensis, the Goa jacana: caruncle red; legs yellow; head, neck, wings, and middle of the tail, black; body beneath white. It is found in or near Goa; and is about thirteen inches long. The bill is dusky; from the hind part of the eye a black streak runs through the sides of the neck as far as the breast; the back and wing-coverts reddish-brown, the greater ones white; the tail is white at the base, and tipped with brown.

5. Parra Senegalla, the Senegal jacana: claws moderately long, legs red. It is found, as its name imports, near Senegal; and is twelve inches long. The bill is of a yellowish-green, tipped with black; the front is white; caruncle lax, and of a pale yellow: chin and throat black; lower part of the belly, tail-coverts, and greater wing-coverts, whitish; quill-feathers black, tipped with white. At the bend of the wings is a black spur: the tail, from the base to the middle, is whitish; the rest black, tipped with reddish; the rest of the body and head is of a grey-brown.

6. Parra Chilensis, the Chilian jacana: claws moderately long; legs brown; hind-head sub-crested. It inhabits Chili; and is the size of a jay, but with longer legs. It feeds on worms and insects, is noisy, and defends itself by the spurs on its wings; it builds in the grass, and lays four tawny eggs, which are speckled with black. The bill is conical, and about two inches long, a little curved at the tip; the irides are yellowish; caruncle two-lobed and red; the neck, back, and fore part of the wings, are violet; throat and breast black; wings and a short tail brown; spurs on the wings yellowish, conical, bony, and about half an inch long. It is a handsome species.

7. Parra jacana, the chefnut jacana: hind claws very long; legs greenish. This beautiful bird has spurs on the shoulders, and shreds of membranes on the fore-side of the head; its toes and nails are extremely long; all the nails are straight, round, and drawn out like needles; and from this circumstance probably it received at St. Domingo the appellation of *furceon*. The species is common in all the marshes of Brasil; and also in Guiana, and St. Domingo. We may presume that it is likewise found in all the tropical parts of America, both on the continent and in the islands, as far as New Spain; though Fernandez seems to speak of it only from report, since he makes it come from the north, whereas it is really a native of the south. The head, the neck, and the fore-side of the body, of this bird, are black, tinged with violet; the great quills of the wings are greenish; the rest of the upper surface is fine red chefnut, with a purplish or ferruginous cast: each wing is armed with a pointed spur inserted in the shoulder, exactly like the spines of the craped ray-fish; a membrane, taking its origin at the root of the bill, spreads on the front, and divides into three portions, leaving also a barbel on each side. The bill is straight, inflated somewhat at the point, and of a fine yellow jonquil, like the spurs; the tail is very short, and this character, as well as the form of the bill, the tail, the toes, and the height of the legs, of which the half is covered with feathers, belongs more or less to all the species of jacanas. Total length about ten inches: they are always found lean; yet it is said their flesh is palatable and good.

These birds go commonly in pairs; and, when separated by some accident, they call each other incessantly till they join again; a very striking instance of conjugal affection. They are generally very wild, and the sportsman cannot approach them but by wiles, covering himself with leaves, or running behind the bushes or the reeds. They are seen regularly in St. Domingo during the rainy months of May and November, or shortly after; yet a few are seen at other times, which would show that

1. The Chestnut Jacana. 2. the African. 3. the Chinese.

the places of their habitual abode are not very remote. But they are never found except in marshes, or at the sides of pools and brooks. The flight of these birds is not lofty, but pretty rapid: in rising they vent a shrill cry, which is heard far, and seems to bear some resemblance to that of the white owl. The poultry are alarmed, taking it for the scream of a bird of prey, though the jacana is very remote from that tribe. Nature we might suppose has armed it for war, yet we know not any foe which it combats. It is represented on the annexed Plate, at fig. 1.

8. *Parra nigra*, the black jacana: hind claws very long; legs cinereous; head, neck, tail, and body above, black. It inhabits Brasil, and is about the same size as the last. The bill is of a saffron-colour; the front is rufous; the breast, belly, and vent, brown; quill-feathers green, tipped with brown; the wing-spurs are yellow.

9. *Parra Brasiliensis*, the Brazilian jacana: hind claws very long; body greenish-black. It inhabits Brasil and Guiana. The Brasilians call it *aguu-pecaca*. The name *porphyrio*, which Barrere has given it, seems intended to denote its red feet. The same author says that it is common in Guiana, where it inhabits the pools of fresh water, and the meres; it is usually seen in pairs, though sometimes twenty or thirty flock together. There are always some in summer seen round the town of Cayenne; and in the rainy season they appear even in the open parts of the town; they lurk among the rushes, and live on fish and water-insects. In Guiana, as well as in Brasil, there are four or five varieties of this species, which are known under different names. They sit on the broad leaves of the water-lily; and the natives give them the appellation of *hinkin*, expressive of their shrill note.

10. *Parra viridis*, the green jacana: hind-claws long, yellow; legs yellowish-green; body blackish-green. It inhabits Brasil; and is of the size of a pigeon. The bill is partly red, and partly yellow; the front is red; the head, neck, and breast, are of a glossy-violet; the toes are very long.

11. *Parra variabilis*, the variable jacana: hind-claws long; legs bluish. This is also denominated "the spur-winged water-hen," and is about nine inches long. The colour of the bill is of an orange-yellow. On the forehead is a flap of red skin; the crown of the head is brown, marked with spots of a darker colour; the hind part of the neck is much the same, but of a deeper dye. On the fore part of the wing is a yellow spur. The legs and claws are of a bluish ash. This species inhabits Brasil; and is said to be pretty common about Carthagera, and in other parts of South America.

12. *Parra Luzoniensis*, the Luzonian jacana: beneath white; toes long; legs black. This species is found in the marshy and maritime parts of the Manilla islands; and is about the size of the lapwing. Bill of a greyish colour, straight, and a little enlarged at the end: top of the head deep brown; over the eye a stripe of white, passing down on each side the neck; and changing into pale-yellow behind the eye: through the eye another stripe of an ash-colour accompanies the first quite down to the wing; the back is brown; the under parts, from chin to vent, white, except a large spot of brown on the breast; at the bend of the wing is a sharp spur; the smaller wing-coverts are white, the others pale brown, transversely barred with black; the second quills white; the prime ones black; from the three last of these arise three naked shafts, two inches long, and ending in a lance-shaped feathered point; they spring from the middle of the shaft of the feather to which they belong, the shaft appearing as divided or branching into two at that part; the toes and claws are very long, as in the others, and of a dusky-black.

13. *Parra Africana*, the African jacana: colour pale cinnamon; toes long; legs greenish-black. Length nine inches and a half. Bill dusky, of a pale brownish

horn-colour at the tip; forehead bare. The upper parts of the plumage of a very-pale cinnamon-colour; chin and throat white; breast of a tawny yellow, mottled and barred on the sides of it and the neck with black; the under parts like the back, but darker; greater quills black; on the inner part of the bend of the wing a short blunt spur; through the eye, passing to the hind part of the neck, quite to the back, black; legs greenish black; hind claw an inch and a half in length. Inhabits Africa; represented at fig. 2.

14. *Parra Sinensis*, the Chinese jacana: toes very long; legs greenish; body claret-colour. This species is much larger than the last, approaching nearly to the size of the golden pheasant; and is in length, including the tail, twenty-one inches. Bill dusky blue; crown of the head, forehead, and all beneath, as far as the breast, pale cinereous cream-colour; back part of the head black, of the neck yellow, divided from the white before by a line of black on each side; the body vinaceous red; wing-coverts white, quills black; tail very long. It is supposed to inhabit China, having been seen among some fine drawings done in that country. It also inhabits the East-Indies. See fig. 3.

15. *Parra chavaria*, the faithful jacana: crested; toes long, legs tawny. This is the largest of the genus; and stands a foot and a half from the ground. The bill is conic, a little bent, and of dirty-white colour; the upper mandible as in the cock; nostrils oblong, pervious; on both sides, at the base of the bill, is a red membrane, which extends to the temples; in the middle of this are placed the eyes; the irides are brown. The hind head is furnished with about a dozen blackish feathers, three inches in length, which form a crest; these hang downwards; the rest of the neck, which is pretty long, is covered with a thick black down, but under the bill and temples it is of a pure white. The body is brown; the wings and tail blackish, clouded with grey; tail short; on the bend of the wing appear two or three spurs half an inch in length; belly black, but less deep; the thighs are half-way bare of feathers; knee-joints thick and swelling; legs very long, strong, and of a yellowish-red colour.

This bird inhabits the lakes, &c. near the river Cinu, about thirty leagues from Carthagera, in South America, and is said to feed on vegetables. Its gait is solemn and slow; but it flies easily and swiftly. It cannot run, unless assisted by the wings at the same time. When any part of the skin is touched by the hand, a crackling is felt, though it is very downy beneath the feathers; and indeed this down adheres so closely as to enable the bird at times to swim. The voice is clear and loud, but far from agreeable. The natives, who keep poultry in great numbers, have one of these tame, which goes along with the flock about the neighbourhood to feed during the day, when this faithful shepherd defends them against birds of prey; being able, by means of the spurs upon the wings, to drive off birds as big as the carrion-vulture, and even that bird itself. It is so far of the greatest use, as it never deserts the charge committed to its care, bringing them all home safe at night. It is so tame as to suffer itself to be handled by a grown person; but will not permit children to touch it. For this account we are indebted to Linnæus, who seems to be the only ornithologist that has given any account of this singular bird.

16. *Parra Indica*, the Indian jacana: blackish-blue; back and wings brown; eye-brows white; a red spot at the gape of the mouth. It is found in many parts of India, among the marshes, and builds a floating nest. The bill is yellow, the base above is bluish; the legs are of a yellowish-brown.

PAR'RAL, a town of Mexico, in the province of New Biscay, on a river which runs into the Conchos: 230 miles north of Durango, and 550 north of Mexico. Lat. 28. 10. N. lon. 105. 12. W.

PARRAMATTA, a settlement founded in New South Wales, near Port Jackson: ten miles west of Sydney Cove.

PARRAMPORE, one of the small islands in the Atlantic ocean, which line the east coast of Northampton county, Virginia.

PARRAS, a town of Mexico, in the province of Zacatecas: ninety miles north of Zacatecas.

PARRECEY, a town of France, in the department of the Jura: three miles south of Dôle, and four north-north-east of Chauslin.

PARREL, *f.* [a naval word.] A frame or machine to fasten the yards to the mast, so as to raise or lower them.

PARRENNIN (Dominic), a distinguished Jesuit missionary, was born in 1665, at le Russey, in Franche-Comté. He entered among the Jesuits at Avignon in 1682; and, feeling a strong inclination to engage in the missions of the society, he was sent to China in 1698. The emperor Cam-hi, who reigned at that time, was favourable to the Christian missionaries, on account of the scientific improvements which they introduced into his dominions; and father Parrennin had masters assigned him for the Chinese and Manthoo-Tartar languages, in which he acquired a proficiency beyond that of any preceding European. The emperor, who was a thoughtful and learned man, frequently conversed with him on the history, manners, and politics, of Europe, and on different sciences with which he was desirous of becoming acquainted; and the missionary was obliged to study hard, to satisfy the curiosity of the Chinese monarch. He translated into the Tartarian language every thing which he found new and curious in geometry, astronomy, and anatomy, in the Memoirs of the French Academy of Sciences, and in other works. During the space of twenty years he followed this emperor in his progresses through the different provinces of the empire; and for a still longer time he acted as interpreter for all European missionaries and ambassadors who came into China, and as mediator in the disputes between the courts of Moscow and Peking. He drew up many books in the Chinese and Tartarian languages, as well for the information of the emperor as the instruction of the proselytes. He wrote a vast number of letters to correspondents in Europe, relative to the business of his mission, and to the manners, customs, sciences, and occurrences, of China, which were printed in Du Halde's Collection. Of these the most valuable are his letters to De Mairan. From the labours of this zealous missionary proceeded the maps of all the provinces of China, and of the Chinese Tartary, with which Du Halde's description of that empire is illustrated. Parrennin died at Peking in 1741, and was honoured by the emperor Kien-Long with a public funeral.

PARREO, a town of Hindoostan, in Bahar: twenty-three miles west-south-west of Patna.

PARRET, a river of England, which has its source, and derives its name, from South Perrot, a small village about four miles south of Crewkerne, in Somersetshire, on the borders of Dorsetshire, where it rises from a small spring, and passes through a fine valley to Haselbury, South Petherton, Langport (where it first becomes navigable), Bridgewater, &c. and runs into the Bristol Channel about ten miles below the last town. *Wilkes's British Directory*, vol. ii.

PARRHASIA, in ancient geography, a town of the Peloponnesus, in Arcadia: it is mentioned by Homer and Pliny; but not noticed by Pausanias nor Strabo. It was supposed to be founded by Parrhasius, the son of Jupiter. The Arcadians are sometimes called *Parrhasians*, and *Arcus Parrhasis*.

PARRHASIUS, a famous painter of antiquity, was a native of Ephesus. His father, Evenor, was also a painter, and flourished in the ninetieth olympiad, or B.C. 420. The son may be placed twenty-five years later, which will correspond with the age of Zeuxis, with whom he is related to have had a competition. According to the re-

presentation of Pliny, Parrhasius first gave symmetry to painting, first threw a sprightly expression into the countenance, made the hair to flow with elegance, and infused grace into the features; and, by the general consent of artists, excelled all painters in the contour or outline. As an instance of his powers in expressing the complications of character and sentiment, the same writer mentions that he painted the Genius of the Athenian state, fickle and inconstant, at once mild and passionate, clement and cruel, just and unjust, proud and humble, in short, a medley of inconsistencies. How he contrived to represent these contradictory qualities in one subject, we are not told, nor is it easy to conceive. Some of his other celebrated pieces were a picture of Theseus, which appears to have procured him the citizenship of Athens, and was afterwards placed in the Capitol of Rome; Meleager, Hercules, and Perseus, in one piece; a Cretan nurse, with a child in her arms; Bacchus, with Virtue standing by; two admirable figures, one of a man running a race in armour and seeming to sweat under the weight; the other pulling off his armour and appearing to pant with the past exertion. He likewise painted fancied portraits of many of the heroes of antiquity; and was not less distinguished for the fertility than the powers of his pencil. His high reputation rendered him singularly vain and arrogant. He assumed lofty titles, and affected a splendor in his dress beyond the condition of a private citizen. This might perhaps be the cause of the preference given above him to Timanthes, when they painted in concurrence the contest of Ajax with Ulysses for the armour of Achilles. Parrhasius is said to have relaxed from his greater exertions by small performances of a lascivious character. A story which, if true, would render his memory detestable, is the subject of one of the controversial declamations of Seneca the rhetorician; who says, that this painter, having to represent Prometheus tortured, purchased an old Olynthian captive, and caused him to die in torments by way of a model. But this is probably a mere fiction; for Olynthus was not taken till Parrhasius must have been, if living, in extreme old age. It is certain that he was in high esteem among his contemporaries; and Xenophon makes him an interlocutor with Socrates in a dialogue on the pictorial art. A work of his is the subject of an elegant epigram in the Greek Anthology; and there are several passages in the poets alluding to his celebrity. See farther under the article PAINTING, p. 210 of this volume.

PARRHASIUS (Aulus-Janus), the assumed name of GIANPAOLO PARISIO, an eminent philologist, born in 1470. He was originally from Cosenza; and his father, Tommaso Parisio, was a counsellor in the Neapolitan senate. Having imbibed in his youth a decided taste for polite literature, he displeased his father by declining the study of the law, and was deprived of further assistance in his education. The wars in the kingdom of Naples occasioned his removal to Rome, where his life was brought into danger through his intimacy with two cardinals who incurred the displeasure of pope Alexander VI. He made his escape to Milan, where he married a daughter of Demetrius Chalcondylas, and was appointed professor of eloquence in the university. He was in this situation in 1500, when he first published his Commentaries upon Claudian's Rape of Proserpine. Such was the reputation he acquired by his learned lectures, that he had sometimes the famous general Trivulzi for an auditor. He had also among his scholars the celebrated Andrea Alciati, who, however, afterwards brought a charge of imposture against his master, as citing books which never existed. The cause of his quitting Milan, was an accusation of an infamous nature brought against him; which perhaps, had no other foundation than the envy of his rivals. He retired to Vicenza, where he was elected to the chair of eloquence with a liberal salary. The wars consequent upon the league of Cambray obliged him to quit that country; and he returned to his native place, where

where he laid the foundation of the Cosentine Academy, which afterwards became famous. Some domestic difficulties caused him to accept an invitation from Leo X. to occupy the chair of eloquence at Rome. The gout, however, to which he was a martyr, would not permit him long to fulfil the duties of this office; and he returned to Cosenza, where, after passing many years in continual suffering, he was released by death in 1534. Parrhasius ranks among the many unfortunate men of letters; having been a wanderer during great part of his life; subject to frequent losses, among which was that of his children, and of his library, which was five times pillaged; and a victim to indigence and disease.

The works of Parrhasius were published conjunctively by Henry Stephens in 1567, 8vo. The principal of these is entitled, "*Liber de Rebus per Epistolam quæsitis*," and consists of a number of letters written to different learned men, containing explanations of passages in the ancient writers, and elucidations of points of antiquity, and displaying much erudition, but not equal felicity of style. There are, besides, Illustrations of Ovid's Heroical Epistles, of Horace's Art of Poetry, of Cicero's Oration for Milo, and various other tracts on classical subjects. The whole collection was reprinted in the first volume of Gruter's *Thesaurus Criticus*. A new edition of the book *De Quæsitis*, with additions from the author's manuscript, was given at Naples in 1771. *Tiraboschi*.

PARRHESIA, *f.* [Greek.] In rhetoric, a figure in which a person admonishes or reproves another with art and address, and in such circumstances as render it difficult to displease. See *Rev.* ii. 2—5.

PARRIAH, a town of Hindoostan, in Bahar: 35 miles north of Durbungah. Lat. 26. 41. N. lon. 85. 52. E.

PARRICIDAL, or **PARRICIDIOUS**, *adj.* [from *parricide*.] Relating to parricide; committing parricide.—He is now paid in his own way, the *parricidious* animal; and punishment of murderers is upon him. *Brown*.

On brothers' and on fathers' empty beds
The killers lay their *parricidal* heads. *May's Lucan*.

PARRICIDE, *f.* [*parricide*, Fr. *parricide*, Lat.] One who destroys his father:

I told him the revenging gods
Gainst *parricides* did all their thunder bend;
Spoke with how manifold and strong a bond,
The child was bound to the father. *Shakespeare*.

One who destroys or invades any to whom he owes particular reverence: as his country or patron. The crime of murdering a father.—*Parricide* is not distinguished in the British law from any other case of murder; except where the child is also the servant of the parent, when it is punishable as petty treason. *Jacob's Law Dict.*

Morat was always bloody, now he's base;
And has so far in usurpation gone,
He will by *parricide* secure the throne. *Dryden*.

Murder of any one to whom reverence is due.—Although he were a prince in military virtue approved, and likewise a good law-maker; yet his cruelties and *parricides* weighed down his virtues. *Bacon*.

PARRICIDE, *Parricida*, or *Patricida*, in strictness, denotes the murder or murderer of a father; as *matricide* does of a mother: though the word parricide is ordinarily extended to both. The Romans, for a long time, had no law against parricides; which was also the case at Athens; from an opinion that nobody could be so wicked as to kill a parent. The Persians, according to Herodotus, entertained the same notion, when they adjudged all persons who had killed their reputed parents to be accounted bastards. L. Ostius was the first who killed his father, five hundred years after Numa's death; and then the Pompeian law was made, which ordained, that the person convicted of this crime, after he had been first scourged till the blood came, should be tied up in a

VOL. XVIII. No. 1271.

leathern sack, together with a dog, an ape, a cock, and a viper, and so thrown into the sea, or the next river.

PARRIDA, a small island in the Pacific Ocean, near the coast of Veragua. Lat. 7. 16 N.

PARRIER, a town of Hindoostan, in Oude: thirty-five miles south-west of Lucknow.

PARROAH, a town of the island of Ceylon: fifty miles west-south-west of Trincomalee, and thirty-six north of Candy. Lat. 8. 17. N. lon. 80. 34. E.

PARROCEL (Joseph), an eminent battle-painter, was born in 1648, at Brignoles in Provence. He learned the rudiments of his art under his father Bartholomew, a painter, and his brother Louis, who practised in the same profession in Languedoc. At the age of twenty he went to Rome, where he entered the school of Courtois, named *Bourgoigne*, a famous painter of battles. He imbibed from that master a taste for the same branch of composition, and acquired a great degree of excellence. For further improvement he travelled to the other principal towns of Italy, and resided a considerable time at Venice to study the eminent colourists of that school. On his return to France, he fixed himself at Paris, where he married, and was received into the Academy of Painting. The victories of Louis XIV. furnished subjects to his pencil which could not fail of pleasing that monarch: and, notwithstanding the ill-offices of Mansard, superintendent of the royal buildings, whom he offended by an action for debt, the king heard of his picture of the Passage of the Rhine, and, upon inspection, approved it so much, that he ordered several pieces of him for the palace of Versailles. He was very industrious, and worked with great facility, drawing all his ideas from the fund of his own fancy, for he never was a witness of scenes similar to those he painted. His colouring was extremely fresh and lively, his touch light, and his compositions full of spirit and movement. Few have surpassed him in fire and animation, and in the variety of characteristic attitudes and expressions. Although battles, marches, and huntings, were his favourite subjects, he did not confine himself to them, but occasionally painted portrait and history. He had a taste for letters, and was well acquainted with sacred and profane history; a series of his own etchings of the Life of Christ, presented to the academy, did him great credit, as well for the design as the excellent management of the lights and shades. Parrocel was a man of very respectable private character, regular in his conduct, sincere, pious, and charitable. He died of an apoplexy in 1704, at the age of fifty-seven. His principal works are at Paris, in the church of Notre Dame, Versailles, the Invalids, and various hotels.

PARROCEL (Charles), son of the preceding, born at Paris in 1688, was brought up first under his father, and then in the school of La Fosse. He studied at Rome and Venice; and, following his father's line of the art, he served some years in the cavalry, in order to obtain exact ideas of military operations. On his return to France he painted several great works, by which he acquired a high reputation. He particularly excelled in representing horses, to which he gave singular animation, with the greatest variety and truth of figure and action. In 1744 and 1745 he accompanied Louis XV. into Flanders for the purpose of recording his victories by his pencil. He made ten designs from these subjects, but only finished that of the Battle of Fontenoy, in which he introduced a number of portraits. His health was injured by his campaigns; and he died of a dropy of the chest in 1752. Although his pictures have much merit, he was never able to attain his father's brilliancy and truth of colouring. Many of his battle and history pieces, and his cavalry-studies, are dispersed in the hotels and cabinets of Paris; and a number of his designs have been engraved.

There have been several other painters of this name and family; of whom *Ignatius Parrocel*, son of Louis,

and nephew and pupil of Joseph, is reckoned to have approached nearest to the manner of his uncle in his battle-pieces. He worked much in Italy and at Vienna; and died in 1722. *D'Argenville*.

PAR'ROCK, *f.* (the diminutive of park.) A paddock, a small inclosure. *Scott*.

PARROQUET', or PAROQUET. See PSITTACUS.

PARROT, *f.* [*perroquet*, Fr.] A party-coloured bird with a hooked bill, remarkable for the exact imitation of the human voice. See PSITTACUS.—Who taught the parrot human notes to try? *Dryden*.

Some will evermore peep through their eyes,
And laugh like parrots at a bag-piper. *Shakespeare*.

PARROT-FISH, *f.* A fish of the Pacific Ocean. See SCARUS.—The other sorts were chiefly parrot-fish. *Cook and King's Voyage*.

PARROT ISLANDS, a cluster of islands in Dusky Bay, New Zealand; three miles south-west of Facile Harbour.

PARROT'S KEY, a small island in the Spanish Main, near the Mosquito shore. Lat. 12. 7. N. lon. 82. 56. W.

PAR'ROTED, *adj.* [from *parrot*.] Taught to speak by rote like a parrot. *Ash*.

PAR'RY (Richard), a learned divine, was educated at Oxford, and in 1604 was made bishop of St. Asaph. He revised the first edition of the Welch Bible, which was published in 1620. Before his elevation to the episcopal dignity, he was master of Ruthin school, Denbighshire.

PAR'RY (John), generally known by the appellation of the celebrated *blind harper*. He was the first among his contemporaries who played either a lesson or a concerto on the treble Welch harp, an instrument which had been long lost to the world, and owed its revival to the genius and diligence of this great performer. He died at Rhubon, in Denbighshire, in 1782, about which time the pedal harp seems to have superseded all other harps on the continent as well as in our island, so that it appears as if its resuscitation was for a very short period.

To PAR'RY, *v. n.* [*parer*, Fr.] To put by thrusts; to fence.—A man of courage, who cannot fence, and will put all upon one thrust, and not stand *parrying*, has the odds against a moderate fencer. *Locke*.—Good fencers push and *parry* at the same time. The Spaniards *parry* with the poniard. The ancients *parried* with their bucklers. *Chambers*.

With learned skill, now push, now *parry*,
From Darii to Bocardo vary.

Prior.

To PAR'RY, *v. a.* To turn aside.—It enables him to put by, and *parry*, some subjects of conversation, which might possibly lay him under difficulties both what to say and how to look. *Ld. Chesterfield*.

Vice *parries* wide

The undreaded volley with a sword of straw. *Cowper's Task*.

PAR'RYING, *f.* The action of defending a man's self, or of staying off the thrusts, strokes, &c. offered him by another. See FENCING.

PAR'SBERG, a town of Bavaria, in the principality of Neuburg: nine miles north-east of Dietfurt, and eighteen north-west of Ratibon.

PARSCHINA, a town of Russia, in the government of Tobolsk, on the Nisnei Tunguska: 560 miles south-east of Turuchansk. Lat. 60. 40. N. lon. 106. 54. E.

PARSCHWITZ. See PARCHWITZ.

To PAR'SE, *v. a.* [from *pars*, Lat. a part.] To resolve a sentence into the elements or parts of speech. It is a word only used in grammar-schools.—Let him construe the letter into English, and *parse* it over perfectly. *Afcham's Schoolmaster*.—Let scholars reduce the words to their originals, to the first case of nouns, or first tense of verbs, and give an account of their formations and changes, their syntax and dependencies; which is called *parsing*. *Watts on the Mind*.

PAR'SEE. See PERSEE.

PARSHANDA'THA, *f.* [Heb. revelation of corporeal impurities.] A man's name. *Ejther*.

PARSHEPATNAM', a town of Hindoostan, in Marawar, on the coast: six miles north of Tondy.

PAR'SHORE. See PERSHORE.

PARSIMO'NIOUS, *adj.* [from *parsimony*.] Covetous; frugal; sparing. It is sometimes of a good, sometimes of a bad, sense.—Extraordinary funds for one campaign may spare us the expence of many years, whereas a long *parsimonious* war will drain us of more men and money. *Addison*.

PARSIMO'NIOUSLY, *adv.* Covetously; frugally; sparingly.—Our ancestors acted *parsimoniously*, because they only spent their own treasure for the good of their posterity; whereas we squandered away the treasures of our posterity. *Swift*.

PARSIMO'NIOUSNESS, *f.* A disposition to spare and save.—To view the Moors in their private roofs, I find them without *parsimoniousness*, and placing no character of good housekeeping in abundance of viands. *L. Addison's W. Barbary*.

PAR'SIMONY, *f.* [*parsimonia*, Lat.] Frugality; covetousness; niggardiness; saving temper.—The ways to enrich are many: *parsimony* is one of the best, and yet is not innocent; for it withholdeth men from works of liberality. *Bacon*.

PAR'SING, *f.* The act or exercise of resolving a sentence into the parts of speech, and accounting for the construction.

PAR'SLEY, *f.* [*perfil*, Fr. *perfil*, Welsh. *Johnson*.—Anciently and rightly our word was *perfeley*, from the Greek *περφολελλον*, growing on rocks. *Todd*.] An herb. See APIUM, vol. i.—Green beds of *parsley* near the river grow. *Dryden*.

PAR'SLEY, Macedonian. See BUBON.

——— Mountain. See ATHAMANTA.

——— Piert. See APHANES.

——— Stone. See ATHAMANTA.

——— Wild. See CARDIOSPERMUM.

PAR'SLEY-BED, *f.* That part of a garden where *parsley* is planted.—Sempronia dug Titus out of the *parsley-bed*, as they use to tell children; and thereby became his mother. *Locke*.

PAR'SNEP, *f.* See PASTINACA.—November is drawn in a garment of changeable green, and bunches of *parsneps* and turneps in his right hand. *Peacham on Blazoning*.

COW-PARSNEP. See HERACLEUM.

PRICKLY PARSNEP. See ECHINOPHORA.

WATER-PARSNEP. See SIUM.

PAR'SON, *f.* [derived either from *persona*, because the *parson* "omnium personam in ecclesia sustinet;" or from *parochianus*, the parish-priest. *Johnson*.—It is from *persona*, "ecclesiae persona;" and so anciently *parson* was written *persone*. *Todd*.] The rector or incumbent of a parish; one that has a parochial charge or cure of souls.—Abbot was preferred by king James to the bishopric of Coventry and Litchfield, before he had been *parson*, vicar, or curate, of any parish-church. *Clarendon*.—A clergyman:

Sometimes comes she with a tithe-pig's tail,

Tickling the *parson* as he lies asleep;

Then dreams he of another benefice. *Shakespeare*.

The ancient and honourable appellation of PARSON is synonymous with the modern term *rector*, i. e. director or governor of a parish. He is called *parson*, *persona*, because, by his person the church, which is an invisible body, is represented; and he is in himself a body-corporate, in order to protect and defend the rights of the church (which he personates) by a perpetual succession. 1 *Inst.* 300. It has been also said, that he is called *parson*, because he is bound, by virtue of his office, *in propria persona servire Deum*, to administer the sacraments, and officiate at the holy altar, in *person*. *Fleta*, l. 9. c. 18.

Though a parson has, during his life, the freehold in himself

himself of the parsonage-house, the glebe, the tithes, and other dues; yet these are sometimes *appropriated*; that is to say, the benefice is perpetually annexed to some spiritual corporation, either sole or aggregate, being the patron of the living; whom the law esteems equally capable of providing for the service of the church as any single private clergyman. See APPROPRIATION, vol. i.

The appropriating corporations, or religious houses, were wont to depute one of their own body to perform divine service, and administer the sacraments, in those parishes of which the *society* was thus the *parson*. This officiating minister was in reality no more than a curate, deputy, or viceregent of the appropriator, and therefore called *vicarius*, or vicar. His stipend was at the discretion of the appropriator, who was, however, bound of common right to find somebody, *qui illi de temporalibus, episcopo de spiritualibus, debeat respondere*. But this was done in so scandalous a manner, and the parishes suffered so much by the neglect of the appropriators, that the legislature was forced to interpose: and accordingly it is enacted, by stat. 15 Rich. II. c. 6. that in all appropriations of churches the diocesan bishop shall ordain (in proportion to the value of the church) a competent sum to be distributed among the poor parishioners annually; and that the vicarage shall be sufficiently endowed. It seems the parish were frequently sufferers, not only by the want of divine service, but also by withholding those alms for which, among other purposes, the payment of tithes was originally imposed: and therefore in this act a pension is directed to be distributed among the poor parochians, as well as a sufficient stipend to the vicar. But he, being liable to be removed at the pleasure of the appropriator, was not likely to insist too rigidly on the legal sufficiency of the stipend; and therefore, by statute 4 Hen. IV. c. 12. it is ordained, that the vicar shall be a secular person, not a member of any religious house; that he shall be vicar perpetual, not removeable at the caprice of the monastery; and that he shall be canonically instituted and inducted, and be sufficiently endowed, at the discretion of the ordinary; for these three express purposes, to do divine service, to inform the people, and to keep hospitality.

From this statute we may date the origin of the present vicarages; for, before this time, the vicar was nothing more than a temporary curate. All the tithes or dues of the church of common right belong to the rector; or to the appropriator or impropriator, who have the same rights as the rector; and the vicar is entitled only to that portion which is expressed in his endowment; or what his predecessors have immemorially enjoyed by prescription, which is equivalent to a grant or endowment. These endowments frequently invest the vicar with some part of the great tithes; therefore the words *rectorial* and *vicarial* tithes have no definite signification: but *great* and *small* tithes are technical terms; and which are, or ought to be, accurately defined and distinguished by the law. 1 Comm. c. 11. in n.

The distinction therefore of a parson and vicar is this: the parson, or *rector*, has for the most part the whole right to all the ecclesiastical dues in his parish; but a *vicar* has generally an appropriator over him, entitled to the best part of the profits, to whom he is in effect perpetual curate, with a standing salary; though in some places the vicarage has been considerably augmented by a large share of the great tithes; which augmentations were greatly assisted by stat. 29 Car. II. c. 8, enacted in favour of poor vicars and curates; which rendered such temporary augmentations (when made by the appropriators) perpetual.

The method of becoming a parson and a vicar is much the same. To both there are four requisites necessary: holy orders; presentation; institution; and induction. The method of conferring the holy orders of deacon and priest, according to the liturgy and canons, is foreign to the present purpose, any farther than as they are necessary requisites to make a complete parson or vicar. See the

article ORDINATION, vol. xvii. and Cookson's Common Prayer, p. 611.

By stat. 13 and 14 Car. II. c. 4, no person is capable to be admitted to any benefice, unless he hath been first ordained a priest; and then he is, in the language of the law, a *clerk in orders*. But, if he obtains orders, or a license to preach, by money or corrupt practices, (which seems to be the true though not the common notion of simony,) the person giving such orders forfeits 40l. and the person receiving 10l. and is incapable of any ecclesiastical preferment for seven years afterwards. 31 Eliz. c. 6.

Any clerk may be presented to a parsonage or vicarage; that is, the patron, to whom he advowson of the church belongs, may offer his clerk to the bishop of the diocese to be instituted. A layman also may be presented; but he must take priest's orders before his admission. As to *advowsons*, or the right of presentation, which are a species of private property, see the article ADVOWSON, vol. i.

But, when a clerk is presented, the bishop may refuse him upon many accounts. As, if the patron is excommunicated, and remains in contempt forty days. 2 Rol. Abr. 355. Or if the clerk be unfit: *Glanvil*, l. 13. c. 20. First, with regard to his person; as if he be a bastard; (though that incapacity seems now exploded, see BASTARD;) an outlaw, an excommunicate, an alien, under age, or the like. 2 Rol. Abr. 356. 2 Infl. 632. Stats. 3 Ric. II. c. 3. 7 Ric. II. c. 12. Next, with regard to his faith or morals; as for any particular heresy, or vice that is *malum in se*. Or, lastly, the clerk may be unfit to discharge the pastoral office, for want of learning. In any of which cases the bishop may refuse the clerk.

If an action at law be brought by the patron against the bishop for refusing his clerk, the bishop must assign the cause. If the cause be of a temporal nature, and the fact admitted, (as, for instance, outlawry,) the judges of the king's courts must determine its validity, or whether it be a sufficient cause of refusal: but, if the fact be denied, it must be determined by a jury. If the cause be of a *spiritual* nature, (as heresy, particularly alleged,) the fact, if denied, shall also be determined by a jury: and, if the fact be admitted or found, the court, upon consultation and advice of learned divines, shall decide its sufficiency. If the cause be want of learning, the bishop need not specify in what points the clerk is deficient, but only allege that he is deficient; for the statute 9 Edw. II. ft. 1. c. 13. is express, that the examination of the fitness of a person presented to a benefice belongs to the ecclesiastical judge. But, if the bishop return the clerk to be *minus sufficiens in literatura*, the court shall write to the metropolitan to re-examine him, and certify his qualifications; which certificate of the archbishop is final.

If the bishop hath no objections, but admits the patron's presentation, the clerk so admitted is next to be *instituted* by him; which is a kind of investiture of the spiritual part of the benefice; for by institution, the care of the souls of the parish is committed to the charge of the clerk. When a *vicar* is instituted, he (besides the usual forms) takes, if required by the bishop, an oath of perpetual residence; for the maxim of law is, that *vicarius non habet vicarium*: and, as the non-residence of the appropriators was the cause of the perpetual establishment of vicarages, the law judges it very improper for them to defeat the end of their constitution, and by absence to create the very mischief which they were appointed to remedy; especially as, if any profits are to arise from putting in a curate and living at a distance from the parish, the appropriator, who is the real parson, has undoubtedly the elder title to them.

When the ordinary is also the patron, and confers the living, the presentation and institution are one and the same act, and are called a *collation to a benefice*. By institution or collation the church is full, so that there can be no fresh presentation till another vacancy, at least in the

the case of a common patron; but the church is not full against the king till induction: nay, even if a clerk is instituted upon the king's presentation, the crown may revoke it before induction, and present another clerk. Upon institution also the clerk may enter on the parsonage house and glebe, and take the tithes: but he cannot grant or let them, or bring an action for them, till induction.

Induction is performed by a mandate from the bishop to the archdeacon, who usually issues out a precept to other clergymen to perform it for him. It is done by giving the clerk corporal possession of the church, as by holding the ring of the door, tolling a bell, or the like; and is a form required by law, with intent to give all the parishioners due notice, and sufficient certainty of their new minister, to whom their tithes are to be paid. See further under *INDUCTION*, vol. xi. And when a clerk is thus presented, instituted, and inducted into a rectory, he is then, and not before, in full and complete possession. *Co. Lit.* 300.

For the *rights* of a parson or vicar, in his tithes and ecclesiastical dues, see *TITHES*. As to his *duties*, they are so numerous, that it is impracticable to recite them here with any tolerable preciseness or accuracy; but the reader who has occasion may consult Bishop Gibson's *Codex*, Johnson's *Clergyman's Vade Mecum*, and Burn's *Ecclesiastical Law*. We shall therefore only just mention the article of *residence*, upon the supposition of which the law doth style every parochial minister an *incumbent*. By stat. 21 Hen. VIII. c. 13. parsons willingly absenting themselves from their benefices, for one month together, or two months in the year, incur a penalty of 5l. to the king, and 5l. to any person that will sue for the same; except chaplains to the king, or others therein mentioned, during their attendance in the household of such as retain them; and also except all heads of houses, magistrates, and professors in the universities, and all students under forty years of age residing there, *bona fide*, for study. Legal residence is not only in the parish, but also in the parsonage-house; for it hath been resolved, that the statute intended residence, not only for serving the cure and for hospitality, but also for maintaining the house, that the successor also may keep hospitality there.

For the more effectual promotion of this important duty of residence, a provision is made, by stats. 17 Geo. III. c. 53. 21 Geo. III. c. 66. for raising money upon ecclesiastical benefices, and to be expended in rebuilding, or repairing, the houses belonging to such benefices. By 43 Geo. III. c. 107. the governors of queen Anne's bounty are empowered to build parsonage-houses on livings augmented by that fund; and by 43 Geo. III. c. 108. persons, possessed in their own right, may by deed enrolled, or by will executed, three months before their decease, give lands not exceeding five acres, or personal property not exceeding 500l. for building parsonages (or churches), &c. Various acts have been passed for the effectuating of the like beneficent purposes in Ireland; viz. 43 Geo. III. c. 106. 46 Geo. III. c. 60. 48 Geo. III. c. 65.

Although there is but one way whereby one may become a parson or vicar; there are many circumstances, besides death, by which one may cease to be so. As, 1. By *cessum*, in taking another benefice. For, by stat. 21 Hen. VIII. c. 13. if any one, having a benefice of 8l. per ann. or upwards, (according to the present valuation in the king's books, *Cro. Car.* 456.) accepts any other, the first shall be adjudged void, unless he obtains a dispensation; which no one is entitled to have but the chaplains of the king and others therein mentioned; the brethren and sons of lords and knights, (but not of baronets, as that dignity did not exist at the time of the stat. 21 Hen. VIII.) and doctors and bachelors of divinity and law, admitted by the universities of this realm.

2. By *consecration*; for, when a clerk is promoted to a bishopric, all his other preferments are void the instant

that he is consecrated. But there is a method, by the favour of the crown, of holding such livings *in commendam*. *Commenda*, or *ecclesia commendata*, is a living commended, or recommended, by the crown to the care of a clerk, to hold till a proper pastor is provided for it. This may be temporary, for one, two, or three, years; or perpetual; being a kind of dispensation to avoid the vacancy of the living, and is called a *commenda retinere*. There is also a *commenda recipere*, which is to take a benefice *de novo*, in the bishop's own gift, or the gift of some other patron consenting to the same; and this is the same to him as institution and induction are to another clerk.

3. By *resignation*. But this is of no avail, till accepted by the ordinary; into whose hands the resignation must be made.

4. By *deprivation*; either, first, by sentence declaratory in the ecclesiastical courts, for fit and sufficient causes allowed by the common law; or conviction of other infamous crime in the king's courts; for heresy, gross immorality, and the like; or secondly, in pursuance of divers penal statutes, which declare the benefice void, for some *non-feasance* or neglect, or else some *mal-feasance* or crime. As, for simony; by stats. 31 Eliz. c. 6. 12 Ann. st. 2. c. 12. for maintaining any doctrine in derogation of the king's supremacy, or of the thirty-nine articles, or of the Book of Common Prayer; by stats. 1 Eliz. c. 1. 2. 13 Eliz. c. 12. for neglecting, after institution, to read the Liturgy and Articles in the church, or make the declarations against popery, or take the abjuration-oath; 13 Eliz. c. 12. for using any other form of prayer than the Liturgy of the Church of England; 1 Eliz. c. 2. in all which and similar cases the benefice is *ipso facto* void, without any formal sentence of deprivation. 6 Rep. 29, 30. 1 Comm. c. 11.

Though the parson is the chief person in a parish, yet the church-wardens have great power also: they are called *ecclesie guardiani*, guardians or keepers of the church. See vol. iv. 576-80. And, as the politics of the church-wardens and of the minister are often very much at variance, disputes frequently arise between them as to their respective rights and privileges in and about the church. The two following cases happened, both of them, during the last year, 1820; and both, we believe, arose out of a difference of opinion relating to her majesty the queen.

1. One of the church-wardens, and the ringers, of Charlton Mackrel, Somerset, having denied the right of the rector (the Rev. Mr. Sharpe) to control the ringing of the church-bells, the latter consulted Dr. Lushington on the subject, and the following is the substance of the doctor's opinion on the questions put to him by the rector: "That the consent of the minister (whether incumbent or curate) is necessary to authorize the ringing of bells in the church; the consent of the minister and one church-warden would be sufficient; but the consent of the minister against both church-wardens would not justify the ringing; and that no person has a right without the consent of the minister to place flags, garlands, or any thing else, either in or upon the church, or in the church-yard.

2. A cause of great importance was brought on before the spiritual court at Blandford, in December 1820. The rector of Wyke Regis and Weymouth, in the county of Dorset, was one day informed by his clerk, that Mr. Friend, the church-warden, had taken the key of the church from him, declaring that the rector had no right to the possession of it; that, as church-warden, it ought to be in his custody, and that, whenever the rector had any occasion for it, he might have it; but that he should first acquaint him with the particular purpose for which it was wanted, and with the nature of the duty to be performed. In such a case he would grant the key. The rector clearly saw, that, as the key had always been left with the clerk for the accommodation of both parties, this claim was set up merely to insult him; and he immediately ordered his proctor to cite Friend before the spiritual

ritual court, and to take Dr. Lushington's opinion upon the case, of which the following is a copy: "I am of opinion that the rector is entitled to the custody of the key of the church, he allowing the church-warden the use of it upon proper and necessary occasions. It is the duty of the church-warden to apply to the rector for the key when he wants it for lawful purposes; and he has no right to retain the general custody, and thereby put the rector to the inconvenience of sending to him for it. If the church-warden persists in retaining the possession of the key after demand made, I think he may be articled against in the ecclesiastical court having local jurisdiction, and punished by its authority. S. LUSHINGTON."—The defendant Friend, when the business came before the court, prudently followed the advice of his counsel; and, quite satisfied with the expenses which had already been incurred, instructed his proctor to confess the articles, and put an end to the suit by admitting the rector's exclusive right to the custody of the key. This affair, it seems, had been much canvassed among the advocates at Doctors' Commons. As the case is rather of a novel kind, they were at first somewhat divided in their opinions; but they are now unanimously agreed, that the key of the church is under the sole authority of the rector or vicar.

PARSON MORTAL. The rector of a church, instituted and inducted for his own life, was called *persona mortalis*; and any collegiate or conventional body, to whom the church was for ever appropriated, was termed *persona immortalis*. For further matter relating to parsons, see the articles CHURCH, CLERGY, CURATE, TITHES, &c.

PAR'SON'S FIE'LD, a town of Massachusetts, in the province of Maine: thirty-six miles north-west of Portland.

PAR'SON'S I'SLAND, a small island near the coast of Maine. Lat. 44. 36. N. lon. 67. 25. W.

PAR'SON'S TOWN, a town of the state of North-Carolina: thirty miles north-east of Salisbury.

PAR'SONAGE, *f.* The benefice of a parish.—I have given him the *parsonage* of the parish. *Addison*.—The house appropriated to the residence of the incumbent.—Dined by two o'clock at the Queen's Head, and then fraggled out alone to the *parsonage*. *Gray's Letters*.

PAR'SONS (Robert), an English Jesuit, was born of mean parentage at Nether Stowey in Somersetshire, in 1546. The quick parts which he displayed from infancy, caused him to be noticed by the vicar of the parish, who instructed him in Latin, and in 1563 procured him admission into Baliol college, Oxford. He soon acquired distinction as an acute disputant; and, having obtained a fellowship in his college, was made chaplain, and entered into holy orders. He took pupils, and became the most eminent tutor in that seminary. At this period he was so zealous a Protestant, that he gave admission to the writings of several authors of that persuasion into the college-library, exchanging for them many old books and manuscripts. In 1572 he succeeded to the office of burfar, and in the following year proceeded M. A. At this period a storm arose against him which was the occasion of his quitting the university, and the cause of which is differently stated. It appears that his harsh and disputatious temper had made him many enemies; and there seems sufficient authority for crediting a charge brought against him of falsifying his burfar's accounts, and thereby defrauding the society. More, a brother-jesuit, indeed affirms that his open declaration of an attachment to the Roman-catholic religion was the cause of measures being taken to compel him to resign; but there is good evidence that he continued to profess himself a Protestant as long as he remained in college.

His resignation took place in February 1573-4, and in that year he left England and went to Flanders. He spent some time in the Jesuits' college at Louvain, and then proceeded to Italy, with the intention of studying physic or law. Instead of pursuing either of these professions, he entered the society of Jesuits, in June 1575,

at Rome; and, completing his course of theological studies, became a chief penitentiary, and a director of the English seminary in that capital. On the recommendation of father (afterwards cardinal) Allen, he was appointed in 1580, together with Edmund Campion, to the dangerous mission of England, the object of which was not only to propagate the Catholic religion, but to excite disturbances against the government of Elizabeth. Parsons landed at Dover, disguised in a military habit, and proceeded to London, where he was joined by his companion. He entered with great zeal into the business of his mission, and loudly condemned those compliances with the existing authority in which many of the catholic laity thought themselves justified. He particularly opposed the occasional conformity of the papists in going to church, and wrote a discourse containing reasons against this practice. The vigilance of the queen's ministers rendered his office very hazardous; and, on the apprehension of Campion, the danger appeared so urgent, that he crossed the sea and withdrew to Rouen. He there employed himself in printing several books for the support of the cause, which he procured to be privately dispersed in England. One of these, entitled "A Christian Directory or Exercise," is highly extolled by the writers of his communion, and is said to have been very successful. In 1583 Parsons returned to Rome, where the management of the English mission was confided to him; and in 1586 the students in the English seminary at Rome chose him for their rector. In 1588, the year of the armada, he was sent by the general of the order into Spain, where he employed every engine to promote Philip's designs for the conquest of England. Among other expedients, he planted several English seminaries, the members of which he obliged to subscribe to the infant's title to the crown of England.

After the failure of this great project, when there were no longer any hopes of effecting the deposition of Elizabeth, he turned his thoughts to the defeating of king James's succession to the crown; and for this purpose, under the assumed name of *Doleman*, published in 1594 a famous treatise, entitled "A Conference about the next Succession to the Crown of England." This work is supposed to have been drawn up by Parsons from materials suggested in a society to which he belonged with cardinal Allen, sir Francis Inglesfield, and other English Catholics. Its object is twofold: first, to show upon what grounds kings may be deposed or set aside, of which one of the principal is argued to be difference of religion: this topic had been amply discussed, especially by the Jesuits, in the case of Henry IV. of France, and is here urged with so much force, that the book was afterwards reprinted, under very different circumstances, in support of the national rights in the disposal of the crown. The other object was to invalidate James's hereditary title to the English crown, by exhibiting the many other claims that might plausibly be adduced from different stocks of royalty. On this account the work was popularly called the "Book of Titles;" there were, however, several mistakes or misrepresentations in the genealogies, as was shown by Camden.

Parsons continued two years longer in Spain; and in 1596, after the death of Allen, he went to Rome, with the hope, it is thought, of succeeding him in the cardinalate. He was, however, not only disappointed in this expectation; but, upon several complaints against him from the English secular priests on the ground of his meddling and factious conduct, found the pope so ill disposed towards him, that he thought proper to retire to Naples, where he remained till the death of that pontiff, (Clement VIII.) In 1606 he returned to Rome, having assiduously employed himself during this interval, as he did afterwards, in executing the office of superintendant of the English mission, and writing a number of books for the advantage of his religion and order. It is allowed that he acquitted himself with equal vigour and fidelity in the

discharge of his trust, inflexible in the rigorous principles with which he commenced his catholic warfare. Of this he gave an example, by procuring the removal of the arch-priest of England for taking the oath of supremacy to king James; and by obtaining a brief from Paul V. for the deprivation of all the priests who took it. In April 1610 he was attacked with a fever, and soon appeared past recovery. In this state he dictated three letters relative to his office; and, having been indulged in all the ceremonial belonging to cardinals on their death-bed, he expired, and was interred in the chapel of the college of which he was rector. Father Parsons was undoubtedly a man of considerable abilities, and great industry; but his bigoted zeal led him to employ his talents to the injury of his native country, whilst his busy and domineering temper involved him in frequent quarrels with those of his own persuasion.

PARSONS (James), a physician, anatomist, and antiquarian, was born at Barnstable in 1705. Soon after birth he was taken to Ireland by his father, who was made a barrack-master in that country, and he received the early part of his education at Dublin. Being destined to the profession of physic, he went to Paris, where he attended the lectures of all the most eminent teachers in the different branches of medical science. He took the degree of M. D. at Rheims in 1736, and came to London, where he was employed as an anatomical assistant by Dr. James Douglas. He soon after commenced practice, and married. His residence was for many years in Red-lion-square, and the branch of the profession in which he was principally engaged was the obstetrical. In 1740 he was admitted a fellow of the Royal Society, with the most learned members of which he maintained an intimate connexion. He was likewise a member of the Antiquarian Society, and that of Arts and Manufactures; and he maintained a correspondence with some of the most eminent men of science abroad. Respectable for his morals, attainments, and usefulness, he died, much regretted, in 1770.

Dr. Parsons left the following works. 1. A Mechanical and Critical Enquiry into the Nature of Hermaphrodites, 8vo. 1741. which was principally a compilation. 2. A Description of the Urinary Human Bladder, and the Parts belonging to it, with Figures, 1742. which was intended to disprove the reported utility of Mrs. Stephens's medicines for the stone. 3. Philosophical Observations on the Analogy between the Propagation of Animals and that of Vegetables, 8vo. 1752. As an antiquary, Dr. Parsons distinguished himself by an elaborate publication, entitled, 4. Remains of Japhet; being historical enquiries into the affinity and origin of the European languages, 4to. 1767. This is a performance of great erudition and research; but the author, like most of the speculators upon these topics, is induced, by his zeal for establishing a system, to place too much confidence in fabulous traditions and dubious remains. He finds, in the inhabitants of the British isles, the lineal descendants of Gomer and Magog, with the vestiges of their primitive language. Besides these separate publications, Dr. Parsons was the author of several papers, printed in the Philosophical Transactions; viz. Croonian Lectures on Muscular Motion, 1745, in which he considers the muscular fibres as tubes. Human Physiognomy explained, in the Appendix to the Phil. Trans. for 1746; and several other papers on anatomical and physiological subjects, especially an account of the dissection of a rhinoceros, which is valuable, and illustrated by good figures. *Nichols's Anecdotes of Bowyer.*

PARSONS' TOWN. See BIRR, vol. iii.

PARSON'SIA, *f.* in botany, a genus of plants received that appellation from Mr. R. Brown, in memory of Dr. James Parsons. (See his article.) Dr. P. Browne, in his History of Jamaica, had already dedicated a plant to the same purpose; but that is *LYTHRUM PARSONIA* of Linnæus. As to the present genus, the three first of its

seven species are taken from the genus *ECHITES*, and have been already described under that article. The fourth is the *PERIPLOCA capularis*; while the three last, and indeed the whole genus, as the author himself remarks, are but too nearly related to *LYONSIA*. See, therefore, the articles referred to.

PART, *f.* [*pars*, Lat.] Something less than the whole; a portion; a quantity taken from a larger quantity.—The people stood at the nether *part* of the mount. *Exodus*.—This law wanted not *parts* of prudent and deep foresight; for it took away occasion to pry into the king's title. *Bacon*.—The citizens were for the most *part* slain or taken. *Knolles*.—These conclude that to happen often, which happeneth but sometimes; that never, which happeneth but seldom; and that always, which happeneth for the most *part*. *Brown*.—Our ideas of extension and number, do they not contain a secret relation of the *parts*? *Locke*.

Hele's cheeks, but not her heart;
Atalanta's better *part*.

Shakespeare.

Member.—He fully possessed the revelation he had received from God; all the *parts* were formed, in his mind, into one harmonious body. *Locke*.—Particular; distinct species.—Eusebia brings them up to all kinds of labour that are proper for women, as sowing, knitting, spinning, and all other *parts* of housewifery. *Law*.—Ingredient in a mingled mass.—Many irregular and degenerate *parts*, by the defective œconomy of nature, continue complicated with the blood. *Blackmore*.—That which, in division, falls to each.—My *part* was nothing but the shame. *Dryden*.

Go not without thy wife, but let me bear
My *part* of danger with an equal share.

Dryden.

Proportional quantity:

It was so strong, that never any fill'd
A cup, where that was but by drops inflill'd,
And drunke it off; but 'twas before allaid
With twenty *parts* in water.

Chapman.

Share; concern.—Sheba said, We have no *part* in David, neither have we inheritance in the son of Jesse. 2 *Sam.* xx. 1.—Agamemnon provokes Apollo, whom he was willing to appease afterwards at the cost of Achilles, who had no *part* in his fault. *Pope*.—Side; party; interest; faction. To take *part*, is to act in favour of another.—Call up their eyes, and fix them on your example; that so natural ambition might take *part* with reason and their interest to encourage imitation. *Glanville*.

Michael Caffio,

When I have spoken of you dispraisingly,
Hath ta'en your *part*.

Shakespeare.

Something relating or belonging.—For Zelmane's *part*, she would have been glad of the fall, which made her bear the sweet burden of Philoclea, but that she feared she might receive some hurt. *Sidney*.—For my *part*, I have no servile end in my labour, which may restrain or enslave the freedom of my judgement. *Wotton*.

For your *part*, it not appears to me,
That you should have an inch of any ground
To build a grief upon.

Shakespeare's Hen. IV.

Particular office or character.—The pneumatical part, which is in all tangible bodies, and hath some affinity with the air, performeth the *parts* of the air: as, when you knock upon an empty barrel, the sound is, in part, created by the air on the outside, and, in part, by the air in the inside. *Bacon's Nat. Hist.*

Accuse not nature; she hath done her *part*;
Do thou but thine.

Milton's P. L.

Character appropriated in a play.—That *part* was aptly fitted, naturally performed. *Shakespeare*.—Have you the lion's *part* written? give it me, for I am slow of study. *Shakespeare's Mid. Night's Dream*.—God is the master of the

the scenes : we must not chuse which *part* we shall act ; it concerns us only to be careful, that we do it well. *Bp. Taylor's Holy Living*.—Business ; duty.—Let them be so furnished and instructed for the military *part*, as they may defend themselves. *Bacon*.—Action ; conduct :

Find him, my lord,
And chide him hither strait : this *part* of his
Conjoins with my disease. *Shakespeare*.

Relation reciprocal.—The scripture tells us the terms of this covenant on God's *part* and our's ; namely, that he will be our God, and we shall be his people. *Tillotson*.

It might be deem'd, on our historian's *part*,
Or too much negligence or want of art,
If he forgot the vast magnificence
Of royal Thebesus. *Dryden*.

In good *PART* ; in ill *PART* : as well done ; as ill done.—God accepteth it in good *part*, at the hands of faithful men. *Hooker*.—[In the plural.] Qualities ; powers ; faculties, or accomplishments.—Any employment of our talents, whether of our *parts*, our time or money, that is not strictly according to the will of God, that is not for such ends as are suitable to his glory, are as great absurdities and failings. *Law*.

I conjure thee, by all the *parts* of man,
Which honour does acknowledge. *Shakespeare*.

Quarters ; regions ; districts.—Although no man was, in our *parts*, spoken of, but he, for his manhood ; yet, as though therein he excelled himself, he was called the courteous Amphialus. *Sidney*.—When he had gone over those *parts*, he came into Greece. *Æt* ii. 2.

All *parts* resound with tumults, plaint, and fears ;
And grisly death, in sundry shapes, appears. *Dryden*.

For the most *PART*. Commonly ; oftener than otherwise.—Of a plain and honest nature, for the most *part*, they were found to be. *Heylin*.

PART, *adv*. Partly ; in some measure :

For the fair kindness you have shew'd me,
And *part* being prompted, by your present trouble,
I'll lend you something. *Shakespeare's Tw. Night*.

To *PART*, *v. a*. To divide ; to share ; to distribute.—All that believed, sold their goods, and *parted* them to all men, as every man had need. *Acts* ii. 45.

Jove himself no less content wou'd be
To *part* his throne, and share his heaven with thee. *Pope*.

To separate ; to disunite.—Nought but death shall *part* thee and me. *Ruth* i. 17.

All the world,
As 'twere the business of mankind to *part* us,
Is arm'd against my love. *Dryden*.

To break into pieces.—*Part* it in pieces, and pour oil thereon, *Levit*. ii. 6.—To keep afunder :

In the narrow seas that *part*
The French and English, there miscarried
A vessel of our country. *Shakespeare*.

To separate combatants.—The stumbling night did *part* our weary powers. *Shakespeare*.

Jove did both hosts survey,
And, when he pleas'd to thunder, *part* the fray. *Waller*.
To discern :

The liver minds his own affair,
And *parts* and strains the vital juices. *Prior*.

To *PART*, *v. n*. To be separated.—Powerful hands will not *part* easily from possession. *Milton*.

'Twas for him much easier to subdue
Those foes he fought with, than to *part* from you. *Dryden*.

To quit each other.—He wrung Bassanio's hand, and so they *parted*. *Shakespeare*.—If it pleases God to restore

me to my health, I shall make a third journey ; if not, we must *part*, as all human creatures have *parted*. *Swift*.

What ! *part*, for ever *part* ? unkind Ismena ;
Oh ! can you think, that death is half so dreadful,
As it would be to live without thee. *Smith*.

To take farewell.—Upon his removal, they *parted* from him with tears in their eyes. *Swift*.

Ere I could
Give him that *parting* kiss, which I had set
Betwixt two charming words, comes in my father. *Shakef*.

Nuptial bower ! by me adorn'd, from thee
How shall I *part*, and whither wander ? *Milton's P. L*.

To have share.—As his *part* is that goeth down to the battle, so shall his *part* be that tarrieth by the stuff ; they shall *part* alike. 1 *Sam*. xxx. 24.—[*Partir*, Fr.] To go away ; to set out ;

So *parted* they ; the angel up to heaven
From the thick shade, and Adam to his bower. *Milton*.

To *PART WITH*. To quit ; to resign ; to lose ; to be separated from.—The ideas of hunger and warmth are some of the first that children have, and which they scarce ever *part with*. *Locke*.—What a despicable figure must mock-patriots make, who venture to be hanged for the ruin of those civil rights, which their ancestors, rather than *part with*, chose to be cut to pieces in the field of battle ? *Addison's Freeholder*.—The good things of this world so delight in, as remember, that we are to *part with* them, to exchange them for more durable enjoyments. *Atterbury*.—As for riches and power, our Saviour plainly determines, that the best way to make them blessings, is to *part with* them. *Swift's Miscell*.

Celia, for thy sake, I *part*
With all that grew so near my heart ;
And, that I may successful prove,
Transform myself to what you love. *Waller*.

Thou marble hew'rt, ere long to *part with* breath ;
And houses rear'rt, unmindful of thy death. *Sandys*.

PARTABLE, *adj*. Divisible ; such as may be parted.—His hot love was *partable* among three other of his mistresses. *Camden's Remains*.

PARTABPOUR, a town of Bengal : twenty-five miles east of Midnapour. Lat. 22. 21. N. lon. 87. 50. E.

PARTABPOUR, a town of Hindoostan, in Oude : ten miles east of Fyzabad.

PARTAGE, *f*. [French.] Division ; act of sharing or parting.—Men have agreed to a disproportionate and unequal possession of the earth, having found out a way, how a man may fairly possess more land than he himself can use the product of, by receiving, in exchange for the overplus, gold and silver : this *partage* of things, in an equality of private possessions, men have made practicable out of the bounds of society, without compact, only by putting a value on gold and silver, and tacitly agreeing in the use of money. *Locke*.

To *PARTAKE*, *v. n*. preterite, I *partook* ; participle passive, *partaken* ; [from *part* and *take*.] To have share of any thing ; to take share with : it is commonly used with *of* before the thing shared. *Locke* uses it with *in*.—How far brutes *partake in* this faculty is not easy to determine. *Locke*.—Truth and falsehood have no other trial, but reason and proof which they made use of to make themselves knowing, and so must others too, that will *partake in* their knowledge. *Locke*.

Partake and use my kingdom as your own,
And shall be yours while I command the crown. *Dryden*.

To participate ; to have something of the property, nature, claim, or right.—The attorney of the duchy of Lancaster *partakes partly* of a judge, and partly of an attorney-general. *Bacon*.—To be admitted to ; not to be excluded :

You

You may *partake* of any thing we say;
We speak no treason.

Shakespeare's Rich. III.

To PARTA'KE, *v. a.* To share; to have part in.—Let her with thee *partake* what thou hast heard. *Milton's P. L.*

My royal father lives!

Let every one *partake* the general joy. *Dryden.*

To admit to part; to extend participation to. *Obsolete.*
—Your exultation *partake* to every one. *Shakespeare.*

My friend, hight Philemon, I did *partake*
Of all my love, and all my privy,
Who greatly joyous seemed for my sake.

Spenser.

PARTA'KER, *f.* A partner in possessions; a sharer of any thing; an associate with: commonly with *of* before the thing partaken.—They whom earnest lets hinder from being *partakers* of the whole, have yet, through length of divine service, opportunity for access unto some reasonable part thereof. *Hooker.*

Didst thou

Make us *partakers* of a little gain;

That now our loss might be ten times as much? *Shakespeare.*

Sometimes with *in* before the thing partaken: perhaps *of* is best before a thing, and *in* before an action.—If we had been in the days of our fathers, we would not have been *partakers* with them *in* the blood of the prophets. *Matth. xiii. 30.*

With me *partaker* in thy happiness,
When thou dost meet good hap.

Shakespeare.

Accomplice; associate.—Thou consentedst, and hast been *partaker* with adulterers. *Psalms l. 18.*—He took upon him the person of the duke of York, and drew with him complices and *partakers*. *Bacon.*

PARTA'KING, *f.* Combination; union in some bad design. *A juridical sense.*—As it prevents factions and *partakings*, so it keeps the rule and administration of the laws uniform. *Hale.*

PARTAPA'H, a town of Hindoostan, in Bahar: thirteen miles north of Hajypour. Lat. 25. 54. N. lon. 85. 28. E.

PART'ED, *adj.* [from *part.*] Possessing accomplishments.—A man well *parted*, a sufficient scholar, and travelled. *B. Jonson's Every Man out of his Humour.*

PARTENAY. See PARTHENAY.

PARTENI, a river of Natolia, which runs into the Black Sea near Amasreh.

PARTENKERCH, a town of Bavaria, in the bishopric of Freysing: six miles south of Weilheim.

PART'ER, *f.* One that parts or separates.—The *partier* of the fray was night, which, with her black arms, pulled their malicious fights one from the other. *Sidney.*

PARTER'RE, *f.* [*parterre*, Fr.] A level division of ground, that, for the most part, faces the south and best front of an house, and is furnished with greens and flowers. *Miller.*—There are as many kinds of gardening as of poetry; your makers of *parterres* and flower-gardens are epigramatists and sonneteers. *Spectator.*

The vast *parterres* a thousand hands shall make;
Lo! Cobham comes, and floats them with a lake. *Pope.*

Of *parterres* there are two kinds; the plain ones and the *parterres* of embroidery. Plain *parterres* are most valuable in England, because of the firmness of the English grass-turf, which is superior to that of any other part of the world. *Parterres* of embroidery are those which are cut into shell and scroll work, with alleys between them. An oblong or long square, is accounted the most proper figure for a *parterre*; and a *parterre* should indeed be always twice as long as it is broad, because, according to the known laws of perspective, a long square always sinks to a square; and an exact square always appears less than it really is.

Parterres were formerly in great estimation, and were commonly situated directly in the front of the house, ge-

nerally the whole width, and sometimes more, extending proportionably in length: and, where the intermixture of the figures is artfully disposed, they strike the eye very agreeably, and afford an ornamental effect at all seasons. But works of this sort are now almost wholly out of use in this country; though, for the sake of variety, they may, on some occasions, still be admitted.

PARTESTI, a town of Bukovina: eighteen miles west of Sucava.

PAR'THA, a river of Saxony, which runs into the Pless near Leipzig.

PAR'THA, in mythology, a name of the Phallic emblem, worshipped by certain sects of Hindoos, and called by them LINGAM; see that article. The Partha is, we believe, a domestic idol, made of the usual conical form, with clay, and without any thing indecent in its appearance, for females to pay their daily adoration to. It is sometimes placed under a tree, and circumambulated a certain number of times daily, especially by barren females, in the hope of offspring. This ceremony is called *pradakshna*, and is described under that word.

PARTHENAY, a town of France, and principal place of a district, in the department of the Two Seves, near the river Thoue. The place contains 3213 inhabitants. The trade of the town, which is considerable, consists in cattle and corn: twenty-one miles north-north-east of Niort. Lat. 46. 38. N. lon. 0. 10. W.

PARTHENAY (John de), Lord of Soubise, an heroic leader among the protestants of France; born 1512, died 1566.

PARTHENAY (Catharine de), daughter and heiress of the preceding, whose courage and constancy in the cause of Calvinism she likewise inherited, was born in 1554. To her fortitude was joined a good share of wit, and no contemptible turn to poetry, as appears from some poems which she published in 1572, when she could not be above eighteen years of age. She wrote also tragedies and comedies; and particularly the tragedy of Holofernes, which was represented on the theatre of Rochelle in 1574. She also translated the Precepts of Isocrates into French.

This lady was twice married: first, in 1568, when only fourteen years of age, to the baron de Pons; and afterwards, in 1575, to Renatus viscount Rohan. The celebrated duke de Rohan, who so courageously defended the protestant cause in France during the civil wars of Louis XIII. was her eldest son. Catharine, one of her daughters, has rendered her name illustrious by the following answer which she made to Henry IV. who solicited her favours: "I am too poor, sire, to be your wife, and too proud to be your mistress." Catharine, the subject of this article, was at Rochelle at the time of its memorable siege; and, when the place surrendered, she and her daughters were sent to the castle of Niort. She died in 1631, at the age of seventy-seven.

PARTHENIA, or PARTHENOS, in mythology, an epithet given to Minerva, because she is said to have preserved her virginity. When the Rhodians neglected the worship of that goddess, and their care in improving the fine arts, the Athenians began to distinguish themselves in this respect, and took her for their patroness. Accordingly they dedicated to her a magnificent temple, under the name of Parthenon. Phidias adorned it with a statue of gold and ivory, which was a master-piece; and the Athenians also celebrated to her honour a festival, which was afterward called PANATHENÆA, described at p. 313 of this volume.

Parthenos was also a name given to Juno, from a notion that this goddess, by bathing herself every year in the fountain called Canathos, which was at Nauplia, recovered her virginity; a fable, founded, according to Pausanias, upon the secret mysteries that were celebrated in honour of this goddess.

PARTHENIA, in ancient geography, a town of Illyria, according to Polybius; called by Julius Cæsar *Opidum Parthinorum*.

PARTHENIAD,

PARTHENIAD, *f.* [from the Gr. *παρθενος*, a virgin.] A poem in honour of a virgin—Divers pieces of *partheniads*, and hymnes in praise of the most praise-worthy. *Harrington's Apologie of Poetrie.*

PARTHENIÆ. See the article GREECE, vol. viii. p. 843.

PARTHENIAN, *adj.* [from the Gr. *παρθενος*, a virgin.] Belonging to virginity. *Cole.*

PARTHENIAS, a river of Triphylia, which ran from north to south, and discharged itself into the river Alpharus near Olympia.—The ancient name of Samos.

PARTHENIAS'TRUM, *f.* in botany. See **PARTHENIUM**.

PARTHEN'ICUM, in ancient geography, a town of Sicily, upon the route from Lilybæum to Tyndaris, between Segestæ and Hyccara, according to the Itin. of Antonine.

PARTHENIUM, *f.* [a name adopted from Dioscorides, whose *παρθενιον*, however, is the real feverfew, *Matricaria parthenium* of Linnæus. The name, from *παρθενος*, a virgin, alludes to its reputed efficacy in some female complaints. The above name, being therefore unemployed as a generic one, Linnæus applied it to this new genus, much resembling the ancient herb in aspect, and perhaps in sensible qualities, which Nisfol and Dillenius, on account of such resemblance, had called *Partheniastrum*.] In botany, a genus of the class monocia, order pentandria, natural order of nucamentacæ, (corymbifera, *Juss.*) Generic characters.—Calyx: perianthium common, quite simple, five-leaved, spreading: leaflets roundish, flat, equal. Corolla: compound convex. Corollets hermaphrodite, many in the disk: females, five in the ray, scarcely surpassing the others. Proper of the hermaphrodites one-petalled, tubular, erect, with the mouth five-cleft, the length of the calyx: of the females one-petalled, tubular, ligulate, oblique, blunt, roundish, the same length with the other. Stamina: in the hermaphrodites; filaments five, capillary, the length of the corollet. Antheræ as many, thickish, scarcely cohering. Pistillum: of the hermaphrodite; germ below the proper receptacle, scarcely observable; style capillary, generally shorter than the stamens; stigma none. Of the female, germ inferior, turbinate-cordate, compressed, large; style filiform, the length of the corollet. Stigmas two, filiform, the length of the style, spreading a little. Pericarpium: none; calyx unchanged. Seeds: in the hermaphrodite, abortive: in the females, solitary, turbinate-cordate, compressed, naked. Receptacle: scarcely any, flat; chaffs separate the florets, so that each female has two hermaphrodites behind.—*Essential Character.* Male. Calyx common five-leaved; corolla of the disk one-petalled. Female. Corolla of the ray five; on each side two males, with one female between, superior. There are two species.

1. *Parthenium hysterophorus*, cut-leaved parthenium, or bastard feverfew: leaves compound-multifid. This is an annual plant, growing wild in great plenty in the island of Jamaica, where it is called *wild wormwood*. It thrives very luxuriantly about all the settlements in the low lands. It is observed to have much the same qualities with feverfew; and may be used, like that, in resolutive baths and infusions. It was cultivated in 1739 by Mr. Miller; and flowers here in July and August.

2. *Parthenium integrifolium*, or entire-leaved parthenium: leaves ovate, crenate; (see **BOTANY** Plate VII. fig. 6.) This is a perennial plant, which dies to the ground every autumn, and shoots up again the following spring. Height three feet and more, with thick round fleshy stems. Leaves half-embracing, hirsute, not hairy, somewhat paler underneath, with frequent oblique veins or nerves: root-leaves larger and longer, on keeled petioles. The flowers grow in a corymb at the ends of the stem and branches; the heads are snow-white above, whitish-green below, villose at first. The florets are white, and much larger than in the first species. Native

VOL. XVIII. No. 1271.

of Virginia, cultivated about 1661 by Mr. Walker, as appears from Plukenet; who says, that thirty years before (he published his *Phytographia*) he gathered a specimen of this plant in a garden belonging to Mr. Walker, at Westminster. Mr. Ray also (in 1686) says, that he cultivated it some years in his little garden at Cambridge, and that he had it from Walker, a gardener at London, whose son brought it, with other rare plants, from Virginia. Mr. Miller had seeds of it from his good friend Dr. Thomas Dale, who sent them from South Carolina: he says, that it grows also plentifully in several parts of the Spanish West Indies. It flowers in July, but seldom produces good seeds in England.

Propagation and Culture. The first may be propagated by sowing the seeds on a hot-bed early in the spring; and, when the plants come up, they should be transplanted on another hot-bed, at about five or six inches distance, observing to water and shade them until they have taken new root; after which time they must have a pretty large share of fresh air in warm weather, by raising the glasses of the hot-bed every day; and they must be duly watered every other day at least. When the plants have grown so as to meet each other, they should be carefully taken up, preserving a ball of earth to their roots, and each planted into a separate pot, filled with light rich earth; and, if they are plunged into a moderate hot-bed, it will greatly facilitate their taking fresh root; but, where this conveniency is wanting, the plants should be removed to a warm sheltered situation, where they must be shaded from the sun until they have taken new root; after which time they may be exposed, with other hardy annual plants, in a warm situation, where they will flower in July, and their seeds will ripen in September. But, if the season should prove cold and wet, it will be proper to have a plant or two in shelter, either in the stove or under tall frames, in order to have good seeds, if those plants which are exposed should fail, whereby the species may be preserved. The other species may be propagated by parting the roots in autumn, and may be planted in the full ground, where it will abide the cold of our ordinary winters very well. See **ACHILLEA**, **CHRYSANTHEMUM**, **IVA**, and **MATRICARIA**.

PARTHENIUM KARANDIP, a village of the Tauric Chersonesus, in the narrowest part of the strait called Cimmerian Bosphorus, sixty stadia above Panticapæum, and over against Achillæum. *Strabo*.—Also, a promontory of the Tauric Chersonesus, nearly south of Chersonesus. Near this promontory was a temple, and a statue of the goddess of the country.—Also, a town of the Peloponnesus, in Arcadia.—A town of Asia, in Mysia, in the vicinity of the Troade.—A town of Greece, in the island of Eubœa.

PARTHENIUM MA'RE, the name of a part of the Mediterranean Sea which bathed Asia and Africa in the place where these two regions of the globe joined each other. *Macrobius*.—Also, a promontory in the vicinity of the town of Heraclea.

PARTHENIUS, in ancient geography, a river of the Isle of Samos.—Also, a river of Asia Minor, which ran into the Euxine Sea, and separated the territories belonging to the towns of Amastris and Teium. *Strabo* represents it as a beautiful river, which pursued its course among meadows; and it had the name of the Virgin, on account of the worship paid to Diana on its banks.—Also, a river of Asia, in Cilicia, near the town of Anchiala. *Suidas*.—Also, a mountain of Argolis, which extended from west to east, from the Argolic Gulf to the frontiers of Arcadia. The poet Callimachus describes this mountain by the expression, "The sacred mountain of Augé:" denoting, as it is supposed, that on this mountain passed the amours of Hercules and Augæa, of which Telephus was the fruit. Here Telephus had a temple. Here also Atalanta was exposed and brought up. *Lempriere's Class. Dict.*

PARTHENON. See the article **ATHENS**, vol. ii. p. 466.

8 C

PARTHEN'OPÉ,

PARTHENOPE, one of the Syrens.—Also, a city of Campania, afterwards called *Neapolis*, or the New City, when it had been enlarged and beautified by a colony from Eubœa. It received its first name, Parthenope, from one of the Syrens, whose body was found on the sea-shore there. Now NAPLES.

PARTHENOPOLIS, a town of Macedonia. *Steph. Byz.*—Also, a town of Asia, in Bithynia, which did not subsist in the time of Pliny.—Also, a town of Upper Mœsia, subjugated by Lucullus.

PARTHIA, a celebrated empire of antiquity in Asia, bounded on the west by Media, on the north by Hyrcania, on the east by Aria, on the south by Carmania the desert; surrounded on every side by mountains, which still serve as a boundary, though its name is now changed, having obtained that of *Irac* or *Arac*; and, to distinguish it from Chaldæa, that of *Irac Agemi*. By Ptolemy it is divided into five districts, viz. Camisene, or Gamisene, Partheyne, Choroane, Atticene, and Tabiene. The ancient geographers enumerate a great many cities in this country. Ptolemy in particular reckons twenty-five large cities; and it certainly must have been very populous, since we have accounts of 2000 villages, besides a number of cities, in this district, being destroyed by earthquakes. Its capital was named *Hecatompolis*, from the circumstance of its having 100 gates. It was a noble and magnificent place; and, according to some, it still remains under the name of *Ispahan*, the capital of the present Persian empire.

Parthia is by some supposed to have been first peopled by the Phetri or Pathri, often mentioned in Scripture; and that the Parthians are descended from Pathrusim the son of Misraim. But, however true this may be with regard to the ancient inhabitants, yet it is certain, that those Parthians who were so famous in history were originally Scythians, driven out of their own country, and obliged to settle in this barren and inhospitable region. They called themselves, on their first settling here, *Parthians*; that is, in the old Scythian language, "exiles;" and hence, it is said, originated the name of Parthia.

The Parthians were a courageous and warlike people, not undervalued by the best horseman and archers in the world. They were accustomed, from their infancy, says Dionysius, (in *Poem de Situ Orb.*) to the warlike and manly exercises of managing a horse and handling a bow; and in both excelled all other nations. They had the art, peculiar to themselves, of discharging their arrows with incredible dexterity whilst they were retiring at full speed, so that their retreat was more formidable than their attack. To these exercises of horsemanship and archery, the air and country very much contributed; for the dry air, as Dio observes, seasoned their bows, and their extensive plains afforded them room for training their horses. From the age of twenty to fifty, they were all, without exception, obliged to serve in war, to attend the musters, learn the military exercises, and be ready, at a very short warning, to take the field. Persons of any rank or distinction among them, never appeared in public on foot, but always on horseback, armed with scimitars. In war they did not use trumpets like other nations, but large hollow vessels of brass, covered with skins, like our kettle-drums, which, being beat with hammers, yielded a very warlike sound. The Roman poets often refer to the military character and evolutions of the Parthians.

Their religion was much the same with that of the Persians, and they worshipped the sun under the name of Mithras. They believed that those who fell in battle enjoyed perpetual happiness; a doctrine suited to the genius of a warlike nation. They were religious observers of their promises, thinking it highly dishonourable not to perform their engagements, or to deceive those who reposed confidence in them.

As to their government, it was monarchical, and in the highest degree absolute. The kings treated their subjects

as the meanest of slaves, and scarcely as men, whilst they put themselves on a level with the immortal gods. Their usual titles were "the king of kings, the great monarch, the brother of the sun and moon." These haughty titles they not only assumed in all the laws and edicts they enacted, but in their letters to other princes. Their conduct corresponded to the lofty titles which they assumed; for they obliged all whom they vouchsafed to see, to kiss the threshold on their first entrance into the royal palace; to prostrate themselves before them on the ground, and to acknowledge their majesty with some offering.

The history of the Parthians is involved in great obscurity before the time of Arsaces I. They were first subject to the Medes, afterwards to the Persians, and lastly to Alexander the Great. Upon his death, Parthia fell to the share of Seleucus Nicator, whose successors held it till the reign of Antiochus Theus, when Arsaces, shaking off the Macedonian yoke, founded a new kingdom, which became much the most powerful in the east. Arsaces I. was properly the founder of the Parthian monarchy. Having induced the Parthians to revolt from Antiochus Theus, about the year 250 before Christ, and having defeated and taken prisoner his son and successor, Seleucus Callinicus, he assumed the title of king, and established an empire in the East, which counterbalanced the overgrown power of the Romans in the West. He reduced Hyrcania, and some other neighbouring provinces; and was at last killed in a battle against Ariarathes IV. king of Cappadocia. From him all his successors of the same race took the name of *Arsaces*; so that the Empire of the Parthians was sometimes denominated the Empire of the Arsacides.

Arsaces II. succeeded his father; and, entering Media, made himself master of that country, while Antiochus the Great was engaged in a war with Ptolemy Evergetes king of Egypt. Antiochus, however, was no sooner disengaged from that war, than he marched with all his forces against Arsaces, and at first drove him quite out of Media: but he soon returned with an army of 100,000 foot and 20,000 horse, with which he put a stop to the further progress of Antiochus; and a treaty was soon after concluded, in which it was agreed, that Arsaces should remain master of Parthia and Hyrcania, upon condition of assisting him in his wars with other nations.

Arsaces II. was succeeded by his son Priapates, who reigned fifteen years, and left three sons, Phraates, Mithridates, and Artabanus. Phraates, the eldest, succeeded to the throne, and reduced under his subjection the Mardi, who had never been conquered by any but Alexander the Great. After him, his brother Mithridates was invested with the regal dignity. He reduced the Bactrians, Medes, Persians, Elymeans, and overran in a manner all the east, penetrating beyond the boundaries of Alexander's conquests. Demetrius Nicator, who then reigned in Syria, endeavoured to recover those provinces; but his army was entirely destroyed; and himself taken prisoner, in which state he remained till his death. The reign of Mithridates is regarded by authors as the epoch of the Parthian grandeur; for, under him, that empire was by far the most extensive, as well as powerful, in the east: all the countries that lie between the Euphrates and Mount Caucasus receiving law from him; and most of the princes of Asia being either subdued, or obliged to enter into an alliance with him upon his own terms.

Mithridates died in the thirty-seventh year of his reign, and left the throne to his son Phraates II. who was scarcely settled in his kingdom, when Antiochus Sidetes, king of Syria, marched against him at the head of a numerous army, under pretence of delivering his brother Demetrius, who was still in captivity. Phraates was defeated in three pitched battles; in consequence of which he lost all the countries conquered by his father, and was reduced within the limits of the ancient Parthian kingdom. Antiochus did not, however, long enjoy his good fortune;

for

for his army, on account of their number, amounting to no fewer than 400,000, being obliged to separate to such distances as prevented them, in case of any sudden attack, from joining together, the inhabitants, whom they had most cruelly oppressed, taking advantage of this separation, conspired with the Parthians to destroy them. This was accordingly executed; and the vast army of Antiochus, with the monarch himself, were slaughtered in one day, scarcely a single person escaping to carry the news to Syria. Phraates elated with this success, proposed to invade Syria; but, in the mean time, happening to quarrel with the Scythians, he was by them cut off with his whole army, and was succeeded by his uncle Artabanus.

The new king enjoyed his dignity but a very short time, being, a few days after his accession, killed in another battle with the Scythians. He was succeeded by Pacorus, who entered into an alliance with the Romans; and he by Phraates III. This monarch took under his protection Tigranes, the son of Tigranes the Great, king of Armenia, gave him his daughter in marriage, and invaded the kingdom with the design to place the son on the throne of Armenia; but, on the approach of Pompey, he thought proper to retire, and soon after solemnly renewed the treaty with the Romans.

Phraates was murdered by his children Mithridates and Orodes; and soon after the former was put to death by his brother, who thus became sole master of the Parthian empire. In his reign happened the memorable war with the Romans under Crassus. This was occasioned, not by any breach of treaty on the side of the Parthians, but through the shameful avarice of Crassus. The whole Roman empire at that time had been divided between Cæsar, Pompey, and Crassus; and, by virtue of that partition, the eastern provinces had fallen to the lot of Crassus. No sooner was he invested with this dignity, than he resolved to carry the war into Parthia, in order to enrich himself with the spoils of that people, who were then looked upon to be very wealthy. Some of the tribunes opposed him, as the Parthians had religiously observed the treaty; but Crassus having, by the assistance of Pompey, carried every thing before him, left Rome in the year 55 B. C. and pursued his march to Brundisium, where he immediately embarked his troops, though the wind blew very high; and, after a difficult passage, where he lost many of his ships, he reached the ports of Galatia. From Galatia, Crassus hastened to Syria; and, passing through Judea, plundered the temple at Jerusalem in his way. He then marched with as great expedition as he could to the river Euphrates, which he crossed on a bridge of boats; and, entering the Parthian dominions, began hostilities.

As the Parthians had not expected an invasion, they were quite unprepared for resistance; and therefore Crassus overran all Mesopotamia; and, if he had taken advantage of the consternation which the Parthians were in, might have also reduced Babylonia. But, instead of this, early in the autumn he repassed the Euphrates, leaving only 7000 foot and 1000 horse to garrison the places he had reduced; and, putting his army into winter-quarters in Syria, gave himself totally up to his favourite passion of amassing money. Early in the spring, the Roman general drew his forces out of their winter-quarters, in order to pursue the war with vigour; but, during the winter, Orodes had collected a very numerous army, and was well prepared to oppose him. Before he entered upon action, however, the Parthian monarch sent ambassadors to Crassus, in order to expostulate with him on his injustice in attacking an ally of the Roman empire; but Crassus, without attending to what they said, only returned for answer, that "they should have his answer at Seleucia."

Orodes, finding that a war was not to be avoided, divided his army into two bodies. One he commanded in person, and marched toward Armenia, in order to oppose the king of that country, who had raised a considerable

army to assist the Romans. The other he sent into Mesopotamia, under the command of Surenas, a most experienced general, by whose conduct all the cities which Crassus had reduced were quickly retaken. On this, some Roman soldiers who made their escape, and fled to the camp of Crassus, filled the mind of his army with terror at the accounts of the number, power, and strength, of the enemy. They told their fellow-soldiers, that the Parthians were very numerous, brave, and well disciplined; that it was impossible to overtake them when they fled, or escape them when they pursued; that their defensive weapons were proof against the Roman darts, and their offensive weapons so sharp, that no buckler was proof against them, &c. Crassus looked upon all this as the effect of cowardice: but the common soldiers, and even many of the chief officers, were so disheartened, that Cassius, the same who afterwards conspired against Cæsar, and most of the legionary tribunes, advised Crassus to suspend his march, and consider better of the enterprise before he proceeded farther in it. But Crassus obstinately persisted in his former resolution, being encouraged by the arrival of Artabazus king of Armenia, who brought with him 6000 horse, and promised to send 10,000 cuirassiers and 30,000 foot, whenever he should stand in need of them. At the same time, he advised him by no means to march his army through the plains of Mesopotamia, but to take his route over the mountains of Armenia. He told him, that, as Armenia was a mountainous country, the enemy's cavalry, in which their main strength consisted, would there be entirely useless; and besides, his army would there be plentifully supplied with all manner of necessaries: whereas, if he marched by the way of Mesopotamia, he would be perpetually harassed by the Parthian horse, and frequently be obliged to lead his army through sandy deserts, where he would be distressed for want of water and all other provisions. This salutary advice, however, was rejected; and Crassus entered Mesopotamia with an army of about 40,000 men.

The Romans had no sooner crossed the Euphrates, than Cassius advised his general to advance to some of those towns in which the garrisons yet remained, in order to halt and refresh his troops: or, if he did not choose to follow this advice, he said that his best way would be to march along the banks of the Euphrates to Seleucia; as by this method he would prevent the Parthians from surrounding him, at the same time he would be plentifully supplied with provisions from his ships. Of this advice Crassus seemed to approve; but was dissuaded by Abgarus king of Edeffa, whom the Romans took for an ally, but who was in reality a traitor sent by Surenas to bring about the destruction of the Roman army.

Under the conduct of this faithless guide, the Romans entered a vast green plain divided by many rivulets. Their march proved very easy through this fine country; but the farther they advanced, the worse the roads became, insomuch that they were at last obliged to climb up rocky mountains, which brought them to a dry and sandy plain, where they could neither find food to satisfy their hunger, nor water to quench their thirst. Abgarus then began to be suspected by the tribunes and other officers, who earnestly entreated Crassus not to follow him any longer, but to retreat to the mountains; at the same time an express arrived from Artabazus, acquainting the Roman general that Orodes had invaded his dominions with a great army, and that he was obliged to keep his troops at home in order to defend his own dominions. The same messenger advised Crassus in his master's name to avoid by all means the barren plains, where his army would certainly perish with hunger and fatigue, and by all means to approach Armenia, that they might join their forces against the common enemy. But all was to no purpose; Crassus, instead of hearkening either to the advice of the king or his own officers, first flew into a violent passion with the messengers of Artabazus,

Artabazus, and then told his troops, that they were not to expect the delights of Campania in the most remote parts of the world.

Thus they continued their march for some days across a desert, the very sight of which was sufficient to throw them into the utmost despair; for they could not perceive, either near them or at a distance, the least tree, plant, or brook; nor so much as a hill, or a single blade of grass; nothing was to be seen all around them but huge heaps of burning sand. The Romans had scarcely got through this desert, when word was brought them by their scouts, that a numerous army of Parthians was advancing in full march to attack them; for Abgarus, under pretence of going out on parties, had often conferred with Surenas, and concerted measures with him for destroying the Roman army. Upon this advice, which occasioned great confusion in the camp, the Romans being quite exhausted and tired out with their long and troublesome march, Crassus drew up his men in battalia, following at first the advice of Cassius, who was for extending the infantry as wide as possible, that they might take up the more ground, and by that means prevent the enemy from surrounding them: but, Abgarus assuring the proconsul that the Parthian forces were not so numerous as was represented, he changed this disposition, and, believing only the man who betrayed him, drew up his troops in a square, which faced every way, and had on each side twelve cohorts in front. Near each cohort he placed a troop of horse to support them, that they might charge with the greater security and boldness. Thus the whole army looked more like one phalanx than troops drawn up in manipuli, with spaces between them, after the Roman manner. The general himself commanded in the centre, his son in the left wing, and Cassius in the right.

In this order they advanced to the banks of a small river called the Balissus, the sight of which was very pleasing to the soldiers, who were much harassed with drought and excessive heat. Most of the officers were for encamping on the banks of this river, or rather rivulet, to give the troops time to refresh themselves after the fatigues of so long and painful a march; and, in the mean time, to procure certain intelligence of the number and disposition of the Parthian army; but Crassus, suffering himself to be hurried on by the inconsiderate ardour of his son, and the horse he commanded, only allowed the legions to take a meal standing; and, before this could be done by all, he ordered them to advance, not slowly, and halting now and then, after the Roman manner, but as fast as they could move, till they came in sight of the Parthians, who, contrary to their expectation, did not appear either so numerous or so terrible as they had been represented; but this was a stratagem of Surenas, who had concealed his men in convenient places, ordering them to cover their arms, lest their brightness should betray them, and, starting up at the first signal, to attack the enemy on all sides. The stratagem had the desired effect; for Surenas no sooner gave the signal, than the Parthians, rising as it were out of the ground, with dreadful cries, and a most frightful noise, advanced against the Romans, who were greatly surprised and dismayed at the sight; and much more so, when the Parthians, throwing off the covering of their arms, appeared in shining cuirasses, and helmets of burnished steel, finely mounted on horses covered all over with armour of the same metal. At their head appeared young Surenas, in a rich dress, who was the first to charge the enemy, endeavouring, with his pikemen, to break through the first rank of the Roman army; but, finding it too close and impenetrable, the cohorts supporting each other, he fell back, and retired in a seeming confusion: but the Romans were much surprised when they saw themselves suddenly surrounded on all sides, and galled with continual showers of arrows. Crassus ordered his light-armed foot and archers to ad-

vance; but they were soon repulsed, and forced to cover themselves behind the heavy-armed foot. Then the Parthian horse, advancing near the Romans, discharged showers of arrows upon them, every one of which did execution, the legionaries being drawn up in such close order, that it was impossible to miss their aim. As their arrows were of an extraordinary weight, and discharged with incredible force and impetuosity, nothing was proof against them. The two wings advanced in good order, but to no effect; for the Parthians drew their bows with as great dexterity when their backs were turned as when they faced the enemy; so that the Romans, whether they kept their ground, or pursued the flying enemy, were equally annoyed with these fatal arrows.

The Romans, as long as they had any hopes that the Parthians, after having spent their arrows, would either betake themselves to flight or engage them hand to hand, stood their ground with great resolution and intrepidity; but, when they observed that there were a great many camels in their rear loaded with arrows, and that those who emptied their quivers wheeled about to fill them anew, they began to lose courage, and loudly to complain of their general for suffering them thus to stand still, and serve only as a butt to the enemy's arrows, which, they well saw, would not be exhausted till they were all killed to a man. Hereupon Crassus ordered his son to advance, at all adventures, with 1300 horse, 500 archers; and 8 cohorts. But the Parthians no sooner saw this choice body (for it was the flower of the army) marching up against them, than they wheeled about, and betook themselves, according to their custom, to flight. Hereupon young Crassus, crying out as loud as he could, "They fly before us!" pushed on full speed after them, not doubting but he should gain a complete victory; but, when he was at a great distance from the main body of the Roman army, he perceived his mistake; for those who before had fled, facing about, charged him with incredible fury. Young Crassus ordered his troops to halt, hoping that the enemy, upon seeing their small number, would not be afraid to come to a close fight; but herein he was likewise greatly disappointed; for the Parthians, contenting themselves to oppose his front with their heavy-armed horse, surrounded him on all sides; and, keeping at a distance, discharged incessant showers of arrows upon the unfortunate Romans, thus surrounded and pent up. The Parthian army, in wheeling about, raised so thick a dust, that the Romans could scarcely see one another, much less the enemy: nevertheless, they found themselves wounded with arrows, though they could not perceive whence they came. In a short time the place where they stood was all strown with dead bodies.

Some of the unhappy Romans, finding their entrails torn, and many overcome by the exquisite torments they suffered, rolled themselves in the sand with the arrows in their bodies, and expired in that manner. Others, endeavouring to tear out by force the bearded points of the arrows, only made the wounds the larger, and increased their pain. Most of them died in this manner; and those who outlived their companions were no more in a condition to act; for, when young Crassus exhorted them to march up to the enemy, some showed him their wounded bodies, others their hands nailed to their bucklers, and some their feet pierced through and pinned to the ground; so that it was equally impossible for them either to attack the enemy or defend themselves. The young commander, therefore, leaving his infantry to the mercy of the enemy, advanced at the head of the cavalry against their heavy-armed horse. The thousand Gauls, whom he had brought with him from the west, charged the enemy with incredible boldness and vigour; but their lances did little execution on men armed with cuirasses, and horses covered with tried armour: however, they behaved with great resolution; for some of them, taking hold of the enemy's spears, and closing with

with them, threw them off their horses on the ground, where they lay without being able to stir, by reason of the great weight of their armour; others, dismounting, crept under the enemy's horses, and, thrusting their swords into their bellies, made them throw their riders. Thus the brave Gauls fought, though greatly harraised with heat and thirst, which they were not accustomed to bear, till most of their horses were killed, and their commander dangerously wounded. They then thought it advisable to retire to their infantry, which they no sooner joined, than the Parthians invested them anew, making a most dreadful havoc of them with their arrows. In this desperate condition, Crassus, spying a rising ground at a small distance, led the remains of his detachment thither, with a design to defend himself in the best manner he could, till succours should be sent him from his father. The Parthians pursued him; and, having surrounded him in his new post, continued showering arrows upon his men, till most of them were either killed or disabled, without being able to make use of their arms.

Young Crassus had two Greeks with him, who had settled in the city of Carrhæ. These, touched with compassion, at seeing so brave a man reduced to such straits, pressed him to retire with them to the neighbouring city of Ichenes, which had declared for the Romans; but the young Roman rejected their proposal with indignation, telling them, that he would rather die a thousand times than abandon so many valiant men, who sacrificed their lives for his sake. Having returned this answer to his two Greek friends, he embraced and dismissed them, giving them leave to retire and shift for themselves in the best manner they could. As for himself, having now lost all hopes of being relieved, and seeing most of his men and friends killed round him, he gave way to his grief; and, not being able to make use of his arm, which was shot through with a large barbed arrow, he presented his side to one of his attendants, and ordered him to put an end to his unhappy life. His example was followed by Censorius a senator, by Megabacchus an experienced and brave officer, and by most of the nobility who served under him. Five hundred common soldiers were taken prisoners, and the rest cut to pieces.

The Parthians, having thus cut off or taken the whole detachment commanded by young Crassus, marched without delay against his father, who, upon the first advice that the enemy fled before his son, and were closely pursued by him, had taken heart, the more because those who had remained to make head against him seemed to abate much of their ardour, the greatest part of them having marched with the rest against his son. Wherefore, having encouraged his troops, he had retired to a small hill in his rear, to wait there till his son returned from the pursuit. Young Crassus had dispatched frequent expresses to his father, to acquaint him of the danger he was in; but they had fallen into the enemy's hands; only the last messenger, who had escaped with great difficulty, arrived safe, and informed him that his son was lost if he did not send him an immediate and powerful reinforcement. This news threw Crassus into the utmost consternation; a thousand affecting thoughts rose in his mind, and disturbed his reason to such a degree, that he scarcely knew what he was doing. However, the desire he had of saving his son, and so many brave Romans who were under his command, made him immediately decamp, and march to their assistance; but he was not gone far before he was met by the Parthians, who, with loud shouts and songs of victory, gave, at a distance, the unhappy father notice of his misfortune. They had cut off young Crassus's head, and, having fixed it on the point of a lance, were advancing full speed to fall on the father. As they drew near, Crassus was struck with that dismal and affecting sight; but, on this occasion, behaved like a hero: for, though he was under the deepest concern, he had the presence of mind to stifle his grief, for fear of discouraging the army, and to cry out to the dis-

mayed troops, "This misfortune is entirely mine; the loss of one man cannot affect the victory. Let us charge; let us fight like Romans: if you have any compassion for a father who has just lost a son whose valour you admired, let it appear in your rage and resentment against these insulting barbarians." Thus Crassus strove to reanimate his troops; but his efforts were unsuccessful: their courage was quite sunk, as appeared from the faint and languishing shout which they raised, according to custom, before the action. When the signal was given, the Parthians, keeping to their old way of fighting, discharged clouds of arrows on the legionaries, without drawing near them; which did such dreadful execution, that many of the Romans, to avoid the arrows, which occasioned a long and painful death, threw themselves, like men in despair, on the enemy's heavy-armed horse, seeking from their spears a more quick and easy kind of death. Thus the Parthians continued plying them incessantly with their arrows till night, when they left the field of battle, crying out, that they would allow the father one night to lament the death of his son.

This was a melancholy night for the Romans. Crassus kept himself concealed from the soldiery, lying not in the general's tent, but in the open air, and on the bare ground, with his head wrapped up in his *pahudamentum*, or military cloak; and was, in that forlorn condition, says Plutarch, a great example to the vulgar, of the instability of fortune; to the wife, a still greater of the pernicious effects of avarice, temerity, and ambition. Octavius, one of his lieutenants, and Cassius, approached him, and endeavoured to raise him up and console him: but, seeing him quite sunk under the weight of his affliction, and deaf to all comfort, they summoned a council of war, composed of all the chief officers; wherein it was unanimously resolved, that they should decamp before break of day, and retire, without sound of trumpet, to the neighbouring city of Carrhæ, which was held by a Roman garrison. Agreeably to this resolution, they began their march as soon as the council broke up; which produced dreadful outcries among the sick and wounded, who, perceiving that they were to be abandoned to the enemy, filled the camp with their complaints and lamentations: but their cries and tears, though very affecting, did not stop the march of the others, which indeed was very slow, to give the stragglers time to come up. There were only 300 light horse, under the command of one *Ægnatius*, who pursued their march without stopping. These arriving at Carrhæ about midnight, *Ægnatius*, calling to the centinels on the walls, desired them to acquaint Coponius, governor of the place, that Crassus had fought a great battle with the Parthians; and, without saying a word more, or letting him know who he was, continued his march with all possible expedition to the bridge of Zeugma; which he passed, and by that means saved his troops, but was much blamed for abandoning his general.

However, the message he sent to Coponius was of some temporary service to Crassus. For that commander, wisely conjecturing, from the manner in which the unknown person had given him that intelligence, that some misfortune had befallen Crassus, immediately ordered his garrison to stand to their arms; and, marching out, met Crassus, and conducted him and his army into the city: for the Parthians, though informed of his flight, did not offer to pursue him, observing therein the superstitious custom which obtained among them and the Persians, *not to fight in the night*; but, when it was day, they entered the Roman camp, and having put all the wounded, to the number of 4000, to the sword, dispersed their cavalry all over the plain in pursuit of the fugitives. One of Crassus's lieutenants, named *Vargunteius*, having separated in the night from the main body of the army, with four cohorts, missed his way, and was overtaken by the enemy; at whose approach he withdrew to a neighbouring hill, where he defended himself, with great va-

lour, till all his men were killed, except twenty, who made their way sword in hand, and got safe to Carrhæ: but Vargunteius himself lost his life.

In the mean time Surenas, not knowing whether Crassus and Cassius had retired to Carrhæ, or chosen a different route; in order to be informed of the truth, and take his measures accordingly, dispatched a messenger, who spoke the Roman language, to the city of Carrhæ, enjoining him to approach the walls, and acquaint Crassus himself, or Cassius, that the Parthian general was inclined to enter into a treaty with them, and demanded a conference. Both Crassus and Cassius spoke from the walls with the messenger; and, accepting the proposal with great joy, desired that the time and place for an interview might be immediately agreed upon. The messenger withdrew, promising to return quickly with an answer from Surenas: but that general no sooner understood that Crassus and Cassius were in Carrhæ, than he marched thither with his whole army; and, having invested the place, acquainted the Romans, that if they expected any favourable terms, they must deliver up Crassus and Cassius to him in chains. Hereupon a council of the chief officers being summoned, it was thought expedient to retire from Carrhæ that very night, and seek for another asylum. It was of the utmost importance that none of the inhabitants of Carrhæ should be acquainted with their design till the time of its execution; but Crassus, whose whole conduct evidently shows that he was blinded, as Dio Cassius observes, by some divinity, imparted the whole matter in confidence to one Andromachus, choosing him for his guide, and relying injudiciously on the fidelity of a man whom he scarcely knew. Andromachus immediately acquainted Surenas with the design of the Romans; promising at the same time, "as the Parthians did not engage in the night," to manage matters so, that they should not get out of his reach before daybreak. Pursuant to his promise, he led them through many windings and turnings, till he brought them into deep marshy grounds, where the infantry were up to the knees in mire. Then Cassius, suspecting that their guide had led them into those bogs with no good design, refused to follow him any longer; and, returning to Carrhæ, took his route towards Syria, which he reached with 500 horse. Octavius, with 5000 men under his command, being conducted by trusty guides, gained the mountains called by Plutarch and Appian *Sinnaci*, and there intrenched himself before break of day.

As for Crassus, he was still entangled in the marshes, when Surenas, at the rising of the sun, overtook him, and invested him with his cavalry. The proconsul had with him four cohorts, and a small body of horse; and with these he gained, in spite of all opposition, the summit of another hill within twelve furlongs of Octavius; who, seeing the danger that threatened his general, flew to his assistance, first with a small number of his men, but was soon followed by all the rest, who, being ashamed of their cowardice, quitted their post, though very safe, and, charging the Parthians with great fury, disengaged Crassus, and obliged the enemy to abandon the hill. Upon the retreat of the Parthians, the Romans formed themselves into a hollow square; and, placing Crassus in the middle, made a kind of rampart round him with their bucklers, resolutely protesting, that none of the enemy's arrows should touch their general's body, till they were all killed fighting in his defence. Surenas, loth to let so fine a prey escape, surrounded the hill, as if he designed to make a new attack: but, finding his Parthians very backward, and not doubting but the Romans, when night came on, would pursue their march, and get out of his reach, he had recourse again to artifice; and declared before some prisoners, whom he soon after set at liberty, that he was inclined to treat with the proconsul of a peace; and that it was better to come to a reconciliation with Rome, than to sow the seeds of an eternal war, by shedding the blood of one of her generals.

Agreeably to this declaration, Surenas, as soon as the prisoners were released, advanced towards the hill where the Romans were posted, attended only by some of his officers, and, with his bow unbent, and open arms, invited Crassus to an interview. So sudden a change seemed very suspicious to the proconsul; who therefore declined the interview, till he was forced, by his own soldiers, to intrust his life with an enemy whose treachery they had all experienced; for the legionaries, flocking round him, not only abused him in an outrageous manner, but even menaced him if he did not accept of the proposals made him by the Parthian general. Seeing, therefore, that his troops were ready to mutiny, he began to advance, without arms or guards, towards the enemy, after having called the gods and his officers to witness the violence his troops offered him; and entreated all who were present, but especially Octavius and Petronius, two of the chief commanders, for the honour of Rome their common mother, not to mention, after his death, the shameful behaviour of the Roman legionaries. Octavius and Petronius could not resolve to let him go alone; but attended him down the hill, as did likewise some legionaries, keeping at a distance. Crassus was met at the foot of the hill by two Greeks, who, dismounting from their horses, saluted him with great respect; and desired him, in the Greek tongue, to send some of his attendants, who might satisfy him that Surenas, and those who were with him, came without arms. Hereupon Crassus sent two brothers, of the Roscian family; but Surenas, having caused them to be seized advanced to the foot of the hill, mounted on a fine horse, and attended by the chief officers of his army. Crassus, who waited for the return of his two messengers, was surprised to see himself prevented by Surenas in person, when he least expected it. The Parthian general, perceiving, as he approached Crassus, that he was on foot, cried out, in a seeming surprise, "What do I see? a Roman general on foot, and we on horseback! Let a horse be brought for him immediately." "You need not be surprised, (replied Crassus;) we are come only to an interview, each after the custom of his country." "Very well, (answered Surenas;) there shall be henceforth a lasting peace between king Orodes and the people of Rome: but we must sign the articles of it on the banks of the Euphrates; for you Romans do not always remember your conventions." Crassus would have sent for a horse; but a very stately one, with a golden bit, and richly caparioned, was brought to him by a Parthian; which Surenas presenting to him, "Accept this horse from my hands, (said he,) which I give you in the name of my master, king Orodes." He had scarcely uttered these words, when some of the king's officers, taking Crassus by the middle, set him upon the horse, which they began to whip with great violence before them in order to make him quicken his pace. Octavius, offended at this insult, took the horse by the bridle; Petronius and the few Romans who were present, seconded him, and, flocking all round Crassus, stopped his horse. The Parthians endeavoured to repulse them; and they began to jostle and push one another with great tumult and disorder. At last, Octavius, drawing his sword, killed one of the king's grooms; but at the same time another, coming behind Octavius, with one blow laid him dead at his feet. Both parties fought with great resolution, the Parthians striving to carry off Crassus, and the Romans to rescue him out of their hands. In this scuffle most of the Romans who came to the conference were killed; and, amongst the rest, Crassus himself, but whether by a Roman or a Parthian is uncertain. Upon his death, the rest of the army either surrendered to the enemy, or, dispersing in the night, were pursued, and put to the sword. The Romans lost in this campaign at least 30,000 men; of which 20,000 were killed, and 10,000 taken prisoners.

When the battle of Carrhæ was fought, king Orodes was in Armenia, where he had made peace with Artabazus.

bazus. While the two kings were solemnizing their new alliance with expensive and public feasts, Syllaces or Syllaces, a Parthian officer, whom Surenas had sent with the news of his late victory, and the head of Crassus as a proof of it, arrived in the capital of Armenia. The transports of joy which Orodes felt at this sight, are not to be expressed; and the lords of both kingdoms, who attended their sovereigns, raised loud and repeated shouts of joy. Syllaces was ordered to give a more particular and distinct account of that memorable action; which when he had done, Orodes commanded melted gold to be poured into Crassus's mouth; reproaching him thereby with avarice, which had been always his predominant passion.

Surenas did not long enjoy the pleasure of his victory; for Orodes, jealous of his power and authority among the Parthians, soon after caused him to be put to death. Pacorus, the king's favourite son, was put at the head of the army; and, agreeably to his father's directions, invaded Syria: but he was driven out from thence with great loss by Cicero and Cassius, the only general who survived the defeat of Crassus.

After this we find no mention of the Parthians till the time of the civil war between Cæsar and Pompey, when the latter sent ambassadors to solicit succour against his rival. This Orodes was willing to grant upon condition that Syria was delivered up to him; but, as Pompey would not consent to such a proposal, the succours were not only denied, but, after the battle of Pharsalia, he put Lucius Hirtius in irons, whom Pompey had again sent to ask assistance, or at least to desire leave to shelter himself in the Parthian dominions.

Cæsar is said to have meditated a war against the Parthians, which in all probability would have proved fatal to them. His death delivered them from this danger. But, not long after, the eastern provinces, being grievously oppressed by Mark Anthony, rose up in arms; and, having killed the tax-gatherers, invited the Parthians to join them and drive out the Romans. They very readily accepted the invitation, and crossed the Euphrates with a powerful army under the command of Pacorus, and Labienus a Roman general of Pompey's party. At first they met with great success, overran all Asia Minor, and reduced all the countries as far as the Hellespont and the Egean Sea, subduing likewise Phœnicia, Syria, and even Judea. They did not however long enjoy their new conquests: for, being elated with their victories, and despising the enemy, they engaged Ventidius, Anthony's lieutenant, before Labienus had time to join them, and were utterly defeated. This so disheartened Labienus's army, that they all abandoned him; and he himself, being thus obliged to wander from place to place in disguise, was at last taken and put to death at Cyprus. Ventidius, pursuing his advantage, gained several other victories; and at last entirely defeated the Parthian army under Pacorus, cutting almost the whole of them in pieces, and the prince himself among the rest. He did not, however, pursue this last victory as he might have done; being afraid of giving umbrage to Anthony, who had already become jealous of the great honour gained by his lieutenant. He therefore contented himself with reducing those places in Syria and Phœnicia which the Parthians had taken in the beginning of the war, until Anthony arrived to take the command of the army upon himself.

Orodes was distracted with grief on receiving the news of the loss of his army and the death of his favourite son. However, when time had restored the use of his faculties, he appointed Phraates, the eldest but the most wicked of all his children, to succeed him in the kingdom, admitting him at the same time to a share of the sovereign authority with himself. The consequence of this was, that Phraates very soon attempted to poison his father with hemlock. But this, contrary to expectation, proving a cure for the dropsy, which an excess of grief had brought upon the king, the unnatural son had him stifled

in bed; and soon after not only murdered all his own brethren, who were thirty in number, but cut off all the rest of the royal family, not sparing even his own eldest son; left the discontented Parthians should place him, as he was already of age, on the throne.

Many of the chief lords of Parthia, being intimidated by the cruelty of Phraates, retired into foreign countries: and among those one Monaces, a person of great distinction, as well as skill and experience in war. This man, having fled to Anthony, soon gained his confidence, and was by him easily prevailed upon to engage in a war against his countrymen. But Phraates, justly dreading the consequences of such a person's defection, sent a solemn embassy to invite him home on such terms as he should think fit to accept; which greatly provoked Anthony; though he did not hinder him from returning, lest others should thereby be discouraged from coming over to him. He therefore dismissed him with great civility, sending ambassadors at the same time to Phraates to treat of a peace. Thus he hoped to divert the Parthian monarch's attention from making the necessary preparations for war, and that he should be able to fall upon him in the spring when he was in no condition to make resistance. But herein he was greatly disappointed; for on his arrival at the Euphrates, which he intended to pass, and enter the Parthian dominions on that side, he found all the passes so well guarded, that he thought proper to enter Media, with a design first to reduce that country, and then to enter Parthia.

This plan had been suggested to him by Artabazus king of Armenia, who in the end betrayed him; for, instead of conducting the army the straight way from Zeugma on the Euphrates to the Araxes, which parted Media from Armenia, and which was about five hundred miles distant from the place whence he first set out, Artabazus led them over the rocks and mountains so far about, that the army had marched above a thousand miles before they reached the borders of Media, where they intended to begin the war. Thus they were not only greatly fatigued, but had not sufficient time, the year being far spent, to put in execution the design on which they had come. However, as Anthony was impatient to get back to Cleopatra, he left behind him most of the baggage of the army, and three hundred waggons loaded with battering-rams and other military engines for sieges; appointing Statianus, one of his lieutenants, with a body of 10,000 men, to guard them, and to bring them, by slower marches, after the army. With the rest of the forces he marched more than three hundred miles before the rest, without allowing his men any respite till he arrived at Praaspa, or Phraata, the capital of Media, which he immediately invested. But the Parthians, well knowing that he could not make any progress without his military machines, passed by his army, in order to attack Statianus; which they did with such success, that the body commanded by him were all to a man cut off, and all their military engines taken, among which was a battering-ram eighty feet long.

Anthony, notwithstanding this disaster, continued the siege of Praaspa; but was daily harassed by sallies of the garrison from within, and the enemy's army without. At last he began to think of a retreat when his provisions were almost exhausted, finding it impossible to become master of the city. But, as he was to march three hundred miles through the enemy's country, he thought proper first to send ambassadors to the Parthian monarch, acquainting him that the Roman people were willing to allow him a peace, provided he would restore the standards and prisoners taken at Carrhæ. Phraates received the ambassadors, seated on a golden throne; and, after having bitterly inveighed against the avarice and unbounded ambition of the Romans, told them that he would not part with the standards and prisoners; but that, if Anthony would immediately raise the siege of Praaspa, he would suffer him to retire unmolested.

Anthony,

Anthony, who was reduced to great straits, no sooner received this answer, than he broke up the siege, and marched towards Armenia. However, Phraates was not so good as his word; for the Romans were attacked by his army no fewer than eighteen times on their march, and were thrice in the utmost danger of being cut off. A famine also raged in the Roman army; upon which they began to desert; and indeed Anthony would probably have been left by himself, had not the Parthians, in a very cruel as well as impolitic manner, murdered all those who fled to them in flight of the rest. At last, having lost 32,000 men, and being reduced to such despair that he was with difficulty prevented from laying violent hands on himself, Anthony reached the river Araxes; when his men, finding themselves out of the reach of the enemy, fell down on the ground, and kissed it with tears of joy.

Anthony was no sooner gone, than the kings of Media and Parthia quarrelled about the booty they had taken; and, after various contests, Phraates reduced all Media and Armenia. This monster prolonged his reign under the character of a warlike prince. In process of time he made peace with Augustus, and restored all the captives and ensigns which the Parthians had taken in their wars with Crassus and Anthony. He also sent four of his sons, with their wives and children, as hostages to Rome. His son Phraatrus remained with him; and it is said that he was poisoned by his wife Thermosa, in order to place that son upon the throne. The Parthians, however, disdaining to be governed by so wicked a parricide, rose up in arms, and drove him into banishment, where he perished some years after. The succeeding reigns were of short duration; and Artabanus, one of the race of the Arsacides, who reigned in Media, was called to the Parthian throne. His cruelty rendered him detestable, and afforded to Tiberius an opportunity of placing on the throne Tiridates, who was likely to be more devoted to the will of the Roman emperor. Artabanus was ultimately restored to the kingdom by the influence of Izates, king of the Adiabeniens; and from this time he governed the kingdom with great equity and moderation; so that, after a reign of thirty years, he died, greatly lamented by all his subjects, leaving behind him seven sons, one of whom succeeded him.

Under the reign of Nero, about the year 54, one Vologeses, the son of Gortarzes, a former king, became peaceable possessor of the throne. He carried on some wars against the Romans, but with very indifferent success; and at last gladly consented to a renewal of the ancient treaties with that powerful people.

From this time the Parthian history affords nothing remarkable till the reign of the emperor Trajan; when the Parthian king, by name *Cosroes*, infringed the treaty with Rome, by driving out the king of Armenia. Upon this, Trajan, who was glad of any pretence to quarrel with the Parthians, immediately hastened into Armenia. His arrival there was so sudden and unexpected, that he reduced almost the whole country without opposition; and took prisoner Parthamasiris, the king whom the Parthians had set up. After this he entered Mesopotamia, took the city of Nisibis, and reduced the whole of that wealthy country. A.D. 106.

Early in the spring of the following year, Trajan who had kept his winter-quarters in Syria, took the field again; but was warmly opposed by *Cosroes*. He found him encamped on the banks of the Euphrates, with a design to dispute his passage, which he did with such vigour, that the emperor, after having several times attempted to ford that river, and been always repulsed with great slaughter, was obliged to cause boats to be built on the neighbouring mountains, which he privately conveyed from thence on carriages to the water-side; and, having in the night-time formed a bridge with them, he passed his army the next day; but not without great loss and danger, the Parthians harassing his men the whole time with incessant showers of arrows, which did great execution.

Having gained the opposite bank, he advanced boldly into Assyria, the Parthians flying every-where before him; and made himself master of Arbela. Thence he pursued his march; subduing, with incredible rapidity, countries where the Roman standard had never before been displayed. Babylonia, or the province of Babylon, voluntarily submitted to him; and the city itself was, after a vigorous resistance, taken by storm; by which means he became master of all Chaldea and Assyria, the two richest provinces of the Parthian empire. From Babylon he marched to Ctesiphon, the metropolis of the Parthian monarchy; which he besieged, and at last reduced. But as to the particulars of these great conquests, we are quite in the dark; this expedition, however glorious to the Roman name, being rather hinted at than described by the writers of those times.

While Trajan was thus making war in the heart of the enemy's country, *Cosroes*, having recruited his army, marched into Mesopotamia, with a design to recover that country, and cut off all communication between the Roman army and Syria. On his arrival in that province, the inhabitants flocked to him from all parts; and most of the cities, driving out the garrisons left by Trajan, opened their gates to him. Hereupon the emperor detached Lucius and Maximus, two of his chief commanders, into Mesopotamia, to keep such cities in awe as had not revolted, and to open a communication with Syria. Maximus was met by *Cosroes*; and, having ventured a battle, his army was entirely defeated, and himself killed. But Lucius, being joined by Euricius and Clarius, two other commanders sent by Trajan with fresh supplies, gained considerable advantages over the enemy, and retook the cities of Nisibis and Seleucia, which had revolted.

And now Trajan, seeing himself possessed of all the best and most fruitful provinces of the Parthian empire, but at the same time being well apprised that he could not, without a vast expense, maintain his conquests, nor keep in subjection so fierce and warlike a people at such a distance from Italy; resolved to set over them a king of his own choosing, who should hold the crown of him and his successors, and acknowledge them as his lords and sovereigns. With this view he repaired to Ctesiphon; and, having there assembled the chief men of the nation, he crowned one of the royal family, by name *Parthaspates*, king of Parthia, obliging all who were present to pay him their allegiance. He chose *Parthaspates*, because that prince had joined him at his first entering the Parthian dominions, conducted him with great fidelity, and shown on all occasions an extraordinary attachment to the Romans. Thus the Parthians were at last subdued, and their kingdom made tributary to Rome. But they did not long continue in this state of subjection; for they no sooner heard of Trajan's death, which happened shortly after, (A.D. 117.) than, taking up arms, they drove *Parthaspates* from the throne; and recalling *Cosroes*, who had retired into the country of the Hyrcanians, openly revolted from Rome. Adrian, who was then commander-in-chief of all the forces in the east, and soon after acknowledged emperor by the army, did not wish, though he was at that time in Syria with a very numerous army, to engage in a new war with the Parthians; but contented himself with preserving the ancient limits of the empire. Therefore, in the beginning of his reign, he abandoned those provinces beyond the Euphrates which Trajan had conquered; withdrew the Roman garrisons from Mesopotamia; and, for the greater safety of other places, made the Euphrates the boundary of, and barrier in, those parts, posting his legions along the banks of that river.

Cosroes died after a long reign, and was succeeded by his eldest son Vologeses II. in whose reign the Alani, breaking into Media, then subject to the Parthians, committed great devastations; but were prevailed upon, with rich presents sent them by Vologeses, to abandon that kingdom, and return home. Upon their retreat, Vologeses,

geses, having no enemy to contend with at home, fell unexpectedly upon Armenia; surprised the légions there; and, having cut them all in pieces to a man, entered Syria; defeated with great slaughter Attilius Cornelianus, governor of that province; and advanced without opposition to the neighbourhood of Antioch; putting every-where the Romans, and those who favoured them, to the sword. Hereupon the emperor Verus, by the advice of his colleague Antoninus surnamed the Philosopher, leaving Rome, hastened into Syria: and, having driven the Parthians out of that province, ordered Statius Priscus to invade Armenia, and Cassius with Martius Verus to enter the Parthian territories, and carry the war into the enemy's country. Priscus made himself master of Artaxata; and in one campaign drove the Parthians, though not without great loss on his side, quite out of Armenia. Cassius, on the other hand, having in several encounters defeated Vologeses, though he had an army of 400,000 men under his command, reduced, in four years time, all those provinces which had formerly submitted to Trajan, took Seleucia, burnt and plundered the famous cities of Babylon and Ctesiphon, with the stately palaces of the Parthian monarchs, and struck terror into the most remote provinces of that great empire. On his return, he lost above half the number of his forces by sickness and famine; so that, after all, the Romans, as Spartianus observes, had no great reason to boast of their victories and conquests.

However, Verus, who had never stirred during the whole time of the war from Antioch and Daphne, took upon him the lofty titles of *Parthicus* and *Armenicus*, as if he had acquired them justly in the midst of his pleasures and debaucheries. After the revolt and death of Cassius, Antoninus the Philosopher repaired into Syria, to settle the affairs of that province. On his arrival there, he was met by ambassadors from Vologeses; who, having recovered most of the provinces subdued by Cassius, and being unwilling either to part with them or engage in a new war, solicited the emperor to confirm him in the possession of them, promising to hold them of him, and to acknowledge the sovereignty of Rome. To these terms Antoninus readily agreed, and a peace was accordingly concluded between the two empires; which Vologeses did not long enjoy, being soon after carried off by a distemper, (and not murdered by his own subjects, as we read in Constantinus Manasses, who calls him *Belegeses*.)

Upon his death, Vologeses III. the son of his brother Sanatruces, and grandson of Cosroes, was raised to the throne. He sided with Niger against the emperor Severus: who thereupon, having settled matters at home, marched with all his forces against him; and, advancing to the city of Ctesiphon, whither he had retired, laid close siege to that metropolis. Vologeses made a most gallant defence: but the city, after a long siege, and much bloodshed on both sides, was at length taken by assault. The king's treasures, with his wives and children, fell into the emperor's hands; but Vologeses himself had the good luck to make his escape; which was a great disappointment to Severus, who immediately dispatched an express to acquaint the senate with the success that had attended him in his expedition against the only nation that was then formidable to Rome. But he had no sooner crossed the Euphrates, than Vologeses recovered all the provinces, except Mesopotamia, which he had reduced. These expeditions were chargeable to the Romans, and cost them much blood, without reaping any advantages from them; for, as they had not sufficient forces to keep in awe the provinces they had subdued, the inhabitants, greatly attached to the family of Arsaces, never failed to return to their ancient obedience as soon as the Roman armies were withdrawn. Vologeses was soon after engaged in a war still more troublesome and destructive, with his brother Artabanus, who, encouraged by some of the discontented nobles, attempted to rob him of the crown, and place it on his own head. Vologeses gained several victories over

his brother and rebellious subjects, but died before he could restore the empire to its former tranquillity.

Artabanus, who had a numerous army at his devotion, did not meet with any opposition in seizing the throne, vacant by the death of his brother, though Tiridates had a better title to it, as being his elder brother. He had scarcely settled the affairs of his kingdom, when the emperor Caracalla, desirous to signalize himself, as some of his predecessors had done, by some memorable exploit against the Parthians, sent a solemn embassy to him, desiring his daughter in marriage. Artabanus, overjoyed at this proposal, which he thought would be attended with a lasting peace between the two empires, received the ambassadors with all possible marks of honour, and readily complied with their request. Soon after, Caracalla sent a second embassy to acquaint the king that he was coming to solemnize the nuptials; whereupon Artabanus went to meet him, attended with the chief of the nobility, and his best troops, all unarmed, and in most pompous habits: but this peaceable train no sooner approached the Roman army, than the soldiers, on a signal given them, falling upon the king's retinue, made a most terrible slaughter of the unarmed multitude, Artabanus himself escaping with great difficulty. The treacherous Caracalla, having gained by this exploit great booty, and, as he thought, no less glory, wrote a long and boasting letter to the senate, assuming the title of *Parthicus* for this piece of treachery; as he had before that of *Germanicus*, for murdering, in like manner, some of the German nobility.

Artabanus, resolving to make the Romans pay dear for their inhuman and barbarous treachery, raised the most numerous army that had ever been known in Parthia, crossed the Euphrates, and entered Syria, putting all to fire and sword. But, Caracalla being murdered before this invasion, Macrinus, who had succeeded him, met the Parthians at the head of a mighty army, composed of many légions, and all the auxiliaries of the states of Asia. The two armies no sooner came in sight of each other, but they engaged with the utmost fury. The battle continued two days; both Romans and Parthians fighting so obstinately, that night only parted them, without any apparent advantage on either side; though both retired when night had put an end to the contest, crying, "Victory, victory!" The field of battle was covered with dead bodies, there being already above 40,000 killed, including Romans and Parthians: nevertheless Artabanus was heard to say, that the battle was only begun, and that he would continue it till either the Parthians or Romans were all to a man cut in pieces. But Macrinus, being well apprised that the king was highly enraged against Caracalla in particular, and dreading the consequences which would attend the destruction of his army, sent a herald to Artabanus, acquainting him with the death of Caracalla, and proposing an alliance between the two empires. The king, understanding that his great enemy was dead, readily embraced the proposals of peace and amity, upon condition that all the prisoners who had been taken by the treachery of Caracalla should be immediately restored, and a large sum of money paid him to defray the expenses of the war. These articles being performed without delay or hesitation, Artabanus returned into Parthia, and Macrinus to Antioch.

But, as Artabanus had lost on this occasion the flower of his army, Artaxerxes, a Persian of mean descent, but of great courage and experience in war, revolting from the Parthians, prevailed on his countrymen to join him, and attempt the recovery of the sovereign power, which he said they had been unjustly deprived of, first by the Macedonians, and afterwards by the Parthians their vassals. Artabanus, upon the news of this revolt, marched with the whole strength of the kingdom to suppress it; but, being met by Artaxerxes at the head of a no less powerful army, a bloody battle ensued, which is said to have lasted three days. At length the Parthians, though

they behaved with the utmost bravery, and fought like men in despair, were forced to yield to the Persians, who were commanded by a more experienced leader. Most of their troops were cut off in the flight; and the king himself was taken prisoner, and soon after put to death by Artaxerxes's order. The Parthians, having lost in this fatal engagement both their king and their army, were forced to submit to the conqueror, and become vassals to a nation which had been subject to them for the space of 475 years.

Thus ended an empire, once so formidable, that, while it possessed eighteen kingdoms between the Caspian and Arabian seas, it even disputed the empire of the world with the Romans; and could never be subdued by that nation, which had seen no people on earth unconquered by their arms. For a continuation of its history, and present state, see the article PERSIA.

We may just add, that the royal family of Arsaces did not end in Artabanus, but continued to reign in Armenia till the time of the emperor Justinian, holding that kingdom of the Persian monarchs.

To this historical account of the Parthians we shall subjoin a concise statement of the geography of their country, more especially as very erroneous ideas concerning the local situation of this country have generally prevailed. Those, whose knowledge of it has been chiefly derived from its wars with the Romans, have conceived Parthia to be only the country bordering on the Euphrates and Tigris: whereas Parthia proper was a small province very near to the south-east extreme of the Caspian Sea, which territory, as we have already historically detailed, after the division of Alexander's empire, fell to the choice of the Seleucidæ, kings of Syria and of the east, about 300 years before our era. About 50 years after, Parthia rebelled; and, together with Hyrcania and other adjoining provinces, became an independent state under Arsaces. As the empire of the Seleucidæ grew weaker, the Parthians extended their country westward; and the fine province of Media fell to them; and, within a century after the foundation of their state, it had swallowed up all the countries from the Indus to the Euphrates, Bactria included: and this province had thrown off the yoke of the Seleucidæ, long before Parthia. The Parthian conquests in Armenia, about 70 years B.C. brought them acquainted with the Romans; whose conquests met theirs both in that country and in Syria. The Parthians, together with their conquests, had advanced their capital westwards, and had established it on the Tigris at Seleucia, or rather Ctesiphon (near the present Bagdad), before their wars with the Romans commenced. The expeditions of Pompey and Anthony, and the defeat of Crassus, need not be again recited. On occasion of the last event, the Parthians extended their conquests farther westward, but afterwards were compelled to retire; and they generally lost ground in Armenia and Mesopotamia, during the time of the Roman emperors. Trajan penetrated to their capital, and satisfied his curiosity by embarking on the Indian Sea. The moderation of Adrian restored the ancient boundary of the Euphrates. In A. D. 245, Persis, or Persia proper, which had for some ages ranked as a province of Parthia, gained the ascendancy; and, under Artaxerxes, put an end to the dynasty of the Arsacidæ, and restored the ancient name of Persia to the empire, after that of Parthia had existed about 480 years: so that, in fact, the Parthian empire, considered generally, was the Persian, under another name. *Rennell's Memoir.*

PAR'THIAN, *adj.* [from *Parthia*.] Belonging to Parthia.

PAR'THIAN, *f.* A native of Parthia.

PAR'TI, or PARTY, in HERALDRY; see that article, vol. ix. p. 430.

PARTIAL, *adj.* [French.] Inclined antecedently to favour one party in a cause, or one side of the question, more than the other.—Self-love will make men *partial* to

themselves and friends, and ill-nature, passion, and revenge, will carry them too far in punishing others; and hence, God hath appointed governments to restrain the partiality and violence of men. *Locke*.—Inclined to favour without reason: with to before the part favoured.—Kings heretofore, who showed themselves *partial* to a party, had the service only of the worst part of their people. *Davenant*.

Authors are *partial* to their wit, 'tis true;
But are not critics to their judgment too?

Pope.

Affecting only one part; subsisting only in a part; not general; not universal; not total.—If we compare these *partial* dissolutions of the earth with an universal dissolution, we may as easily conceive an universal deluge from an universal dissolution, as a *partial* deluge from a *partial*. *Burnet*.—That which weakens religion, will at length destroy it; for the weakening of a thing is only a *partial* destruction of it. *South*.

All discord, harmony not understood;
All *partial* evil, universal good.

Pope.

PARTIALIST, *f.* One who is partial.—I say, as the apostle said, unto such *partialists*, You will forgive me this wrong. *Bp. Morton's Discharge*, &c. 1633.

PARTIALITY, *f.* [partialité, Fr. from *partial*.] Unequal state of the judgment and favour of one above the other, without just reason.—*Partiality* is properly the understanding's judging according to the inclination of the will and affections, and not according to the exact truth of things, or the merits of the cause. *South's Serm.*—As there is a *partiality* to opinions, which is apt to mislead the understanding; so there is also a *partiality* to studies, which is prejudicial to knowledge. *Locke*.

To PARTIALIZE, *v. a.* [partializer, Fr. from *partial*.] To make partial.—No man, drenched in hate, can promise to himself the candidness of an upright judge; his hate will *partialize* his opinion. *Feltham's Refl.*

Such neighbour-nearness to our sacred blood
Should nothing privilege him, nor *partialize*
Th' unstooping firmness of my upright soul. *Shakespeare*.

PARTIALLY, *adv.* With unjust favour or dislike. In part; not totally.—The message he brought, opened a clear prospect of eternal salvation, which had been but obscurely and *partially* figured in the shadows of the law. *Rogers*.

PARTIALNESS, *f.* Partiality. *Ash*.

PARTIARY, *f.* [from *part*.] A partaker. *Cole*.

PARTIBILITY, *f.* [from *partible*.] Divisibility; separability.

PARTIBLE, *adj.* [from *part*.] Divisible; separable.—Make the moulds *partible*, glued or cemented together, that you may open them when you take out the fruit. *Bacon*.—The same body, in one circumstance, is more weighty, and, in another, is more *partible*. *Digby on the Soul*.

PARTICIPABLE, *adj.* [from *participate*.] Such as may be shared or partaken.—Plato, by his ideas, means only the divine essence, with this connotation, as it is variously imitable or *participable* by created beings. *Norris*.

PARTICIPANT, *adj.* [Fr. from *participate*.] Sharing; having share or part: with *of*.—During the parliament, he published his proclamation, offering pardon to all such as had taken arms, or been *participant* of any attempts against him; so as they submitted themselves. *Bacon*.—If any part of my body be so mortified, as it becomes like a rotten branch of a tree, it putrefies, and is not *participant* of influence derived from my soul, because it is now no longer in it to quicken it. *Hale*.

PARTICIPANT, *f.* A partaker.—Relations, both in print and manuscript, composed by their own members, the *participants* in their most sacred and mysterious rites. *Warburton's Doct. of Grace*.

TO PARTICIPATE, *v. n.* [*participo*, Lat. *participar*, Fr.] To partake; to have share:

The other instruments
Did see and hear, devise, instruct, walk, feel;
And mutually *participate*. *Shakespeare.*

With *of*.—An aged citizen brought forth all his provisions, and said, that, as he did communicate unto them his store, so would he *participate of* their wants. *Hayward.*—
With *in*:

His delivery, and thy joy thereon,
In both which we, as next, participate. *Milton's S. A.*

To have part of more things than one.—Few creatures *participate of* the nature of plants and metals both. *Bacon.*—Those bodies, which are under a light which is extended and distributed equally through all, should *participate of* each other's colours. *Dryden.*

God, when heaven and earth he did create,
Form'd man, who should of both *participate.* *Denham.*

To have part of something common with another.—The species of audibles seem to *participate* more with local motion, like percussions made upon the air. *Bacon.*

TO PARTICIPATE, *v. a.* To partake; to receive part of; to share.—As Christ's incarnation and passion can be available to no man's good which is not made partaker of Christ, neither can we *participate* him without his presence. *Hooker.*

Such as I seek, fit to *participate*
All rational delight. *Milton's P. L.*

PARTICIPATION, *f.* The state of sharing something in common.—Civil society doth more content the nature of man, than any private kind of solitary living; because, in society, this good of mutual *participation* is so much larger. *Hooker.*—A joint coronation of himself and his queen might give countenance of *participation* of title. *Bacon.*—The act or state of receiving, or having part of something.—All things seek the highest, and covet more or less the *participation* of God himself. *Hooker.*—What an honour, that God should admit us into such a blessed *participation* of himself? *Atterbury.*—Distribution; division into shares.—It sufficeth not, that the country hath wherewith to sustain even more than to live upon it, if means be wanting whereby to drive convenient *participation* of the general store into a great number of well-servers. *Raleigh.*

PARTICIPATIVE, *adj.* Capable of partaking.

PARTICIPIAL, *adj.* [*participialis*, Lat.] Having the nature of a participle.—The participle, with an article before it, and the preposition of after it, becomes a substantive, expressing the action itself which the verb signifies. This rule arises from the nature and idiom of our language, and from as plain a principle as any on which it is founded; namely, that a word which has the article before it, and the possessive preposition of after it, must be a noun; and, if a noun, it ought to follow the construction of a noun, and not have the regimen of a verb. It is the *participial* termination of this sort of words, that is apt to deceive us, and make us treat them as if they were of an amphibious species, partly nouns, and partly verbs. That these *participial* words are sometimes real nouns, is undeniable; for they have a plural number as such: as, "The outgoings of the morning." *Lowth's Eng. Grammar.*

PARTICIPIALLY, *adv.* In the sense or manner of a participle.

PAR'TICIPLE, *f.* [*participium*, Lat.] In grammar, an adjective formed of a verb; so called because it still *participates* of some of the properties of the verb; retaining the regimen and signification of it: whence most authors confound it with the verb. There are two kinds of participles: the one called *active*, because expressing the subject which makes the action of the verb; as *legens*, *audiens*, reading, hearing; the other called *passive*, because expres-

sing the subject that receives the action of the verb; as *lectum*, *auditum*, read, heard.

As our adjectives are not declined, the participles, being real adjectives, are also not declined. In the Latin, &c. where the adjectives are declined, the participles active are declined likewise: thus they say *audiens*, *audientis*, *audienti*, &c. and in the French the participles passive are declinable like their adjectives; as, *j'ai lu*, *elle a lue*, *nous avons lus*, &c. In our language, the participles and gerunds are not at all distinguishable. The English grammar lays down a good rule with respect to its participle of the past, "that they all terminate in *d*, *t*, or *n*;" which analogy is liable to as few exceptions as any.

PAR'TICIPLE, *f.* Any thing that participates of different things. *Not used.*—The *participles* or confiners between plants and living creatures, are such as are fixed, though they have a motion in their parts: such as oysters and cockles. *Bacon.*

PAR'TICLE, *f.* [*particula*, Fr. from *particula*, Lat.] Any small portion of a greater substance.—There is not one grain in the universe either too much or too little; nothing to be added, nothing to be spared: nor so much as any one *particle* of it, that mankind may not be either the better or the worse for, according as 'tis applied. *L'Estrange.*—It is not impossible, but that microscopes may, at length, be improved to the discovery of the *particles* of bodies on which their colours depend. *Newton's Optics.*

With *particles* of heavenly fire,
The God of nature did his soul inspire. *Dryden.*

A word unvaried by inflection.—The Latin varies the signification of verbs and nouns, not as the modern languages, by *particles* prefixed, but by changing the last syllables. *Locke on Education.*—*Particles* are the words, whereby the mind signifies what connection it gives to the several affirmations and negations, that it unites in one continued reasoning or narration. *Locke.*

It is in the right use of particles, Mr. Locke observes, that more particularly consist the clearness and beauty of a good style. To express the dependence of his thoughts and reasonings one upon another, a man must have words to show what connection, restriction, distinction, opposition, emphasis, &c. he gives to each respective part of his discourse. This cannot be rightly understood without a clear view of the postures, stands, turns, limitations, exceptions, and several other thoughts, of the mind. Of these there is a great variety, much exceeding the number of particles that most languages have to express them by; for which reason it happens that most of these particles have divers, and sometimes almost opposite, significations. Thus the particle *but*, in English, has several very different significations: as in "*but* to say no more," where it intimates a stop of mind in the course it was going, before it came to the end of it. "I saw *but* two planets;" here it shows, that the mind limits the sense to what is expressed with a negation of all other. "You pray, *but* it is not that God will bring you to the true religion, *but* that he would confirm you in your own:" the former of these intimates a supposition in the mind, of something otherwise than it should; the latter shows that the mind makes a direct opposition between that and what goes before. "All animals have sense, *but* a dog is an animal:" here it signifies the connection of the latter proposition with the former. And in the Hebrew tongue there is a particle, consisting but of one single letter, of which there are reckoned up above fifty several significations.

PARTICLES, is also a term in theology, used in the Latin church for the crumbs or little pieces of consecrated bread, called *μεσίδες* in the Greek church. In the Greek church they have a particular ceremony, called *των μεσίδων*, "of the particles," wherein certain crumbs of bread, not consecrated, are offered up in honour of the Virgin, St. John Baptist, and several other saints. Gabriel, archbishop of Philadelphia, has a little treatise wherein

wherein he endeavours to show the antiquity of this ceremony, in that it is mentioned in the Liturgies of St. Chrysostom and Basil. But there has been a considerable dispute on this head, between the Reformed and the Catholic divines. Aubertin and Blondel explain a passage in the Theory of Germanus, patriarch of Constantinople, where he mentions the ceremony of the particles as in use in his time; Messieurs de Port Royal contest the explanation; but M. Simon, in his notes on Gabriel of Philadelphia, endeavours to show, that the passage itself is an interpolation; not being found in the ancient copies of Germanus: and consequently that the dispute is very ill grounded.

PARTICOTTY, a town of Hindoostan, in the Carnatic: seven miles north-east of Tinevely.

PARTICULAR, *adj.* [*particulier*, Fr.] Relating to single persons; not general.—As well for *particular* application to special occasions, as also in other manifold respects, infinite treasures of wisdom are abundantly to be found in the Holy Scripture. *Hooker*.—Individual; one distinct from others.—Wheresoever one plant draweth such a *particular* juice out of the earth, as it qualifieth the earth, so as that juice which remaineth is fit for the other plant; there the neighbourhood doth good. *Bacon*.—Artists, who propose only the imitation of such a *particular* person, without election of ideas, have often been reproached for that omission. *Dryden*.—Noting properties or things peculiar.—Of this prince there is little *particular* memory; only that he was very studious and learned. *Bacon*.—Attentive to things single and distinct.—I have been *particular* in examining the reason of children's inheriting the property of their fathers, because it will give us farther light in the inheritance of power. *Locke*.—Single; not general; one among many.—Rather performing his general commandment, which had ever been, to embrace virtue, than any new *particular*, sprung out of passion, and contrary to the former. *Sidney*.—Odd; having something that eminently distinguishes him from others. This is commonly used in a sense of contempt.

PARTICULAR, *f.* A single instance; a single point.—Having the idea of an elephant or an angle in my mind, the first and natural inquiry is, whether such a thing does exist? and this knowledge is only of *particulars*. *Locke*.—The master could hardly sit on his horse for laughing, all the while he was giving me the *particulars* of this story. *Addison*.—Vespasian he resembled in many *particulars*. *Swift*.—Individual; private person.—It is the greatest interest of *particulars*, to advance the good of the community. *L'Estrange*.—Private interest.—Our wisdom must be such, as doth not propose to itself our own *particular*, the partial and immoderate desire whereof poisoneth wheresoever it taketh place; but the scope and mark which we are to aim at, is the publick and common good. *Hooker*.—They apply their minds even with hearty affection and zeal, at the least, unto those branches of publick prayer wherein their own *particular* is moved. *Hooker*.—We are to give thanks for temporal blessings, whether such as concern the publick, as the prosperity of the church or nation, and all remarkable deliverances afforded to either; or else such as concern our *particular*. *Whole Duty of Man*.

His general lov'd him
In a most dear *particular*. *Shakespeare*.

Private character; single self; state of an individual;
For his *particular*, I'll receive him gladly;
But not one follower. *Shakespeare's K. Lear*.

A minute detail of things singly enumerated.—The reader has a *particular* of the books, wherein this law was written. *Ayliffe's Parergon*.

IN PARTICULAR. Peculiarly; distinctly.—Invention is called a muse, authors ascribe to each of them, *in particular*, the sciences which they have invented. *Dryden*.

PARTICULARIST, *f.* One who holds the doctrine of particular redemption. *Ash*.

PARTICULARITY, *f.* [from *particular*.] Distinct notice or enumeration.—So did the boldness of their affirmation accompany the greatness of what they did affirm, even descending to *particularities*, what kingdoms he should overcome. *Sidney*.—Singleness; individuality; single act; single case.—Knowledge imprinted in the minds of all men, whereby both general principles for directing of human actions are comprehended, and conclusions derived from them, upon which conclusions groweth, in *particularity*, the choice of good and evil. *Hooker*.—Petty account; private incident.—To see the titles that were most agreeable to such an emperor, the flatteries that he lay most open to, with the like *particularities* only to be met with on medals, are certainly not a little pleasing. *Addison*.—Something belonging to single persons:

Let the general trumpet blow his blast,
Particularities and petty sounds
To cease. *Shakespeare's Hen. VI*.

Something peculiar.—I saw an old heathen altar, with this *particularity*, that it was hollowed like a dish at one end, but not the end on which the sacrifice was laid. *Addison on Italy*.—He applied himself to the coquette's heart; there occurred many *particularities* in this dissection. *Addison*.

TO PARTICULARIZE, *v. a.* To mention distinctly; to detail; to show minutely.—He not only boasts of his parentage as an Israelite, but *particularizes* his descent from Benjamin. *Atterbury*.

TO PARTICULARIZE, *v. n.* To be particular; to be attentive to things single and distinct.—The parson questions what order is kept in the house, as about prayers morning and evening on their knees, reading of Scripture, catechising, singing of psalms at their work and on holydays; who can read, who not: and sometimes he hears the children read himself, and blesteth, encouraging also the servants to learn to read, and offering to have them taught on holydays by his servants. If the parson were ashamed of *particularizing* in these things, he were not fit to be a parson. *Herbert's Country Parson*.

PARTICULARLY, *adv.* Distinctly; singly; not universally.—Providence, that universally casts its eye over all the creation, is yet pleased more *particularly* to fasten it upon some. *South's Sermon*.—In an extraordinary degree.—This exact propriety of Virgil, I *particularly* regarded as a great part of his character. *Dryden*.—With the Flower and the Leaf I was so *particularly* pleased, both for the invention and the moral, that I commend it to the reader. *Dryden*.

PARTICULARNESS, *f.* Particularity. *Scott*.

TO PARTICULARIZE, *v. n.* [from *particular*.] To make mention singly. *Obsolete*.—I may not *particulate* of Alexander Hales, the irrefragable doctor. *Camden's Remains*.

PARTIDO, a small island in the south-west part of the bay of Campeachy.

PARTIDO, a river of Mexico; which runs into the Pacific Ocean in lat. 11. 20. S.

PAR'TILE, *adj.* See **ASTROLOGY**, vol. ii. p. 310.

PAR'TING, *f.* [from *part*.] Division.—The king of Babylon stood at the *parting* of the way, at the head of the two ways. *Ezech. xxi. 21*.—Separation; ceremony of taking leave.—[In chemistry.] An operation by which metals are separated from their ores, or from each other. See the article **CHEMISTRY**, vol. iv. p. 309-16. and **MINERALOGY**, vol. xv. p. 481.—[In naval language.] State of being driven from the anchors, when the ship has broke her cable.

PAR'TISAN, *f.* [*pertuisane*, Fr. *Johnson*.—Robert Stephens and Menage derive *pertuisane* from the Lat. *pertundo*, to strike through. Serenius, from the old Goth. *bard*, an axe; and that from *beria*, to strike; thence the Germ.

Germ. *bardike*, a little axe, and the low Lat. *bardueium*, whence the French word. *Todd.*—A kind of pike or halberd.—He held a *partisan* in his hand, and had a great basket-hilt sword by his side. *Herbert's Mem. of Cha. I.*

Let us find out the prettiest plot we can,
And make him, with our pikes and *partisans*,
A grave. *Shakespeare's Hamlet.*

PARTISAN, *f.* [from *parti*, Fr.] An adherent to a faction.—Some of these *partisans* concluded, the government had hired men to be bound and pinioned. *Addison.*—I would be glad any *partisan* would help me to a tolerable reason, that, because Clodius and Curio agree with me in a few singular notions, I must blindly follow them in all. *Swift.*—In the art of war, a person dexterous in commanding a small body of infantry, light horse, &c. who, knowing the country well, is employed in getting intelligence; or in making incursions upon an enemy, disturbing foragers, and intercepting his convoys. During the American war, Capt. Rogers was extremely alert in this kind of warfare; nor was Sir Robert Wilson less active or useful in the Spanish war.—The chief qualities required in a *partisan* of this description, are activity, quickness at expedient, and uncommon vigilance. *James.*

PARTITION, *f.* [Fr. *partitio*, Lat.] The act of dividing; a state of being divided:

We grew together,
Like to a double cherry, seeming parted,
But yet an union in *partition*. *Shakespeare.*

Division; separation; distinction.—We have, in this respect, our churches divided by certain *partitions*, although not so many in number as theirs. *Hooker.*

We shall be winnowed with so rough a wind,
That ev'n our corn shall seem as light as chaff,
And good from bad find no *partition*. *Shakespeare.*

Part divided from the rest; separate part:
Lodg'd in a small *partition*; and the rest
Ordain'd for uses to his Lord best known. *Milton.*

That by which different parts are separated.—Make *partitions* of wood in a hoghead, with holes in them, and mark the difference of their found from that of an hoghead without such *partitions*. *Bacon.*

Partition firm and sure,
The waters underneath from those above
Dividing. *Milton's P. L.*

Part where separation is made:
The mound was newly made, no fight could pass
Betwixt the nice *partitions* of the grass,
The well-united fods so closely lay. *Dryden.*

PARTITION, in rhetoric, otherwise called enumeration, is that part in which the orator acquaints his hearers with the several parts of his discourse upon which he designs to treat. Some also comprehend under this head *separation*, in which the orator shows in what he agrees with his adversary, and wherein he differs from him. The requisites of a good partition are the following: it must be short, so that each proposition contains in it nothing more than what is necessary; it ought to be complete, no necessary part being omitted in the enumeration; and it should consist of as few members as is consistent with the nature of the subject. The ancient rhetoricians prescribe three or four at the most; and Cicero never exceeds that number. It may be afterwards convenient to divide these general heads of a discourse, or at least some of them, into several parts or members: and this is best done as the speaker comes to each of them, in the order at first laid down. Instances of this kind occur in Cicero's oration for the Manilian law.

To PARTITION, *v. a.* To divide into distinct parts.—These sides are uniform without, though severally *partitioned* within. *Bacon.*

VOL. XVIII. No. 1272.

PAR'TITIVE, *adj.* [from *partitio*, Lat.] Distributive.—Sometime of a noun *partitive*, or distributive. *Lilly.*

PAR'TITIVELY, *adv.* In a partitive way.—Nouns of the comparative and the superlative degree, being but *partitively*, that is to say, having after them this English *of* or *among*, require a genitive case. *Lilly.*

PAR'TITOR, *f.* A divider. *Cole.*

PAR'TLET, *f.* A ruff or band worn by women; "a kind of kercher for the neck, so called because the neck is the *parting* of the head and body." Butler's English Gram. 1633. It is still a northern word.—In that day shall the Lord take away the gorgeousness of their apparel, and spangs, chains, *partlettes*, and collerts. *Knight's Tr. of Truth*, 1580.—He commanded the women, which followed his army, to cast their kerchiefs and *partlets* on the ground, wherein their enemies being entangled by their spurs (for though horsemen they were forced to alight, and fight on foot, through the roughness of the place), were slain before they could unloose their feet. *Fuller's Holy State.*—A hen.—Dame *partlet* was the sovereign of his heart. *Dryden's Cook and Fox.*

Thou dotard, thou art woman tir'd; unroofed
By thy dame *partlet* here. *Shakespeare's Wint. Tale.*

PAR'TLY, *adv.* [from *part*.] In some measure; in some degree; in part.—That part, which, since the coming of Christ, *partly* hath embraced, and *partly* shall hereafter embrace, the Christian religion, we term, as by a more proper name, the Church of Christ. *Hooker.*—The inhabitants of Naples have been always very notorious for leading a life of laziness and pleasure, which I take to arise out of the wonderful plenty of their country, that does not make labour so necessary to them, and *partly* out of the temper of their climate, that relaxes the fibres of their bodies, and disposes the people to such an idle indolent humour. *Addison on Italy.*

PAR'TNER, *f.* [from *part*.] Partaker; sharer; one who has part in any thing; associate.—Those of the race of Sem were no *partners* in the unbelieving work of the tower. *Raleigh's Hist. World.*—The soul continues in her action till her *partner* is again qualified to bear her company. *Addison.*

My noble *partner*;
You greet with present grace. *Shakespeare's Macbeth.*
To undergo the pain; or to accuse
My other self, the *partner* of my life. *Milton's P. L.*
One who dances with another:

Lead in your ladies every one; sweet *partner*,
I must not yet forsake you. *Shakespeare's Hen. VIII.*

To PAR'TNER, *v. a.* To join; to associate with a partner:

A lady who
So fair, and fasten'd to an empery,
Would make the great'st king double, to be *partner'd*
With tomboys, hired with self-exhibition,
Which your own coffers yield. *Shakespeare.*

PAR'TNERSHIP, *f.* Joint interest or property:

He does possession keep,
And is too wise to hazard *partnership*. *Dryden.*
The union of two or more in the same trade.—'Tis a necessary rule in alliances, *partnerships*, and all manner of civil dealings, to have a strict regard to the disposition of those we have to do withal. *L'Estrange.*

PARTNERSHIPS may be considered under four distinct heads.

1. *Occasional joint trade*; as where two or more merchants agree to employ a certain sum in trade, and divide the gain or loss so soon as the adventure is brought to an issue. This kind of contract being generally private, the parties concerned are not liable for each other. If one of them purchase goods on trust, the furnisher,

who

who grants the credit through confidence in *him* alone, has no recourse, in case of his insolvency, against the other partners. They are only answerable for the share of the adventure that belongs to the insolvent partner. If it be proposed to carry the adventure farther than originally agreed on, any partner may withdraw his interest; and, if it cannot be separated from the others, may insist that the whole shall be brought to an issue.

II. *Standing Partnerships*, which are generally established by written contract between the parties, where the stock, the firm, duration, the division of the gain or loss, and other circumstances, are inserted.

All the partners are generally authorized to sign by the firm of the company, though this privilege may be confined to some of them by particular agreement. The firm ought only to be subscribed at the place where the copartnery is established. If a partner has occasion, when absent, to write a letter relating to their affairs, he subscribes his own name *for* the company. The signature of each partner is generally sent to new correspondents; and, when a partner is admitted, his signature is transmitted, with an intimation of the change in the copartnery, to all their correspondents.

No partner is liable to make good the loss arising from his judging wrong in a case where he had authority to act. If he exceeds his power, and the event prove unsuccessful, he must bear the loss; but, if it prove successful, the gain belongs to the company; yet, if he acquaints the company immediately of what he has done, they must either acquiesce therein, or leave him the chance of gain, as well as the risk of loss.

Debts contracted under the firm of the company are binding on all the partners, though the money was borrowed by one of them for his private use, without the consent of the rest. And, if a partner exceeds his power, the others are nevertheless obliged to complete his engagements; though *they* may render him responsible for his misbehaviour.

A debt to a company is not cancelled by the private debts of the partner: and, when a partner becomes insolvent, the company is not bound for his debts beyond the extent of his share. The debts of the company are preferable, on the company's effects, to the private debts of the partners.

Partnership is generally dissolved by the death of a partner; yet, when there are more partners than two, it may, by agreement, subsist among the survivors. Sometimes it is stipulated, that, in case of the death of a partner, his place shall be supplied by his son, or some other person descended on. The contract ought to specify the time and manner in which the surviving partners shall reckon with the executors of the deceased for his share of the stock, and a reasonable time allowed for that purpose.

When partnership is dissolved, there are often outstanding debts that cannot be recovered for a long time, and effects that cannot easily be disposed of. The partnership, though dissolved in other respects, still subsists for the management of their outstanding affairs; and the money arising from them is divided among the partners, or their representatives, when it is recovered. But, as this may protract the final settlement of the company's affairs to a very inconvenient length, other methods are sometimes used to bring them to a conclusion, either in consequence of the original contract, or by agreement at the time of dissolution. Sometimes the debts and effects are sold by auction; sometimes they are divided among the partners; and, when there are two partners, one divides them into shares, as equal as possible, and the other chooses either share he thinks best.

Houses that have been long established, often retain the old firm, though all the original partners be dead or withdrawn. But, if a partner withdraws from the trade, yet, for the credit of the house, leaves his name in the firm, it is at his own risk; he is liable to all the debts and

misfortunes of the remaining acting partners; and many have suffered severely by this.

A dissolution of partnership is generally performed by a deed of separation registered in a public office, and by destroying, or otherwise cancelling, the articles of partnership, as by cutting out the names, &c. But the dissolution must also be advertised in the London Gazette; and at the Gazette-office, the MS. of such advertisement, with the real signatures of all the partners, must remain.

III. *Companies, where the business is conducted by officers.* There are many companies of this kind in Great Britain, chiefly established for purposes which require a larger capital than private merchants can command. The laws with respect to these companies, when not confirmed by public authority, are the same as in partnerships, but the articles of their agreement usually very different. The capital is divided into a certain number of shares, whereof each partner may hold one or more, but is generally restricted to a certain number. Any partner may transfer his share; and the company must admit his assignee as a partner. The death of the *partners* has no effect on the *company*. No partner can act personally in the affairs of the company: but the execution of their business is intrusted to officers, for whom they are responsible; and, when the partners are numerous, the superintendency of the officers is committed to directors chosen annually, or at other appointed times, by the partners.

IV. *Companies incorporated by authority.* A royal charter is necessary to enable a company to hold lands, to have a common seal, and enjoy the other privileges of a corporation. A charter is sometimes procured, in order to limit the risk of the partners: for, in every private company, the partners are liable for the debts, without limitation; in incorporated societies, they are only liable for their shares in the stock of the society. The incorporation of societies is sometimes authorized by act of parliament: but this high authority is not necessary, unless for conferring exclusive privileges. See the article COMPANY, vol. iv. p. 873 & seq.

Mr. Paley says, "I know of nothing upon the subject of *partnership* that requires explanation, but how the profits are to be divided where one partner contributes money and the other labour, which is a common case.

"*Rule.*—From the stock of the partnership deduct the sum advanced, and divide the remainder between the moneyed partner and the labouring partner, in the proportion of the interest of the money to the wages of the labour, allowing such a rate of interest as money might be borrowed for upon the same security, and such wages as a journeyman would require for the same labour and trust.

"*Example.*—A advances 1000l. but knows nothing of the business; B produces no money, but has been brought up to the business, and undertakes to conduct it. At the end of the year the stock and effects of the partnership amount to 1200l. consequently there are 200l. to be divided. Now nobody would lend money upon the event of the business succeeding, which is A's security, under 6 per cent. therefore A must be allowed 60l. for the interest of his money. B, before he engaged in the partnership, earned 30l. a-year in the same employment: his labour, therefore, ought to be valued at 30l. and the 200l. must be divided between the partners in the proportion of 60l. to 30; that is, A must receive 133l. 6s. 8d. and B 66l. 13s. 4d. If there be nothing gained, A loses his interest, and B his labour, which is right. If the original stock be diminished, by this rule B loses only his labour as before; whereas A loses his interest and part of the principal; for which eventual disadvantage A is compensated, by having the interest of his money computed at 6 per cent. in the division of the profit when there is any. It is true, that the division of the profit is seldom forgotten in the constitution of the partnership; and is therefore commonly settled by express agreement; but these agreements, to be equitable, should pursue

pursue the principle of the rule here laid down. All the partners are bound by what any one of them does in the course of the business; for, *quoad hoc*, each partner is considered as an authorized agent for the rest." Paley's Moral and Political Philosophy.

PAR'TRIDGE, *f.* [*perdix*, Fr. *pertris*, Wel. *perdix*, Lat.] A bird of game. See TETRAO.—The king is come out to seek a flea, as when one doth hunt a *partridge* in the mountains, 1 *Sam.* xxvi. 20.

PAR'TRIDGE BAY, a bay on the south coast of Labrador. Lat. 50. 16. N. lon. 63. 20. W.

PAR'TRIDGE FIELD, a town of the state of Massachusetts: twenty-six miles west-north-west of Northampton.

PAR'TRIDGE ISLAND, an island of the South Pacific Ocean, in the vicinity of Van Diemen's Land, and discovered in the voyage for search of La Perouse, May 1792; and so called by some of the crew who first observed it, from an apprehension that it abounded with partridges, which were probably mistaken for quails. This small island is only about 100 toises in length, and situated in lat. 43. 23. 30. S. On the shore was found the low species of parsley, which they called *Apium prostratum*, in great abundance. Many species of the *Casuarina*

grow here; and, among the plants, seen for the first time, was a remarkable species of the *Limodorum*. Numerous kinds of ferns were also collected, and a beautiful species of the *Glycine*, remarkable for its scarlet flower. No fresh water was found upon this island; though several forsaken huts showed that it had been frequented by the savages. *Perouse*, vol. i.

PAR'TULA, or PARTUN'DA, in heathen mythology, the goddesses who were supposed to preside over pregnant women, and to assist at the child-birth.

PAR'TURE, *f.* Departure. *Not in use.*

The tydings bad,
Which now in faery court all men do tell,
Which turned hath great mirth to mourning sad,
Is the late ruine of proud Marinell,
And sudden *parture* of faire Florimell
To find him forth. *Spenser's F. Q.*

PARTUR'IENT, *adj.* [*parturiens*, Lat.] About to bring forth:

In mid state, I call't *parturient*,
And should bring forth that live divinity
Within ourselves. *More's Imm. of the Soul.*

P A R T U R I T I O N.

PARTURITION, *f.* [from *parturio*, Lat. to bring forth; or from *partus*, child-labour, of *pario*.] The act of bringing a child into the world.—Confirmation of parts is required, not only unto the previous conditions of birth, but also unto the *parturition*, or very birth. *Brown's Vulg. Err.*—Any production.—The ardency of love, which we have to any new *parturition*, is by some space of time abated, after that we have diverted to some other employment; amongst which, as amongst children, commonly the youngest is most affected. *Lisfr. for Orat.* 1682.

INTRODUCTION.

THE art of delivering women of the mature foetus must be nearly coeval, as a practice, with the creation. At first it was very simple, and consisted solely in the knowledge of the method of dividing the navel-string. Animals usually bite it asunder with their teeth. Women probably first made use of the sharp edge of a stone, or of a shell, for the purpose; which is the mode still practised in barbarous countries. As difficulties would occasionally occur, either in the exclusion of the foetus, or of the placenta, or after-birth, some female friend or relative would be called upon to give assistance. If the placenta happened to be detained beyond the usual time, which is one of the most ordinary accidents in labours, the assistant would naturally attempt to draw it away by the funis, which she would find hanging from the pudenda. If a leg or arm of the foetus presented, instead of the head, she would, doubtless, take hold of the presenting part, and endeavour by that means to draw the child from its confinement. In these attempts, if it should be one of the lower limbs that presented, her exertions would generally be crowned with success; but, as the obstacle making assistance necessary supposes a relative disproportion between the birth and the passage through which it is to pass, the child would usually be dead born. On the other hand, if an arm presented, the same success would attend the exertions of the midwife in a few cases only; as in premature birth, or where the child happened to be remarkably small. It would more commonly happen, that all attempts to bring the child in that posture would fail; but the uterus persisting to exert itself, or, in other words, the labour-pains continuing, they would some-

times thrust down the feet or the breech of the child, the head and shoulders gradually receding, and rising upwards, and it would at length be forced into the world in that position. In these cases, though the child would be dead, the woman would frequently recover. It would more often happen, that this evolution would not take place, and that the woman, exhausted by long-continued and fruitless exertions, bruised and injured by the pressure of the foetus, and tormented by the distension of her bladder, no egress being allowed to the urine, would fall a sacrifice to the pressure of so many accumulated evils.

There can be hardly any doubt that, in the first ages, the practice of this art was altogether in the hands of women, and that men were never employed but in the utmost extremity. Indeed it is natural to suppose, that, while the simplicity of the early ages remained, women would have recourse to none but persons of their own sex, in diseases peculiar to it; accordingly, we find that in Egypt it was practised by women. See Gen. xxxv. 17. xxxviii. 28, 29. Exod. i. 15-21.

Hyginus relates, that in Athens a law was made, prohibiting women and slaves from practising physic in any shape: but the modesty of the sex rendered it afterwards absolutely necessary to allow free women the privilege of sharing this art with the men.

In the *Harmonia Gynæciorum*, there are extant several directions and recipes on the subject of midwifery, collected from the writings of one *Cleopatra*, interspersed with those of *Moschion* and *Priscian*; and some people imagine this was no other than the famous *Cleopatra* queen of Egypt, because, in the preface, *Arinoë* is mentioned as the author's sister. *Galen*, who lived two hundred years after this Egyptian queen, advises the reader to consult the writings of one of that name, but does not inform us whether she was or was not that celebrated princess; so that, in all probability, it was some other person of the same name, as the study and exercise of such an art was not at all suited to the disposition of such a gay voluptuary as queen *Cleopatra* is described to have been.

Ætius transcribes some chapters from the works of one *Aspasia*, touching the method of delivering and managing women in natural labours; but gives no account of

of the place of her residence, nor of the time in which she wrote. Several other female practitioners are mentioned by different historians; but, as none of their writings are extant, and the accounts given of them are mostly fabulous and foreign to our purpose, we shall forbear to mention them in this place, and, referring the curious to Le Clerc's History of Physick, begin with *Hippocrates*, the most ancient writer now extant upon our subject, who may be styled the father of midwifery as well as medicine; because all the succeeding authors, as far down as the latter end of the sixteenth century, have copied from his works the most material things relating to the diseases of women and children, as well as to the obstetric art.

Hippocrates, who practised medicine in Greece about 460 years before the Christian era, no doubt availed himself of the observations of those who went before him in the exercise of the same profession. He acquired the highest reputation by his wise predictions and successful practice, and by his uncommon sagacity and experience greatly improved the healing art. In his book *De Natura Muliebri*, and those *De Mulierum Morbis*, he mentions and describes many diseases peculiar to the female sex, according to the theory of those times, and prescribes more medicines for the diseases of women than for any other distempers. Many of his remedies, indeed, are very strange and uncouth; but a number of them are still accounted excellent in the present practice, unless his names of them have been mistaken and misapplied to other medicines: and, although his theory is frequently odd and erroneous, his diagnostics, prognostics, and method of cure, are often just and judicious. As to his theory of conception, and his opinions about the birth in the seventh or eighth month of gestation, they were espoused by all medical writers till the 17th century.

At the early period we are speaking of, the chief means made use of in tedious and difficult labours appear to have been, anointing the pudenda with oils, and putting the women into warm baths, as we find it recommended by Hippocrates, Avicenna, and other ancient writers; by these means they hoped to relax the parts, and render them more easy of distention, and thence to procure a freer passage for the fœtus. This continued to be the practice for many ages. From examining the little that has been written by the ancients on the subject, it is evident they had no knowledge of that species of obstacle to the birth of the child, which is occasioned by the mal-conformation of the bones of the pelvis of the woman: they attributed the whole of the difficulty to a rigidity of the muscles, or of the ligaments connecting the bones of the pelvis together, which they hoped by these means to loosen.

Hieronymus Mercurialis, who flourished about the middle of the sixteenth century, tells us, it was not unusual to put women on a course of bathing and anointing several weeks before they attained to the period of parturition. Speaking of what is to be done, prior to the labour, he says, "Utatur balneis aquæ dulcis, in quibus herbæ laxantes et emollientes coquantur. Inungatur etiam, eodem tempore, dorsum, et pectus, similiter loca muliebria iis linimentis, quæ possent emollire, et lenire." (*De Morb. Mul. lib. ii.*) Another custom which was probably only practised among the common people, was placing the parturient women in an erect posture that they might profit by the weight of the fœtus, and shaking them strongly; thinking, probably, that the child would drop down, as fruit falls from the tree.

"Alii," Moschion says, (*Harm. Gynæc. p. 11.*) "ad scalas ligabant, et sic pendere jubebant; alii infinitum deambulare et salire cogebant, alii scalas ascendere; alii autem, manibus sub axillis missis, a terra subleabant, et diutius exagitabant." Hippocrates had long before, and probably with the same view, recommended, in cases where the head of the child presented, but on account of the straitness of the passage was detained above the brim

of the pelvis, to anoint the parts, and to put the woman into a bath of warm water. These methods failing, the head of the child was to be opened with a scalpel, and then to be extracted with strong iron pincers, or hooks. "Caput gladiolo dissectum. Instrumento quod constringat comminuto, et officula per ossum vossella extrahito, aut unco attractorio ad claviculam uti firmiter adhæreat immisso, non confestim, sed paulatim remittendo, et rursus adurgendo, extrahito." (*Hip. Oper. Om. Fœtio. p. 618.*) Celsus recommends a similar practice, (*lib. vii. cap. 29. De Medecina.*) Avicenna mentions a kind of fillet that was used in these cases. This contrivance, although it had a few favourers, was never in general use; the more common method in tedious and difficult births was to diminish the bulk of the child, or of the part nearest to the external surface, with scalpels, or other cutting instruments, and then to draw it away with iron hooks, pincers, or forceps, armed with teeth. Those who wish to see the forms of these instruments, or a more particular account of the methods of applying or using them, may consult Albucasis's *Methodus Medendi*, lib. ii. and Ruett, *De Conceptione et Gen. Hominis*, in which many of them are particularly delineated and described.

As cases of such difficulty as to render the use of instruments necessary are rare, not occurring oftener than once in five or six hundred labours, and as the practice was for many ages, indeed so late as to the end of the sixteenth century, almost exclusively in the hands of women, it is not to be wondered at, that little improvement was made in the method of assisting women in the only cases that would come under the care of the surgeon, until a very late period. Hippocrates, having learned that in ordinary births the child presented with its head to the orifice of the womb, thought that in all cases when it offered in a different posture, it ought to be pushed back, in order to bring down the head. This he attempted to do even when the breech or the feet came first. "If an olive," he says, "comes into the neck of a bottle across, and you attempt to bring it through in that posture, you will either crush the olive or break the glass." But, as it is of little consequence which of the ends of the olive comes first, he should have seen, that it is nearly equally immaterial which end of the child comes first. This, however, does not seem to have occurred to him; and, as his name was of great authority in every thing relating to medicine, his rules continued to be followed until the middle of the sixteenth century.

In his first book of the Diseases of Women, he gives directions for excluding the *secundines*, provided they are not expelled in the natural way. He says, if the *secundines* come not away immediately after the birth, the woman labours under a pain in her belly and side, attended with rigours and a fever, which vanish when they are discharged; though, for the most part, the after-birth putrefies and comes away about the sixth or seventh day, and sometimes later. In this case, he orders the patient to hold her breath, and prescribes internally, mugwort, cretan dittany, flowers of white violets, leaves of agnus, castus, with garlic boiled or roasted, small onions, castor, spikenard, rue, and black wine.

In the book *de Superfætatione*, after having described the methods of delivering a dead child, he says, if the *secundines* come not away easily, the child must be left hanging to them, and the woman seated on a high stool, that the fœtus by its weight may pull them along; and, lest this should be too suddenly effected, the child may be laid on wool newly plucked, or on two bladders filled with water, and covered with wool, which being pricked, as the water evacuates, they will subside, and, the child sinking gradually, will gently draw the *secundines* away; but, should the navel-string happen to be broke, proper weights must be tied to it, in order to answer the same purpose; these being the easiest and least hurtful methods of extracting the *placenta*.

He likewise ascribes several complaints and disorders of women

women to the different positions and motions of the uterus; of which last, Plato, who lived immediately after Hippocrates, gives a very odd and romantic description, in his *Timæus*. After affirming "that there is implanted in the genitals of man, an imperious headstrong inobedient power, that endeavours to subject every thing to its furious lusts;" he says, "the vulva and matrix of women is also an animal ravenous after generation, which, being balked of its desire for any length of time, is so enraged at the disappointment and delay, that it wanders up and down through the body, obstructing the circulation, stopping the breath, producing suffocations and all manner of diseases."

Although there is a piece in English, called "Aristotle's Midwifery," we find little or nothing of the practice in his works. He has written on the generation of animals; and we find in him several hints, curious enough, even upon our subject. He tells us, that women suffer more than other animals from uterine gestation and labour; that those women who take most exercise, endure both with the greatest ease and safety; and that the fœtus in all animals naturally comes by the head, because, there being more matter above than below the navel, the head necessarily tilts downwards. For this reason, he says, every birth in which the head presents is natural, and those unnatural in which the feet, or any other part of the body, come foremost.

We have nothing written on the subject of parturition from his time to that of Celsus, who is supposed to have lived in the reign of the emperor Tiberius. This author has given a chapter on the delivery of dead children, and the placenta, in which he has copied from Hippocrates, though he is more full than his master, and mentions several improvements on his practice. After having given directions with regard to the woman's position, he advises the operator to introduce one finger after another until the whole hand shall gain admittance; he says, that the largeness of the uterus, and the strength and courage of the patient, are great advantages to the birth; that the woman's abdomen and extremities must be kept as warm as possible; that we must not wait until an inflammation is produced, but assist her without delay; because, should her body be swelled, we can neither introduce our hands, nor deliver the child, without great difficulty; and vomitings, tremors, and convulsions, often ensue.

Rufus Ephesus, who lived in the reign of Trajan, gives a short account of the uterus and its appendages, and describes those tubes which are now called *Fallopian*, as opening into the cavity of the womb; though Galen arrogates this discovery to himself, so particularly, as to say upon this subject, that he was surprised to find they had escaped the notice of the common herd of anatomists; but more especially amazed that a man of Herophilus's accuracy should be ignorant of them: yet Rufus has expressly mentioned the opinion of Herophilus on this particular.

Galen was born in the time of the emperor Adrian, A.D. 131. about six hundred years after Hippocrates, upon whose works he writes commentaries, and gives some reasonable aphorisms relating to women and children. We have two books of his writing, *de Semine* (the third being accounted spurious); one, *De Uteri Dissectione, de Fœtum Formatione, De Septimesfri Partu, De Usu Partium*. In his physiology he is prolix and inaccurate: his anatomy is pretty exact in many things; but, upon the whole, he contains little or nothing to our purpose.

In Oribasius, who was physician to Julian, we have a description of the parts, and in several places of his works, an account of the medicines used by the ancients in the diseases of women and children: he has also a chapter on the choice of a nurse, and another upon the milk; but says nothing of the operation.

Ætius, who (according to Le Clerc) lived in the end of the fourth, but in the opinion of Dr. Freind in the end of the fifth, century, was likewise a collector from the

ancients: for neither he nor Oribasius can be styled original writers: the last indeed, copied from none (almost) but Galen, and was therefore called *Simia Galeni*; whereas the other compiled from all the authors that went before him, many of whom would have been lost in oblivion, had not they been mentioned in his works; he is very particular upon the diseases and management of women; his fourth Sermo of the 4th Tetrab being expressly written on this subject, and containing almost every thing which had been said before him.

In his first chapter, *De Uteri Situ, Magnitudine, ac Forma*, he distinctly divides the womb into a fundus and neck, and describes the *os tinea* as ending in the *sinus muliebris, sive pudendum*, which plainly appears to be no other than what we now call the *vagina*; for, he says, it is above six inches in length; but his description of the figure of the uterus is imperfect. His seventh chapter treats of conception, from Soranus. In his twelfth and fifteenth chapters he gives a detail of Aspasia's practice in the care and management of women, during pregnancy, and in time of labour; but the greatest part of these and the other chapters are taken from Hippocrates, to whom he has made a few insignificant additions, until we come to the twenty-second, in which there is a very full and distinct account of difficult births.

Among the causes that produce difficult labours, he enumerates weakness of mind or body, or both, a confined uterus, a narrow passage, natural smallness of the parts, obliquity of the neck of the uterus, a fleshy substance adhering to the cervix or mouth of the womb, inflammation, abscess, or induration of the parts, rigidity of the membranes, premature discharge of the waters, which ought to be detained for moistening and lubricating the parts, a stone pressing against the neck of the bladder, and extraordinary fatness; an anchylosis of the ossa pubis at their juncture, by which they are hindered from separating in time of parturition, too great pressure of the uterus on the cavity of the loins, or too great quantity of fœces and urine retained in the rectum and bladder, an enfeebled constitution, advanced age, slender make, and greenness of years, attended with weakness and inexperience. He observes, that difficult labours likewise proceed from circumstances belonging to the child that is to be born; from the extraordinary size of the body, or any part of it; from its being unable (through weakness) to facilitate the birth by its leaping and motion: from the crowding of two or three fœtuses: from twins presenting together at the mouth of the womb: from the death of the child, as it can give no assistance in promoting labour: from its tumefaction after death, and wrong presentation.

His twenty-third chapter contains the method of extraction and exsection of the fœtus, from Philumenus. He says, before the operator begins to deliver by exsection, he ought to consider the strength of the patient, and determine with himself, whether or not there is a probability of saving her life; because, if she is exhausted, enervated, lethargic, or convulsed, with a disordered pulse, it is better to decline the operation, than run the risk of her perishing under his hands; but, if he thinks her strength and courage sufficient for the occasion, let her be laid in bed, on her back, her head being low, and her legs held asunder by strong experienced women; she may take, by way of cordial, two or three mouthfuls of bread dipped in wine, in order to prevent her fainting; for which purpose, her face may be also sprinkled with wine during the operation. The surgeon, having opened the pudenda with an instrument, and observed the source of the difficulty, whether tumor, callus, or any of the causes already mentioned, he must take hold of it with a forceps, and amputate with a bistory: if a membrane obstructs the mouth of the womb, it must be divided: if the delivery is prevented by the rigidity of the membranes that envelop the fœtus, they must be pinched up with a pair

of small forceps, and cut with a sharp knife; then the perforation may be dilated with the fingers, so as to effect a sufficient opening for the passage of the child.

The next considerable author on this subject, is Paulus Ægineta, whom Le Clerc supposes to have lived in the latter end of the fourth century; though Dr. Freind brings him down to the seventh; he was the last of the old Greek medical writers. His method of practice is much the same with that of Ætius and Philumenus, as above described; and, though not so full as they, he is very distinct and particular. He tells us in his preface, that he had collected from others; and, although he was the first who had the name of *man-midwife* from the Arabians, the writings of Ætius plainly show, that there had been many male practitioners before him. In the seventy-sixth chapter of his third book, which treats of difficult births, he gives the appellation of natural to all those in which the head or feet present; and all other positions he deems præternatural. Paulus is supposed to have studied at Alexandria: for, long before his time, the Roman empire in the west had been overrun and ruined by the Goths and Vandals; and, soon after this period, learning began to decline in the east; the schools of Alexandria were removed to Antioch and Haran by the Saracens, who subdued Egypt, and destroyed the Roman empire in Asia, and then the Greek physicians were translated into the Syriac and Arabic: at least, the Arabians copied from them. This subject is fully discussed by Dr. Freind, in his History of Physic.

Serapion, one of the first Arabian writers, in his Tractatus Quintus has several chapters on the diseases of pregnant women, with the method of cure.

The next author of any note, belonging to this country, was Rhazes; who, in the latter end of the ninth century, lived at Bagdat. Like other systematic writers in physic, he hath treated of the diseases of women; and written one book expressly on the diseases of children. In the last chapter of his *Liber Divisionum*, he orders the membranes, when they are too tough, to be pierced with the nail of the finger, or with a little knife: and, if the waters are discharged a long time before delivery, so that the parts remain dry, he directs us to anoint them with oily cerates.

Avicenna lived at Ispahan about the year 1000; and was so famous for his writings all over Asia and Europe, that no other doctrine was taught in the schools of physic, till the reformation of learning. He is a voluminous author, treats largely of every part of midwifery, so far as it was known in his time; copying from those that went before him: the operation for the dead child he takes from Paulus; the extraction of the secundines from Philumenus; and the use of the fillet from his countryman Rhazes. He is very full on all the diseases of women, relating to the menses, uterine gestation, and delivery. In all præternatural cases, he says, the head ought to be reduced into the natural position; but, should this be found impracticable, he advises us to deliver by the feet. He alleges, that the head is the only natural way of presenting, and that all other positions are præternatural; though of these, the easiest is when the fœtus presents with the feet.

The next Arabian medical writer is Albucasis, who, in the eleventh or twelfth century, lived at Cyropolis, a city of Media, on the Caspian Sea; and it appears from an Arabian manuscript, in the Bodleian library, that this is the same person who was also known by the name of Alfaharavius. He has written on natural labours in the same way with his predecessors, advising us to assist the birth with fomentations and ointments, and by reducing the child into the natural position, when any other part than the head presents. His operation for extracting the dead child is literally the same with that described by Ætius; but whether he copied it from that author, or from other Arabians his predecessors, is uncertain.

What is most particular in this author is, the descriptions and figures of the instruments then used in midwifery: namely, a *vertigo* for opening the matrix, which seems to be much of the same contrivance with that which Rhazes calls the *toreulum volvens*: he likewise exhibits the figures of two other instruments for the same purpose; but not one of the three in the least resembles the *speculum matricis*, described in later writers: an *impellens*, to keep up the body of the child while the operator endeavours to reduce the head into the natural position; two kinds of forceps, of a circular form, furnished with teeth on the inside, to squeeze and crush the head, when it is of an extraordinary bigness; the larger he calls *almiflach*, the other *miflach*; and two different kinds of crotchets.

After the twelfth century, physic began to decline in Asia. Theodore Gaza brought the Greek manuscripts from Constantinople, after that city was taken in the year 1453; and about this time, the art of printing being found out, all the knowledge of the ancients was soon dispersed over Europe. In the next century, the practice of physic began to be encouraged in England. Linacre, born at Canterbury, and chosen fellow of All-souls, in Oxford, in the year 1484, was a man of learning, and projected the foundation of the college of physicians in London; for which he obtained a patent from king Henry VIII. and was himself president of it till the day of his death.

But the study of the art of parturition, though it now began to be cultivated with some success, continued in a very rude state till the 17th century; and, even after physic and surgery had become distinct professions, it remained almost totally uncultivated.

"It is a curious fact, (says the editor of the Encyclopedia Britannica,) that in the empire of China the very reverse of this has taken place. In that empire, according to the latest accounts, both physic and surgery are still in a state of the utmost degradation, even more so than among the savages of America; but for some hundred years the art of midwifery has been practised by a set of men destined to the purpose by order of government. These men, who hold in society the same rank which lithotomists did in this country about the beginning of last century, are called in whenever a woman has been above a certain number of hours in labour, and employ a mechanical contrivance for completing the delivery without injury to the infant. A certain number of such individuals is allotted to each district of a certain population.

"Both sir George Staunton and Mr. Barrow were ignorant of this fact; and the latter in particular expressly mentions, that there are no men-midwives in China. But the writer of this article had his information from a more authentic source than the works of gentlemen who were only a few months in that country, and were in a great measure treated as state-prisoners. He has it, through the medium of a friend, from a gentleman who resided upwards of twenty years as surgeon to the British factory at Canton, and who had both the ability and the inclination to learn, during the course of so long a residence, all the customs and prejudices of the natives relating to the preservation of human health."

Towards the end of the 16th century, the same causes which had so long before led to the cultivation of midwifery in China produced the same effects in Europe. The dangers to which women are sometimes exposed during labour excited the compassion of the benevolent; so that a considerable part of the first hospital which was established for the reception of the indigent sick, the Hotel Dieu of Paris, was appropriated to lying-in women. The opportunities of practice which that hospital afforded, directed the attention of medical men to the numerous accidents which happen during labour, and to the various diseases which occur after delivery. Public teaching

teaching followed, and soon after the custom of employing men in the practice of midwifery began.

Several authors of note lived and wrote in the sixteenth century, or betwixt the years 1530 and 1590, upon the diseases of pregnant women, and the different methods of delivery. A collection of the most remarkable among these writers, who are called the *old moderns*, was published at Basil, 1586, in quarto, entitled "*Gynæciorum Commentaria*;" and afterwards, in 1597, republished at Strasburg in folio, by Israel Spachius, professor of medicine in that city, with the addition of two authors, who had not been mentioned in the first. At the head of this collection, is Felix Platerus, born at Basil: he published tables, explaining the use and structure of the parts of generation proper to women. The next is the "*Harmonia Gynæciorum*," collected from Cleopatra, Moschion, Theodorus Priscianus, and another uncertain author, freed from repetitions and superfluities, by Casparus Vulpius. Then follows Eros or Trotula, first published among the old Latin writers at Venice, by the sons of Aldus. The fourth place is held by Nicholas Rocheus, a Frenchman, whose works, published at Paris, are taken from the Greeks and Arabians; though he has added some observations of his own. In his twenty-eighth chapter, he says, if the child is large, the os uteri must be dilated; if the hand or foot presents, neither must be laid hold on; but the operator, introducing his hand to the buttock or shoulder, must reduce the foetus into the natural situation, that is, so as to present with the head. His thirty-second chapter treats of monsters. Ludovicus Bonaciolus, of Ferrara, is the fifth: his works were published at Strasbourg. The sixth is Jacobus Silvius, of Amiens in Picardy. Then comes Jacobus Rueff, who published at Zurich in Switzerland, and afterwards at Frankfort. He is the first that gives a draught of the speculum matricis, for dilating the os internum, which he directs to be stretched in width; but by no means lengthways, lest the ligaments breaking, the womb should fall down. When the feet present, and the hands are stretched along the sides, he advises us to deliver footling; but, if the hands are up over the head, he says the child ought not to be brought by the feet, unless the head be very small. If the knees present, he orders them to be pushed up, and the child to be delivered by the feet: but if the breech comes first, it must be reduced, and the foetus brought by the head. The same practice he recommends in the presentation of the hands, shoulder, or hands and feet together. He is succeeded by Hieron. Mercurialis, who lived at Padua, Venice, and Bologna, and practised much in the same manner. The ninth is Johannes Baptista Montanus of Padua. Victor Trincavillius, of Venice, is the next. Albertus Bottonus, of Padua, is the eleventh. After him comes Joannes le Bon Heteropolitanus.

The author, who holds the next place in this collection, is Ambrosius Paræus, or Paré, the famous restorer and improver of midwifery: he lived at Paris, and his works were translated into Latin by Jacob Guillemeau. Next to him Spachius places Albucaasis the Arabian, already mentioned. Then Franciscus Roussetus, who wrote on the Cæsarian operation: his work was translated from the French by Casparus Bauhinus; and several of his cases are published in the memoirs of the academy of surgeons, by M. Simon. There is also the figure of a petrified child, extracted from the womb after the death of the mother; a particular account of which is added to Cordæus's comment upon Hippocrates. Casparus Bauhinus, professor at Basil, is the sixteenth. Then Mauritius Cordæus, of Rheims and Paris. The next is Martinus Akakia, of Paris; and the last is Ludovicus Mercatus, a Spaniard. This author says, if the child does not present with the head or feet, the case is dangerous, and præternatural; nor is the presentation of the feet without hazard or difficulty. In laborious cases, if the woman be young or vigorous, he prescribes bleeding in the foot,

after Hippocrates; but is against the use of the bath. He exclaims against the Cæsarian operation as an unchristian undertaking; directs us, when the placenta adheres, to introduce the hand, and pull the funis gently from side to side; and recommends sneezing to the woman, as conducive to its expulsion. When he treats of the manner of extracting a dead child, he says, with Ætius, we ought first to consider whether or not the woman has strength sufficient to bear the operation; then gives the method of Hippocrates, and in the next page describes the manner of Ætius.

Having thus given a short sketch of the authors collected by Spachius, we shall return to Paré, who (as already hinted) was the first modern that made any considerable improvements in midwifery; which continued, to his time, without any material alteration, even after the other branches of physic had been improved. For example, if the child did not present in the natural way, they shook and altered the position of the woman, by which means they imagined the foetus would turn to the right posture; or they attempted to move it so as that it should present with the head. If this could not be effected, and the feet were near at hand, they brought it footling; but, if they failed in this attempt, the child was supposed to be dead, and extracted with crotchets and hooks of various kinds; and if it could not be delivered in that manner, on account of its extraordinary size, or the narrowness of the pelvis, they dismembered and separated the body with crooked and straight knives, and then extracted it piecemeal. Paré was the first that deviated from this practice, and expressly orders the child to be turned and brought away by the feet, in all præternatural cases. He says, the most natural case is that in which the child presents with the head, and is delivered immediately on the discharge of the waters: it is more difficult when the foetus comes by the feet; and still more so, in the presentation of the arm and legs together, the back, belly, arm alone, or any other unnatural position. He directs us to bring away the secundines immediately after the child is delivered: he retains the old notions relating to the diseases and medicines; for the ancient theory was not altered till after the great Harvey found out the circulation of the blood.

Cotemporary with him, was the above-mentioned Jacobus Rueff, who practised at Frankfort, and in his writings recommends the method of the ancients: a circumstance from which we learn, that the improvements had not then reached Germany. Indeed they were very much retarded by the modesty of the women, who were shy of male practitioners; and by the mistaken notions which were at that time entertained of the structure of the uterus; for, all the descriptions till the time of Vesalius were very imperfect; and the womb in women supposed to be formed of different cells, resembling that of the brute species.

Jacobus Guillemeau was the pupil of Ambrosius Paré, adopted and confirmed his master's practice, and has written with learning and judgment.

A few years before Ambrosius Paré's book appeared, Eucharius Rhodion, a physician at Frankfort, published the first popular work that we are acquainted with on the subject. As it was intended for the instruction of the midwives, it was printed at first in the German language. In 1532, it was translated into Latin, under the title of "*De Partu Hominis*," and in a few years after, into French, English, and other modern languages. The practical rules recommended by him, are such as he had learned from Hippocrates, Avicenna, and other ancient writers. In cross-presentations, the midwife was to endeavour to bring down the head; when this could not be effected, if the breech, or feet, were next the uterine orifice, the child was to be allowed to come into the world in that posture, taking, however, especial care, he says, that the hands should be brought down, and placed one on each side of the body of the child, a rule which

which could not possibly be followed, and which shows that the writer had never practised the art. The same censure may be passed upon almost every regulation that had been hitherto promulgated on the subject; nearly all of them tending rather to mislead than to inform the practitioner, and to increase rather than diminish the pain, difficulty, and danger, of the labour.

We have two translations of Rhodion's book into our language. The first by Richard Jones, who dedicated it to Katherine, queen to Henry VIII. It was printed in the year 1540; and is decorated or illustrated with some indifferent engravings on copper, which, however, are esteemed, as being the first specimens of the kind executed in this country. In 1545, Thomas Raynold, physician, published a second translation. This has passed through several editions, under the title of "The Byrth of Mankynd, or the Woman's Booke;" and was nearly the only manual used by the midwives until the year 1634, when all the works of Ambrose Paré were translated into one volume.

In the year 1688, Francis Mauriceau, after an extensive practice for several years, in the Hotel Dieu and city of Paris, published a Treatise on Midwifery, which exceeded every thing before made public on that subject. He describes the bones of the pelvis, and all the parts subservient to generation; the diseases incident to pregnant women, with the methods of prevention and cure; and, after having given a full and distinct account of all the different labours, and the way of delivering in each case, concludes his work with the diseases of women and children. His method of practice was nearly the same with that of Paré and Guillemeau; but he is much fuller than either. In laborious cases, when the head presents, and cannot be delivered by the labour-pains, he orders a fillet, or stripe of linen, to be slit in the middle, and slipped over the head: this contrivance hath since been improved with laces, by which it is contracted on the head. It is introduced by three different instruments, fixed with a great deal of trouble, and, after all, of very little use. He also invented a *tire-tête*, which cannot be applied until the skull is opened with a knife; consequently can be of no service in saving the child: and, granting the fœtus to be dead, other methods are much more effectual. He was ignorant of the forceps. When the head is left in the uterus, he advises us to extract it, by introducing over it a broad fillet, like a sling. In 1706, he published a second volume, containing about 800 observations. But, long before that period, he had gained such reputation by his writings, as encouraged others of the same nation to write on the same subject: accordingly, we have the works of Portal, Peu, and Dionis; but all of them fall short of Mauriceau. About this time also, Saviard wrote several observations on the same art.

Cotemporary with Mauriceau were Dr. Chamberlen and his three sons, who practised in London with great reputation. One of these three sons, father to the late Dr. Hugh Chamberlen, translated the first volume of Mauriceau into English; and, in the preface to the translation, Dr. Chamberlen announces an invention, "known only," he says, "to his father, brothers, and himself, with which they were enabled to terminate the most difficult labours, without injuring either the mothers or the children." Though he gives no intimation by which it could be discovered what were the means used for the purpose, yet it was in time found out to be the forceps. The merit of the invention consisted in making the blades of the instrument separable, and capable of being locked, or united together, after being introduced into the vagina, and placed one on each side of the head of the child: a most invaluable discovery, and which has deservedly immortalized the inventor. But he at first very much overrated their power, imagining that they were applicable in all cases, where the head of the child was *enclavé*, or fixed in the pelvis; not having met with a

case, we may suppose, where the bones-forming that cavity were considerably distorted. Accordingly he undertook to deliver a woman whose pelvis was so contracted and narrow as to render it impossible that the head of a full-grown fœtus should pass through it undiminished. The operation, or trial, which was performed at Paris, where he went with the view of selling his secret, failed. Mortified at the check he received, he left the country, and went to Amsterdam, where he is said to have sold the secret to Roonhuysen, a surgeon in great practice in that city, who has the credit of having invented the lever which bears his name.

Dr. Denman, in the preface to his Midwifery, has given some extracts from a curious MS. written by Dr. Percival Willughby, who lived at Derby, and afterwards in London; which will give the reader some idea of the practice of that time, many of the cases being dated from 1640 to 1670. This work is entirely practical, and was intended to be published for the use of midwives, there being a title-page, and two copies with variations. His preface is in this manner:

"I have read many bookes, with all the late writers in midwifery, and I do perceive that they all followe one common roade, taking their severall scheemes and figures one from another. In severall of these scheemes various things may be perceived which will be troublesome to the labouring woman, which a judicious practitioner will not followe. Let midwives mark what hath been written in my observations, let them consider diligently the severall reportes not fained, or the surmised thoughtes, notions, or man's fantasie, sitting and meditating in his studie, but which really have been performed in the traailing woman's chambre. From mine and their directions let midwives choose the best and easiest waies of relieving women in affliction; and to decide all disputes let reason be the judge, let experience argue the dubious points of practice; and, after a full debate, let unspotted truth recorde to succeedinge times what is most fitt to be followed and used, &c."

This is a specimen of his illustration. "Let midwives observe the waies and proceedings of nature for the production of her fruit on trees, or the ripening of walnuts and almondes, from their first knotting to the opening of the huskes and falling of the nutt; the green huskes sticking so close that it is not possible to separate the huske from the shell, whilest it is unripe; but as the fruit ripeneth the huske choppeth, and with a fissure openeth, and by degrees separateth the fruit without any enforcement. An egge representeth the wombe: now the henne with keeping the egge warme doth breed the chicken, which when it comes to maturitie doth chip the shell, and is by degrees hatched without injurie. These signatures may teach midwives patience, and persuade them to let nature alone to performe her owne worke, and not to disquiet women by their strugglings; for such enforcements rather hinder the birthe than any waie promote it, and oft ruinate the mother and usually the childe; and let midwives knowe that they bee natur's servantes, &c."

Willughby's practice is very little different from that of the present time. He divides labours into two kinds only, natural and unnatural. It appears, that this Dr. Willughby was one of the six sons of sir Percival Willughby, and grandson of sir Francis, so famous in the time of queen Elizabeth.

About this time flourished Nicholas Culpeper, a writer very much admired by the common people. He was the son of Nicholas Culpeper, a clergyman, and grandson of sir Thomas Culpeper, bart. He was for some time a student of the university of Cambridge; and soon after was bound apprentice to an apothecary, under whom he acquired a competent knowledge of the materia medica, and of the art of preparing and compounding medicines; but he employed all his leisure hours in adding to the study of physic that of astrology, both which he afterwards

wards professed; and set up business in Spitalfields, next door to the Red Lion, (formerly known as the Half-way House between Islington and Stepney,) where he had considerable practice, and was much resorted to for his advice, which he gave to the poor gratis. In his works he styles himself "Gent. Student in Physic and Astrology;" and those physicians of early times, whom he seems to have particularly studied, Paracelsus, Galen, and Avicenna, regarded those as homicides who were ignorant of astrology: Paracelsus, indeed, went farther; he declared, that a physician should be predestinated to the cure of his patient; and that the horoscope should be inspected, the planets gathered at the critical moment, or at least during the planetary hour. Culpeper published "A Directory for Midwives;" in which he has copied the theory and practice of the old writers, many of whom he mentions, namely, Hippocrates, Galen, Aëtius, &c. and frequently advises the reader to consult his translations of Sennertus, Riverius, Riolanus, Bartholin, Johnston, Veslingius, Rulandus, Sanctorius, Cole, the London Dispensatory, and a book which he himself had published under the title of "The ENGLISH PHYSICIAN, and Complete Herbal; being an astrologo-physical Discourse of the vulgar Herbs of the Nation; containing a complete Method or Practice of Physic, whereby a Man may preserve his Body in Health, or cure himself when sick, with such things only as grow in England, they being most fit for English Constitutions." This work has always been in great request, and has been many hundred times reprinted, not only in England and Scotland, but in America. He published several other works; and died at his house in Spitalfields, on the 10th January, 1654, in the thirty-eighth year of his age. He was succeeded in this way of writing by one Dr. Salmon, who was also a great translator and compiler; and was partly author of a spurious piece called Aristotle's Midwifery, which hath undergone a great many editions, and contributed to keep up the belief of the marvellous effects of various medicines.

It is probable that the fortune and eminence acquired by the supposed advantages of the method of the Chamberlens, which they reserved as a secret, might be the occasion that many gentlemen engaged in practice endeavoured to establish themselves upon the same principles; that is, of concealing the means they used; of which class was Dr. Bamber. Others might attempt to gain equal reputation and fortune by the very contrary means; that is, by decrying the use of instruments of every kind, on any occasion; for, about the year 1723, Dr. John Maubray published a volume upon this subject called "The Female Physician, or the Whole Art of New Improved Midwifery," in which he exclaims with great vehemence against their use. In the following year he also published an appendix, under the title of "Midwifery brought to Perfection," in which he demands great credit for the many improvements he had made. This appendix is in truth no more than a Sylabus of his Lectures, a course of which consisted of twenty, twelve anatomical and physiological, and eight practical; and it would be unjust to deny to Maubray the credit of having been the first public teacher of midwifery in Britain. He gave his lectures at his house in Bond-street.

In the year 1701, Deventer, an eminent surgeon of a town in Holland of that name, acquired considerable fame by his practice in the obstetric art. He also declaimed violently against the use of instruments, affirming he could terminate the most difficult labours with his hand alone. He contended that the greatest obstacle to the birth of the child arose from the oblique position of the uterus, its fundus falling too much forward, or to one side of the abdomen of the mother. The head of the child was therefore forced by the pains, either against the sacrum, or against one of the sides of the pelvis, instead of being directed into the centre of that cavity. In

all cases of difficulty, if the head of the child was not forced down so low as to render it impracticable, he passed his hand into the uterus, turned the child, and delivered it by the feet. When that could not be done, he introduced his left hand into the back part of the vagina, and gradually pushed back the bones of the coccyx so as to give space sufficient for the head of the child to pass. In cases where the pelvis was distorted, he must necessarily have failed in this attempt, for the same reason that Chamberlen failed with his forceps; but, as such cases would only occur once in five or six hundred labours, that small number of exceptions would give little check to his fame, which was continued to his name for many years after his death. His book was translated in 1729; and, thus becoming known to the English practitioner, it may be esteemed (says Dr. Denman) a considerable addition to the stock of obstetric knowledge in this country. Dr. Smellie has quoted one of his observations; namely, "that an imaginary straight line falling down from the navel, would pass through the middle of the pelvis." This will nearly hold true, when the abdomen is not distended; but, in the last month of uterine gestation, in order to pass through the middle of the pelvis, such a line must be let fall from the middle space betwixt the navel and scrobiculus cordis. This, however, was a good hint, and useful in practice. Deventer was originally a watchmaker.

The next writer to be noted is Lamotte, who lived at Valognes, near Caen in Normandy; and in 1715 published a book on midwifery, which seems to be the best of the kind since Mauriceau, and has been translated into English by Mr. Tomkyns. It contains about 400 observations, the greatest part of which are illustrated with many judicious reflections. In describing a case in which the head presented, he mentions the great fatigue it had cost him to turn and deliver by the feet; and hopes that some easier method will be found out, for extracting the child in such circumstances: so that, although he wrote so lately, he must have been ignorant of the forceps.

The next writer in midwifery is Monf. Amand of Paris, who describes the method of extracting the head, when left in the uterus, by means of a net. The contrivance is ingenious, but is not applied without great trouble, and cannot succeed when the pelvis is too narrow, or the head too large to pass.

Dr. Simson, professor at St. Andrew's in Scotland, published in 1729 his "System of the Womb," a work of sufficient ingenuity, but not of much use in practice, even if his theory had been true.

About the year 1733, Edmund Chapman published his "Treatise on the Improvement of Midwifery," in which there are several useful observations; and other writings of temporary consequence only. Chapman was the second public teacher of midwifery in London; and he was the first who described the forceps as used by Chamberlen, in the third volume of the Edinburgh Medical Essays.

In the year 1734, Dr. Hody published a "Collection of Cases in Midwifery," written by Mr. William Giffard. These cases, 225 in number, seem to be written with great fidelity; and, as they occurred in his own practice, they were lessons of conduct which ought to be pursued in similar cases, and may now be considered as examples of the state of practice at that time. Giffard also gave a plate representing the forceps, and was among the first who asserted that the placenta might be attached over the os uteri.

"The Midwife rightly Instructed," was published in the year 1736 by Thomas Dawke; and the "Midwife's Companion," by Henry Bracken, in the following year, with some other things equally unimportant.

About this time lived Richard Manningham, who quitted the profession of pharmacy, and applied himself with great assiduity to the practice of midwifery. In a pamphlet, published in the year 1730, he is mentioned as having been knighted. In the year 1739 he established

a ward or small hospital in the parochial infirmary of St. James, Westminster, for the reception of parturient women, which was the first thing of the kind in the British dominions. At this ward, which was supported by public subscription, he gave lectures, and the students had opportunities of being qualified for practice. He published a *Compendium Artis obstetriciæ*; a *Treatise on the Febricula*; on the Use and Abuse of Physick; *Aphorismata Medica*; and many other essays, relating chiefly to the practice of midwifery. Sir Richard Manningham was a man of much learning and information, eminent and successful in practice; and very humane in the exercise of his art. He died about the year 1750.

Heister, professor at Helmstadt, a little town in the dukedom of Brunswick, in the year 1739 published at Amsterdam a *Treatise on Surgery*; in which we find a very concise and distinct account of the practice of midwifery, as well as of the Cæsarian operation.

Sir Fielding Ould, surgeon in Dublin, in the year 1742 published a *Treatise on the Practice of Midwifery*, in which there are two good observations: one relating to a case in which the head presents; and the other specifying what is to be done, when delivery is retarded by the twisting of the funis round the neck of the child. He prefers his *terebra occulta* to the scissors, probably because he did not know the proper dimensions of this last instrument. The very next year, Mous. Mesnard published, at Paris, a book on the same subject, by way of question and answer; and is the first who contrived the curved in lieu of the straight crotchet, which is a real improvement.

Practitioners in the art being now possessed of such powerful assistants as the forceps and crotchet, it was to be feared they might be induced to have recourse to them for the purpose of accelerating the labour in cases where there were only such obstacles as in a moderate space of time would be overcome by the pains. Cautions against this fascinating practice are found in all the late treatises on the art. Smellie, who had a larger share of practice, and who instructed a greater number of pupils, than any other professor in his time, is frequent in his admonitions against using art, other than in aid of nature, where she is absolutely and decidedly incompetent to the completion of the labour. How seldom also this happens, he is careful to inform them. He very much simplified the form of the forceps; and, that they might not be used before the head of the child had descended sufficiently low in the pelvis, he considerably reduced them in length; he also contrived a method of locking them, much more convenient than had been before used. Before he retired from the practice, in which he introduced several valuable improvements, he published, in 1752, "A *Treatise on the Theory and Practice of Midwifery*," which contained the substance of every thing that was useful, that had been printed on the subject, as well as the result of his own extensive practice. This was followed by a set of plates, in large folio, correctly drawn and well engraved, illustrating his practice. Soon after he published two volumes of cases, arranged in classes, referring to his treatise, and showing the efficacy of the rules he had there inculcated. The advice with which he concludes the Introduction to his *Treatise on Midwifery*, is very much to our present purpose.

"That the young practitioner may not be misled by the useless theories and uncertain conjectures of both ancient and modern writers, it is necessary to observe in general, that all the hypotheses hitherto espoused are liable to many material objections; and that almost every system hath been overthrown by that which followed it. This will probably be always the case; and indeed, as theory is of but little service towards ascertaining the diagnostics and cure of diseases, or improving the practice of midwifery, such enquiries are the less material. What Hippocrates has written about the form of the uterus, and its various motions, conception, the forma-

tion of the child, the seventh and eighth months' births, was believed as infallible till the last century, when his doctrine of conception, and the nutrition of the fœtus, was overthrown; and many new and uncertain theories, on the same subject, introduced.

"Some of the moderns conclude, that the ancients never turned and brought children by the feet, because Hippocrates directs us in all cases to bring the head into the natural situation; and says that, when delivery is performed by the feet, both mother and child are in imminent danger. Celsus, and all the writers till the time of Ambrose Paré, adopted this practice of bringing the head to present: but, at the same time, many of them observe, that, if this be not practicable, we must search for the feet, and deliver the fœtus in that manner. Celsus says, if the feet are at hand, the child is easily delivered footling: and Philumenus goes still farther, saying, that if even the head should present, and the child cannot be delivered in that position, we must turn and bring it by the feet.

"With regard to the fillets and forceps, they have been alleged to be late inventions; yet we find Avicenna recommending the use of both: and although, by the figures of the forceps given by Albucasis, who represents them furnished with long sharp teeth, one would imagine the instrument was designed for squeezing the bones and bringing the child along at any rate, without endeavouring to save its life, yet the forceps recommended by Avicenna is plainly intended to save the fœtus; for he says, if it cannot be extracted by this instrument, the head must be opened, and the same method used which he describes in his chapter on the delivery of dead children.

"To conclude, we find among the ancients several valuable jewels, buried under the rubbish of ignorance and superstition; because the assistance of men was seldom solicited in cases of midwifery, till the last extremity: and, those disadvantages being considered, we ought to be surprised at finding so many excellent observations in the course of their practice, and be ashamed of ourselves for the little improvement we have made in so many centuries, notwithstanding our opportunities, and the advantages we had from their experience."

While Smellie was making large strides toward improving every part of the practice of midwifery, and bringing it to perfection, Levret, and various other writers on the continent, were exerting themselves in a similar manner, and with perhaps equal felicity. In the mean while, hospitals and other institutions were formed, for the reception of parturient women. As the management and care of these were under the immediate direction of the physicians and surgeons, and the opportunity which for so many ages had been wanting, of acquiring an exact knowledge of the process of a natural labour, and of the obstacles that occasionally obstructed its progress and completion, was now obtained. To this also, the change that had been taking place, within something more than a century, in the opinions and manners of the public, had contributed. Several physicians and surgeons had, in the course of that time, applied themselves to the practice of midwifery. Hence we find Mauriceau, Deventer, Ruysch, Roonhuysen, our countryman Dr. Chamberlen, and others, enjoying a considerable portion of practice in the art.

The custom of employing men in the place of women, originated among the ladies of the highest rank in France, and gradually descended to the middling and lower classes of the people. The advantages derived from the change, both in the manner of conducting the labour, and in the management of the woman and child after the labour, became so obvious, that the practice has by degrees spread over all Europe. That the poor who could not, and a few who from prejudice still refused to, employ men, might reap the benefit of the improvements that have been made in the practice of the art, no women are now allowed

allowed to engage in the business who have not been previously instructed by some public teacher, and who do not obtain from him certificates of their qualifications. The consequence of these arrangements has been, that every part of the art has been investigated with the greatest care; and such has been the zeal of the professors, or persons engaged in the practice, that the works on the subject of midwifery, which have been published within less than a century, are sufficiently numerous to form of themselves no inconsiderable library. Thus this art, which was so late in being cultivated, has already attained a degree of perfection, that puts it on an equality, at least, with any other branch of medicine.

Of this great mass of publications, many of them excellent, it may be sufficient to mention, among foreign productions, Puzos's *Traité des Accouchemens*, Baudelocque's *Art des Accouches*, Crant De Re *Instrumentaria*, and the *Opuscula* of Roederer, and of Plenck, which embrace the whole circle of the art. Among our own writers, White on the Management of Pregnant and Lying-in Women, and Rigby on Uterine Hemorrhage, have each in their way given directions that are calculated to abide the test of time. Observations on Human and Comparative Parturition, published in 1794, may be added, as containing a number of curious and useful facts not generally known or attended to. The late Dr. William Hunter's splendid Plates of the human Gravid Uterus, and not more splendid than correct, place before our eyes the fœtus at different periods of its existence, show the posture in which it lies in the uterus, and the manner in which it is connected with that viscus. Dr. Denman's Introduction to the Practice of Midwifery, has already passed through several editions; and for comprehensiveness and exactness, it holds the same rank now that Smellie's Treatise did at the time when it was published. From these, and from the following more recent works, the present article is compiled: 1. The London Practice of Midwifery, 1811. 2. Conquest's Outlines of Midwifery, 1820. 3. Dr. Merriman's Synopsis of the various Kinds of difficult Parturition, 1821. Besides which, we have been indebted to various articles in the London Medical and Physical Journal, at present edited by Dr. Hutchinson; and to the private communications of a respectable professor in full London practice.

Many particulars which might be expected to be explained in a Treatise on Parturition, will be found anticipated under the articles ABORTION, and ANATOMY, vol. i. CONCEPTION, vol. v. and GESTATION, vol. viii. Having thus cleared the way for the instruction of the pupil in real practice, we proceed to the grand Hippocratic divisions of Natural Parturition, and Preternatural Parturition, with their respective varieties, or sub-divisions.

I. OF NATURAL PARTURITION.

HUMAN parturition, where every thing is natural, is perhaps one of the most beautiful and interesting operations in nature; for what can be more beautiful than a process accomplished by the combined action of a number of powers admirably well adapted to the intended purpose? and what can be more interesting than the continuation of our species which depends on the operation?

The fœtus, at the full period, weighs from between six and seven to between ten and eleven pounds, and measures from eighteen to twenty-two inches. It is placed within the ovum in such a manner as to occupy the least possible space. This position has been beautifully described by Harvey: "*Infans in utero ut plurimum reperitur, adductis ad abdomen genibus, flexis retrosum cruribus, pedibus decussatis, manibusque ad caput sublati, quarum alteram circa tempora vel auriculas, alteram ad genam detinet, ubi maculæ albæ, tanquam confractionis vestigia, in cute cernuntur: spina in orbem flexit, caput ad genua incurvato collo propendit. Tali membrorum situ qualem in somno per quietem quæ-*

rimus. Harvey Exercit. de Partu. This position may be viewed in the two last figures of the engraving to the article CONCEPTION, vol. v. p. 12. See also ANATOMY, vol. i. p. 620-624, and Plate VI. fig. 2. also, ANATOMY of the GRAVID UTERUS, Plate V. p. 652.

Natural labour supposes four things: First, that the vertex presents. Secondly, that there is sufficient room in the pelvis to admit of the ready descent of the head of the child in that direction which permits the occiput to emerge under the arch of the pubis. Thirdly, that there is parturient energy adequate to the expulsion of the contents of the uterus without manual interference, and without danger either to the mother or child. Fourthly, that the process of parturition is completed within a moderate time.

The sufferings of a woman during labour having been compared to the fatigues of a person on a journey, the phenomena of labour have been divided into *stages*, each stage being marked by some distinguishing circumstances, either in the nature of the pains, the dilatation of the parts, or the degree of descent of the head; and various have been the divisions arbitrarily adopted by different authors. Thus, Dr. Denman divides labour into three stages only. "The first includes the dilatation of the os uteri; the rupture of the membranes; the discharge of the waters. The second, the descent of the child; the dilatation of the external parts; the expulsion of the child. The third, the separation of the placenta; the expulsion or extraction of the placenta." Aphorisms, p. 3.—The London Practice of Midwifery makes four stages. "The first stage is that when the head of the child enters the pelvis, passing down as far as it can move without changing its position. The second includes the period of the child's head passing through the os uteri into the vagina. The third, the change which has taken place in the vagina and os externum. The fourth, the delivery of the body of the child, and the expulsion of the placenta."—Dr. Bard, of New York, makes four stages. "The first is occupied in opening and dilating the internal orifice of the womb; the second, in the passage of the child's head through the bones; the third, in dilating the external orifice, and the delivery of the child; and the last, in the delivery of the placenta, or after-birth." Compendium of Midwifery, p. 105.—Mr. Hogben divides labour into five stages. "The first lasts from the commencement of labour till the child's head enters the brim of the pelvis. The second is the time in which the face passes into the lower pelvis, the face turning into the cavity of the sacrum. The third, the further advance of the head without the os externum. The fourth, the expulsion of the body and lower extremities of the child. The fifth, the discharge of the placenta and membranes." Obstetric Studies, p. 33. This work is illustrated with very curious Anatomical Tables, on an entirely new plan.—Dr. Merriman prefers a division into four stages; and his third includes the third and fourth of Mr. Hogben.

FIRST STAGE.—For some days previous to the accession of those phenomena which characterize the existence of labour, there are often present certain premonitory symptoms, which, by women who have borne children, are viewed as precursors of that hour they so much dread. Subsidence of the uterus and abdomen is not an unusual monitor of the approach of suffering. It may be viewed in a favourable light, inasmuch as it indicates room in the pelvis. Glairy mucous secretion from the os uteri and vagina, popularly termed a *show*, sometimes occurs for days before the more active symptoms of labour. It is often streaked with blood, and tends to lubricate the parts concerned in parturition. Irritability of the bladder and rectum, demanding their frequent relief, is another occasional precursor of labour.

In consequence of the resistance which the uterus meets with during its contractile efforts, pain follows every such contraction; but the pain attendant on parturition differs

differs very materially in its nature and in its influence on the uterus. Paroxysms of *intestinal pain*, or such as are termed *false* or *spurious pains*, may be distinguished from genuine labour-pains, by being unconnected with uterine contraction; by attacking different parts of the abdomen; and by recurring irregularly. These pains usually originate in some source of intestinal irritation, and may almost always be removed by emptying the bowels, and subsequently exhibiting an opiate. They can hardly be confounded with enteritis by an observant practitioner. The *uterine pains* are either dilating or expulsive. *Dilating pains*, or, as they are popularly termed, *grinding pains*, result from uterine contraction. They are principally confined to the back, and occur in the earliest stage of labour, and are often peculiarly distressing to the patient, who expresses her suffering by restlessness, despondency, and moaning. They often continue a long time without the intermissions being free from uneasiness, and appear almost exclusively to dilate the os uteri, having little or no influence over the fundus of the uterus. It is during the existence of these dilating pains that *rigors* most commonly occur, and may be relieved by avoiding spiced or fermented fluids; and by giving any simple warm diluents. When the mouth of the womb is considerably dilated, *expulsive pains*, sometimes termed *forcing* or *bearing-down pains*, commence on the loins, and gradually proceed round the abdomen, till they meet at the region of the pubes, and dart down the labia pudendi and thighs.

Vomiting is a common attendant on uterine pain, and is beneficial by rejecting food, which from its quantity or quality may be a source of inconvenience to the stomach. It principally occurs during the dilating pains, and unquestionably assists in the relaxation and dilatation of the os uteri.

Besides these attendants on parturition, the pulse usually becomes quickened and full; the countenance florid; the whole surface of the body covered with profuse perspiration; and the lower extremities cramped.

The premonitory symptoms having continued for an indefinite time, pains in the loins darting through the pelvis, with an appearance of *show*, indicate the approach of less unequivocal evidences of the commencement of parturition. For some time these pains are of the *dilating* kind; and, on an examination per vaginam, will be found rather to be diminishing the thickness of the cervix uteri than to be opening the mouth of the womb. When the cervix uteri becomes reduced to the thickness of the other parts of that organ, it begins to open; and, as soon as it can admit the extrusion of any portion of the membranes distended with liquor amnii, the pains become rather of the *expulsive* character, and there will be a sensible bearing-down of the whole uterine tumour. Successive paroxysms of pain dilate the os uteri more and more, whilst the protruded membranes, distended like a tense bladder, fill up the opening, and perform the office of an inimitable *wedge*, till the uterus and vagina form one continuous passage.

When the wedge begins to act, the grinding or cutting pains diminish, and, as a larger quantity of the waters increases the bulk of the protruding bag or wedge, the *bearing-pains* begin to be felt; and, in proportion as the pains grow stronger, there is a greater freedom from uneasiness during the intermissions; commonly too the pains are rather longer apart. The irritable state of the *os uteri*, during the first stage of labour, very often produces, from sympathy, those shiverings and vomitings already spoken of; and, when the *cutting-pains* are very frequent and severe, despondency and lowness of spirits generally prevail.

The first stage of labour may be considered as terminated, when the os uteri is dilated to the full extent of two inches in diameter, provided that the head of the *fœtus* has descended so much as to occupy the superior

aperture or brim of the pelvis. This is the position which is shown on the annexed Plate I. where A, A, A, denote the left side of the vagina, relaxed by labour, and distended in some measure by the descending child. B, B, the left labium pudendi. C, the cut surface of the integuments of the abdomen. D, the nymphæ. E, the clitoris. F, the urethra. G, the meatus urinaris. H, the bladder pushed forwards by the uterus. I, the os pubis. K, the rectum. L, the anus. M, the left thigh. N, the external surface of the uterus. P, P, the cut edge of the coats of the uterus. Q, the divided edges of the os uteri. R, R, R, the intestines. S, S, S, the canal containing the medulla spinalis. T, the perineum. b, b, b, os coccygis. c, c, c, sacrum. d, d, d, lumbar vertebrae.

SECOND STAGE.—When the first stage of labour has terminated favourably, the second seldom offers much difficulty or delay; the pains become more *forcing*, and of longer duration, and a new power is called in, to assist in propelling the child through the pelvis. This assistance is afforded by the diaphragm and abdominal muscles, which are brought into action during the pains.

It is no uncommon thing, during the earlier period of the labour, to hear the poor patient advised by her nurse and female friends to assist herself and bear down with all her might; and the chidings that she undergoes, for not making her pains useful, tend greatly to produce dismay and depression of spirits; whenever the accoucheur observes this, he should endeavour to repress such absurd and improper behaviour. The fact is, that, during the first stage of labour, the voluntary efforts of the patient are neither called for, nor can be beneficial. They may exhaust her strength, but cannot advance the labour. The action of the diaphragm and abdominal muscles is almost, if not altogether, useless, till the os uteri is getting well dilated; then, indeed, it becomes a powerful auxiliary in producing greater dilatation, and in propelling the child through the pelvis.

But now the woman cannot withhold her exertions; it is no longer a matter of choice, but of necessity; she is compelled to strive in forwarding the birth; she eagerly grasps in her hands whatever is within her reach, and endeavours to fix her feet against some firm body; she holds in her breath, and *bears down* with all her force. By these powers united, she is enabled to get through the second stage of labour, which may be considered as finished, as soon as the os uteri is fully dilated, and the head of the *fœtus* is so placed as for the forehead to occupy the hollow of the sacrum. A violent straining to vomit occasionally accompanies the pain, which completely dilates the os uteri.

Sometimes, however, the second stage of labour takes up a longer time, depending, perhaps, upon the want of a due proportion between the pelvic cavity and the fetal head. And delay is sometimes occasioned by the premature rupture of the membranes, and the discharge of the *liquor amnii*. Whether this arises spontaneously, accidentally, or by design, it has the effect of interrupting the progress of the labour; for the dilating power so admirably possessed by the soft, steady, equable pressure of the bag of waters, is now removed, and the dilatation must be effected by the head of the child slowly moulded into a conical shape; the hardness and inequalities of which little adapt it for such a purpose. If the *show* has not already appeared, it will be discovered during this stage, and may be considered as a very favourable occurrence; for the discharge of this intermixture of blood and glairy matter tends very much to produce relaxation in the soft parts of the mother.

In the progress of this second stage, the phenomenon which peculiarly strikes us, is that change in the position of the head, by which the face is turned into the hollow of the sacrum. Although the advantage, and even necessity, of this change in the position of the head, has been

been long known to practitioners, yet Dr. Osborn is, perhaps, the first author who has clearly explained the efficient cause of this. His remarks are these: "As it (viz. the head) descends obliquely through the pelvis, the pressure of the two converging ischia will not be exactly opposite to each other on the two parietal bones; but, one ischium acting or pressing on the part of that bone contiguous to the occiput, and the other on the opposite side next to the face, the head being made up of different bones, united by membranes, and forming various futures and fontanels, which permit the shape to be changed, and the volume to be lessened, it necessarily follows, that the head, thus compressed, will take a shape nearly resembling the cavity through which it passes; and as, from the convergency of the ischia, the cavity of the pelvis somewhat approaches the form of a cone, the child's head is moulded into that shape, the shape of all others best adapted to open the soft parts, and make its way through the os externum. This unequal pressure of the two ischia upon the head, will, in the first instance, direct the occiput, or apex of the cone, to turn under the arch of the pubis, where there is little or no resistance; while the pressure of the other ischium, in its further descent, will have the same effect on the other side, and direct or compel the face to turn into the hollow of the sacrum."

This change of position is productive of three advantages. 1st. The largest part of the head is again adapted to the widest part of the pelvis. 2dly. The smallest possible surface of the head is applied to the surface of the bones of the pubes. 3dly. As Dr. Osborn, in the passage quoted, very justly observes, the head is moulded into that shape which is best calculated to pass, without doing harm, through the soft parts. This is the position exhibited on Plate II.

THIRD STAGE.—The strength of the pains now increases; but generally there is a longer interval between them; and during this the patient sometimes gets a few minutes' sleep, and always is refreshed. After each period of quietude, when the pain returns, strong pressure is made to force forwards the head of the child and to expand the external orifice: the perinæum is stretched, the anus opens, the anterior part of the rectum is pushed outwards; the woman imagines that she is going to part with a stool, and, if any feces are contained in the rectum, they are actually expelled. The pain now ceases, the head is retracted, the bag of waters, if still entire, becomes flaccid, the woman is again at rest. After a while, another pain comes on; it would seem, as if the force was sufficient to make the head break down every thing that opposed it; but again the pain abates, and again the head is retracted. Thus the patient must continue to suffer, till the external outlet is sufficiently dilated to allow the child's head to pass.

During the second and third stages of labour, the pulse will have been gradually increasing in quickness and force; the skin grows hot; the face becomes intensely red; drops of sweat stand upon the forehead; and a perspiration, sometimes profuse, breaks out all over the body; frequent violent tremblings accompany the last pain; and, at the moment that the head passes into the world, the extremity of suffering seems to be beyond endurance.

The head of the child being born, the poor woman experiences a temporary relief from pain: and this is the moment to ascertain whether there be any portion of the navel-string round the neck of the infant; and, if there be, it must be slackened or drawn over the head, otherwise the infant will be lost. Time should be allowed for the accommodation of the shoulders, and the expulsion of the body of the infant; and the utmost attention should be paid to supporting the perinæum during that part of the process; for now the throes return for the purpose of expelling the shoulders; which is effected thus: When the head passes into the world, the chin of the fœtus rests against the perinæum; but, while the head con-

tinues in this position, the shoulders are in a wrong direction for passing through the inferior bony aperture; for the long diameter of the shoulders is opposed to the short diameter of the pelvis. The first effect of the pain, then, is to turn the chin of the child towards the thigh of the mother; this alters the direction of the shoulders, and first one and then the other passes through the external parts; this is often effected by the same pain, and not unfrequently the whole body is at the same time protruded; but sometimes two or three pains are required to accomplish the entire expulsion.

The child is now born into the world, and parturition may be said to be accomplished; but, as the management of the after-birth is a very important part of natural labour, this is now denominated the

FOURTH STAGE.—After the parts are cleaned and dried, the patient has a little respite till the placenta begins to separate. This process was some time since, under the direction of Dr. Hunter, entrusted wholly to nature; nor was art suffered to interfere, though a day or two elapsed before the separation took place. This was an error in many respects. The mind was kept in anxiety; for the patient was not completely a mother till restored to her former state; nor, till the circulation in the uterus was free, was there any probability of the flow taking place to the breasts. Modern practitioners have, therefore, neither hurried on the separation, nor delayed it many hours, should not nature complete the business. It is usually an operation of nature without assistance; and, after about ten minutes from delivery, pains begin; the cord, if kept tense, is elongated, the abdominal tumor subsides into a rounded ball, sinking gradually lower, and the placenta, with little difficulty, is brought through the vagina. If the labour has been long and tedious, or the patient previously debilitated, the contraction of the uterus, which produces the separation, takes place slowly. We must then wait; and, if in five or six hours, gently pulling in the interval by the cord, it does not advance, the hand, guided by the funis, must be introduced into the uterus, and the edges of the placenta separated around. It then soon comes forward, for the centre is first naturally loose. The cake is distinguished from the clots which usually surround it, by its being in the centre of the funis, by its firmer consistence, and by its convex puckered feel. When flooding is violent, the separation must be quickly accomplished; and when the contraction of the uterus is irregular, reducing its form to that of an hour-glass, the stricture must be steadily dilated; a work of no little difficulty. In general, the separation should be left to nature; but, should hæmorrhage and convulsions occur; should the separation, notwithstanding every effort, be delayed for more than twelve hours; the most steady but determined mode of separation should be adopted.

From what has been said it will be seen, that natural labour requires but little assistance on the part of the accoucheur. During the whole of the first stage, indeed, and great part of the second, if he attempts to give assistance, he will do mischief. The dilatation of the soft parts will be effected by the natural pains, assisted by the bag of waters gradually insinuating itself through the os uteri and vagina, much more easily and more safely than by any artificial means that he can employ; of course no attempts ought to be made by him to produce artificial dilatation.

During the first and second stages, the patient may be allowed to sit, stand, kneel, or walk about, as her inclination may prompt her; if fatigued, she should repose occasionally upon the bed, or a couch; but it is not expedient, during these two stages, that she should remain very long at a time in a recumbent posture. She should be supplied, from time to time, with mild bland nourishment in moderate quantities. Tea, coffee, gruel, barley-water, milk and water, broths, &c. may safely be allowed. Beer, wine, or spirits, undiluted or diluted, should be

forbidden;

forbidden; they are very rarely required, even when the third stage of labour is nearly terminated, but in the earlier periods are almost always manifestly injurious. The attendants in the lying-in chamber frequently object to toast and water, lemonade, oranges, and other subacid fruits, &c. but, under many circumstances, such articles are highly grateful to the patient, and may be indulged in without hazard.

If the presence of the practitioner in the lying-in chamber is not absolutely required, it is better for him to be in another room; thus the patient, being less under restraint, will attend to the calls of nature, which ought not to be interrupted. It has already been observed, that during the early stages of labour a frequent urgency to make water is present. The bowels should be opened by castor-oil, or other mild aperients, early in the labour. After the labour has made much progress, the rectum, if loaded, should be emptied by clysters. Indeed, the utility of clysters, in almost every stage of labour, is so apparent, that it is to be lamented they are not more frequently employed.

The spirits of the patient should be kept up, by kind and cheerful conversation. Noisy discourse is always offensive to the parturient woman, and all conversation on melancholy or unpleasant topics should be checked. Particularly no mention should be made of unfortunate cases in midwifery. The discreet practitioner will discourage all such subjects of discourse; and will likewise endeavour to prevent calumnious reflections and insinuations against his medical brethren, whose character and reputation are too often abused in the lying-in chamber.

After the child has breathed freely and cried vigorously, a ligature may be made upon the navel-string, at the distance of two inches from the belly, and another an inch nearer to the placenta, and the funis should be divided with a pair of scissors between the two ligatures, the second ligature being intended only to prevent blood escaping from the divided cord, and soiling the bed. The London Practice of Midwifery, and Dr. Conquest, direct this operation to be performed under the bed-clothes, "it being indelicate and unnecessary to expose either mother or child." But Dr. Merriman very justly observes, that "it should never be done under the bed-clothes. A very careless accoucheur, not long since, included one of the little fingers of the child, in the ligature which he had made upon the funis, and cut off the first joint with his scissors;" and Dr. Denman used to mention in his lectures the calamitous instance of a practitioner who included the penis of a child between the blades of his scissors. These accidents, as Dr. Merriman very justly observes, could not have happened, had the part to be divided been brought into view.

We may just add, that, after dry warm linen has been put on, all impurities removed, and a little well-boiled gruel given, the woman should be left perfectly quiet, the child put by her side, and the room, with a moderate light, kept perfectly tranquil.

The process by which, under the most favourable circumstances, a child is produced or brought into the world, is with great propriety called *labour*, as it is rarely effected without considerable exertion, which has the usual effect, that of exhausting the strength and spirits of the woman. These are to be recruited in the same manner as if the waste had been occasioned by any other kind of exercise; viz. by rest, and by taking a moderate portion of plain and simple food at small intervals. In the choice of their food, the women may generally be allowed to consult their own tastes, which will rarely, at such times, incline them to spiced meats, or to drinks that are heating. It will be proper that they be kept in a recumbent posture for the first four or five days, only leaving their beds so long as may be sufficient to open and refresh them. By that time the vessels of the uterus will be so much contracted, as to remove all danger of hæmorrhage, or of an inconvenient descent of that viscus, which is sometimes

the consequence of leaving the bed too early. It is proper also, on the second, or at the latest on the third, day after being delivered, to procure stools, either by purgative medicines or by giving a clyster. By these means the fever which is usually excited by the secretion of the milk will be moderated. This, which is called the *milk-fever*, is of short duration, lasting only three or four days, and is not attended with danger. In the cure, nothing is required but to keep the body open, and to supply the patient with diluting drinks, taken warm, with the view of inducing a gentle perspiration.

The child should be put to the breasts a few hours after the completion of the labour, that it may get some mouthfuls of the thin whey-like fluid which is at first secreted. This will stimulate its bowels, and enable them to discharge the *meconium*, or black viscid excrements, with which they are always filled. It will also keep the breasts of the mother from being too much distended, the pain occasioned by which, if it is not the cause of, yet it certainly tends to increase, the milk-fever.

But there is another fever to which women are at this time subjected, which is attended with considerable danger, and which not unfrequently proves fatal. It is called, from an opinion that it is peculiar to this state, the *puerperal fever*. Its commencement is almost always marked by a strong shivering fit, which is followed by a quick pulse, head-ache, lassitude, and dejection of the spirits. It sometimes makes its attack during the labour, more frequently on the next or subsequent day. It is sometimes mistaken for the milk-fever; but, besides that its attack is earlier than that of the milk-fever, which never comes on until the third day after delivery, the secretion of the milk is in this fever interrupted, and the breasts, instead of being full and turgid, remain flaccid. From after-pains, with which it is sometimes confounded, it is to be distinguished by the quickness of the pulse, arising very soon to 120 strokes in a minute, by the head-ache, nausea, and other concomitants of fever. Tenderness of the abdomen, increasing to extreme soreness and pain, soon come on, which are increased by drawing in the breath, and are rendered almost intolerable by coughing. As there is always a high degree of inflammation of the peritoneum present in this fever, and perhaps of some of the contained viscera, we cannot be too early in taking away eight, ten, or twelve, ounces of blood from the arm, according to the strength of the patient. If the abdomen appears distended, attended with soreness and pain, six or eight leeches may be advantageously applied to that part, which may be afterwards fomented with flannels wrung out of a decoction of camomile and marsh-mallows moderately heated, and then covered with a poultice made with linseed meal. A draught with infusion of senna and some neutral salt may be given to procure two or three stools. The bowels may afterwards be kept open, and the pain relieved by giving a drachm of purging salt with two or three drops of the tincture of opium, in a sufficiency of water to dissolve the salt, every two or three hours. There are few cases that will require or bear a repetition of the bleeding. If, however, the pulse should appear to be strong, and the pain, with the difficulty in breathing, require it, that may be done on the second or third day; and a blister may be applied over the part of the abdomen which is most distressed. A blister applied to the nape of the neck, succeeds remarkably in relieving the pain of the head. There is rarely delirium, at the least not to any considerable degree, attending this fever. The patient should be nourished with light broths, panada, and such like mild food, and drink barley-water, gruel, baum-tea, toast and water, or, where preferred, table-beer. By persisting in the use of these remedies, the fever is frequently subdued by the end of six or eight days, when recourse may be had to a light decoction or infusion of bark, or some other tonic taken twice in the day to recruit the strength. Too often, however, these and all other means that have been devised

devised prove insufficient; and the patient dies, sometimes as early as the third or fourth, day; at others, not until the sixth, eighth, tenth, or twelfth, day. Puerperal fever is by no means to be considered as solely the consequence of tedious and difficult parturition; it full as often makes its attack after natural, easy, and expeditious, labours; on which account it was thought proper to delineate the history and treatment of it here, rather than under the following head.

Puerperal fever occurring in lying-in hospitals, or where a great number of sick or wounded persons are confined, at some times, that is, under certain dispositions and temperatures of the atmosphere, becomes infectious, almost every person delivered in the ward where the fever rages partaking of it in a greater or less degree. At such times, a larger proportion than usual of those who are delivered in their own houses are subjected to it. When it has made its way into a lying-in ward, the women should be removed, and separated, where it can be safely done, and no more persons admitted until the ward has been well ventilated and purified. It is recommended, that the floors be scoured, the walls and ceiling scraped and lime-washed; that the beds be taken down, and the bed-clothes, and the whole room, exposed to the vapour of burning sulphur, or fumigated with the vapour of the marine or nitric acid.

We are told by Strabo, that the men in the northern part of Spain, after the delivery of their wives, went to bed, and suffered themselves to be nursed by them. This custom still exists in some of the provinces of France bordering on Spain, where it is called making a *couvade*. The same thing is related by Diodorus Siculus of the Corsicans, and by Apollonius Rhodius of the Tibarenes, a people inhabiting the coast of the Pontus Euxinus, in Asia Minor. Marco Polo, speaking of a province which in the French translation is called Arcladam or Ardandam, says that the women left their bed as soon after delivery as possible, and that the men then took their place, where they remained for forty days, and nursed the newborn child. This custom is said to be usual also among the Japanese.

When the Carib women in Guiana are delivered, the men bind up their heads and place themselves in bed, as if seized with the pains of labour: they are then visited by their neighbours, who console them by all the means usual among these people. This custom must always be strictly observed; for, even when engaged in war, as soon as they hear of the delivery of their wives they must return home. We are told by Labat, that the father of the child, on this occasion, must observe a strict fast for thirty or forty days; but he adds, that this ceremony is practised only in regard to the first-born, otherwise, says he, the poor husbands, who have five or six wives, would be obliged to keep more fasts than the Capuchins. This account is confirmed by Fermin in his description of Surinam, but he says nothing of the strict fasting which must be observed by the father of the child. Piso, a Dutch physician, says, that the women among the Brazilian savages, when they find the pains of labour approaching, go out into the woods to cut with a shell the umbilical cord of the child, which they boil and eat; and that the husbands, in the mean time, go to bed, and use the best food they can procure, under a pretence of repairing their lost strength. We are told the same thing by captain Woods Rogers, who says that the Brazilian women, at the time of their delivery, go out alone into the woods, and when delivered wash the child; while the men place themselves in bed for twenty-four hours, where they are attended in the same manner as if really suffering from the pains of labour.

Such pains, we may suppose, are in that country not very severe, or they could not thus be made a joke of, or endured by proxy. We may therefore conclude that such labours come very legitimately under the present head of Natural Parturition. But we mean to include also certain species which are usually confined to the

next grand division. We mean those protracted labours which vary from the strictly natural chiefly in the time they take for their accomplishment, but without requiring the use of instruments; and of plural births, when they also are completed in the natural way.

PROTRACTED LABOUR may arise from various causes; as, from weakness of the mother; from the small size of the pelvis, or the large size of the child; from the membranes breaking too early, and the waters being discharged suddenly, before the os uteri is properly dilated; which last accident is sometimes occasioned by the unskilfulness of the midwife. These are cases which Mr. Hogben calls "Difficult (but natural) Labour;" and Dr. Merriman *Dystocia diutina*, or lingering labour, i. e. "Labour in which the head presents, as in Eutocia; which terminates without danger to the mother; which is effected, principally, by the natural pains; but which occupies a space of time exceeding twenty-four hours." Dr. Breen does not denominate the labour tedious, till thirty hours have elapsed from its commencement: some of Dr. Merriman's cases under this head extend from 60 to 80 hours.

1. *Feeble or irregular uterine action* will protract labour. Any circumstance debilitating the constitution, or the uterus only, will produce this condition of parts. Parturition protracted from this cause usually occupies a long time; during which, it is of the greatest moment to support the powers of the system, and husband the strength, by mild unirritating nutritious diet, and by kind and sympathizing conduct: no voluntary exertions, or forcible straining, should be permitted: the room ought to be cool and well ventilated; every encouragement to repose should be given; and uterine action must be increased, by steadily-employed friction of the abdomen and loins, with moderate pressure on the uterine region. A pint of tepid water, or gruel, with a handful of salt, as an enema, will sometimes increase the uterine energies. Opium is a very efficient remedy for this cause of protracted labour. It should be given, not in such a quantity as to paralyze the uterine energy, but in a dose of about twenty minims of the tincture, or a grain of the gum, to procure sleep, and suspend irregular or inert contractions of the uterus, so that, on their recurrence, they usually act with redoubled energy.

2. *Plethora*, as indicated by the calibre of the vessels, or by the force or frequency of the circulation, will sometimes produce this feeble and partial action of the uterus. The detraction of a few ounces of blood will accelerate the progress of labour retarded by this cause.

3. *An excessive quantity of liquor amnii*, by over-distending the uterus, will enfeeble or paralyze its contractile power. Should this cause be *very obvious*, the membranes may be punctured by a probe or quill, or scratched with the finger-nail; but the necessity for this *very rarely occurs*, and can scarcely ever be necessary until the membranes, distended with fluid, have fully performed their office of dilating the os uteri and passages to the os externum.

4. *Prematurely discharging the liquor amnii* cannot be too sedulously avoided; for among the most wearisome and trying cases of protracted labour, both to the accoucher and patient, those which follow this occurrence must be classed; consequently a practitioner should not rashly interfere in these cases, or he may expect his temerity to be attended with augmented sufferings to his patient, inasmuch as the os uteri and vagina must be slowly dilated by some hard and irregular part of the child, instead of the soft wedge formed by the membranes filled with their secretion. When this circumstance occurs, from some accidental cause in the earliest stage of labour, the process is always protracted, and the woman must submit to an incessant dribbling of the liquor amnii, without obtaining any relief from manual interference. Children under these circumstances are not unfrequently expelled dead.

5. *Rigidity of the os and cervix uteri* gives rise to a very protracted

protracted labour. With this condition of parts, if the finger be carried within the os uteri it feels smooth and unyielding; and, whenever this sensation is communicated to the finger on examination, considerable time will elapse before the mouth of the womb dilates; and, if assistance be not given, after suffering through days and nights, the os uteri will remain close, and thick, and hard.

The management of these cases requires considerable discretion; and, although time will usually terminate them, yet the dilatation may be materially accelerated by the abstraction of blood in quantity to be regulated by the powers of the woman. This being done, the bowels should be freely opened by an aperient exhibited by the mouth, and by a large emollient clyster. After these measures have been adopted, a few ounces of tepid water or gruel, with from one to two drachms of tincture of opium, should be thrown into the rectum; or the os uteri may have gently rubbed into it, about half a drachm of the extract of belladonna. By these means, relaxation is often speedily secured. In addition, the patient's mind may be amused by sitting over steam; by having large emollient enemata frequently exhibited; and by fomentations to the uterine region.

6. *Malposition of the uterus* is very embarrassing to those who have not met with the occurrence. If the os uteri be thrown backwards against the promontory of the sacrum, the labour is generally protracted. It principally happens to women with capacious pelves, and is not easily detected on the first examination. Time will rectify this displacement, and the woman who is the subject of it should pass through parturition lying on her back. If the os uteri be forced forwards against the symphysis pubis, or tilted over it with the fundus backwards, the case will probably prove to be *retroversion of the uterus*, continuing to the full period of gestation. This is a particularly trying case, in which nothing but time and patience can effect any thing.

7. *Small size of the pelvis, or large size of the fœtus.*—The treatment arising from either of these causes must be nearly the same. Much must necessarily be trusted to time. If care be taken to avoid all causes of fever and inflammation, and to prevent the patient from exhausting her strength by unavailing strainings, the labour may be suffered to proceed for very many hours without danger; and at length the head of the fœtus may be squeezed through the pelvis, very much elongated and compressed: yet the child may be born living, and the mother may have a favourable recovery.

The most frequent obstacle to labour is an enlargement of the head from hydrocephalus; but it has been estimated, that even this does not occur oftener than once in nine hundred labours. Sometimes, in such cases, the head is sufficiently compressible to be expelled undiminished by the pains. An hydrocephalic fœtus has passed entire, the circumference of whose head was seventeen inches; another passed alive, and lived nearly an hour, whose head measured in circumference twenty-two inches; both the above labours were long and painful.

But, when the child is really *monstrous*, from the redundancy of some large parts, as from two heads or two bodies, it is sufficiently obvious that, if the mother be at the full term of gestation, the obstacles to delivery will often be insurmountable by the natural powers. Fortunately, however, in by far the greatest number of cases of monsters of that kind, the action of the uterus is excited before the ordinary period. But we shall here introduce a recent case, where a child with two heads was born at the full time, and of the full size, by the process of natural but protracted labour. The account is from Mr. Jackson, a member of the London Royal College of Surgeons, residing at Bolton le Moors, in Lancashire.

Mary Honeyford, the mother of the child to be de-

scribed, is about twenty years of age, of a sanguineous temperament, florid complexion, and rather below the middle stature; she has enjoyed nearly uninterrupted good health from infancy. In the forenoon of the 10th of August, 1820, I was desired to visit her, and take with me the midwifery-instruments. I learnt from the messenger, that she had been in labour upwards of two days, and that midwives had been with her most of the time. For the last eighteen hours, one of them had been constantly assisting her, but was unable to accomplish her delivery: the pains were very weak, and her strength nearly exhausted. When I arrived at the house, I was informed by the midwife that the waters had been drained off twenty or twenty-four hours; the head had been in the situation it now occupied for ten or twelve hours; and, to use her own expression, the head had descended slowly to the birth, and then it had stuck on the spare bone. The patient's pulse was 135, and weak. The parturient paroxysms occurred every three minutes, but were inefficient. Anxiety was depicted in her countenance, and a general restlessness pervaded her; as is frequently, if not always, witnessed in tedious painful labours.

On examination *per vaginam*, I found the os frontis presenting, the integuments of which were tumefied, from the time it had remained in the pelvis, and the attempts the midwife had made to assist her. The face was towards the pubis, or rather towards the right groin, and the soft parts of the mother quite relaxed: thus, reasoning from my experience in similar presentations, I believed there could be no apparent obstacle to a speedy and favourable termination. I ordered her a little wine and water, and calmed her mind, by flattering her with a speedy release from her suffering and anxious situation. As the parturient energies were nearly exhausted, I was persuaded it was not safe to trust any longer to nature, and that artificial aid was necessary to assist the natural efforts to promote her delivery: I therefore assisted her in the following manner. I introduced two fingers under the os pubis of the mother, where I could reach the mouth of the child, by which I could command considerable force, and assist the expulsive efforts of the uterus: thus, by extracting at each pain, in less than half an hour the face emerged from under the pubis, and the head was nearly half protruded through the os externum. Finding that something impeded the complete expulsion of the head, though I used considerable extracting force, I passed two fingers by the head of the child to ascertain the obstruction, and where it existed, when they came in contact with a firm tumor, descending into the cavity of the pelvis, closely joined in contact with the neck of the first head. On examining it as particularly as the confined state of the parts would permit, I was convinced it was the head of a child, from the hair on the scalp and the feel of a suture. I imagined it a case of twins, in which the head of the second child, by some partial contraction of the uterus, had been forced down, or somehow got entangled before the shoulder of the first.

The woman continued to have regular, though very inefficient, pains, at each of which I used such extracting force as I thought was compatible with the safety of the mother and child: I easily ascertained it was living, by the pulsation of the temporal arteries. After some time I found I was gaining a little ground, and that the heads retained their relative situation; that is, as one was further protruded, the other descended lower towards the os externum. Having more space for examining the presenting part of the second head, I satisfied myself, from the futures and posterior fontanel, that it was the occiput. I thus continued extracting and guarding the perineum for about an hour, when the second head was protruded; immediately after which followed a sharp expulsive pain, when the body of a living male child with two heads was brought to view.

The

The child appeared lively. I lost no time in tying the umbilical cord, which was no thicker than ordinary, that I might remove it, to examine it more particularly and make further observations. Having taken it into an adjoining room, I found it had all the powers of voluntary motion as perfect as a natural fœtus: the eyes of each head were opened and closed occasionally; and the muscles of each face contracted, as if to squall, and one of them made a considerable noise, which was the first head protruded. On a closer inspection, I found the other head never breathed, although it was equally lively with the first. It continued gradually to weaken for about forty minutes, when it ceased to breathe. For a considerable time after respiration had ceased, I could feel the heart palpitating, with a tremulous motion in the epigastric region.

Mr. Bailey, of Blackburn, a respectable surgeon and good anatomist, assisted in examining the child, about twenty-four hours after its death; when we made the following observations. The heads were well formed; the bones of which were as perfectly ossified, as well as those of the limbs, as is found in the majority of infants. The neck of the left head appeared somewhat longer than the other; but I attributed that to the extending force I used in the extraction; and the other would be forced in an opposite direction upon the breast, by the resistance given from the soft parts of the mother. The weight of the child was 8 pounds 15 ounces and 6 drachms avoirdupoise. The measurement of the left and larger head, from the sinus frontalis to the tubercle on the os occipitis, $8\frac{1}{2}$ inches; round the head, 13 inches, at the same relative points. The smaller head measuring $7\frac{3}{4}$ inches, and $12\frac{1}{2}$ inches. The circumference of the chest immediately below the arms, 14 inches. The sternum was broader than usual, and the ribs appeared to make a greater curve than is generally observed. The claviculæ were three; two in their natural situations; and the third, which was equally as large as the others, was attached to the top of the sternum, and proceeded backwards between the two necks; where there was also a third scapula, forming a protuberance, or shoulder. On examining the back, there felt as if there were three vertebral columns: the middle one, on dissection, was found to be the cartilages of ribs, each about an inch in length, coming from the two spines, which joined at obtuse angles, and gave to the touch externally the feel of spinous processes.

On opening the thorax, the first thing that attracted our attention was the situation of the heart in its pericardium: it was situated between the two lungs, and about as much inclined to the right side as in a natural case it is to the left. The lungs were large, having two tracheæ, each terminating separately; the one in the right, the other in the left, lung. Each lung had three lobes. Each head had a distinct œsophagus, which passed separately through the diaphragm. The appearance of the lungs confirmed the observation I before made, that only the left head had breathed; the right lung having the appearance of liver, the colour of which, on being inflated, was instantly changed to that peculiar pulmonary mottled hue which characterizes this organ after respiration. On opening the pericardium, the heart was found to be very large. The aorta, which was also very large, arose from the left ventricle; as also did the pulmonary artery to the left lung. The contents of the abdomen appeared natural: the liver was large, but had nothing peculiar in its appearance. On turning back the liver, we found two stomachs: the one to the left head occupied the natural situation, the other was situated under the right lobe of the liver. Each stomach had its separate duodenum, the right one about half an inch, and the left one about an inch and half in length; when they united, forming one common duodenum. There were two gall-bladders, each having a separate duct, which terminated at the junction of the duodena. The

spleen, pancreas, and kidneys, were natural; as also were the intestines; the colon and rectum were distended with meconium. The contents of the pelvis were similar to those of a single child. On examining the vertebral columns, we found two, perfect and entire, but which gradually approximated as they approached the sacrum; which was single, but much broader than natural. Cases similar to the present very rarely occur: few so singular are on record; and, of those related, but a small share are well authenticated, or else, as before observed, they were expelled before the full time of utero-gestation.

With respect to the mother, I may briefly state, that, whilst I was examining the child immediately after its birth in an adjoining room, one of the midwives, by officiously attempting to bring away the placenta, broke the umbilical cord; so that I was obliged to introduce my hand into the uterus, to detach and bring it away. Notwithstanding this circumstance, added to the tedious and painful parturition, she recovered as well as after an ordinary labour: no unpleasant symptoms supervened, except that the prostration of strength required a longer time to be re-established.

8. *The death of the fœtus* is not necessarily a cause of lingering labour. The affection of the mother, of whatever nature it might be, which occasioned the death of the child, may possibly retard the labour; otherwise it will terminate favourably, unless the size of the fœtus is increased by putrefaction; and from this cause very troublesome and dangerous labours have sometimes occurred. When a child, after death, becomes putrid, and thence enormously swelled by the included and rarefied air, the birth will be impeded; but the difficulty will arise not from the death of the child, but from its increased bulk.

9. *Shortness of the navel-string* will seldom be a cause of lingering labour, till the head is about to pass through the external parts; it may then be an impediment to the birth by occasioning the head to be retracted after each pain. We are not, however, always to conclude that the retraction of the head is produced by shortness of the funis; for the resiliency of the parts, especially in first labours, occasions a greater or less degree of retraction of the head. The delay in the labour, which shortness of the funis occasions, will generally be overcome by the unaided powers of Nature. Changing the position of the woman sometimes facilitates the birth.

It has been recommended, after the head is born, if the birth of the shoulders is prevented by the navel-string being twisted round the neck of the child, to introduce a pair of scissors, divide it, and thus set the parts at liberty. This operation may sometimes be expedient; great care being taken to guard against doing mischief; but it is proper to remark, that Dr. Denman relates a case of the death of the infant from dividing the funis under these circumstances.

Besides the causes of difficult parturition above enumerated, it sometimes happens, that incautious practitioners occasion lingering labours by mismanaging the different stages, and thus interrupting the natural progress of the labour; and this may be effected in various ways, particularly, by the injurious practice of giving cordials and strong drinks, under a false idea of supporting the patient's strength; by keeping the room too hot and close; by allowing too much company, who fatigue the patient, by their noise and talking, or by urging the woman to exert herself in bearing-down before the parts are well dilated. "But this must the mydwyfe above all thynges take hede of, that she compell not the woman to labor before the byrth come forwarde and shewe itselfe. For before that tyme all labor is in vayne, labor as muche as ye lyst. And in this case many tymes it cometh to passe, that the partie hath labored so sore before the tyme, that when she shoulde labor in dede, her myght and strength is spent before in vaine, so that she is not nowe able to helpe herselfe; and that is a perylous case."

These cautions of honest Richard Jonas in 1540, are quite applicable to 1820.

Ergot of rye, or *spurred rye* as it is called, has been strongly recommended by some eminent accoucheurs in America, as having a very decided effect in exciting and strengthening the action of the uterus during protracted labour; and, according to Mr. Oliver Prescott, of the Massachusetts Medical Society, it is endued with a singular and valuable property, denied to every other medicine with which we are acquainted—that of operating exclusively upon the uterus.

This production is generated by a peculiar *disease* which occasionally affects the grains of rye; and is one of the four diseases of plants enumerated by Linnæus, and by him denominated *clavus*. The Americans term this production *Secale cornutum*, or horned rye. This disease very often attacks the rye in France; and, in such seasons as are very moist, it is occasionally seen in Great Britain and other parts of Europe. The rye in America also is so liable to the same disease, that in the new settlements there is always more or less of it to be found; but it is more rarely to be discovered on fields that have been kept in a state of constant cultivation for a considerable number of years.

The earliest account of this diseased rye is probably that of M. Dodart, in 1676; after which it does not seem to have been noticed till the abbé Tessier read a memoir upon it before the Royal Medical Society at Paris in 1776. This diseased grain, called *ergot*, is found in the ear of the rye in greater or less quantity, according to the season, and its situation. Its form is ordinarily crooked and long; it projects much from the glume; is larger in the middle than at the extremities, which are sometimes blunt, and sometimes pointed. It is seldom round in its whole length, there being generally three angles, and certain longitudinal lines extending from one end to the other. In many grains, particularly the largest, there are small cavities, supposed by some to be occasioned by insects, by others by the fun. Its external colour is violet of different degrees of intensity, which encloses a dull white substance of a firm consistence, from which the external coat does not separate itself even after long boiling. A grain of ergot breaks short, like a dry almond, and has nothing disagreeable either in its odour or taste; the grains are of different size, and vary in their length. Some are less than the grains of rye themselves, while others are eighteen or nineteen lines in length, and two or three in thickness; but the length is more usually ten or twelve lines. Sometimes they are short, and at the same time large; but these are not of an ordinary form. When the ergot is large, there are generally but few upon an ear, and the grains of rye, on the same ear, are fine and healthy, and the whole plant vigorous; on the contrary, when the grains of ergot are small, there are many on an ear, and the stalk is less strong and thrifty. There are commonly found four or five of these grains upon one ear, frequently ten or twelve, and sometimes even twenty. The grains of rye in those ears which have many ergots are never good, but are shrunk, and covered at their superior extremity with a black powder. This production, if exposed to the air, dries readily, and becomes less in size, and very light. A measure of it, that holds fourteen pounds of rye, will weigh but nine pounds. It is occasionally found on *wheat*; but on the ears of this grain it is always short, though thick and well-nourished; the quantity, however, produced by this plant is very inconsiderable. These grains, if planted, will not vegetate, the germ being destroyed. Winter and spring rye are, as far as has been observed, equally liable to this disease.

The soil and climate about Orleans are so peculiarly adapted to the growth of this substance, that it is said to produce more of it than all France besides; for, in some years, not less than one-fourth of all the grain raised in that province is ergoted. In this district and

its vicinity, there has, at different periods, prevailed among the peasants, a very malignant and mortal disease, which is characterized by a *dry gangrene* in some one of the extremities, sometimes in all of them, which has been generally ascribed to their living upon bread made of the ergoted rye. It has also been accused of causing the spotted fever. See London Med. and Phys. Journal, vol. xxxvi. p. 474.

In France, many experiments have been made on animals, to prove its malignant effects; and numerous communications have been published, showing its noxious properties. But it had never been considered, by any of those writers, as capable of subserving any medicinal or other useful purpose.

The first information the public received, from a source entitled to credence, that this production was, in reality, endued with such an unexampled property, was through the medium of the New-York Medical Repository, vol. ii. by a letter from Dr. J. Stearns to Dr. Akerly. In this communication Dr. Stearns designates it by the appellation of *pulsis parturiens*. Very soon after this publication, the exhibition of it began to prevail in America. Dr. Bigelow says, "It is now ascertained, by the experience of a number of years, that the spurred rye given to parturient women has an unequivocal effect in increasing the force of the uterine pains and hastening the delivery of the child. This effect it sometimes fails to produce; but its failures are not more frequent than those to which almost any other article in the materia medica is liable. When given prematurely, or under improper circumstances, it has proved injurious to the mother, and still more frequently to the offspring. When administered at too early a stage, or while considerable obstacles to delivery exist, it creates unnecessary suffering to the mother, and endangers the child's life. The principal circumstances that contraindicate its use, are—earliness of the stage, rigidity of the soft parts, any unfavourable conformation, or any presentation that requires changing."

This, and some other accounts of the virtues of the ergot of rye, made Dr. Merriman anxious to procure some for the purpose of experiment; but, though he enquired for it, of many corn-dealers, physical-herb-men, &c. he never had the good fortune to get any, till Mr. Henry Davies, of Condit-freet, surgeon and lecturer on midwifery, gave him some, which he had received from Dr. Bibby, of New York, who sent at the same time a letter, from which the following are extracts. "The *ergot*, or spurred rye, has been much used in different parts of America and France, in cases of protracted labour, from a want of uterine action. It is given in infusion. A drachm, infused in three or four ounces of boiling water for ten or fifteen minutes, is the usual dose. Should pain not come on in half an hour, it may be repeated. The period for its exhibition is when the head of the fœtus has passed the brim of the pelvis, and would protrude the external part during a pain. The infusion is given at this period, with the happiest effects: at any previous period, by increasing uterine action, the life of the child will be almost certainly sacrificed." A most extraordinary circumstance also is noted, that where the fœtus has been some time dead, and putrefaction to any extent taken place, the remedy is altogether inert. In no case where it has been used has hemorrhage occurred; and in natural labour, when hemorrhage does occur, it has been given with great advantage.

A few cases, some occurring in his own practice, and others communicated by friends, have been added by Dr. Merriman; and, upon the whole, they are certainly in favour of the exhibition of this most active and powerful remedy. But it has been suggested by a writer in the New-England Journal of Medicine and Surgery, that the death of the infant is a more frequent occurrence, in cases in which the ergot has been employed, than where
its

its agency has not been used; and Dr. Merriman inclines to the same opinion. If this indeed be the case, it forms at once an insuperable objection to its use, except in cases where its safety is well defined; and the subject certainly demands deliberate attention and serious inquiry. But, in a matter of such importance, we ought not to be governed by conjecture; but should adopt or reject it, as its beneficial or destructive operation is tested by experiment. "My own experience (says Mr. Prescott) has been such, as to persuade me that the above suggestion is unfounded. It is true, that in 22 cases of first labour, in which this medicine had any effect, I lost four children; and in 35, where it was given to women who had been previously delivered, I have lost one. But all these deaths were attended with such circumstances as fully to exculpate the ergot from any agency in the event. And, when it is recollected, that this medicine is not used except in cases that are long protracted, or are likely to prove tedious and troublesome, it will not be thought, I conclude, that this unfortunate event happened more frequently, or in greater proportion to the whole number of cases, than might reasonably have been expected, had this medicine not been prescribed."

The uniform operation of the ergot to restrain uterine hemorrhage, has been noticed by other physicians. It has in consequence frequently been prescribed, a little previous to the birth of the child, or immediately after, to patients that have been accustomed to flood immoderately at such times, and it has always proved an effectual preventive. This singular property of the ergot, to diminish the enlarged cavity of the uterus, is never more strikingly exemplified, than when its agency is employed to restrain those floodings which sometimes appear in the early months of pregnancy, when the action of gestation has ceased, and abortion must follow. In such cases it speedily excites in the uterus such energetic action, that its contents are soon expelled, and the hemorrhage ceases.

In order to determine what operation it might have on a healthy male subject, the decoction of one drachm has been taken at a dose, but it produced neither nausea nor other perceptible effect. After a few days, the same person took a like quantity, which proved equally inert; neither did the larger quantity of two drachms, at a few doses, but all within the space of two hours, occasion nausea, vomiting, or pain in the female to whom it was prescribed, for deficient catamenia. Its operative powers, therefore, appear wholly confined to the uterine fibres, when lengthened from an enlargement of that viscus. In such case it speedily excites in them strong contractile action; and so long as the stimulating effect of the medicine lasts, this action is unceasing. The uterus is thus made to compress closely upon any substance whatever within its cavity; and this resistance to its further collapsing will cause violent pain in that organ; but, if it find no such resistance, the contractile action progresses without any uneasy sensations. The healthy unimpregnated uterus, having nothing within its cavity, will therefore not be affected by the ergot; neither is it calculated to restrain menorrhagia, proceeding from increased arterial action; as the size of the uterus, in such cases, is nearly at its minimum.

Until we clearly understand the reason why some medicines possess a greater affinity to one part of the system, or to one organ, than to another, it will be difficult to explain the *modus operandi* of the ergot. It is but a few years since it first attracted the notice of physicians, as being subservient to any useful purpose in medicine. Like all other active and valuable medicines, when first made known to the public, it requires a long series of judicious and attentive experiments, fully to develop its character, its qualities, and the precise manner in which it may affect different parts of the human system. Like them, while its use is beneficial, its abuse is destructive. A cautious direction of its powers cannot, therefore, be too strongly recommended. If properly administered, it

must be esteemed an important and valuable acquisition to our *materia medica*, and is unquestionably destined to hold a high rank among the means which Nature has provided for relieving the sufferings of her children.

PLURAL BIRTHS.—It is requisite, after the first child is born, (the funis being properly tied and divided to prevent bleeding,) and before any effort has been made to draw out the placenta, that the accoucheur should lay his hand on the abdomen of the mother, to ascertain whether there be another child left in the womb; and, when it so happens, the abdomen will feel nearly as large as before the first child was born.

All the signs by which the existence of more than one child in utero can be ascertained, previous to the actual commencement of labour, are fallacious; and, in general, it is not till after the birth of one child that it can be determined that another remains in the womb; and, unless under very particular circumstances, it is of no importance. The circumstances alluded to are where different parts of both children are forced into the passage at the same time. Of this a very remarkable case is recorded in the book of Genesis, chap. xxxviii. ver. 27.

When the womb appears to remain bulky and hard after the birth of one child, there is reason to suppose that it contains a second. But, if there be any doubt on the subject, the practitioner has it in his power to ascertain the point by internal examination: two fingers of the left hand are to be carried into the uterus guided by the funis; and, if its insertion into the placenta be felt, it is hardly possible for a second child to escape detection, taking care not to be misled by a distended bladder, enlarged ovary, or by the membranes containing coagula. If, therefore, the accoucheur still remains in doubt, he had better pass his whole hand into the vagina: but it will generally be observed, that, when there is no second child in the uterus, the further the fingers are carried up within the passages, the more contracted do they feel, whereas, if there be a second child, the more open they are found.

Each of the twins is commonly smaller than a single child: this often occasions the birth to be rapid, and gives to the practitioner the first idea that he is attending a case of twins. At other times, though it is evident to the touch that the child is small, and that there is plenty of room for it to pass, yet the pains, though frequent, do not propel it: hence the accoucheur is led to suspect that the uterine action is impeded or suspended by another child occupying the fundus uteri.

When it is ascertained that another infant remains, the woman's abdomen should be immediately compressed by means of a roller, in order to prevent faintness from the sudden relaxation of the parietes abdominis; and the portion of the navel-string remaining attached to the after-birth of the first-born should be carefully secured.

Much diversity of opinion has prevailed among practitioners of midwifery, respecting the best method of managing twin-cases: but this difference exists only with regard to the second labour; for the first requires to be conducted precisely as if it were a single child. Thus, if the foetus presents naturally, the case is to be left to nature; if it presents preternaturally, or if any other circumstances occur, constituting difficult labour, it will require the kind of management directed in the various sections of Preternatural Labour. Should, however, the case be of such a kind as makes turning necessary, the operator must take care not to mistake the parts of the two children, lest he bring down a limb of each, and add greatly to the embarrassment of the case.

It is very well known that repeated instances have happened where the second child has been retained many hours or days after the birth of the first, and no mischief, nor danger, nor much of inconvenience, has followed. In the London Medical Journal for April 1811, a case of twins is related, in which the second child was retained for fourteen days after the birth of the first; and the author

thor of that communication states, that another case had come to his knowledge, in which six weeks had elapsed between the births of the twins. Mrs. Dixon, of Middleton Place, was delivered, on the 27th of October, 1806, of a daughter, and on the 8th of December of a son. March 4, 1814, the wife of Mr. James Pickworth, grazier, of Sempringham, Lincolnshire, was delivered of two boys; after which she was so much composed, that she got up the next day, and remained in that state till the 6th, when she was delivered of two more boys. *Gent. Mag.* March 1814. From such cases as these, some have concluded, rather hastily, that the birth of the second child may always be safely trusted to nature, and that the interference of art is very seldom, if ever, necessary.

On the other hand, very dangerous, and not unfrequently fatal, consequences, having occurred from allowing the second child to be long retained after the first is born, many have argued, that it is always proper to accelerate by art the birth of the second child.

Others, again, steer a middle course, and teach us to wait a moderate or reasonable time, before we interfere by art, to effect the second delivery; and it seems to be the opinion of some authors of great reputation and judgment that about *four hours* is the proper time to wait.

It will hardly be denied, that some time ought to be allowed to recruit the woman's strength, and to give an opportunity for the second labour to come on spontaneously; but there will often be a difficulty in determining what space of time is to be considered as *reasonable*. There are many cases, in which it would be unadvisable to wait so long as four hours, before the birth of the second child is artificially excited; for, even when the first labour has been favourable, and the second child is in a proper position, it may be doubted whether any advantage is likely to accrue from letting it remain four hours before an attempt is made to facilitate the delivery. In general, indeed, under these favourable circumstances, the secondary pains come on shortly after the first birth, and expel the child; but, should this not happen, it may be prudent to excite them, by rupturing the membranes, in a much shorter space of time than four hours. "It has seemed to me, (says Dr. Merriman,) upon various occasions, when so long a period as this has been permitted to elapse, that the pains of the second labour have been more severe than they would have been had the action of the uterus been earlier excited. I should be very unwilling (the doctor adds) to appear the advocate of precipitation, in any part of the practice of midwifery; but, having known more than one instance of mischief arising from the delay of bringing the second twin into the world, I think myself justifiable in recommending an opposite mode of conduct, though somewhat different from that which other practical accoucheurs have taught.

"The following is an outline of the practice, which I have been in the habit of adopting. 1. When both the children present naturally, and the labour of the first terminates without artificial assistance, and without much fatigue to the patient, I wait for the spontaneous occurrence of the secondary pains; but, should these not come on soon, I rupture the membranes; and then commonly find, that the second child passes with comparative ease through the pelvis, the parts having already undergone sufficient dilatation. 2. If the first labour has been natural, and the second child presents in a wrong direction, I have deemed it generally expedient, with very little delay, to extract it by the feet. 3. If the first labour has been preternatural, or very difficult, or dangerous, this has always seemed to me an additional reason for terminating the second as expeditiously as circumstances will admit." In every case, the extraction of the placenta is to be conducted with great care; for it is to be noted, that every fetus has its separate placenta, though they are generally united at the edges.

It is an established rule, not to acquaint the mother that

there are twins, till both are born; for it is known that sudden emotions of the mind have been productive of ill consequences during labour, and some mischief or inconvenience might ensue from the apprehension with which the patient might contemplate the second labour. But, though it is proper to conceal this circumstance from the mother, if possible, yet it is right to acquaint the husband, or some friend of the patient, of the real nature of the case, as soon as it is certainly known to the practitioner.

The rules which are applicable to twin-cases, will equally apply to cases where there are three or more children. It very commonly happens, that twin-labours occur before the full term of nine months.

There seems to be a very extraordinary variety in the averages of twin and triplet births, in different countries, and under different circumstances. Thus the average of twin births has been stated,

By Dr. Clarke, at the Dublin Lying-in Hospital as 1 in 56½	
By Dr. Bland, at the Westminster Dispensary	80
By Prof. Boer, in the Vienna Lying-in Hospital	80
By Dr. Denman, at the British Hospital	91
By Dr. Denman, at the Middlesex Hospital	93
By Mr. Burns, in his own practice	95
By Mad. Boivin, at the Hôpital de la Maternité	132
By M. Tenon, surgeon to the Salpêtrière at Paris	96

Respecting triplets, the averages are still more various: many accoucheurs, of very extensive practice, have passed through a long life, without once witnessing three children at a birth. Dr. Bland kept a very exact register of 1897 women delivered at the expense of the Westminster General Dispensary, among which there was one case of triplets; while Dr. Merriman held the office of physician-accoucher to that charity, about 3500 women were delivered; among whom he was twice called to triplet-labours. In the first 18,300 women delivered at the British Lying-in Hospital, not a single instance of triplets had occurred; but there were three such cases among 20,357 women delivered at the Hôpital de la Maternité, at Paris, and 19 among 59,354 women at the Dublin Lying-in Hospital; or 1 in 3124.

The averages of four children at a birth can scarcely be ascertained, yet several such instances are known to have happened in this island.—In the year 1674, there was published in London a 4to. pamphlet, intitled, "The Fruitful Wonder; or a strange Relation, from Kingston-upon-Thames, of a Woman who, on Thursday and Friday, the 5th and 6th days of this instant March, 1673-4, was delivered of 4 children at one birth, viz. 3 sons and 1 daughter, all born alive, lusty children, and perfect in every part, which lived twenty-four hours, and then died, all much about the same time; with several other Examples of numerous Births, from credible Historians, with the Physical and Astrological Reasons for the same. By J. P. Student in Physic."—Dr. Plott, in his History of Staffordshire, mentions Eleanor, the wife of Henry Diven, of Watlington, who was delivered of 4 children at a birth in the year 1675.—Sir Robert Sibbald, in his *Scotia Illustrata*, after mentioning a case of three born at once, adds, "Imo in variis regni locis repertæ sunt mulieres quæ quatuor fetus uno partu ediderunt;" but makes no mention of more.—In the Gentleman's Magazine, which is reckoned a pretty authentic record of the times, we have the following accounts.—Ann Boynton, of Hensbridge, in Somersetshire, was this day, June 1, 1736, delivered of three daughters and one son; one of the daughters died, the rest are likely to live. The mother has been married but four years, and has had twice twins before, which completes the number of eight children at three births.—October 3, 1743, at Rate, in Berkshire, Joan Galloway was delivered of two boys and two girls, three of whom were alive.—In January 1746, the wife of Plumer, a labouring man, at Mill-Wimley, near Hitchin, Hertfordshire, was delivered of three

three living boys, and a dead one.—August 22, 1746, the wife of Williams, of Coventry-street, Piccadilly, was delivered of two boys and two girls, all likely to live.—June 1752, a woman in the parish of Tillicultrie, near Stirling, in Scotland, was delivered of four children, which were all immediately baptized, and all died at the same time next morning.—In September 1757, a poor woman, of Burton Ferry, Glamorganshire, was delivered of three boys and one girl.—Dr. Hamilton writes, that not many years ago a woman was delivered of four children, at Pennycuick, the seat of Sir John Clark, bart. near Edinburgh, when she was advanced to the middle of her last month of pregnancy, and that some of these children lived two or three years. He further says, that he attended a woman at Edinburgh, who, in the seventh month of her pregnancy, after a journey of thirty miles, was suddenly delivered of four children, all perfect and well grown for the time, of which one was born dead, and three alive; but those three died next day. He further adds, that these are the only cases of quadruplets, or any larger number, he had ever heard of, as born in Scotland in his memory.

Though cases of five children born at once are still much more uncommon, and though Haller's assertion of their not happening above once in a million of births may be reckoned a very moderate calculation, yet we are not altogether without such instances in this country. From the *Gent. Mag.* we learn that, on the 5th of October, 1736, a woman at a milk-cellar in the Strand was delivered of three boys and two girls at one birth; and that, in March 1739, at Wells in Somersetshire, a woman was delivered of four sons and one daughter, all alive, all christened, and all then seemingly likely to live.—In the *Commercium Literarium Norimbergense* for the year 1731, we have two such cases; one hapening in Upper Saxony, the other near Prague in Bohemia; in each of which five children were born and christened, all of whom were arrived to that equal degree of maturity which rendered it probable they were all conceived about the same time.—The following more recent case was communicated by Mr. Hull, the accoucher, at Blackburne in Lancashire, to Dr. Blane, and by him to Dr. Garthshore, who laid it before the Royal Society; and it was printed in the *Phil. Transf.* for 1787. p. 344.

"Margaret Waddington, aged twenty-one, a poor woman of the township of Lower Darwin, near Blackburn in Lancashire, formerly delivered of one child at the full term of pregnancy, conceived a second time about the beginning of December 1785, and from that period became affected with the usual symptoms that attend breeding. At the end of the first month, she became lame, complained of considerable pains in her loins, and the enlargement of her body was so remarkably rapid, that she was then judged by her neighbours to be almost half-gone with child. When the third month was completed, she thought herself fully as large as she had formerly been in her ninth month; and to her former symptoms of nausea, vomiting, lameness, and pain of the loins, she had now added a distressing shortness of breath. She continued to increase so rapidly in size, that she thought she could perceive herself growing larger every day, and was under the frequent necessity of widening her clothes. When she reckoned herself eighteen weeks gone, she first perceived somewhat indistinctly the motion of a child. By the 20th of April, 1786, all her complaints were become much more distressing; she had much tension and pain over all the abdomen, her vomiting was incessant, and she could not make water but with the utmost difficulty. The symptoms being palliated by medical assistance, she advanced in her pregnancy to Monday the 24th of April, when, being supposed to have arrived at the twentieth week, she was seized with labour-pains. These continued gradually to increase till the next day, about two in the afternoon; at which time Mr. Hull was sent for, and she was soon delivered of a

small, dead, but not putrid, female child. The pains continuing, this was soon followed by a second less child; to this very soon succeeded a third, larger than the first, which was alive; to these a fourth soon followed, somewhat larger than the first, and very putrid; last of all, there soon succeeded a fifth child, larger than any of the former, and born alive. These five children were all females; two were born alive; and the whole operation was performed in the space of 50 minutes; as the first child made its appearance at two in the afternoon, and the last at ten minutes before three. Each child presented naturally, was preceded by a separate burst of water, and was delivered by the natural pains only. In a short time after the birth of the last, the placenta was expelled by nature without any hæmorrhage, was uncommonly large, and in some places beginning to be putrid. It consisted of one uniform continued cake, and was not divided into distinct placentulæ, the lobulated appearance being nearly equal all over. Each funis was contained in a separate cell, within which each child had been lodged; and it was easy to perceive, by the state of the funis, and that part of the placenta to which it adhered, in which sex the dead, and in which the living, children had been contained. The two living children having survived their birth but a short time, Mr. H. was allowed to carry them home: he preserved the whole five in spirits, and they were exhibited to the R. S. when this paper was read, and were afterwards deposited in the Museum of Mr. John Hunter," which is now in Surgeons' Hall in Lincoln's Inn Square.

"The mother, in spite of the crowds with which her chamber was continually filled, continued to recover, and was able to be out of bed on the 27th and 28th, her third and fourth days; but, finding herself then weak, kept her bed till the 11th of May, when she went out of doors, and on the 21st walked to Blackburn, two miles distant. This was the twenty-seventh day from her delivery; she having entirely recovered her strength without any accident."

Though the females of the human species produce most commonly but one child at a birth; and though their formation with only two breasts, and one nipple to each, renders it probable they were not originally intended to produce in general more than two; yet, from what we know of the womb and its appendages, and what from the latest experiments we are led to conjecture as to the mode of conception, we cannot presume a priori to set limits to the fertility of nature, nor determine decisively what number of fœtuses may be conceived and nourished to a certain period in the human uterus at the same time. The present singular and well-attested case assures us, that five have certainly been born at once; and we have no title absolutely to reject all the testimonies of even more numerous births, or to say that, in some rare instances, this number has never been exceeded. Dr. Osborn is said to have once witnessed an expulsion of six abortive ova; and Borellus asserts, that about three years before he published his second Century of Observations, the wife of a nobleman in Languedoc was delivered of eight at a birth! But Borellus, it must be acknowledged, tells many marvellous stories. We will therefore not pursue the subject any farther, lest we should at length reach the history of the lady who had as many children as there were days in the year, without being able to inform our readers how many days there were (at that time) in the year.

We need hardly mention, that a greater number of twin-children, on an average, die during infancy than of single children; and this remark applies still more strongly to triplets, quadruplets, &c. for it is very seldom they are all born living; or, at least, they survive but a short time.

There are instances, however, of triplets living to mature age.—Three brothers at the same birth, by the name of John, Michael, and William, Dunn, aged 30

years, are now (1813) living in London. Three sisters, Anne, Susan, and Catharine, Howel, were born together at Malwyd in Merionethshire: at the age of fifteen years, in 1796, they were all three very beautiful, and so alike that the slightest difference could not be perceived. *Obstetric Studies*, p. 50.—Mary Baker, wife of Robert Baker, carrier, at Streatham, in the county of Surrey, was delivered on the 11th of December, 1796, of three children, one boy and two girls; the children all thrived well, have all grown up hale and strong, and are all now living, having on Thursday Dec. 11, 1817, completed their twenty-first year. The father and mother are also alive, and in the enjoyment of good health. *Morning Chronicle*, Dec. 13, 1817.

A most extraordinary instance of human fecundity is related in the *Menagiana*, tom. i. p. 332; which, if it does not convince, may at least amuse; it is the abbé himself who speaks. "Mr. D—— told me, the day before yesterday, that the wife of a petty shopkeeper, in his neighbourhood, of the name of Blunet, had borne twenty-one children in seven successive child-bearings. That these triplet-children had not only been baptized, but had lived, some several days, others several months, and that twelve of the most robust were still alive, who were all grown up, and in good health. He added, that as doubts might be entertained whether the husband or the wife contributed the most to produce this kind of prodigy, the man made a further experiment, by seducing a servant girl who lived with them. At the end of nine months, the likewise was delivered of three male children, who, notwithstanding their mother's youth and delicateness, lived a fortnight or three weeks."

M. Menage adds, that probably the whole ancient world could not produce another example of a fecundity so prodigious! But this Parisian father of multitudes must be considered as nothing, when compared with the wonderful Russian, who is mentioned in the *Gentleman's Magazine* for September 1783, p. 753. This man, Feoder Wafilief, a peasant, aged 75, is said to have had

By his first wife;	By his second wife;
$4 \times 4 = 16$	$6 \times 2 = 12$
$7 \times 3 = 21$	$2 \times 3 = 6$
$16 \times 2 = 32$	—
Births 27	Births 8
69 Children.	18 Children.

Births in all, 35; Children, 87; of which 84 are living, and only three buried. The above relation, however astonishing, may be depended upon, as it came directly from an English merchant at St. Petersburg, to his relation in England, who added that the peasant was to be introduced to the empress. The above letter is dated Aug. 13, 1782, at which time the man was said "to be alive, and in perfect health, in the government of Moscow."

Of SUPERFETATION.—The cases we have related, p. 680, of twins being born at remote periods, six weeks or more, from each other, have given rise to an opinion that they must have been conceived at different times; for the term *superfætation* implies a second impregnation whilst a child is in utero. But this cannot be, if the commonly-received theory of conception, which assumes the transmigration of the male semen along the uterus to the tubæ Fallopianæ, be correct; because, the os uteri being blocked up by coagulable lymph, and the entrance to the Fallopian tubes being obstructed by the decidua uteri soon after conception, render such an occurrence impossible. (See, however, Smellie's remark upon theories, p. 670.) "Those cases in which a plurality of children have existed, and in which superfætation is supposed to have occurred, are referrible, either (says Dr. Conquest,) to the premature death of one fœtus, which has remained in utero with the living child to the full period of utero-gestation; or, to the descent of the two ova into the uterus from the ovarium not observing the same order of time; one being more slowly evolved than the other, al-

though both might have been fecundated by the same coitus." *Outlines of Midwifery*, p. 141, 2.

Pliny, the naturalist, relates an instance of a female slave who produced twins, one of which resembled the master of the slave, the other another man with whom she had had sexual connexion. This fact, although it might lead to the suspicion of the possibility of superfætation, still it would by no means demonstrate it. That quoted by Buffon is more conclusive: In the year 1714, a woman of South-Carolina, when in bed, was approached by a negro, who, with a poignard in his hand, obliged her, by violent menaces, to submit to his desires: nine months afterwards she was delivered of two children, one of them black, the other a mulatto. This, being at that period a singular case in history, might be considered as doubtful; but similar instances have since occurred, to support it, and apparently to prove the possibility of superfætation.

Mons. Baudelocque relates, in the second volume of his *Traité de l'Art des Accouchemens*, a case of superfætation observed, in 1780, by Dr. Desgranges, of Lyons. On the birth of the first infant, the discharge from the uterus ceased immediately after delivery; no milk appeared in the breasts; and the belly remained more voluminous than ordinary. Twenty days afterwards this woman admitted the caresses of her husband, and a few days after that she felt the motions of a fœtus in the uterus. After the lapse of a hundred and sixty-eight days from her former accouchement, she gave birth to a full-grown infant; so that it is apparent that this was conceived about seventy-two days after the former. Both of the children were living in 1782.

A woman of Arles produced, November 11, 1796, a female infant, apparently at the full period of gestation, which lived seven months: The lochiæ were suppressed on the fourth day, and no milk appeared in the breasts, although measures were taken to solicit it, from the desire of the mother to suckle her child. Six weeks after her delivery, this woman, with much surprise, felt the motions of a fœtus in the uterus; but, recollecting that she had cohabited with her husband four days after her accouchement, she considered that she was pregnant from that period; but this conjecture was found to be incorrect, by her giving birth to another female child, of the full growth and development, at the termination of the fifth month from that of the former. The milk now appeared in her breasts, with which the mother suckled both her children. This fact is attested by two medical practitioners.

M. Delmas, a surgeon resident at Rouen, relates, that a woman of that city, thirty-six years of age, was delivered at the hospital at Rouen, on the 26th of February, 1806, of two male children, one white, the other mulatto. This woman had been pregnant eight months; the two placentas, united in the manner generally observed in the case of twins, were expelled within a few minutes after the birth of the fœtuses. The woman lived with a white man, but she had twice had connexion with a negro about the time when she believed herself to have been pregnant four months. The infants lived but three hours.

The following has been published, under the title of "a Case of Superfætation," by Dr. Maton, in the fourth volume of the *Transactions of the College of Physicians*, p. 161. A lady, who had previously borne children, had, on the 12th of November, 1807, another male child, which was brought forth under circumstances peculiarly distressing, being dropt on a bundle of straw at midnight in an uninhabited room. Though this infant had every appearance of health at the time of birth, he lived about nine days only. On the 2d of February, 1806, (not quite three months from the former accouchement,) she was delivered of another male infant completely formed, and apparently in perfect health. This child died in about three months of measles.

These

These facts, and many others that our limits oblige us to pass over in silence, seem to prove that superfetation, although rare, is yet a real phenomenon. Those physiologists who still deny its possibility endeavour to account for births occurring at periods too remote to admit of their being referred to the same period of conception, by asserting that it can only be explained by the existence of a double uterus, or by a division of that organ into two cavities; circumstances which anatomical investigation has shown to take place. Those who believe that superfetation may happen in the ordinary state of the uterus, may support their opinion by the case of the woman at Arles, in which the two placenta were united together by their broad surfaces, which could not have happened had they not been formed in the same matrix. The cessation of the lochia, which was observed in this as well as in that related by Baudelocque, tends to prove that the two fœtuses were contained in the same cavity. We refer our readers to the twenty-second, twenty-third, and twenty-fourth, volumes of the London Medical and Physical Journal for some further observations and reflections on this subject.

II. OF PRETERNATURAL LABOURS.

FROM the view we have given of human parturition under the most favourable circumstances, it must be obvious that many deviations from nature may occur. These deviations may proceed; first, from the propelling powers concerned in parturition; secondly, from the state of the child itself; or, lastly, from the state of the passages through which the child is forced. There may also be a combination of these causes.

I. The propelling powers concerned in parturition consist of voluntary and involuntary muscular action. The diaphragm and abdominal muscles furnish the former, and the uterus the latter. An excess or diminution of the action of those powers must interrupt the ordinary progress of labour.

Impaired action of the uterus during the first stage of labour is in many instances productive of no other inconvenience than the protraction of labour; and it has therefore been considered under the preceding head of Natural Parturition. But, if it exhausts the strength of the patient, it influences materially the subsequent process, so as to require manual assistance, and the use of instruments. When it occurs during the second stage, it occasions the most dangerous symptoms; if the head of the child continue to press for a considerable time on the soft parts within the pelvis, these parts must necessarily, from the impeded circulation, become swelled; and consequently the action of the uterus, though it should return, would then be totally insufficient for the expulsion of the child. This effect of the protraction of the second stage was first pointed out to the public in Dr. Hamilton's Letters to Dr. Osborne.

We have explained the effect of the ergot of rye in hastening labour-pains; but, when that remedy is ineffectual, or when some good reason may prevent the exhibition of it, and the child is detained so long in the passage as to endanger the health or life of the mother, it becomes necessary to extract the infant by mechanical means. Two contrivances have been thought of for this purpose, viz. the *vestis* or lever, and the forceps.

Roonhuysen, a Dutch practitioner, who flourished about the beginning of the 18th century, contrived the *vestis*; and, from the great success which attended its use in his hands, an edict was issued by the states-general, that no surgeon should practise midwifery without being possessed of the Roonhuysen secret, for the instrument was not publicly known. In the year 1756, however, the secret having been purchased by two liberal-minded physicians, Vischer and Van de Poll, was published by them for the benefit of mankind. Since that time the instrument has undergone a variety of alterations in its form;

for a particular account of which, the reader is referred to Mulder's *Historia Forcipis*. There can be no doubt that Roonhuysen and his successors employed the *vestis* as a lever of the first species, the head of the infant being the resistance, the parts of the woman the fulcrum, and the hand of the operator forming the moving power. The injuries arising from this practice have been well explained by Dr. Osborne in his *Essays on Laborious Labours*. Although Dr. Bland and Dr. Denman still recommend the same practice, there can be no doubt that, whenever the use of the *vestis* proves successful according to their directions, the fortunate termination is to be attributed to the action of the uterus being exerted by the pressure of the instrument; or, in other words, the delivery might have been completed without any mechanical interference at all. The lever in its present state, called Lounder's lever, is represented on the annexed Plate, at fig. 1. but it has now nearly fallen into disuse, having given way to the *forceps*, which is a double lever so constructed that the fulcrum of each blade is in the handle of the other. The common short forceps is supposed to have been invented by Dr. Hugh Chamberlen, who was physician to king Charles II. but its shape has been greatly altered since his time. The most approved form is that represented at fig. 2.

In order that this instrument be applicable, it is necessary that the head be completely, or nearly so, in the cavity of the pelvis; but sometimes a lengthened pair is used for cases where the head is situated high. In whatever situation the head is, the instrument is to be applied over the ears, otherwise there could be no safe and secure hold. In the process of extracting the child with this instrument too, it is to be observed, that the convex edge of the blades is to be brought along the hollow of the sacrum. The instrument being applied so cautiously over the ears of the infant that no part of the woman be injured by their introduction, the locking-parts are to be brought together, and secured by a ligature; after which the operator, supporting carefully the perinæum with one hand, is to draw gently in a direction of from blade to blade during a pain, or now and then to imitate labour-throes, while he at the same time favours the mechanism of labour by accommodating the child's head to the passage so as to make it take up the least possible room. If this be done with suitable caution and gentleness, no part of the woman should be injured, and the parts of the infant on which the instrument had rested should not even be marked. But, as there can be no doubt that, in the process of using the forceps, the parts of the woman are pressed upon by the blades, if much force be exerted, or if due attention be not paid to the adaptation of the head of the infant to the apertures through which it is to be brought, the most dreadful effects result from the operation.

Violent action of the diaphragm and abdominal muscles, if exerted at the beginning of labour, tends to exhaust the patient and to retard delivery; and, if induced when the head is within the vagina, may, provided proper precautions be not taken, lacerate the perinæum, and render the future life of the patient miserable. The action of these muscles, being quite voluntary, may be readily prevented by the patient submitting to proper advice.

Violent action of the uterus at the beginning of labour, is frequently productive of much mischief. It exhausts the patient, and renders the subsequent process of delivery exceedingly tedious and difficult. It also sometimes occasions an accident which generally proves almost immediately fatal, viz. rupture of the uterus, vagina, or perinæum; but, as these dreadful accidents happen from other causes also, they will be considered, with the proper treatment, farther on.

Violent action of the uterus during the latter stage of labour, although not productive of the same dangers which ensue from it at the beginning, is by no means exempt from hazard; for, if the soft parts be rigid or

not sufficiently relaxed, the woman may be miserably torn. The violent action of the uterus towards the termination of labour proceeds from some power of that organ itself, or from the stimulus communicated by the position of the child. This circumstance, however, is sometimes beneficial; as for instance, when the child is in an unfavourable position. Dr. Denman was the first who discovered this effect of violent uterine action, and published it in the fifth volume of the London Medical Journal.

II. The malposition or malpresentation of the child may occur in different ways; but they may be considered under two divisions, 1. Presentations of the lower extremities; 2. of the superior extremities. As in a natural labour the head always presents, it would seem most analogous that we should begin with noticing the presentation of the upper extremities, as the head (in a wrong position), arm, shoulder, &c. But, as it will be presently seen, that, in the greater part of malpresentations, it is thought advisable to turn the child, and deliver by the feet, the propriety of explaining that process first in order, is sufficiently obvious.

1. PRESENTATIONS of the LOWER EXTREMITIES.

Presentations of the lower extremities comprehend cases where one or both feet, one or both knees, or the breech, present.

Cases where *both feet* present, are more frequent than those where one only presents. It has been calculated that the feet present once in 105 cases of labour. This is moreover the most simple, and probably the safest to the mother, of all the preternatural positions: but the hazard to the child is considerable, particularly if it be a first labour. The danger to the child arises principally from the compression of the navel-string, between its own head and the parts of the mother, after the body of the child has passed through the pelvis. The great object of the accoucheur, then, is to prevent this compression; and this is to be effected, by getting the head of the child through the pelvis, with all proper expedition, as soon as the body is born. In order for this, it is not necessary to hasten the delivery of the body of the child: on the contrary, it is desirable that the delivery of the body should be effected slowly; for thus the parts of the mother will become more dilated and spacious, and of course there will be less resistance opposed to the passage of the head. But, if attempts are too early made to reach the feet, and to expedite the delivery by drawing them down, and afterwards to extract the body rapidly, it will be found, when the head comes to occupy the pelvis, that the soft parts of the mother will be too rigid and undilatable to let the bulky head pass through them; and thus so much delay will take place, and the funis will be so much compressed, as to destroy the child.

Some authors have divided labours of this kind into a great variety of species. There is, however, no necessity for such divisions, and they tend to mislead and embarrass practitioners. All the varieties may be reduced under three heads; for the toes must be either towards the side of the pelvis, or towards the sacrum, or towards the pubes.

1. Where the toes are towards the side of the pelvis, the child is generally placed in such a manner that the abdomen, breast, and face, pass in succession along the sacro-iliac synchondrosis of that side. This is the most favourable situation in which the child under such circumstances can be placed; for the largest parts of its body pass through the largest aperture of the pelvis.

In this case, then, the action of the uterus forcing forward the child, the feet are by degrees excluded through the external parts, the toes being situated between the point of the coccyx and the tuberosity of the ischium; the thighs follow, then the abdomen and thorax; but the farther progress of the child is for some time interrupted

by the arms passing up along each side of the head, which add considerably to its bulk; at last, however, the repeated contractions of the uterus force the face into the hollow of the sacrum, and then, the nape of the neck turning on the inferior edge of the symphysis pubis as on a pivot, the face is excluded, followed by the scaput and occiput.

2. Authors have generally considered that to be the most favourable position in which the feet can present, where the toes are towards the sacrum. But two disadvantages attend this position: first, the largest part of the child's body is forced through the smallest part of the outlet of the pelvis; and 2dly, The longest diameter of the head is applied to the shortest diameter of the brim of the pelvis. In such cases, therefore, the patient commonly suffers much pain, and the child's life is destroyed.

3. When the toes are turned to the pubes, it has been universally acknowledged, that the feet are in the worst possible position. Indeed not only do the disadvantages stated as resulting from the last position equally take place in this one, but another cause of difficulty and danger is added, viz. that, the face being applied to the pubes, the chin may project over, and rest upon the ossa pubis, and it will be difficult to extricate it from this untoward situation. To guard against this accident, it will be proper, as soon as the nates have passed through the os externum, to take hold of the nates and both thighs with a warm napkin; and, when the next pain comes on, to give such an inclination to the body of the child, by guiding it with the hands, as will direct the face towards the mother's spine. The napkin is necessary, in order to give the operator a sufficiently firm hold; without it, his fingers would slip, and his object be defeated. There is not much difficulty in effecting this turn, if it be done prudently and cautiously. Much force is not required; nor is it necessary that the fore parts of the child be turned quite round to the mother's back: an inclination towards the back is all that is wanted.

During the pain which, with the assistance of the accoucheur, produces this turn of the child, it is probable that the whole of the body will be expelled, and nothing will remain in the pelvis but the child's head, with the arms extended on each side above it. It has been a question much discussed, whether it be best in such cases to finish the delivery, leaving the arms thus extended on each side of the head, or to draw them down by manual assistance, before any attempt is made to bring the head into the world. Some writers have asserted that the arms should not be drawn down, because, while thus extended, they prevent the os uteri from contracting round the neck of the child, and impeding the passage of the head. But, if the early part of the labour has been permitted to proceed sufficiently slow to allow the os uteri to become properly dilated, such a contraction is little to be dreaded; and the arms need not be suffered to remain for this purpose.

A far better reason for not bringing down the arms, is, the danger of dislocating or fracturing them; and, if the practitioner will be so heedless and imprudent as to attempt to extract them at an improper time, or to employ violence and undue force in effecting it, this danger will be imminent; but, if the attempt be cautiously and judiciously made, no hazard need attend it. The operation consists in passing the finger over the shoulder of the child, as far as to the bend of the elbow; which is then to be gently depressed, and the fore-arm commonly passes through the vagina without much difficulty. One arm being brought down, the extraction of the second becomes more easy. In proportion to the rigidity of the soft parts will be the difficulty of the extraction: should it be found that the operator's finger cannot reach the bend of the elbow, or does not readily dislodge the arm, it will be better to defer the attempt, or to give it up altogether, rather than to do injury to the infant. With

first

first children, it will require some care to guard against a laceration of the perinæum, as the arm passes.

When the labour has proceeded so far, that only the head remains to be born, we are to extract this with all the speed that circumstances will admit; for little reliance is to be placed on the uterine efforts, solely, to effect the expulsion of the head; and, if it remains long in the pelvis after the body is born, the compression upon the funis will be so great, as speedily to cause the child's death. The extraction of the head will sometimes be more conveniently made, if the woman be turned upon her back, and if the operator stand while using his efforts.

It is desirable that this attempt be made during a natural pain, and that the operator cease from his attempt as soon as the pain goes off; but, if the case be urgent, the extraction must be made without waiting for the natural pains.

One foot may present in the same variety of directions as both feet. Where one foot presents naturally, if the pains be regular and strong, the case is attended with less pain to the mother and less danger to the child, than where under similar circumstances both feet present. It is less painful to the mother, because the child is formed into the shape of a cone, and the apex passes first through the pelvis, by which the parts are gradually prepared, and not suddenly forced open; and, it is less dangerous for the child, because, the one leg being folded along the belly and breast, the umbilical cord is protected from compression. From these circumstances a very erroneous inference has been deduced by some celebrated authors; viz. that in cases where it is necessary to perform the operation styled turning, one foot should be brought down in preference to both. But, as on such occasions the operator cannot be assisted by pains, it is obvious that he could not have a sufficient hold of the child by a single foot. With the exceptions just stated, the phenomena where one foot presents are the same with those which occur in cases where both feet are in the passage.

When the *knees* present, all the inconveniences of footling cases take place, with this additional danger to the child, that, if the legs be crossed, one or both may be fractured before the knees be expelled. The management of knee-presentations must depend on the advance which these parts have made at the time assistance is procured. If they be still at the brim of the pelvis, the feet should be hooked down; but, if they be fairly within the cavity of the pelvis, or in the vagina, they must be allowed to protrude without the parts until the feet be expelled.

Breech-cases occur more frequently than footling ones. It has been calculated that they happen once in 52 cases of labour.

The breech may present in the same variety of positions as the feet; viz. with the belly of the child to the back, to the belly, or to the side, of the mother. Certain advantages and disadvantages attend each of those positions.

When the belly is to the back of the mother, the thigh bones, being straight, pass with difficulty along the curved line of the sacrum; after that obstacle is surmounted, the largest part of the child is applied to the smallest diameter at the brim of the pelvis; and, after the body is delivered, the head is situated in such a direction that it cannot enter the brim; for the sinciput is opposite to the promontory of the sacrum, and the occiput to the symphysis pubis.

If the belly of the child be to the belly of the mother, then the thigh-bones pass very readily along the bones of the pubes, while the spine, bending, accommodates itself admirably to the hollow of the sacrum, consequently at first the labour proceeds speedily and safely; but, after the breech has passed through the cavity of the pelvis, it is applied with its largest diameter to the shortest diameter

at the outlet, and after it has at last overcome the resistance occasioned by that circumstance, and the body is expelled, the face, being towards the symphysis pubis, subjects the patient to all the pain, and the child to all the dangers, already enumerated.

When the belly of the child is placed towards the side of the mother in breech-cases, then the same advantages attend the situation which have been enumerated under the first footling-case; for the largest part of the child is uniformly applied to the largest aperture of the pelvis. Besides this, the child incurs less hazard in this position than where the feet originally present; for the legs being folded on the belly protect the funis umbilicalis from compression.

Breech-cases, where the pains are powerful, are to be left entirely to nature, taking care to support the perinæum till the infant be expelled. It is then highly important that the navel-string be immediately taken off the stretch, and the child accommodated to the passage on the same principle as footling-cases.

Labours of this kind were formerly very much dreaded, as it was supposed that there was not room for the child in this doubled position to pass through the pelvis. Hence some of the older accoucheurs attempted to turn the child, and bring the head to present; others, among the rest Celsus, recommend to bring down the feet. Dr. John Burton, of York, the cotemporary and rival of Smellie says, "When the buttocks come foremost, the more it is suffered to advance, the more dangerous and difficult will be the labour: therefore as soon as the operator perceives, by the softness and fleshy of the parts, what part presents, he must immediately thrust up against the buttocks with all his strength, but without committing violence to the child's os coccygis, or its parts of generation, which are often in this case swelled; and, as he thrusts up, he must endeavour to turn the child with its belly towards the os uteri, and then search for the feet."

Smellie was too fond of this pushing up; indeed it was the doctrine of the day; and Dr. Hunter, in the early part of his practice, used to follow the same plan, in breech-presentations; but, from a conviction of its impropriety, he afterwards discontinued it. "When I first began practice (says he), I followed the old doctrines in breech-presentation, although I did not like them, but yet dared not broach new ones, till I got myself a little settled in life: at this time I lost the child in almost all the breech-cases, but, since I have left these cases to nature, I always succeed." Hunter's Lectures, MS. 1768.

2. PRESENTATIONS of the UPPER EXTREMITIES.

The most natural position of the child, at the beginning of labour, is, as we have already seen, with the head placed at the brim of the pelvis, the face towards the sacro-iliac synchondrosis of one side, and the occiput towards the groin of the opposite side. But there are many deviations from this natural position.

Although the head be applied to the brim of the pelvis, it may be forced with the sinciput towards the promontory of the sacrum, and the occiput towards the symphysis pubis. In this situation the largest diameter of the head is opposed to the smallest of the pelvis; consequently the head remains firmly fixed in that position; for, as the sinciput cannot advance a point beyond the promontory of the sacrum, the occiput is forced just so much below the brim at the pubis as to wedge the head firmly between the sacrum and pubis. By the long-continued pressure the soft parts become much swelled, and at last the head is found so immoveably fixed, that it can neither be made to recede, nor can it advance in the same direction. This constitutes what has been styled the *caput incuneatum*, or, as it is called by French practitioners, *la tête enclavée*. This case most commonly is the effect of mismanagement; for, if a very little pres-

sure be made on the head when it presents at the brim of the pelvis in this unfavourable position, the pains will readily force it into the passage in the proper direction. When the *locked head* has actually taken place, the practice must be varied according to the circumstances of the individual case; hence the long forceps, and sometimes even the crotchet, are required.

The long diameter of the head may also be applied to the short diameter at the brim, in a different manner, viz. with the face towards the pubis, and the occiput to the base of the sacrum. The obstacles to the progress of the head are not in this case so great as in the former; for, as the occiput is round, and its surface inconspicuous, while at the same time the promontory of the sacrum is round, the labour-throes, after some time, force the occiput either a little to one side, or at least past the promontory. The case, however, is tedious, painful, and even dangerous to the patient; for, as the face presents a larger surface to the pubis than the occiput, it must require longer time to pass; and, as there are many inequalities on the face, the patient must suffer much pain from their pressure, and from the same circumstance must incur the hazard of having the urinary bladder or the urethra irreparably injured. Although in this case the natural efforts most ordinarily complete the process, yet in many instances the injury which threatens the urinary bladder renders the application of the forceps expedient.

Although the head may have entered the pelvis in the most natural position, yet it may not make those changes in situation which are required to accommodate it to the outlet; for the face may turn under the symphysis pubis instead of into the hollow of the sacrum. When this happens, the phenomena already described in the preceding paragraph take place.

It sometimes happens, that instead of the smooth part of the cranium being forced first into the pelvis, the *face* presents. In this case it may be situated in three positions, viz. with the chin to the sacrum, or to the pubis, or to the side.

The first case is esteemed the most dangerous both for the mother and child. For the mother, because the child in this position requires more room than the pelvis affords, consequently the soft parts in contact with the chin and smooth part of the cranium are much compressed; and hence, if the delivery be not speedily accomplished, much injury to those parts will ensue. As the chin too must pass along a curve line formed by the sacrum and coccyx, the obstacles to delivery are very great; and, even after the face has been forced so low as to press on the perinaeum, that part is in much hazard of being torn by the violent distension which it undergoes. The delivery in such cases is very rarely accomplished naturally; and Dr. Conquest recommends the employment of the lever, which is to be fixed over the occiput, and during each paroxysm of pain by drawing down the back part of the head, and at the same time elevating the forehead, so as to cause a closer approximation of the chin to the chest, the termination of the case may be materially accelerated.

The second case, viz. where the chin is placed towards the pubis and the sinciput to the sacrum, is neither so dangerous for the mother nor child. For, if by the force of the pains the face be pushed so far forward that the chin becomes engaged within the arch of the pubis, then the inferior edge of the symphysis pubis forms a fulcrum on which the inferior jaw moves, by which the sinciput and occiput pass readily and easily along the hollow of the sacrum, their surface being well adapted to that of the sacrum, and the several parts of the face pass in succession through the vulva. But, should the uterine energy not be adequate to the completion of the labour, assistance is to be given; either first, if the resistance be trifling, by disengaging the forehead and chin, so as to convert it into a vertex-case, by steadily pressing the

face upwards and sideways, with a semi-rotatory motion during pain, so that the occipito-vertex shall be placed against the sacro-iliac symphysis; or, secondly, if the case be discovered early, the lever may be most advantageously used as a hook fixed on the occiput, which it is to depress, whilst the face is gently raised by the fingers. This method of managing such cases refers exclusively to them when discovered early, and when the resistance is inconsiderable: but lastly, if the face be low down, and firmly wedged in the pelvis, then the process adopted by nature must be imitated, and with the lever fixed over the side of the face, the chin must be made first to emerge; or the forceps may be applied as in a vertex case, only that the blades, running in a line from the face to the occipito-vertex, will have their extremities at the occipito-vertex, and the locking part at the face.

The third case, viz. where the chin is to one side, is still more favourable than the second; for the face passes readily through the oblique diameter of the pelvis till stopped by the tuberosities of the ischia, when the chin turns into the arch of the pubis, and then the same phenomena which occur in the second case take place.

On some rare occasions the side of the head presents, so that one *ear* is in the centre of the pelvis. In such a case, the strongest contractions of the uterus cannot make the head enter the pelvis, and the woman would generally die undelivered were it not for the interference of art. Cases of this kind are remarkably rare. The hand of the operator must be carried up in such cases, and moderate pressure must be made in such a direction as shall allow the contractions of the uterus to push the smooth part of the cranium into the cavity of the pelvis. If such presentations be discovered early, we may so employ the lever as very materially to improve the relative situation of parts. This instrument is to be carried over the vertex laterally; and, whilst traction is employed during every parturient exertion, the base of the cranium is to be raised by two fingers.

Sometimes the *hand or arm descends with the head* into the pelvis.—Independent of the awkwardness of position which the head may assume, from the circumstance of the hand or arm descending with it, there will be so much increase in the bulk of the part, as to render its passage slow and difficult. Yet, if the case be not interrupted by mismanagement, it will terminate favourably; for this complication of presentation seldom happens but in a wide pelvis.

There will be some difference in the difficulty of the labour, according to the manner in which the superior extremity enters the pelvis. If it be only the fingers or hand coming down in a flattened shape by the side of the head, the difficulty will not be very great. If the elbow be the part, with the fore-arm bent back upon the humerus, the difficulty will be increased. And it will be still more perplexing, if the hand and arm have descended before the head; the head resting upon the arm at the bend of the elbow. Occasionally it will be practicable, by means of the operator's fingers, to prevent the hand or arm from descending below the brim of the pelvis, till the head has sunk so low as to be clear of the impediment; but, in attempting this, care must be taken not to make the case more embarrassing by drawing the arm down lower, or forcing the head above the brim; for this might convert the case into a truly preternatural labour, and render the turning of the child necessary. The arm of the child is often very much bruised and tumefied in consequence of this position; and it is sometimes difficult to persuade the attendants that it is not fractured or dislocated. However, it seldom fails to recover itself in a few days.

There are no presentations more dangerous, nor more difficult to manage, than those of the superior extremities; for, whether the part presenting be the hand, the elbow, the shoulder, or both hands, it is clearly impossible that a full grown foetus should pass through the pelvis, unless this position be altered.

It was the practice of the ancients to endeavour to push back the arm, and bring the head into the pelvis; but this method could seldom succeed, and it was, after a time, laid aside, principally upon the authority of Ambrose Paré, who directed that the feet should be sought for, and brought down, in all preternatural presentations. It seems now generally agreed, that the preferable mode is to turn and deliver footling; for though it is sometimes practicable to return the arm, and bring the head to present, yet the chance of success in this way is very trifling. The established practice, then, is for the operator to pass his hand into the uterus to take hold of the feet, and bring them without the os externum; thus converting the presentation of the arm into a presentation of the feet.

Under this head we may also include those preternatural and very rare presentations called by Merriman *Dystocia transversa*, transverse or cross presentations; as of the neck, breast, back, belly, or side: for it is quite obvious that a full-grown child cannot possibly be expelled through the natural passages in such positions as these; and consequently, unless nature perform the operation of spontaneous evolution, first described by Dr. Denman, both mother and child must be destroyed; for the unavailing contractions of the uterus will first operate in impeding the circulation of the child; and then, by pushing forward its body with great force on the soft parts of the mother, will induce such a degree of pain and inflammation, that the must at last sink exhausted.

The practice of *turning*, as it is called, that is, of bringing down the feet in cases belonging to this division of preternatural labours, originally suggested by Pierre Franco, but first properly established by Ambrose Paré, has been the means of saving many valuable lives. Indeed the superiority of this practice to that of making the head present under such circumstances must be very obvious; for, after the operator has got hold of the infant's feet, he can complete the delivery without requiring the assistance of pains.

The dangers to be dreaded in performing the operation of turning are—rupture of the uterus, or subsequent inflammation of the passages, and loss of the child. When it is added, that a perseverance for several hours is sometimes necessary for accomplishing this operation, it must be obvious, that it demands in many instances a greater degree of patience, as well as dexterity, on the part of the operator, than most cases of surgery. We shall therefore offer a few observations on the method of proceeding in four different cases, which will be sufficient to enable the young practitioner to regulate his method of management in all others.

1. If it should be ascertained, before the membranes are ruptured, and the waters discharged, that the arm is the presenting part, it will be right not to introduce the hand till the os uteri is sufficiently dilated to allow the hand to pass with tolerable ease into the uterus; for, till the membranes are ruptured, no danger exists, and the dilatation of the parts is more easily and conveniently effected by the bag of waters than by any other means. But, though it may not be expedient for the operator to proceed to the introduction of his hand till the os uteri is favourably dilated, yet he must on no account quit his patient; for he may be obliged to proceed to artificial dilatation, without delay, should the membranes suddenly give way. As soon as the os uteri is sufficiently dilated, (and the more complete the dilatation of this part, the more safe will be the delivery,) the operator must dilate the external parts artificially, till they oppose no further resistance to the introduction of his hand. Then, slowly carrying his hand through the vagina to the os uteri, he must gently insinuate it through this part, in the absence of a pain. If he should find the os uteri less relaxed than he expected, or than is necessary, he must proceed to use artificial dilatation here too, very slowly effecting this, and intermitting his endeavours,

from time to time, as he shall judge prudent. Having obtained room to pass his hand through the os uteri, he must rupture the membranes by pressing a finger firmly against them; when his hand will immediately come in contact with the body or limbs of the child. He is then to pass his hand forwards till he reaches the feet, which he should be careful to draw down along the belly, not over the back of the child; and, proceeding slowly, he will find, that, as the feet are brought lower, the presenting arm will be retracted; and, when the nates are brought to occupy the hollow of the sacrum, the arm will be drawn nearly or completely within the uterus. The case now becomes precisely similar to a feet-presentation, and is to be managed accordingly. This is the easiest and safest case of turning; for the uterus is kept distended all the time by the liquor amnii, which, after the membranes are ruptured, is prevented from passing off by the operator's arm plugging up the vagina and os externum. So that the efforts of the accoucheur to turn are not impeded by the contraction of the uterus upon the body of the child.

2. Sometimes it will be found that the arm is lying in the vagina, or without the os externum, the liquor amnii having been some time discharged, the os uteri nearly or quite dilated, and the patient either quite free from pains, or having pains seldom occurring. Here is another case in which it is advisable to proceed, without delay, to deliver by turning the child: but the turning will not be so easily effected in this as in the former case, because the uterus will be in a state of contraction on the body of the child. There will therefore be greater difficulty in passing up the hand to reach the feet. Still, if there be only the passive contraction of the uterus, the delivery may be effected without much trouble. By *passive contraction* is understood that contraction of the uterus which always takes place in consequence of the discharge of the waters, and which may be considered "as the exercise of that inherent disposition, by which efforts are made by the uterus to recover its primitive size and situation, when any cause of distension is removed:" this passive contraction admits of different degrees of intensity. By *active contraction*, is meant the occurrence of strong muscular action, whether regular, as in labour-pains, or irregular, as in spasm. For a further elucidation of this, see Denman's Introduction to Midwifery, 4to. p. 440.

The hand is to be passed cautiously as before. It must be insinuated, in the most gentle manner, through the os uteri, and slowly conducted over the surface of the child, till it reaches the feet. Should uterine action be excited during the time that the hand is in the uterus, it must be kept in a flattened form close upon the body of the child; or may be a little withdrawn while the pain continues; and, when the pain has subsided, the hand may again be cautiously carried forwards. It is generally more difficult in this than in the former case, to lay hold of *both* the feet; we must sometimes, therefore, be content with *one* only; but the turning is always much more safely and easily accomplished when we can command both feet than when we have only been able to reach one.

3. It may happen, that a superior extremity presents, the liquor amnii is evacuated, and the os uteri but little dilated, perhaps very firm and rigid. In this case, a cautious attempt may, if the attendant thinks fit, be made to produce artificial dilatation; but it will probably be found necessary to wait with patience till the parts become more relaxed or dilated: for, as there would of course be great resistance to the introduction of the hand, it is probable that the attempt to force it into the uterus would excite inordinate or spasmodic action; and a laceration of the uterus, or other serious mischief, might ensue. By allowing time, however, the rigidity would diminish, the parts would dilate, slowly and untowardly indeed for want of the mechanical, or wedge-like,

like, action of the bag of waters; yet at length there would be so much of softness and dilatability, as to authorize the practitioner to proceed to the operation, which must be slowly and cautiously performed, as before described.

4. Suppose the waters to have been early evacuated, the os uteri to be more or less dilated, the pains recurring often, and inordinately strong and forcing. To attempt the turning under such circumstances, would probably be unavailing, and might be attended with great hazard to the mother. Here then nothing remains but to watch the patient attentively; and either to wait till the uterus, having exhausted its strength in its fruitless endeavours to expel the child, becomes torpid, and incapable of further exertion; or to lessen the vigour of the system by bleeding, or other depleting means, or to diminish the uterine action by a large dose of laudanum. This is the method recommended by Dr. Hamilton of Edinburgh, who speaks of it as attended with the most obvious good effects. The dose that he gives is eighty drops. In patients of a plethoric habit it will be frequently expedient to take away from fourteen to sixteen or twenty ounces of blood, before exhibiting the opium. M. Capuron recommends the warm-bath in such cases; but it has not been extensively tried in this country. It seems well deserving of a trial. When, from either of these plans, the action of the uterus becomes suspended, the earliest opportunity is to be taken of proceeding to deliver.

Some practitioners object to delay in either of these last cases, upon the following grounds.

First. They say, that, where the child is thus placed and there are strong pains, much danger is incurred of a ruptured uterus; for that this accident frequently happens in such cases, from the head or one of the limbs of the child forming a protuberance, against which the uterus is so forcibly pressed, that at length its fibres give way, and a laceration ensues. Now it is contended, that the danger of this occurrence can be prevented by one method only, viz. changing the posture of the child, which must therefore be effected at all hazards. That the danger of a rupture of the uterus under such circumstances is very great, we shall not attempt to deny; but how will it be diminished by the means proposed? Will there be less hazard in the efforts of the operator, to push forward his hand, in opposition to the powerful resistance of the uterus? Nay, is not the attempt to introduce the hand likely to excite the uterus to still more inordinate action, and consequently to increase rather than to diminish the danger? An appeal to facts will prove, that rupture of the uterus has occurred, at least as often, from the violent and persevering attempts of the operator, as from the untoward position of the child.

Secondly. It is argued, that, if the uterus be not ruptured by its own powerful action, yet that the labour-pains will, by degrees, force the arm, shoulder, breast, and perhaps the head, of the child, so firmly into the pelvis, as to render it impossible to pass the hand into the uterus after the pains become suspended. Dr. Hamilton, in his "Select Cases," gives an instance of this, and has subjoined some very judicious remarks upon the subject. But since, in the practice of midwifery, as in other branches of the art of healing, we have sometimes only a choice of difficulties, much must of necessity be left to the discretion and judgment of the practitioner, in each individual case that he attends. We are not disposed to think lightly of the hazard that attends having the fœtus, thus preternaturally presenting, wedged into the pelvis; yet we are strongly inclined to believe, that there is less danger in this, than in forcing the hand into the rigid unyielding uterus, in a state of active contraction and irritability. "Upon the whole, therefore, (says Dr. Meriman,) I am of opinion, that there is a greater probability of doing good by delay, and by using such means as are likely to control the excessive action of the uterus,

than in persisting to introduce the hand, when the uterus opposes a resistance so obstinate and impetuous. But, as soon as this excessive action is subdued, the turning should be cautiously undertaken." The doctor has added, in the Appendix to his "Synopsis," two cases to show the effect of patience and laudanum: in one of which, owing to an over-dose, the uterine action was so completely suspended, that it could not afterwards be excited so as to expel the placenta, and the patient died; in the other case, the treatment had the happiest issue, though under the most untoward circumstances.

A curious phenomenon, first accurately noticed by Dr. Denman, and since by other authors, may perhaps, under some circumstances, be admitted as a farther justification of delay. It has occasionally happened, in these presentations, that the labour-pains have had the effect of forcing the nates or feet so low into the pelvis, that they have been precipitated through the os externum, and thus the turning of the child has been produced without the interference of the operator. In one or two such cases, the children have even been born alive. This Dr. Denman calls "the spontaneous evolution" of the child. Dr. Douglas, of Dublin, has published a very interesting pamphlet on this curious subject, the process of which he explains most satisfactorily and clearly; and he is rather sanguine in his belief, that the spontaneous evolution would more frequently take place, if it were more frequently trusted to by the obstetric attendant. The recurrence of the spontaneous evolution has however been comparatively so rare, that no man would be justifiable in implicitly relying upon it. The knowledge that it has sometimes happened, may indeed, under some circumstances of extreme resistance to the passage of the hand into the uterus, reconcile us to delay, as above recommended; but we should never allow it to operate upon our minds, so as to induce us to neglect the proper means and proper time of turning, when we have it in our power.

Dr. Denman, although, in the later editions of his valuable work, he lays less stress upon this point, yet his observations on the management of preternatural labour of the second order, are evidently influenced by his former opinion. He says, "The knowledge of this fact, however, unquestionably proved, does not free us from the necessity and propriety of turning children presenting with the superior extremities, in every case in which that operation can be performed with safety to the mother, or give us a better chance of saving the child. Under such circumstances, the instructions given by former writers, and the observations we have before made, must still be considered as proper to guide our conduct. But, when we are called to a patient with a preternatural labour, in which there is no room to hope for the preservation of the child, or in which we are assured of its death, or when the operation of turning cannot be performed without violence, and some danger to the mother, then the knowledge of this *probability of a spontaneous evolution* will set our minds at ease, and disengage us from the consideration of making any hasty attempts to perform a hazardous operation, from which no possible good can be derived, except that of extracting a dead child, and which at all events might be effected by a method much more safe to the mother." Introduction to Midwifery, vol. ii. p. 249.

We have not attempted to lay down any rules for the position of the patient, while the operator is endeavouring to turn the child; because that position, which gives him the most free use of his hand and arm, is to be preferred; and under some circumstances one position, under others a different position, will be found most convenient.

In all cases of turning, it will be found necessary for the operator to make the entire arm bare, because the feet will seldom be within the grasp of the operator's hand till his elbow is even with, or has passed through, the os externum. The hand and arm should be well smeared over with lard or pomatum, or other greasy substance, before

before the attempt to introduce them, as this considerably facilitates the passage. The late Dr. Thynne recommended to rub the arm with soap and water, so as to form a strong lather upon it; this answers very well. Some have recommended decoctions of marshmallow-roots or linseed, some the white of eggs, and others have proposed to inject warm oil into the uterus, preparatory to turning.

Presentations of the back, belly, or sides.—Each of these presentations is stated in the report from the Maison d'Accouchemens to have occurred once in 5833 labours. Madame Boivin, in her *Memorial de l'Art des Accouchemens*, has given delineations of these positions; but admits, that, in 20,517 cases, delivered at the Hospice de la Maternité at Paris, no instance of such presentation occurred at the full term of gestation. Dr. Bland takes no notice, in his "Calculations of Accidents in consequence of Parturition," of these presentations. Dr. Denman says, "I do not mention the marks by which the back, belly, or sides, might be distinguished, because these, properly speaking, never constitute the presenting part; that is, though they may sometimes be felt, they never advance foremost into the pelvis, in the commencement, at least, of a labour." Dr. Hunter says, "I have read much in authors where the navel is said to present, or, on the contrary, where, on introducing the finger, you feel the middle of the spine: I do not believe there is the possibility of such a thing in nature: the shape of the uterus, pelvis, &c. all deny it." MS. Lectures 1765.

In the very extensive practice of the late Dr. Merriman, and in that of his nephew, amounting together to nearly 20,000 labours, no instance has occurred of either of these presentations, except in one or two cases, where the mother had not completed her seventh month of utero-gestation, and in these the children passed doubled through the pelvis.

A case of a back-presentation is given by Dr. Merriman, Appendix N^o 18. The mode of proceeding is not at all clearly explained. The operator says, "As the pains were not strong, even at an early period of the labour, by introducing the finger, I could distinctly feel the spinous processes of the vertebræ of the child, passing in a direction towards the left ilium of the mother. As the os uteri was by no means in a fit state for the introduction of the hand, I determined to wait; the pains, however, did not increase but in a very slight degree. After waiting from eleven in the morning till about two the next morning, finding the os uteri in a more relaxed state, I determined to deliver her, which was done without much difficulty;" he does not say how. "The child was born alive and of the full size; the mother is doing well." He very justly concludes, "I do not know that much practical information can be obtained from this case." We may therefore just observe, that, should such an unusual presentation occur, it is very probable that in the course of the labour the position would be changed to one more favourable. If no alteration took place spontaneously, the introduction of the hand would be necessary, as soon as the parts were sufficiently dilated, to bring down the feet, and to deliver before the strength of the patient was too much exhausted; and this we suppose was the course pursued in the case we have mentioned.

Smellie, Leake, and some others, speak of having attended in presentations of the *umbilicus*; but, if it ever occurs, it is extremely rare.

Presentation of the *funis umbilicalis* does, however, often occur. This kind of presentation appears to have been much misunderstood formerly. It was supposed, when the funis came through the os uteri into the vagina, or without the os externum, that the child lay across the pelvis, the belly being over the os uteri; and this is the representation of the position given in Smellie's plates; nor is the opinion yet abandoned: M. Maygrier supposes, that the prolapsion of the funis always indicates

VOL. XVIII. No. 1274.

the presentation of the abdomen: "Un signe qui ne laisse aucun doute sur la présentation du ventre, c'est la présence du cordon ombilical." *Methode pour manœuvrer les Accouchemens*, 1804. This, however, is seldom or never the case. When the funis presents, there will be found beyond it, either the head, the nates, or one of the extremities.

The difficulty in this case is not on account of danger to the mother, but because there is a great probability of losing the child. Attention must be given to the pulsation in the funis. If no pulsation is to be felt, the child is already dead; and the case is to be managed precisely as if the navel-string were not prolapsed.

Should there however be a pulsation, we are assured that the child is yet alive; and it becomes us to consider, in what way we can best proceed, so as to preserve its life. Three expedients for this purpose have been recommended. First, To let the labour advance, till the head of the child is within reach of the forceps, and then to hasten the delivery by means of this instrument. Secondly, To remove the navel-string out of the way of compression. Thirdly, To hasten delivery, by turning the child and bringing it by the feet.

The first method probably possesses but little advantage, beyond what may be gained by trusting the case entirely to nature. In some instances, where the mother has had children before, where the pelvis is very wide, the fœtus small, and the pains strong and quick, the child has passed alive without extraordinary assistance. But the probability of this being effected is so remote, that it would be wrong to trust to it, did any other means of affording assistance present themselves. Should it, however be found impossible to remove the funis out of the way of compression, or should the child's head have sunk too low into the cavity of the pelvis, or should any other circumstance be present, so as to render it hazardous to attempt turning, the application of the forceps might be admissible, as the only remaining resource. See Merriman, p. 242.

The second method would be the most eligible, could it always be put in practice; but the means of effecting a reduction of the prolapsed funis are not very easy. It has been proposed, to carry it upon the points of the fingers, or upon a forked piece of cane or whalebone, through the os uteri, and above the head of the child, so as to prevent the funis being pressed upon, as the head descends through the pelvis. But this expedient has been often found to fail; for, upon withdrawing the fingers, or the forked stick, the funis usually sinks again into the vagina. Dr. Mackenzie once succeeded, by drawing without the os externum as much of the prolapsed funis as he could bring down, and inclosing the whole in a small bag, which was slightly tied at the neck. This he passed into the uterus beyond the child's head, where it was retained, and the child was born alive. This method seems deserving of farther trials; but Dr. Mackenzie never succeeded in it but once. The late Sir Richard Croft has related two cases, in which he succeeded, by carrying the prolapsed funis through the os uteri, and suspending it over one of the legs of the child. In both these cases the children were born alive. Mr. Hogben and Mr. Hopkins recommend sponge to be introduced, so as to keep the funis from sinking below the head, after it has been carried, as far as possible, above the brim of the pelvis, either by the fingers, or any other contrivance.

The third method proposed, viz. the hastening of the delivery by turning the child *in utero*, and bringing it by the feet, can only be resorted to under certain favourable circumstances. It is to be recollected, that no possible advantage can accrue to the mother by turning the child; it is the benefit of the child alone that we have in view. In case then of a want of pulsation in the navel-string, which is a certain indication of the child's death, turning ought on no account to be attempted. Or,

8 N

should

should there be any circumstances in the case, rendering it very improbable that the child could be preserved, even if it were turned, it would be injudicious practice to attempt the operation. For, as turning the child *in utero* is an operation always more or less hazardous to the mother, it is not justifiable to put her to this hazard, unless there be a well-grounded expectation of saving the child.

What has been said hitherto, applies chiefly to the presentation of the *funis* along with the head: when it presents together with any other part, the accoucheur will be guided in his practice by the peculiarities of the case. If the arm and *funis* should present together, turning must of course be had recourse to; for this operation will then become necessary, not because the *funis* presents, but because the arm has sunk into the vagina.

3. MONSTROSITY of the FÆTUS.

It has been seen, at p. 676, that monstrosity does not necessarily take the case out of the class of Natural Labours. Most frequently, however, it does. In the following most extraordinary case, the sufferings of the mother were so great, that she survived the birth only two days. But we have no particulars of the nature of the pregnancy, nor whether the birth was premature, nor in what manner the delivery was effected; so that perhaps what we shall relate may rather be considered as a supplement to our account of MONSTERS, vol. xv. than as strictly appertaining to the present article. The account was transmitted by Mr. John Livingstone, surgeon to the British factory, China.

"A-ke was born sixteen years ago, in the district of Yun-lang-yuen, with another male child of nearly the same size united to the pit of his stomach by the neck, as if his brother had plunged its head into his breast;" presenting an appearance, as we should suppose, something like fig. 9. on the engraving which accompanies the article referred to. "The skin of the principal here joins that of the upper part of the neck of the parasite, quite regularly and smoothly, excepting the superficial blood-vessels, which appear somewhat turgid. A careful admeasurement of the parasite was made: the trunk and neck measured about eleven inches, and the longest limb thirteen inches, making the extreme length two feet; but, as the modellers in China do not work by any scale, it would be useless to deduce any *exact* measurement of the whole figure by knowing a part.

"Since that time the parasite has not much increased in size, and at present is not much larger than new-born infants usually are; but the bones are completely formed. The shoulder-bones are remarkably prominent. But all this plumpness has disappeared from the original, whose bones seem only to be covered with skin. The attachment of the neck of the parasite to the chest of the principal, admits of a semi-rotatory motion. The natural position of the bellies is towards each other; but A-ke can turn his brother so far round, that he can bring either side towards his own belly. He also shows that his brother's arms can be moved freely. The thighs and legs remain stiffly bent; the thigh being ankylosed with the ossa innominata above, and the tibiæ below. In sciagraphia, genitalia nimis perfecta apparent; quoniam in archetypo, testium vestigium nullum, scrotique exiguum tantum, videndum sit. At penis proportionaliter crassus est; et præputium glandem semivelat. Tentigo interdum observatur; quo tempore fluidum viscidum ex urethra stillat, quapropter Sinenses semen copiose secerni credunt. Renes officia rite perficiunt; anus deest.

"A-ke is now about four feet ten inches high, of a feeble frame and sickly appearance; but, excepting the incumbrance above described, he is in all respects perfectly formed. He appears to be sufficiently conversible and intelligent; and says that he has the same feeling of pain, if any part of his brother's body is hurt, as if it was the same part of his own body: even the slightest

touch, which would be perceptible if applied to his own person, is equally perceptible if applied to his brother. This statement was most satisfactorily confirmed by an ingenious medical gentleman; who, observing A-ke's attention to be fully employed, and his head turned away in a contrary direction, pinched quickly the hip of the parasite: A-ke instantly struck the same part of his own person, just as if that had been the pinched place.

"Formerly he had reason to imagine, from certain obscure motions which he perceived within his brother when he was himself in pain, that all their feelings were reciprocal; but for some time past he has not been sensible of this, nisi micturis sit. Frater ejus nunquam eodem tempore, seu urgente naturâ, seu curiositati adstantium satisfaciendi causa, urinam reddere deficit.

"A-ke's respiration is never perfectly free: on the contrary; it is commonly laborious; and, on the slightest exertion, such as walking to a little distance, ascending a flight of steps, or the like, he breathes quickly, and with difficulty. To relieve this, he supports the parasite with his hands; but, to obtain any considerable degree of ease, a recumbent posture is necessary. His pulse is commonly quick and small. Mr. Gomez felt distinctly the pulsation of the carotids in the neck of the parasite; it was feeble. He also examined carefully the pulse at the wrists; it was very slow. The usual temperature of both is natural. A-ke wears an unusual quantity of clothes, yet he never appears to perspire, even in the warmest weather. His usual gait is unsteady and feeble: when he walks up or down stairs, he supports himself with one hand, and his brother with the other, and brings both his feet upon the same step before he attempts to advance another foot.

"When in his best state of health, he informed Mr. Gomez his appetite was so good that he could take as much food as any three of his age; at present, his health in general is much impaired. He complains of weakness of stomach, loss of appetite, defective and painful digestion; so it is commonly thought that he cannot live long." London Med. Journal, Aug. 1821.

III. The third class, or order, of impediments to natural labour, consists also of various species. The chief of these are

DEFORMITIES of the PELVIS.

1. When the apertures of the pelvis are too large, the mother incurs much danger, and the child is not totally exempt from hazard.

The danger incurred by the mother arises from there being no resistance to the passage of the child, so that, when the action of the uterus begins, the child may be pushed by the force of the pains through the passage before the soft parts are dilated; hence the uterus may be ruptured, or the soft parts lacerated. If, on the other hand, the external parts be soft and yielding, a considerable portion of the uterus may be excluded without the parts. There is a very wonderful history of a case of this kind alluded to by Saxtorph in the following words: "Memorabilis adhuc exemplum est illud à cel. Wolfg. Mullnero allatum, ubi *totus uterus* una cum fœtu extra genitalia dilapsus, fœtusque vivus extra pelvim versione extractus fuit, matre post reductionem uteri superstite." Diss. de Diverso Partu; Nuremb. 1771.

The hazard which the child undergoes is that of being suddenly expelled, included within the entire ovum, so that it may be lost before proper assistance can be afforded. Another danger is, that, the membranes having given way, it may be dashed with violence upon the floor on which the patient walks. Whenever, from the great width of the hips, there is reason to suspect that the pelvis is too large, the practitioner should continue in constant attendance from the very commencement of labour, and should carefully adopt the appropriate and obvious means to prevent the hazards just enumerated.

2. But

2. But deficiency of space in the apertures of the pelvis occurs much more frequently than excess.

A general explanation of the shape and situation of the pelvis has been given under the article ANATOMY, vol. i. p. 548, 9, 561, 617, 646, 7. And thus, by a knowledge of the parts where, and the manner in which, the bones of the pelvis are connected together, we are enabled to explain many uneasy sensations which women have, and many infirmities to which they are liable, at the time of pregnancy and after their delivery. It was for many centuries a received opinion, that these bones, though joined together in such a manner as scarcely to afford any suspicion of a separation, were always separated at the time of parturition; or that there was a disposition to separate, and an actual separation, if the necessity of any particular case required that enlargement of the cavity of the pelvis which was consequent to it. The degree of separation was also supposed to be proportionate to such necessity; and if it did not take place, or not in such a degree as was required, distending instruments were contrived and used to produce or increase it; and upon the same principle the section of the symphysis of the ossa pubis, of which we shall hereafter speak, has been lately recommended. This opinion ought probably to be assigned as one reason for the superficial notice taken by the early writers in midwifery, of those difficulties which are sometimes found to occur at the time of parturition, from the smallness or deformity of the pelvis.

But this opinion has been controverted by many writers, who assert, that there was neither a separation nor a disposition to separate; but that, when either of them did happen, they were not to be esteemed as common effects attendant on the parturient state, but as diseases of the connecting parts. The disputants on each side have appealed to presumptive arguments, and to facts, proved by the examination of the bodies of those who have died in child-bed, in justification of their several opinions. But, though we are not authorized, by the experience of the present time, to say that a separation, or a disposition to separate, prevails universally at the latter part of pregnancy or at the time of labour; yet that these effects are often, if not generally, produced, may be gathered from the pain and weakness at the parts where the bones of the pelvis are joined to each other, before and after delivery. In some cases pregnant women are also sensible of a motion at the junction of the bones, especially at the symphysis of the ossa pubis, and the noise which accompanies it may be sometimes heard by an attentive by-stander. We may, however, leave the question to be completely settled by future observations. To insist either that the changes occur in every case, or that they never occur, seems an attempt to support opinions repugnant to daily experience. For no person, who has been conversant in the dissection of women who have died in child-bed, can have wanted opportunities of seeing every intermediate state of these parts; from a separation in which the surfaces of the bones were loosened, and at a considerable distance from each other, to that in which there was not the least disposition to separate. Thus it appears, that the degrees of separation at the junctions of the bones of the pelvis to each other may be very different; and that, when it takes place beyond a certain degree, it is to be considered as morbid. "Several cases of this kind, which have occurred in my own practice," says Dr. Denman, "and many for which I have been consulted, have laid me under the necessity of considering this subject with the most serious attention; and I presume that it may be produced by two causes; first, a spontaneous disposition of the connecting parts; secondly, the violence with which the head of the child may be protruded through the pelvis." Of a separation from each of these causes the doctor then gives an example, to prove the fact, and to show its consequences. These cases, however, we shall not transcribe; because we are of opinion that, if the part does yield during par-

turition, it is in a very small degree, and soon recovers itself by rest; or, if it yield more considerably, it is attended either with fatal consequences or with incurable lameness. We shall therefore proceed to consider the pelvis according to its (unyielding) dimensions.

The form of the superior aperture of the pelvis has been described by some as triangular, and by others as oval, with the widest part from one side to the other. But the inferior aperture, independent of the ligaments and soft parts, cannot be said to resemble any known or general form, on account of its irregularity, though the widest part is from the inferior edge of the symphysis to the point of the os coccygis, allowing for the regressive motion of that bone. The dimensions of the superior aperture of the pelvis, from the upper part of the sacrum to the upper edge of the symphysis, are generally stated to be rather more than four inches; and between the two sides they somewhat exceed five. Of the dimensions of the inferior aperture it is difficult to form a judgment; but, if the ligaments are preserved, it may be said that the proportions are reversed, the narrowest part being on each side. But in the form and dimensions of the pelvis, in different women, there is an endless variety, not depending upon any alteration which may be produced by disease. The depth of the pelvis, from the upper part of the sacrum to the point of the os coccygis, is about five inches; but this will be increased when the latter bone is pressed backwards. From the margin of the pelvis to the inferior part of the obtuse process of the ischia the depth is about three inches, and at the symphysis about one and a half. It appears that the depth of the pelvis, at the posterior part, is rather more than three times the depth at the anterior; and that there is a gradual change between the two extremes, if we admit the ligaments to make a part of the outline of the inferior aperture.

Of the distortion of the pelvis there are two general causes. The first is that disease incident to children in the very early part of their lives, known by the term *rachitis*, rickets, which preventing the bones from acquiring their due strength or sufficient firmness to support the weight of the superincumbent body, they bend in different directions and degrees, according to their weakness and the weight imposed upon them. The second is a disease which may occur at any period of life, and from its effect is called *osteoporosis*, or *mollities ossium*, softness of the bones. It is far less frequent than the rachitis, but more dreadful in its consequences; which no medicine hitherto tried has had sufficient efficacy to prevent or to cure. In this disease the ossific matter is not thought to be dissolved or altered, but to be re-absorbed from the bones into the constitution, and carried out of the body by some common excretories; or deposited upon some other part where it is useless or prejudicial. The bones, thus losing the principle of their stability, become soft, according to the degree and continuance of the disease; are unable to sustain the weight of the body, and change their natural forms, in proportion to their weakness; so that in some instances the most distorted and frightful appearance of the whole body hath been exhibited. The effect of either of these diseases is not indeed confined to the pelvis; yet it is scarcely possible that either of them should exist for any length of time without producing their influence upon it.

The pelvis is more commonly distorted at the superior aperture than at any other part. This is particularly occasioned by the natural projection of the upper part of the sacrum, and the lowest of the lumbar vertebrae; though, in very bad cases, a considerable deviation from their natural position is given to several of the vertebrae. Should a disease exist in the constitution which is capable of weakening the bones, it will not appear extraordinary that the sacrum should be distorted, if we recollect, that its texture is originally spongy; that it supports, both in the erect and sedentary position, a great part of the

weight of the body; and that, by the manner of its junction with the last of the vertebrae, a considerable angle is made, which, if but little increased, will cause a very important change in the form and dimensions of the superior aperture of the pelvis. In some cases an irregular convexity, and in others a concavity, are produced by the bending of the os pubis in different ways and degrees; by which, together with the projection of the sacrum and lumbar vertebrae, the dimensions of the superior aperture of the pelvis, which in the narrowest part should exceed four inches, are reduced to less than one, and altered in every possible direction.

Various means have been recommended for accurately measuring the dimensions of the pelvis; and the ingenuity of foreign accoucheurs has produced a number of different instruments, called *pelvimeters*, which are supposed to ascertain this point with great precision. But there is, probably, more of inaccuracy in this mode of admeasurement on the living body, than at first sight may appear; and certainly the inferences drawn from such admeasurements, and the modes of practice in consequence recommended, have sometimes been grossly unscientific. In England we are more in the habit of examining the size of the pelvis by our fingers than by pelvimeters; and Dr. Conquest says, that "all pelvimeters but the fingers are ridiculous and useless;" but, upon a point of so much consequence, we should do well to take every possible means of ascertaining with precision the real dimensions, and might therefore advantageously call to our aid the occasional use of the *pelvimeter*.

Dr. Osborn, who took great pains in investigating the best method of procedure in cases of distorted pelvis, considers, that a foetus at full maturity cannot pass alive, if the dimensions of the pelvis, from the pubes to the projection of the sacrum, be only $2\frac{3}{4}$ inches; and Dr. Clarke of Dublin says, that $3\frac{1}{4}$ inches from the pubes to the sacrum is the least diameter through which he has known a full grown foetus to pass entire; but, as it has been ascertained by Dr. Hamilton, that children have been born living, though the pelvis in this diameter was "manifestly under three inches," it is necessary, that practitioners of midwifery should be very much upon their guard against being deceived in their estimate of the actual dimensions.

When, however, the distortion is so very considerable, as must satisfy us, upon the first examination, of the impossibility of effecting the birth, alive, in the usual way, we are then reduced to the dreadful alternative, of either killing the child, and bringing it away piecemeal, to save the mother, by the operation called *embryotomy*; or *embryulcia*; or of (most probably) killing the mother to save the child, by that most shocking of all operations, the *Cæsarian section*.

For women who are known to have a narrow or deformed pelvis, or who have previously suffered the operation of *embryotomy*, three modes have been proposed for avoiding the dangers we have mentioned.

1. *Abstinence*.—This measure was recommended by Mr. James Lucas, surgeon to the infirmary at Leeds, in a paper published in the second volume of the *Memoirs of the Medical Society of London*; and he has related several instances, by which he attempts to show, that abstemious diet, with occasional blood-letting, and a moderate use of aperients, has tended to restrain the growth of the foetus, and to render the bones of the head more yielding. There can be no doubt, where well-formed women are accustomed to have difficult labours, from the large size of the child, that this method may be occasionally useful; and in a few cases of deformed pelvis, where the deformity is not very great, some good might result from it. But the expected benefits seem to be confined within very narrow limits, and therefore this plan can only be occasionally useful.

Signor Aspalini relates a case, (1811.) in which abstinence was usefully enjoined; but remarks that no great

reliance is to be placed upon it; for women who constantly reject by vomiting every particle of food they swallow, have, notwithstanding, on many occasions large children; and Dr. Merriman has, in his Appendix, given three cases, from which it may be inferred, that slender diet, besides the injury it may do to the general health, is by no means to be depended upon for preventing the growth of the foetus, or for producing a child worth rearing.

2. *Premature Labour*.—The practitioners of midwifery could not fail to have observed, that on many occasions of distorted pelvis, children at seven months, when labour was accidentally excited at that period, have passed with comparative ease, and been born alive; though, when they reached the full term of utero-gestation, they fell sacrifices to the difficulty of the labour. Smellie mentions several such cases, particularly of a woman whose pelvis measured less than two inches and a half of conjugate diameter; she had been five times delivered, "and only one child was saved by being born in the eighth month, of a very small size."

When it was once ascertained, that spontaneous or accidental premature labour, was thus serviceable in preserving the lives of children in cases of distorted pelvis, it was natural to consider whether the artificial inducement of labour would not be attended with equal success; and accordingly, as we are informed by Dr. Denman, there was, in 1756, "a consultation of the most eminent men in London at that time, to consider of the moral rectitude of, and advantages which might be expected from, this practice, which met with their general approbation."

To say that no danger is incurred by the mother from such an operation, would be to assert what is contrary to fact; for no doubt can be made, that several women have lost their lives by it; but it may be truly said, that the woman, who is to undergo the operation of having the child extracted piecemeal, is always placed in at least as much, if not in more, danger. What has been the success of this practice in preserving the lives of children, cannot perhaps be exactly ascertained; but Dr. Merriam has given the particulars of 33 cases of labours prematurely induced, in the eighth month of pregnancy, on account of extreme distortion of the pelvis. In 21 of these the children were born dead; 4 were born alive, but incapable of living more than a few hours; 9 were born alive, and capable of being reared. Thus nearly one-third of the children were saved, who must have lost their lives, had the women gone to their full times, and been delivered by piecemeal: and all the women recovered, the majority of whom must have been lost, had the *Cæsarean* section been performed.

It is of the utmost consequence, in recommending this practice, that the principles, upon which alone it seems justifiable, should be duly weighed and considered. It ought not to be concealed, that it has been had recourse to, by wicked and unprincipled persons, for the atrocious and criminal purpose of procuring abortion: and sometimes has been unnecessarily adopted by the ignorant or incautious. It is therefore incumbent upon all, who wish to steer clear of either of the above imputations, so to act, that, should any judicial inquiry be instituted, they may be able to assign a just and satisfactory reason for their conduct. The possibility of such an inquiry is by no means to be treated slightly. A physician, whose motives could only be praise-worthy, was lately threatened with a prosecution, for proposing such an operation; and it is not long since an accoucheur of eminence was, on an occasion of this kind, called before a coroner's jury, to account for his conduct, which he did most satisfactorily and honourably.

As the primary object is to preserve the life of the child, the operation should never be undertaken till seven complete months of utero-gestation have elapsed: and, if the pelvis of the mother be not too much contracted

tracted to allow of it, the delay of another fortnight will give a greater chance to the child of surviving the birth. The utmost care should be taken to guard against an attack of shivering and fever, which seems to be no unusual consequence of this attempt to induce uterine action, and has often proved destructive to the child, as well as alarming with regard to the mother. The peculiar circumstances under which the operation is performed, and the habit of body of the patient, will determine the accoucheur either to adopt a strictly antiphlogistic plan, or to exhibit opiates, or antispasmodics and tonics. In order to give every possible chance for preserving the life of the child, it will be prudent to have a wet nurse in readiness, that the child may have a plentiful supply of breast-milk from the very hour of its birth.

We shall subjoin a very successful case, which was communicated by Mr. Marshall, of Half-moon-street, to the London Medical Journal for August 1814. We shall give this case at full length, with Mr. Marshall's explanatory introduction.

"Before entering upon a description of the successful termination of this case, I think it expedient to give the heads of two dreadful labours that preceded, the more satisfactorily to prove the relief obtained by adopting this mode of practice.

"Mrs. H. H. D.—was taken in labour of her first child on Tuesday morning, seven o'clock, on the 5th of May, 1809, and was not delivered until the Friday morning following, about two o'clock; the child was still-born, and at the commencement of the labour was felt to move distinctly, and with considerable vigour.

"On the 13th of September, 1810, she was taken in labour of her second child, on Saturday night at eleven o'clock, and was not delivered until the Friday after, at seven in the morning, of a still-born child, which seemed to have but very recently died. After each of these labours, she was so much weakened, that her voice was lost for ten weeks, and she was incapable of walking for nearly four months.

"On the 8th of October, 1811, I first visited this lady; and, hearing attentively her description of the former labours, I proposed to examine the pelvis, after explaining my reasons, and my suspicions of the state of the parts concerned in parturition. On examining, I found, by measuring the pelvis, a considerable contraction of the pubis at the symphysis, so as to allow only the middle finger to fill the curve; the capacity of the pelvis at the brim formed a long triangle, causing a preternatural distance from the symphysis pubis to the sacrum: this mal-formation of the pelvis immediately satisfied me of the great difficulty a full-grown fœtus must have to pass, and the total impracticability of my patient's ever completing the full period of gestation without a result similar to what she before experienced. I calculated, as near as possible, the period she had then completed; and proposed to puncture the membranes of the womb on or about the 19th of November following, which would bring the time to seven months and rather more than a fortnight, with a view to be nearer the eighth than the seventh month, to give the child a better chance of being reared, and to favour the probability of a head-presentation.

"On the 19th of November, about twelve at noon, I punctured the membranes of the womb, by means of a probe half as long again as the usual size, and stouter in proportion, conducting the point with my left hand along the middle finger of the right hand; the liquor amnii began immediately to run off, and was caught in considerable quantity in an earthen vessel before I left the room: and, upon the patient's moving, continued to come away in larger or smaller quantities until the beginning of her pains, which commenced the next day, twenty-six hours after the operation of puncturing, i. e. at two o'clock in the afternoon. The pains were very

feeble; and occurred about every half hour; but at a quarter before eight in the evening the real strong pains of labour began, and continued equally strong and frequent until the birth of the child, which took place at a quarter past eleven that night, making the short space of three hours and a half. The head presented; and, as soon as it escaped the contracted part of the pubis, it required only two or three pains to be delivered. My patient was fully able to suckle her child; and four days after delivery, to use her own words, she felt as well as if nothing had happened.

"I observed during the progressive state of labour, that a considerable quantity of a mucilaginous fluid was given off from the glands situate in the neck of the womb, which appeared to make up for the deficiency of the liquor amnii, and to facilitate the passage of the fœtus. This circumstance I have noticed in every case wherein I have performed the operation. The child is now living, and remarkably strong and healthy."

3. *The Sigaultian operation.*—Mons. Sigault, a surgeon at Paris, submitted, in the year 1768, to the Academy of Surgery, a proposal to divide the *symphysis pubis* during labour, as a mode of facilitating delivery; and in the year 1777, assisted by M. Alphonse Le Roy, he performed the operation on a woman named Souchet, who had borne four children before, but not one alive. On this occasion, however, the life of the child was preserved; but the woman was placed in a state of great danger, and the urethra and bladder were seriously injured by the operation.

Perhaps there never was a surgical operation more enthusiastically received and commended than this. The operator was immediately honoured with a pension from the French government, and a medal was struck to commemorate the invention. So eager were many accoucheurs to adopt this operation, that in a comparatively short space of time, it was performed on a great number of women. But the admirers of this new method soon discovered, that they had been too hasty in forming their opinion. Forty-four women had undergone this operation in different countries; fifteen only of the children were preserved, and thirty of the mothers; and of these, many remained infirm, or suffered from want of power to retain their urine, or other grievous complaints, during the remainder of their lives.

At length the ill success of this practice occasioned it to sink into complete disuse; and therefore we proceed to describe the operation of

EMBRYOTOMY.—When it is determined to have recourse to the operation of embryotomy, the instruments required are—the *perforator*, which, as its name implies, opens the head and breaks down its contents; and the *crotchet*, or sharp-pointed hook, to extract the cranium; or, as a substitute for the crotchet, the craniotomy forceps. Of the craniotomy forceps, as the competitor of the crotchet, Dr. Conquest speaks as follows: "The venerable lecturer on midwifery at Guy's Hospital (Dr. Haighton) has for many years been in the habit of exhibiting a pair of lithotomy-forceps, a little altered, and which he represents as a very valuable substitute for the crotchet, in some cases of difficulty in parturition, arising from the impaction of the cranium at the superior aperture of the pelvis, after the operation of cephalotomia had been performed. Fourteen years back it forcibly struck me, that these forceps, somewhat modified, possessed all the advantages of the crotchet, without having appended to them any of those flagrant defects which fully justify the exclusion of that vile and dangerous instrument from obstetric practice, in all those cases which require the application of considerable extracting force to bring down the perforated cranium. Midwifery is indebted to several continental writers for very similar suggestions; and gentlemen who have attended the lectures of Dr. Hamilton, of Edinburgh, must be familiar with Dr. Lyon's forceps, which are so strongly recommended

mended by him. But it is to Dr. D. D. Davis that the profession is laid under the deepest obligations for the very great improvement which this instrument has attained under his direction. The progressive steps by which it arrived at its present improved construction are detailed in the eighth volume of the London Medical Repository, and the instrument itself is exhibited in an engraving contained in the same volume. By comparing the craniotomy forceps there sketched with those represented in the engraving which accompanies these pages, (see fig. 5.) the mechanism of the two will be seen to be different, whilst their principle of action is the same. To the instrument exhibited in the plate preference is given merely on account of its simplicity, easy application, and adaptation at once to ordinary cases, and to such as require peculiar management."

The operation is to consist of two different processes; first, the diminution of the head; and, secondly, the extraction of the mangled child. In many cases the latter should be performed immediately after the former is accomplished; but, whenever the resistance is very considerable, an interval should be interposed between the two. The advantages resulting from this practice were first publicly noticed by Dr. Osborn, though there can be little doubt that the practice itself was the effect of necessity. By waiting after the head has been opened, the woman's strength will be restored, so that the assistance of the pains in the expulsion of the child may be obtained; the swelling of the soft parts will subside, by which the resistance may be greatly lessened, as well as the danger of inflammation removed.

In opening the head, which is to be done by means of the perforator, the two great points to be aimed at are, to avoid injuring any part of the woman, and to make a sufficiently large opening of the head. On the complete accomplishment of the latter, the eventual success of the operation must depend in all cases of extreme deficiency of space.

Should it be found expedient to delay the extraction of the infant after the head has been opened and its contents evacuated, the teguments are to be carefully brought over the ragged edges of the bones, so that, in the event of labour throes recurring, there shall be no risk of the parts within the pelvis being injured.

After the head has been sufficiently reduced in bulk, it has been usual to fix the crotchet at first on the inside of the cranium; and, while *two fingers of the left hand* are to be kept constantly so applied, that, if the instrument should slip in the process of extraction, it shall be received on the fingers, and not touch any part of the mother, the operator is to draw down with a suitable exertion of force, in such a direction that the largest part of the head shall be brought through the widest part of the pelvis.

In some cases, much time and very violent exertions are required to accomplish the delivery with the crotchet; but these inconveniences we think are likely to be obviated by the substitution of the craniotomy forceps, of which Dr. Conquest farther says, "Some such contrivance as this must, ere long, altogether supersede the crotchet with every scientific practitioner; though for some little time it (the crotchet) may be continued in use, to the manifest danger of both patient and operator. That the craniotomy forceps will soon be generally substituted for the crotchet, is inferred from the following important data. First, because with them the accoucheur may obtain so firm a purchase or hold of the foetal cranium, as will enable him to rectify any thing that may be unfavourable in the position of the head, and also to regulate the degree of power which it may be necessary to employ for its extraction; two highly important advantages, which it is evident the crotchet can never confer. Secondly, because with this instrument there is no danger of injuring the vagina, even should it slip from its hold, whilst considerable extracting power

is being employed. On the contrary, not only is the crotchet much more likely to slip, but many most deplorable instances are recorded in which it has torn the soft parts of the mother, or lacerated the fingers of the accoucheur. And, lastly, because it is essential to the security of the vagina and contiguous organs, that, whenever the crotchet is used, the precautionary measure of *keeping a hand in the passage* should always be had recourse to; a precaution extremely painful to the patient and practitioner, and one altogether needless when the craniotomy forceps are employed."

Thus armed, Dr. Conquest directs the operation to proceed as follows. When the cerebral mass is well broken down, some hours, unless circumstances imperatively forbid, may pass without any thing further being done, during which time uterine contractions will force out the contents of the cranium, so that the bulk of the head becomes materially diminished; and, the difficulty being overcome, the labour may be terminated by the unaided powers of the mother. If this should not take place, by waiting a few hours more; the tumefaction of the soft parts of the mother have time to subside, and the head will have descended more or less into the cavity of the pelvis. The craniotomy forceps are now to be passed up the vagina; and, on reaching the perforation, the handles are to be opened a little way, and the blade without teeth is to be introduced within the cranium so that the cavity of the shanks shall be opposed to the perineum. On closing the handles, the teeth transfix the bones of the head, which is to be extracted in the line of the axis of that part of the pelvis through which it is passing. It is well only to co-operate with uterine efforts; and every attempt must be made to overcome any remaining obstacle by improving the situation of the head, and by the steady employment of extracting power. The extraction of the body is to be effected as under other circumstances; and, when the child is separated from its mother, the mangled head ought to be stuffed and sewed up neatly.

Sometimes, the mere adaptation of the shoulders to the longest diameter will not much facilitate their passage; and the obstruction may be so considerable as to justify assistance with the blunt hook fixed in the axilla. In other instances, it becomes necessary cautiously to perforate and remove the contents of the thorax and abdomen before the body can be extracted.

Should extreme difficulty exist in obtaining the passage of the head through the brim of the pelvis, the bones of the summit of the cranium and of the face must be removed *separatim*, so that the base alone shall remain. The chin is then to be brought through first, by which means there will be rarely more than an inch and a half from the chin to the root of the nose to enter the pelvis. But even this space cannot always be commanded; and there are cases wherein the operation of embryotomy is absolutely impracticable, so that we seem to be absolutely driven to the Cæsarian operation, in order to have a chance of saving one life at least.

In this dreadful situation, Mr. Simmons of Manchester has proposed a revival of the Sigaultian operation, not with the hope of saving the child, but to assist the action of the crotchet or of the craniotomy forceps.

"When a case shall arise in which the child cannot be delivered by the crotchet, from the brim of the pelvis being no more than *one inch* in diameter: I propose to combine the two operations, and to *divide the symphysis pubis to make way for the crotchet*. Dr. Osborn has urged several objections against this proposal, although he admits that the operation at the symphysis is not so certainly fatal as the Cæsarian section. Weighty objections doubtless press against it; but, whilst there are no other means for preserving life, bad as the chance is, it becomes a question whether it be worth risking; and, after maturely considering the case, should an attempt for saving the life of the mother be judged expedient, as the last resource

it may be adopted. The space gained has been differently stated at from three to eight or nine lines in the diameter; the medium distance would probably be sufficient to accomplish the delivery by the crotchet.

"The objections urged against this mode of delivery, when the head is of the full size, will not apply to its reduced bulk; and it should be remembered, that the symphysis is formed of cartilage and ligament; so that whatever pressure shall be made against the divided edges, will not be made against the sharp angles of bone. That much injury may be done anteriorly will not be denied; but, does the continued pressure of the child's head never produce mischief in other cases? By the introduction of a female sound for a guide, a cautious and steady operator will avoid wounding the urethra; and, as the base of the skull will probably be turned sideways, it will suffer less in extraction than in other cases of the crotchet; in which it must in general be injured from pressure against the pubis. If the separation, however, be carried beyond a certain length, laceration will probably ensue; and, should this accident occur, I see no reason to apprehend more danger from it than follows the extraction of a large stone from the bladder through a small opening, which will induce a lacerated wound, but which we know will not uncommonly heal. The sacro-iliac ligaments would certainly not be injured by choice, but the consequences, I believe, are not generally fatal; and, should it be urged that great pain and lameness will afflict the patient for a long time after, a reply will readily occur, that life was at stake; and surely there are few who would not compound, for the prospect of temporary pain and inconvenience, to have it preserved to them.

"A spontaneous separation sometimes occurs, both there and at the pubis; and yet the patient has been again restored to health. I do not see, in other respects, in what this compound operation differs from the most difficult crotchet-case. The section of the symphysis is neither so formidable nor so fatal as the Cæsarian section; and the crotchet has been successfully applied in dimensions which will probably be thus acquired.

"Upon the whole, then, in that supposed case of distortion (which I hope will never happen) in which the mother must be doomed to death, from the impossibility of delivering the child by the crotchet, the compound operation I have recommended will furnish a resource, approved by reason and sanctioned by experience; inasmuch as the section of the symphysis pubis has been made, and the crotchet has been used, though separately, yet with safety. Such a case will be attended, unquestionably, with additional hazard; but it offers the only chance to the mother, to the preservation of whose life our chief care should be directed: and, I hope that in future all trace of the Cæsarian operation will be banished from professional books; for it can never be justifiable during the parent's life, and stands recorded only to disgrace the art."

We are aware that Mr. Simmons's reasonings have been controverted by Dr. Hull, also of Manchester, and by other persons, (see Mem. of the Med. Soc. p. 463.) and that the section of the symphysis is very generally abandoned by the profession. Indeed it never can be said to have obtained here: and Dr. Merriman says, that "the remembrance of it can now be beneficial only as it may serve to caution us against the inconsiderate and hasty adoption of modes of practice, unsupported by just reasoning, and unsanctioned by experience." Yet we have been induced to give a fuller account of this practice in our pages; firstly, on account of the reasoning of Dr. Denman, which is favourable to it; and secondly, because, though the current of professional opinion is now decidedly against it, yet the tide may turn, and this operation may in time become again the substitute for that which we must now proceed to describe. But, for a

further account of the practice in cases of extreme deformity of the pelvis, the reader is referred to Osborn's Essays; Hamilton's Letters to Osborn; Simmons's Reflections, and Hull's Detection of Simmons.

THE CÆSARIAN SECTION.—This is the name given to an operation which consists in making an incision through the parietes of the abdomen and uterus, sufficiently large to admit the introduction of the hand, and the extraction of the fœtus and placenta.

The term *cæsarian* is said to be derived from the operation "*cæso matris utero*;" and Pliny even deduces the title of *Cæsar*, given to the Roman emperors, from one of them having been brought into the world by means of it. Whether this was the case or not, it seems not improbable, from the prevalence of the opinion, that the operation had been performed prior to his time, (on the dead subject,) although no account of it is to be found in the works of Hippocrates, Celsus, Paulus Ægineta, or Albucasis, who all of them treat largely on the mode of assisting in difficult parturition. The only method recommended by these writers for extracting the fœtus when it was too large to pass entire by the natural passage, was to diminish its bulk with scalpels, or other cutting instruments, and then to draw it away with hooks or crotchets; a method, in fact, which is now followed, but with instruments more artificially constructed, and thence less likely to injure the woman, than the more rude ones contrived by the ancients.

The earliest account we find of the cæsarean section in any medical work, is in the *Chirurgia Guidonis de Cauliaci*, published about the middle of the fourteenth century; but the author only speaks of it as resorted to after the death of the woman, as was practised, he says, on the birth of Julius Cæsar. Vigo, who was born towards the end of the 15th century, in the short chapter he gives on difficult birth, takes no notice of this mode of delivery; and Paré, who greatly improved the practice of midwifery, thinks the operation only allowable on women who die undelivered. He had heard, he says, not without astonishment, of women who had been more than once subjected to the cæsarean section, it not being practicable to deliver them by any other means; but he considered the operation as much too dangerous to be adopted. Rousset, however, who was contemporary with Paré, having collected accounts of a number of cases in which the operation was said to have been successfully performed, published, in 1581, 8vo. "*Traité nouveau de l'Hysterotomotomie, ou Enfantelement Césarien, qui est l'extraction de l'enfant par incision laterale du ventre et de la matrice de la femme grosse, ne pouvant autrement accoucher; et ce sans préjudicier à la vie de l'un et de l'autre, ni empêcher la fécondité naturelle par après.*" But, though Rousset speaks with great confidence of the safety of the operation, and is warm in its recommendation, it does not appear that he had ever seen it performed, or that more than one of the six persons, whose cases are related by him, were known to him. The book, however, soon became popular; and, being some years after (viz. in 1601) translated into Latin by Caspar Bauhine, with additional cases and observations, it was quickly circulated over Europe. As this book is now become scarce, we shall direct the reader's attention to the First Part of the "*Medical Records and Researches of a Private Association, 1798.*" in which there is An Inquiry by Dr. Haighton, concerning the Cæsarian Operation; which contains a review of some authors who have written in support of that operation, and the accuracy of whose evidence appears very questionable. Rousset is a principal object of Dr. H's criticism; and, from the view here given of his credulity, his authority seems to be very light indeed. He mentions one woman who had undergone the cæsarean operation seven times, and another who underwent it three. Another advocate for the section relates, that a physician at Bruges performed this operation seven times on his

own

own wife. This kind of accumulated evidence does indeed remind us of Butler's

Sir Agrippa, for profound
And solid lying much renown'd.

Marvellous stories at this time, however, met with a ready credence; and hence the operation began to acquire a certain degree of vogue, particularly on the continent, where it is said to have been frequently performed with complete success. Laying out of our minds the ridiculous exaggerations noticed above, it appears from an elaborate memoir by M. Baudeloeque, translated into English by Dr. Hull of Manchester, that, during the 50 years preceding 1802, the operation has been had recourse to on the continent 95 times, and that 37 of these cases proved successful. In Great Britain, on the contrary, this operation has been in almost every instance fatal to the mother. Records of *twenty-two* cases are to be found, and *twenty-one* of the mothers perished. The solitary case of recovery is related by Mr. Barlow of Blackburn, in the Medical Records and Researches (1798); but doubts have been entertained, whether in this case the incision was actually made into the uterus. Of the children, ten were born dead; and of the twelve extracted alive, four survived only a few days. The whole number of lives preserved does not therefore exceed nine. See Merriman's Synopsis of Difficult Parturition, p. 292.

A very astonishing case is stated to have occurred in Ireland. The patient's name was Aliee O'Neal, and the operator was an illiterate midwife, one Mary Dunally; the instrument used was a razor, with which she first cut through the containing parts of the abdomen, and then the uterus. "She held the lips of the wound together with her hand, till some one went a mile and returned with silk and the common needles which tailors use. With these she joined the lips in the manner of the sitch employed ordinarily for the hare-lip, and dressed the wound with whites of eggs." The woman recovered in twenty-seven days. However incredible this story may appear, there seems no reason to doubt its truth. It is related by Mr. Duncan Stewart, surgeon, in Dunganon, who saw the patient some days after the operation; and the account is confirmed by Dr. Gabriel King, of Armagh, who says, that he drew out the needles, which the midwife had left to keep the lips of the wound together.

It has often been an object of inquiry, why this operation should have been more successful upon the continent than in this country. Some writers have attributed it to the climate of England; but this cannot possibly have had sufficient influence to prevent a recovery; nor can it very well be attributed to the want of skill in our surgeons, since they succeed in other operations, apparently as hazardous. Perhaps the only satisfactory reason that can be assigned for the remarkable difference in the result of the operation performed in this country and on the continent is, that it has scarcely ever been determined on in England until after long-continued fruitless efforts have been made by the mother to expel the child, so that her constitutional powers, and the parts to be operated on, have been in the most unfavourable possible condition; for it has been observed, and with apparent reason, that if it had been performed earlier, before the strength of the woman had been exhausted, and a feverish indisposition induced, or before the bladder and other soft parts had been injured by distension and pressure, a more favourable termination might have been expected. It is at any rate certain, that all over the continent practitioners have less horror at performing the *cæsarean* section than British practitioners have commonly shown; and it is resorted to in cases where the operation of *embryotomy* is preferred in this country, and where of course the women are not in such a precarious state of health as those commonly are who have extreme narrowness of the pelvis. This is evident from the accounts published of women, who, after being subjected

to the operation, have borne living children by the natural passage, which could not happen if the pelvis were considerably distorted or misshapen: and hence Dr. Haighton seems to think it probable, that the extraction of an extra-uterine fœtus (as to which see farther on) has repeatedly passed for an instance of the *cæsarian* section. But two modern French surgeons, Messrs. Stein and Plenek, have laid down rules, calculated upon accurate, or supposed accurate, admeasurements of the pelvis, as to when the *vestis* should be employed, when the forceps, when the perforator, when the section of the symphysis pubis, and when the *cæsarean* operation. See Merriman, p. 297.

But the consideration of the propriety of performing this awful operation has not been left solely to the judgment of medical men. It has been made the subject of ecclesiastical discussion; and the doctors of the Sorbonne, and the heads of theological schools and colleges, have freely given decisions upon it. By these authoritative teachers, it has been ruled, that the *cæsarean* operation ought to be performed, whenever it is known that the child is living, and it is impossible by other means to extract it alive; for they assert, that it is a *deadly sin* to perforate the head of a living child in the womb. The clergy are instructed, in the event of the mother refusing to submit to the operation, to omit no means of persuading her: they are to point out all its advantages, and to intimate, that the operation is not so painful as might be thought: they are directed to speak of submission to it, as an act of the greatest love to God, and resignation to his will, that can possibly be shown: it is even suggested, that under some circumstances, the patient might be forcibly confined, and the operation be performed against her will. It is further declared, that physicians or surgeons refusing to recommend or to perform the operation, when they should think it necessary, would thereby render themselves guilty of a deadly sin, and ought to be reprimanded by the magistrates; and praise is given to an edict, in force in Sicily, which declares, that no person shall be admitted to practise as a surgeon till he has been carefully examined as to the manner of performing the *cæsarean* section on the living mother.

These causes combined will explain the reason, why this terrific operation is more readily acceded to on the continent than in this country; and we are happy to say, that cases requiring it are with us very rare; that is, there are very few women whose pelves are so distorted as not to allow a passage for the fingers of the accoucheur to conduct the necessary instruments for opening the head of the fœtus sufficiently to allow its contents to be squeezed out, and its bones to collapse so far as to allow the operator to fix a hook or crotchet, with which it may be gradually drawn down, and extracted. Through how very narrow a space this may be done, we have a remarkable instance related in Dr. Osborne's Treatise on Laborious Parturition. This gentleman has rendered himself particularly conspicuous on the subject of the *cæsarean* section, and uses very strong language in reprobation of it. His arguments are—its acknowledged fatality; the capability of completing the delivery by means of the crotchet, in cases of such deformity of the pelvis that there is no more than one inch and a half between the pubis and sacrum, or to one side of the projecting sacrum; and, *the impossibility of impregnation taking place in cases of greater deficiency of space.*

Much controversy ensued upon Dr. Osborne's arguments; and some of them perhaps were shown to be untenable. But his reasoning has so far prevailed, that British accoucheurs are always extremely reluctant to propose this operation; and recourse is never had to it, except in such deplorable cases as preclude the possibility of delivery by any other means. Such instances have been met with; and a specimen is now to be seen in the museum of Mr. Charles Bell, in which the distortion of the pel-

vis is so extreme, that a marble, measuring less than one inch in diameter, cannot be made to pass through it in any direction. In this case, and some others of a similar nature, the cesarean section was the means of preserving the child.

Perhaps this was the deformed pelvis taken from the body of Mary Rhodes, on whom the cesarean operation had been performed by Mr. Thompson of the London Hospital, October 21, 1769. She expired five hours after the operation. The child was taken from the uterus alive. See London Medical Observations and Enquiries, vol. iv. in which the particulars of all the symptoms previous to and at the operation are related, with two separate engravings of the pelvis. Mr. Hogben has given a figure of it, which is different from either; it exhibits a front view; although the symphysis pubis was not bent, it was so close to the vertebrae, that the distance between it and the projection of the sacrum measured only seven-eighths of an inch; from the termination of the coccygis to the lower part of the symphysis pubis, one inch and seven-eighths. Dr. Cooper observes of this case: "Martha Rhodes was much deformed, being only about four feet four inches high; her back very hollow, her hips narrow, and lower extremities crooked." She was married in October 1768, and miscarried the Christmas following. She became soon afterwards a second time pregnant, and was attacked with labour-pains about the time her reckoning expired. Upon introducing a finger into the vagina, the first thing that presented itself to the touch was an unusual projection of the os sacrum and inferior lumbar vertebrae; which, being extremely prominent, had very much the feel of a child's head. For farther particulars, we refer to the above-quoted volume of Med. Obs.

The following is a still more remarkable and deplorable case. The patient's name was Mrs. Elizabeth Forster; her age 36 years; and the deformity was occasioned by that dreadful and unaccountable disease, the *mollities ossium*. The operation was performed by the late Mr. Hunter, Aug. 13, 1774. The patient did not survive more than twenty-six hours; but the child was preserved. The particulars are mentioned in the London Medical Observations and Enquiries, vol. v. p. 217. 1776. Mr. Hogben, in the Plates to his Obstetrical Studies, has given a figure also of this pelvis; upon inspection of which, it must readily be conceived that a child could not pass through it, by reason of its contracted shape. The distance from the nearest projecting part of the spine, to the part where the pubes and ilium unite on the right side, measured only one inch; and that on the left one inch and three-eighths. From the internal distorted point of the os pubis on the right side, to the centre of the vertebrae, one inch and three-eighths; and between the same of the left side, one inch and a half. The distance from the two bent-in parts of the ossa pubis, only a quarter of an inch. "Upon a careful examination during a pain, (says Dr. H.) I found the os tincta thin; yielding, and dilated to nearly the bigness of a shilling: the liquor amnii had come away about an hour, and the head of the child was just perceptible to the touch; but the pelvis appeared to me so extremely narrow and ill-formed as not to admit of a possibility for the child to be delivered even by embryulcia; the cesarean operation seemed therefore the only alternative." She was married April 16, 1759; at which time she enjoyed a tolerably good state of health. Previous to the operation she had miscarried once, and had borne many children; but in her two last labours the head of the child was obliged to be reduced before delivery could be accomplished. Latterly her indisposition (which she attributed to a severe cold contracted by going into a damp house recently repaired) was accompanied with a violent rheumatic fever, which continued about six weeks; and from that period she dated her extreme weakness and deformity of body.

There was nothing particular in her general diet, except

that she abstained from fish, cheese, and fruit; she used a great deal of salt, but very little acids. The pelvis was very singular, as having but little of the cretaceous matter in the substance of the bones; on which account they were so soft and spongy when fresh, that a finger might very easily be passed through most parts of them, and there was no difficulty in cutting them with a knife; but, when perfectly dried, their substance became considerably firmer. This disease had diminished her stature. At the time she married she was perfectly straight, very thin, and measured five feet four inches in height; some months before her death she measured four feet four inches only, and she stooped so much latterly as to appear to be little more than three feet high. Mrs. Elizabeth Forster was born Nov. 25, 1738. During her infancy she was of very weak habit of body, but never attacked with rickets: as she grew up, she still retained rather a feeble constitution, but a great share of natural spirits and vivacity; she was an uniform pattern of temperance and sobriety. Her lower extremities were not at all bent, probably through her inability to use them since her violent rheumatic fever; so that the diminution of her stature must have been caused entirely by the various distortions of the spine and pelvis.

We shall, in a future article, give a most remarkable instance of general deformity produced by *mollities ossium*, brought on by the eating of salt.

Whenever, on repeated examination of a woman in labour, the accoucheur finds the pelvis distorted to the degree described above, he should apprise the husband of the dangerous state of the woman, and desire the assistance of one or two of the most experienced persons in the profession; and, if on a consultation it should appear that it is impossible to bring the child by the natural passage, the husband should be made acquainted with the nature of the impediment, and should be informed that there remains no hope of preserving the life of the woman and child, but by opening the abdomen of the woman, and extracting the child through the wound. At the same time acquainting him, that the operation, though hazardous, is not necessarily fatal, many women who submitted to it having recovered; and that the hope of a favourable termination depends on its being performed early, before fever comes on, or any material injury is done to the uterus or neighbouring parts. If the husband should be satisfied of the necessity of the operation, the woman should then be apprised of her situation, in the most cautious manner; and, having obtained her consent, a clyster is to be thrown up to evacuate the contents of the bowels, and the bladder emptied through a catheter, and a few drops of the tincture of opium given to quiet pain as much as possible, prior to the operation, the manner of performing which, is thus described by Mr. Thompson, late surgeon to the London Hospital, in the same volume of the Med. Obs. which contains the first of the above cases.

An incision is to be made on the right or left side of the navel, whichever happens to be most prominent, six inches in length; the middle of the incision to be about level with the navel, from which it should be distant a hand's breadth. First cut through the skin, then through the tendinous expansion of the abdominal muscles, and the peritonæum. The uterus being now brought to view, a small opening must be made, to enable the operator to pass his forefinger as a guide for the knife, in extending it to the size of the external wound; an assistant must then introduce his hand, and bring away the child, and the placenta. This being effected, an assistant must keep in the bowels, which would otherwise protrude, while the operator makes the gastrotomy, or future of the belly. Proper bandages are then to be applied, and the woman put to bed. The cure to be conducted in the same manner as after other operations. *Medical Obs. and Enquiries*, vol. iv. p. 271.

A case in which the operation was performed with a favourable

favourable issue to the mother, is related in the *Annali Universali di Medicina* of Dr. Omodei, (April 1820.) by Dr. Genfani of Saluzzo. The subject was a labouring peasant, thirty-two years of age: she had been five days in labour of a mature child, (it is not stated whether or not it was her first,) when the advice of a surgeon was required.

The fœtus, according to the account of this surgeon, Mr. Alliprandi, was wedged-in between the ossa-ilia; and the mouth of the uterus was nearly closed, from being, as well as the vagina, extremely tumefied and inflamed, in consequence of the repeated and improper manual efforts of an inexperienced country midwife. The surgeon immediately employed blood-letting, tepid fomentations, and emollient clysters. No good arose from these means; and, the patient becoming affected with convulsions, the surgeon soon determined to resort to the cesarian operation, although he could not obtain the advice of any other surgeon, nor the aid of any assistant. He made an incision along the side of the linea alba through the integuments, parted aside the muscles, and, opening into the uterus, extracted a fœtus nearly in a state of putrefaction. He remarked, that the uterus was inflamed in an extraordinary degree, as well as the whole of the abdominal viscera. After this operation the lochia appeared, to which, in the progress of time, was joined some purulent matter. The wound cicatrized perfectly in a short space of time; and a tumor which presented in the left groin, which was opportunely opened, gave vent to pus collected in it, and was reduced and firmly cicatrized in twenty days. The patient in the mean time was re-established, became again pregnant, and had a most fortunate parturition.

It need hardly be observed, that, in the event of a woman, near the full time of pregnancy, dying undelivered, the cesarian operation ought always to be performed, with as little loss of time as possible; since by this measure a chance of preserving the child will be afforded; and several cases of such an operation, after the death of the mother, have been recorded, with the desired effect of saving the infant. "Wednesday, July 15, at Eddecastle, Staffordshire, the wife of Mr. Prescott, an exciseman, being killed by a flash of lightning, was opened, and a living male child taken out, which was immediately christened Jonah, and is like to live." *Gent. Mag.* 1747. See also Spence's *Midwifery* 1784, p. 495.

How long, after the death of the mother, the child may survive *in utero*, it is perhaps impossible to say; some authors mention twenty-four or forty-eight hours! In the late Dr. S. H. Jackson's *Cautions to Women* (1798), mention is made of a child extracted by the forceps, which, by the very praise-worthy and persevering exertions of Dr. Jackson, was restored to life, though the mother had been dead full half an hour before it was born.

The subject of the cesarian section is treated in an ample and ingenious manner by Dr. Denman in his *Introduction to Midwifery*, so often quoted; and by Dr. Hull of Manchester, in his *Defence of the Cesarian Operation*, 8vo. 1798. See also the *Memoirs of the Medical Society of London*, vol. v. for the curious case of Elizabeth Thompson, which is connected with the dispute between Osborne, Hull, and Simmons.

OF EXTRA-UTERINE GESTATION.—Gestation carried on in some other parts than the uterus, as in the abdomen, Fallopian tube, or ovarium, is scarcely less curious and mysterious than the subject of superfœtation.

In these matters, theory must be a most uncertain guide; and it is only from a well-arranged accumulation of observations that we can expect light to be thrown on these occasional deviations from the ordinary progress of nature in the situation and evolution of parts.

As yet, no facts have been advanced which are conclusive on the reality of extra-uterine abdominal pregnancy; and it is more than probable that those cases

which are termed abdominal or ventral, did not exist in the belly from the commencement of utero-gestation; but are the consequence of ova having escaped into the cavity of the abdomen, either by ulceration or laceration of the uterus.

Dr. Merriman has published two cases, which seem to establish the fact, that a *retroversion of the uterus* may exist at the full term of utero-gestation, and which go far to prove, that many cases on record, of supposed extra-uterine gestation of the *ventral kind*, were in reality cases of retroverted uterus. "There is something so repugnant (says the doctor) to all that we know of the processes of conception and generation, in supposing that an ovum, accidentally conveyed into the cavity of the abdomen, can there be lodged and nourished, and brought to perfection, altogether unconnected with the uterine system; that, unless the fact be clearly and unequivocally proved, it will hardly be believed."

In the majority of such cases, if the woman has not sunk under the first shock, such has been the constitutional disturbance that she has soon died; whilst, in several well-authenticated instances, a secretion of coagulable lymph has formed a new receptacle, in which the fœtus has quietly reposed for many years, until, by the rectum, or by an abscess pointing externally at some part of the abdomen, the different bones of the child have been expelled.

The three following cases are from the sixth, xxiid, and xlth, volumes of the *Philosophical Transactions*. We do not attach any great importance to them, especially to the second; yet we think them worthy of being presented to the notice of the student.

In the island of Nevis, in the West Indies, there was a negro-woman belonging to one Capt. Mead, who after being with child a year and a half, was at the last relieved by the navel, in this manner: about the 17th month, the woman being thought hydropical, her navel began to swell and imposthume. It swelled and grew livid of itself, and then broke and voided some quantity of ichorous matter, by which the woman had some ease. In about a month more it imposthumated again, to a far greater degree than before; on which the surgeon opened it, where it seemed most jetting out, which was the navel itself; and then, after voiding a great deal of thin ichor and matter, there appeared some bones, which startled him, not having seen the like before. It proved to be a child, the flesh of which was decayed. After the extraction of the bones, the woman was easy, and in a little time began to recover, she being very low, by reason of the great burden she had carried for a long time. She recovered; and had a child afterwards in the natural way. *Phil. Transf.* for 1697. p. 580.

The wife of Mr. Roper, at Coxwold, twelve miles from York, falling in labour, the midwife extracted the secundines, which offered first, but could not perceive any thing remaining. The woman's body falling, and being pretty easy for some days, and the uterus being contracted, the midwife took the secundines for a *mola*, or false conception; but in about a week more the patient began to discharge plenty of fetid matter by the vagina, which continued, and, in process of time, she felt a troublesome hardness on the hypogastrium, which increased daily for above six weeks; and so reduced her, that they despaired of her life. This lump and soreness wrought upwards to the umbilical region, and continued fixed there for about a month. At length, being very painful, the neighbouring women took it for a great boil, or imposthume, and applied what they usually do in such cases, to assist its suppuration and breaking; which had its effect, and it broke rather under the navel, discharging then, and afterwards, a great quantity of a thin fetid discoloured liquor. The part about it mortified, and the ulcer enlarged so that a man's hand might be introduced in it. It continued exceedingly painful, and emitted such a stench, that neither herself nor any one

she else could endure to look on it. A short time after they found some little bones wrought out of it, which being shown to me, (Mr. Christopher Birbeck, who transmitted the account,) I found them to be the bones of a child's finger, which made me curious of going to see her. When I examined the place, I perceived the fœtus in a confused heap, or mortified lump; for with my probe I felt several bones, and at that time extracted (after I had separated and dilated the mortification about it) above half the ribs, some vertebrae of the back, and other bones, and cut out above a pound of the child's mortified substance, as black as ink, with an extreme nauseous smell. And every second or third day for a month, I extracted what I could, being obliged to do it very slowly on account of the exceeding weakness of the patient, who certainly would have died in the operation, had I forcibly extracted it, and not given her time; for we were obliged every moment to support her with cordials; and after every operation she found herself lighter, and by degrees sweeter, which for the first time gave me hopes of her recovery. For not only the linea alba and muscles of the abdomen, but the peritonæum and omentum, were mortified to a great breadth, and the intestines lay fairly in view, and exposed to the air a long time. After extracting a part, and having a plentiful discharge of thin fetid matter, the other discharge downwards began to lessen and abate, so that I endeavoured to assist it by bandages and compresses, with detarging and drying injections up the vagina; by which means in a little time there was no discharge that way, and those parts soon became perfectly well; and in some time after the ulcer separated from its putrefaction, contracted and united, and has now been quite cicatrized near three months, all the abdomen being soft, easy, and well-conditioned. The woman laboured all this season at hay and corn harvest. I presume that, by the forcible extraction of the secundines, the uterus had been lacerated, and so ulcerated; and the woman being extremely weak, and constantly lying in bed, gave the more liberty for its working upwards. *Phil. Transf.* for 1701. p. 1000.

Sarah M'Kinna, living at Bentram, two miles from Clogher, in Ireland, was married at the age of sixteen years. Before her marriage she never had the appearance peculiar to women; but in a month after her marriage, those appearances showed themselves. Ten months after her marriage, she found the symptoms of pregnancy, and bore a child at the expiration of the usual time. Ten months after she was delivered of another; and each time had a speedy and easy delivery.

Two months after her second delivery, symptoms of pregnancy appeared again, and increased in proportion to the time; but at the end of nine months those symptoms began to abate, and in a little time she had no other reason for thinking she was with child, but an absolute stoppage of her catamenia. Nor had she, during the space of six years and some months, any one return of them; but for the greatest part of that time, especially the first four years, she was perpetually afflicted with most violent pains in the middle region of the abdomen. Some time in the seventh year after her last pregnancy, which ended in such an unusual manner, a swelling in her belly, and other symptoms, made her conclude she was again pregnant. About seven months after this uncertain account, a boil, as she thought, appeared about an inch and a half higher than her navel. During this time of her pregnancy she often found the symptoms of her being quick with child, till about six weeks before this boil, as she called it, appeared. It was attended with very great pain. She sent for one O'Neill, a butcher. This man came to her the Sunday after her message, and found her in an expiring condition. By this time the imposthumation had broken, and an elbow of the child had forced itself through it, and appeared in view. At the request of herself and friends, he undertook to administer relief to her, and made so large an incision above and be-

low the navel, as enabled him, by fixing his fingers under the jaws of the fœtus, to extract it; in which operation he met not with the least impediment. He afterwards looked into her belly, and, seeing something black, he put in his hand, and extracted, by pieces, a perfect skeleton of a child, and several pieces of black putrefied flesh. After the operation, he swathed her up; and in six weeks she pursued her business about the house. She had been in good health ever after; only she had a navel rupture, owing to the ignorance of the man in not applying a proper bandage. *Phil. Transf.* for 1741. p. 814.

An account has been inserted in the Medico-Chirurgical Transactions, vol. v. of a fœtus having been taken from the body of a woman where it had remained 52 years. The woman was a native of Gloucester, had been taken in labour as usual; but, owing to the unskilfulness of the midwife, was not delivered; in a few days after the woman got well, and lived to the age of eighty years, when she died of paralysis. Dr. Cheston, having learned the history of the case, opened the body, and found an ossified globe, which contained the perfect child, the legs and arms of which were somewhat compressed by this osseous mass, and in some parts absorption had taken place. The fœtus was livid, but not putrid; the bony shell in which it was enveloped was thick and hard. The labour occurred in December 1738; the woman died in February 1790.

Other, and very serious, impediments to labour are obstructions arising from the *soft parts*; such as, extreme narrowness or cicatrix of the vagina, or cohesion of the labia; collection of feces in the rectum; or malformation and extreme rigidity of the external parts. More serious impediments are—tumours in the uterus, thickening and induration of the mouth of the uterus, inversion of the uterus, laceration of the uterus, &c. &c.

Malformation or straitness of the external parts does not often prevent conception. Women have conceived though the orifice of the vagina has not been capable of permitting the introduction of even the little finger. And accidental obstructions, such as the presence of a hymen, or a cohesion of the labia, will not probably occasion much embarrassment to the accoucheur. The action of the uterus will alone be sufficient, in most cases, to overcome the difficulty. Should it, however, be found necessary to do more, an incision must be made through the obstruction; very great care being taken not to wound or injure any contiguous part.

Cicatrix of the vagina, in consequence of former injury, may appear at first to impede the progress of the infant; but it will always be found to yield to the pains, if the strength of the patient be supported, and proper means be adopted to counteract the effects of the long-continued labour throes. A case occurred some time ago to Dr. Hamilton, where a substance, of the hardness of gristle, as thick as an ordinary-sized finger, placed between the vagina and rectum, and apparently extending from the ramus of one ischium to that of the other, presented an unsurmountable obstacle to the passage of the child. He was called in after an unsuccessful attempt had been made to tear away the infant, and found the woman in a state of extreme danger. He was informed that five years before that period, she had had a very severe tedious labour, followed by great inflammation and suppuration of the external parts. The indurated part was cut through without the patient making any complaint, and the child was very easily extracted; but she survived the delivery only two days. The relations would not permit the body to be opened.

A collection of feces within the rectum has been known to occasion such resistance to the passage of the child, that the woman has died undelivered. In general, however, it is in the power of an active practitioner to empty the gut at the beginning of labour. (See Duncan's *Med. Com.* 1795. p. 340-47.) But if, from neglect, the head of the child be jammed in the pelvis, and immove-

ably

ably wedged in consequence of an accumulation of feces, it then becomes necessary to open the head.

Extreme rigidity of the external parts is one of the most frequent causes of obstruction which depends on the state of the soft parts. It takes place, in a greater or less degree, in the greatest number of women who lie in for the first time: and generally in all women who are considerably advanced in life before they have children. It is seldom that the resistance opposed by the external parts is so very great as to prove an invincible obstacle to labour. But, on many occasions, the long-continued pressure of the child on those parts produces the most disagreeable consequences, as inflammation of all these parts and of the bladder. Inflammation in those parts is always dangerous, for there seems to be a remarkable tendency to gangrene. Cases are on record where the whole parts have sloughed off, and where the rectum, vagina, and bladder, have formed one canal. Perhaps death is much preferable to life under such circumstances. Copious blood-letting, and the liberal use of some unctuous application, with time and patience, in general overcome the rigidity of the external parts. Placing the patient over the steam of hot water was formerly recommended in such cases; but this practice is now exploded.

DISORDERS of the UTERUS.

It is a curious fact, not only that conception sometimes takes place when there is a tumour within the womb, but also that pregnancy goes on to the full period. When this has happened, the tumour has been pushed down before the infant, and has filled up the passages. If this obstacle be ascertained at an early period of the labour, which it must be if the practitioner be in any ordinary degree skilful and attentive, the tumour may be pushed back, and the feet of the child may be brought down.

The following singular case of an excrescence on the *os uteri*, is stated by Dr. Denman, vol. ii. p. 65. "In June 1770, I was desired to see a patient in the eighth month of her pregnancy, who in the preceding night had a profuse hemorrhage. Her countenance showed the effects of the great loss of blood she had sustained; and, from the representation of the case given me by the gentleman who was first called in, I concluded that the placenta was fixed over the *os uteri*. On examination I felt a very large fleshy tumour at the extremity of the vagina, representing and nearly equalling in size the placenta, which I judged it to be. Had this been the case, there could not be a doubt of the propriety and necessity of delivering the patient speedily; and with that intention I passed my finger round the tumour, to discover the state of the *os uteri*. But this I could not find; and, on a more accurate examination, I was convinced that this tumour was an excrescence growing from the *os uteri*, with a very extended and broad basis. I then concluded that the patient was not with child, notwithstanding the distension of the abdomen, but that she laboured under some disease which resembled pregnancy, and that the hemorrhage was the consequence of the disease. A motion which was very evidently perceived when I applied my hand to the abdomen, did not prevail with me to alter this opinion.

"It was of all others a case in which a consultation was desirable, both to decide upon the disease, and the measures which it might be necessary to pursue; and several gentlemen of eminence were called in. That she was actually pregnant, was afterwards proved to the satisfaction of every one; and it was then concluded, that such means should be used as might prevent or lessen the hemorrhage, and that we should wait and see what efforts might be naturally made for accomplishing the delivery.

"No very urgent symptom occurred till the latter end of July, when the hemorrhage returned in a very alarm-

ing way, and it was thought necessary that the patient should be delivered. There was not a possibility of extirpating the tumour, and yet it was of such a size as to prevent the child from being born in any other way than by lessening the head. This was performed; but, after many attempts to extract the child, the patient was so exhausted, that it became necessary to leave her to her repose, and, very soon after our leaving her, she expired.

"We were permitted to examine the body. There was no appearance of disease in any of the abdominal viscera, or on the external surface of the uterus, which was of its regular form; and, when a large oval piece was taken out of the anterior part, the child, which had no marks of putrefaction, was found in a natural position. An incision was made on each side of the cervix to the vagina, and then a large cauliflower excrescence was found growing to the whole anterior part of the *os uteri*. The placenta adhered with its whole surface; so that the blood which she had lost must have been wholly discharged from the tumour. Were such a case again to occur, there could be no doubt respecting the propriety of fixing a ligature round the neck of the tumour."

In two cases, where a great thickening and induration of the neck and mouth of the womb, approaching to the nature of schirrhosity, had taken place previous to conception, the natural action of the uterus, though after a very considerable time indeed, assisted by copious blood-letting, eventually overcame the resistance. One of the patients died ten months after, with all the symptoms of real cancer uteri. The other was restored to perfect health after lying-in.

Dr. Denman has recorded (vol. ii. p. 73.) two cases, where the *enlarged ovarium* impeded the progress of the child. In the one case the head of the infant was opened, and the delivery completed by the crotchet; but the patient died at the distance of three weeks. In the other, a trocar was passed into the tumour, and a living child was born. The patient recovered from her lying-in; but died hectic at the end of six months. In such cases, the ovary may be pushed back, if the circumstance be discovered early enough.

References to sixteen other cases of this kind may be found in the 10th volume of the *Medico-Chirurgical Transactions*. These tumours have been of various sizes and degrees of firmness. Sometimes they have contained only a thin fluid; sometimes the contents have been of the consistence of honey; and sometimes there has been fatty matter, intermixed with long hair and teeth.

Whenever such tumours have been detected during labour, much doubt has generally been entertained respecting their nature and the proper mode of management. On some occasions the medical attendants have not thought it right to take any immediate step towards accelerating the delivery, because the patient was not considered to be in immediate danger; and it was hoped that the tumour would prove sufficiently compressible to allow the child to pass, when strong pains should come on. And, where the tumour was not very large nor very firm, this method has been successful. Some have taught, that, in such cases, there should be no delay in employing the perforator; considering it more advisable to sacrifice at once the life of the child, than to hazard that of the mother. If, by this sacrifice of the child's life, the mother's could be always ensured, the practice might be defensible; but, unfortunately, it has happened, that in three cases out of five, in which the perforator was employed, the mother did not recover; and in one of the other cases the mother's recovery was very incomplete. Sometimes with the view of preserving the child, or from some other reason, the operation of turning has been undertaken; but this does not appear to have been a successful mode of practice, either to the mothers or the infants. Sometimes the tumours have been opened with the view of diminishing their bulk; but in several instances

instances it has become necessary afterwards to perforate the fetal head, and even then the delivery has been extremely difficult, and ultimately destructive to the mother. But upon the whole, the evidence we at present possess, is more in favour of opening the tumours, when they contain a fluid, than of any other mode of procedure. The first plate in Merriman's Synopsis represents a case of an ovarian tumor impeding delivery: it has indeed a very formidable appearance; but the doctor does not inform us what mode was pursued, nor with what success.

Lacerated or ruptured Uterus.—The most fatal accident perhaps to which parturient women are liable is rupture of the uterus. This occurrence most usually takes place in protracted labours, where the uterine contraction has continued for a considerable time, though in other respects the labour often appears perfectly natural. The laceration occurs in different parts of the uterus; but its most general seat is near the cervix, the fundus rarely being torn. The peritoneal coat of the uterus is sometimes ruptured without involving the structure of the uterus itself; and, vice versa, the uterus may be lacerated without the peritoneal covering participating in the injury; in which cases (it is hardly necessary to add) the symptoms connected with the escape of the fœtus into the abdominal cavity are not manifest.

We are not acquainted with any certain symptoms by which this mournful occurrence may be foreseen; nor is the cause of it known with precision. In many instances, however, it is produced by extensive injuries, as blows, falls, kicks, &c. and not unfrequently by the incautious use of instruments or by forcible attempts to turn the fœtus in utero: it is likewise brought on by tumours in the vagina, exostoses, cartilaginous hardness of the os uteri, or by an unusual sharpness of certain processes of the pelvic bones. Dr. Rambotham is disposed to think that a *thinning* of some part of the uterus, from undue pressure during pregnancy, may be a common cause; and Mrs. Boivin, a French midwife, mentions that, in a woman who died soon after delivery at the Maternité, whose pelvis measured only two inches and three quarters from pubis to sacrum, the uterus, at a few lines above its neck, in the situation corresponding with the sacro-vertebral angle, appeared to be very nearly *worn through* for the space of two-thirds of an inch, being in this part not above the eighth part of a line (96th part of an inch) in thickness. The cases of Denman, Bye, and several others, show also the effect of undue pressure on some projecting point of the bones of the pelvis, in the production of this accident.

The following are the symptoms of this affection.—During the continuance of an expulsive effort, the patient complains of an excruciating pain at some particular spot in the abdomen, which she describes as much differing from common labour-pains, and is so severe that it makes her shriek loudly; it is accompanied by a sensation of something bursting internally, and the burthen appears to rise up from the pelvis into the abdomen; vomiting succeeds immediately afterwards, and uterine action becomes suspended at once, or is gradually rendered weaker: syncope, great prostration of strength, coldness of the extremities, and hemorrhage, occur; respiration is hurried and anxious; the pulse sinks, is rapid and tremulous, and the patient expires in the course of a few hours. Sometimes death is quicker in its progress; for the woman has been observed to become extremely restless after the accident, to gasp and expire immediately: in other cases she is destroyed more slowly by inflammation; and instances are mentioned in which the fœtus has found an exit in process of time through the parietes of the abdomen.

With respect to the treatment of this malady, it was recommended by Smellie, Denman, and Hunter, not to attempt delivery, but trust to the efforts of nature. Recovery however so seldom occurred with this management, that it was afterwards thought more advisable to

extract the fœtus; and the favourable results of such practice seem to place the propriety of it beyond doubt. The delivery may be effected according to the circumstances of the case, by turning the fœtus and bringing down the legs, by means of the crotchet, or by gastrotomy. In the selection of these methods we must be guided by the size of the pelvis, the size and situation of the child, and by the degree of hemorrhage or contraction of the uterus.

We shall insert one curious and recent case, which occurred to the observation of M. Bertrand, a surgeon at Méry-sur-Seine, in France. E. Laurent, 40 years of age, having arrived within a fortnight of the completion of the ninth month of her eighth pregnancy, used some powerful exertions in loading a cart, on the 9th of July, 1811. During this effort, she suddenly experienced very severe uterine pains, accompanied with the escape of some water, and afterwards of blood, from the vagina. The pain and hemorrhage ceased on the patient being placed in bed. This state of calmness continued until the 15th, when the abdomen became tumefied, painful, and symptoms of the presence of inflammation were developed. Towards the end of the month, symptoms of extreme debility succeeded this inflammatory state, and the patient seemed to be on the verge of death. At last, a red circular spot appeared between the navel and the pubes, which was soon converted into an eschar surrounded by a red circle, which separated on the 13th of August, and gave vent to a large quantity of flocculent, puriform, and extremely fetid, fluid; and then to the decomposed body of a fœtus, which appeared to be of the full period. The severity of the symptoms soon disappeared; the strength of the patient was restored; the wound gradually diminished, and, towards the end of September, perfectly healed. Menstruation appeared four months afterwards, and has continued regularly ever since. It should be remarked, that, on the escape of the fœtus, M. Bertrand passed his left hand into the cavity of the uterus, which he could fully explore; and, carrying the fore finger of the right hand into the vagina, he encountered with it that of the left, which had been directed towards the mouth of the uterus. M. Bertrand thinks that the infant lost its life at the time when the violent exertion of the mother gave rise to the severe pains and the rupture of the membranes; that it remained in the uterus; and that some projecting part of its body pressing forcibly against some point of the uterus, produced inflammation of that organ, which was communicated to the adjacent parts, and terminated in the eschar comprising the paries of the uterus and the corresponding part of the abdomen. *London Med. Journal*, vol. xliii. p. lxxxv.

A case occurred to Dr. Bromfield, of rupture of the uterus, where the patient died undelivered; respecting which, he thought it expedient to make an affidavit, which was sworn before Charles Marsh, esq. one of his majesty's justices of the peace for the city and liberty of Westminster; declaring, "that he never passed either of his hands into the vagina, or more than one finger of either hand; and that he used no instrument or force of any kind." On what account this affidavit was thought necessary, from a physician of Dr. Bromfield's rank and eminence in his profession, does not appear.

The most extraordinary accident of this sort on record, is that related in one of the volumes of the Edinburgh Medical Essays, where not only the uterus, but the abdominal parietes also, burst, and exposed the fœtus.

Inversion or Retroversion of the Uterus.—This accident usually happens during the enlarged and dilated state of the uterus, immediately after delivery, and is commonly attributable to a hasty and incautious attempt to bring away the placenta. It has been supposed, that the exploded practice of dragging at the funis, to extract the placenta immediately after the birth of the child, was the principal cause of this misfortune; but there can be

no doubt, that a spontaneous inversion has sometimes occurred.

When the uterus, with the placenta attached to it, is drawn in an inverted state without the vagina, no doubt can exist as to the nature of the accident; but, if it should happen after the exclusion of the placenta, more difficulty in forming an opinion would arise. The following rules, however, would lead to a correct judgment. If a globular tumour is found soon after delivery, in the vagina, or protruded through the os externum, it must be supposed to be, either a polypous excrescence, a prolapsed uterus, or an inverted uterus. If it were a polypus, it would be known by its insensibility, its mobility, and its pedicle, which a careful examination could hardly fail to discover: the edges of the os uteri surrounding the tumour would likewise be perceptible. A prolapsed uterus may always be known, by the os uteri being situated at the most depending part of the tumour. The inverted uterus is sensible to the touch, is less moveable than the polypus, has no pedicle, nor a dependent mouth; in a recent state it is entirely covered with a grumous discharge, proceeding from numberless blood-vessels upon its whole surface.

The presence of an *inverted uterus* being ascertained, it becomes the accoucheur to use the most prompt and decisive means of relieving his patient: and this can only be done by immediately re-inverting the uterus. To effect this, he must first return the uterus within the vagina; then, having his arm bare and well smeared with lard, he must pass his hand through the os externum, and, resting the backs of his folded fingers against the *fundus uteri*, he must carry it forward, till he finds his hand within the cavity of the uterus; and, still pursuing his object, he must push his hand onwards, till he is fully satisfied that he has completely re-inverted the uterus, and that the contraction of the os uteri will prevent any future mischief.

Puzos, Dionis, and others, have recommended to remove the placenta from the inverted uterus, before any attempt is made to revert the womb: but Dr. Denman and other writers, consider it better to return the inversion, while the placenta is still attached.

A case of the latter kind, which occurred in the practice of Mr. Browne of Camberwell, is related in the Memoirs of the Medical Society of London, vol. v. Elizabeth Emmett, a woman of a good habit of body, and tolerably well proportioned, sent for me to attend her in labour, between two and three o'clock in the morning of Monday, Sept. 19, 1796. About nine o'clock, a rupture of the membranes took place, and it appeared clearly to be a footling case, which I delivered in the usual way. The child was dead, and in a very sphacelated state. After the delivery some pain ensued; and, by a very slight effort to extract the secundines, the funis broke (it being also very putrid). The pains, however, not only continued, but became more, excessive, with a degree of bearing-down hardly to be conceived; and an actual inversion of the uterus, with the placenta completely adhering, took place. The dangerous state of the patient admitted of no delay; and having considered whether I should separate the placenta, and return the uterus, or reduce both together, on passing my finger round the placenta, finding it in no part detached from the uterus, I determined on returning them together, and happily succeeded. During this time no hemorrhage ensued, and I was therefore very averse to excite one, which a hasty separation of the secundines, in that relaxed state of the uterus, must have occasioned; having therefore waited a considerable time, (the patient being as little disturbed as might be expected, considering what had occurred,) I endeavoured to impress on the minds of the friends present, that no inconvenience would result: I gave her an anodyne, and directed proper nourishment, and such febrifuge aperient medicines as were requisite to prevent inflammatory symptoms, which, indeed, did not

intervene; and on Thursday, September 22, in the evening, four days from the time of her delivery, a sanguineous discharge, to no great degree, took place, which gave me hopes that the contraction of the uterus was spontaneously occurring: the expulsion of the burden (which I anxiously waited for) happened on Friday the 23d, after a retention of five days, and at this time, (now more than a month from her being put to bed) she has every appearance of recovering as favourably as in any of her former labours, she having had thirteen children.

"The death of the fœtus, by the mother's account, appears to have taken place about the 20th of August, she having on that day accidentally received a severe blow on the abdomen, and never felt it move from that period. The fœtus and funis, as before observed, were highly putrid and offensive; the placenta, on the contrary, was perfectly sound, and had acquired its original size, no doubt, from the maternal circulation being continued till its expulsion."

In the two following cases, the placenta was separated before the uterus was replaced. We do not, however, quote them merely on that account, but because they are related with great perspicuity, and exhibit the highest skill, judgment, and dexterity, in the operators, Dr. Squire and Dr. Merriman.

Case by Dr. Squire.—"Mrs. Schroeder, Green-court, Brewer-street, aged about 21, after the birth of her first child, had the uterus completely inverted, with the placenta adhering to the fundus. The midwife, who attended her, sent for me, and I was with the patient about twenty minutes after the accident; and, on enquiring into the situation of the poor woman, I was informed there had been a profuse hemorrhage, and the people about her supposed her really dead; nor had she indeed much appearance of life, for there was no pulse at the wrist, nor could it be perceived that she breathed.

"Examining, I found the uterus completely inverted, and immediately separated the placenta; and, whilst I was attempting to replace the uterus, Dr. Douglas, who had been likewise sent for, came into the room. By keeping a steady and firm pressure at the fundus, the uterus passed gradually before my hand; but, when getting just above the arch of the pubes, it shot up suddenly *with a kind of spring*, as is frequently perceived in a rupture, when a part of the contents has been returned. Dr. Douglas assisted me, and we were both satisfied that the uterus was replaced. We remained with the poor woman for some time, it being long doubtful whether she would not have died from the great loss of blood; and it was near an hour before it could be pronounced that there was a probable chance of her recovery. The day following, a fever supervened, with a tense abdomen and great pain, which lasted several days. Dr. Douglas visited with me till we saw the patient free from danger. At the end of the month she was perfectly recovered. About fourteen months after this accident, she brought forth another child without any untoward symptom in or after labour."

By Dr. Merriman—"In January 1802, Mrs. Edwards, residing in Brick-street, Piccadilly, was delivered of her first child by Mrs. Cobb, a midwife of much practice. The labour was natural, and of no considerable duration. Some little time after the child was born, the midwife endeavoured, by tightening the navel-string, to extract the placenta, when a violent pain came on, and the uterus was completely inverted, the placenta remaining attached to it. On this, my friend the late Dr. Seares was immediately called in; and he, finding things in this state, desired that I might likewise be sent for. When I arrived, which was in about fifteen or twenty minutes after the accident happened, the body of the uterus, with the adhering placenta, was lying without the os externum; blood was flowing profusely from the internal surface of the uterus, especially from those parts where the placenta was detached; and the woman was in such an exhausted

state, that we doubted if she could survive till the uterus should be replaced. We perfectly coincided in opinion respecting the plan to be pursued; and, as no time was to be lost, Dr. Seares removed the partially-separated placenta, and returned the uterus within the vagina, while I was laying bare my arm. I then introduced my hand, carrying the fundus uteri before me, till I had passed my arm *quite to the elbow* within the vagina; at this moment I found the fundus uteri *spring from the back of my hand*, and the os uteri began to contract; I therefore cautiously withdrew my hand, and soon had the satisfaction to find that the hemorrhage ceased. Mrs. E. during the whole operation, was in a state of syncope; but, on our giving her some wine and other cordials, she revived, and afterwards recovered perfectly without a single bad symptom. She has since borne several children, and has never found any inconvenience from this alarming and dangerous accident.

"Had a very little time longer been suffered to elapse, before this inversion was reduced, either the patient would have sunk beyond recovery, from the profuse hemorrhage; or, had the hemorrhage been stopped by the contraction of the uterus, that very contraction would have prevented us from making any impression on the fundus, and the os uteri would have been closely shut against any attempt we could have made to relax it. Delay indeed, in such cases, is, above every thing, to be deprecated; for sometimes the contraction of the womb is so rapid, that, unless the inversion be reduced in a few minutes after the accident has happened, all attempts to return it will be ineffectual." Yet in White's Midwifery, 5th ed. (1791.) a case of inversion is recorded, in which, by grasping with the hand, and thus compressing the uterus, Mr. W. succeeded in re-inverting it, though as much as *two hours* must have elapsed after the accident. In general a much shorter space of time than this is sufficient to render the reduction impracticable.

A case of *spontaneous inversion of the uterus* occurred in the practice of the late Dr. Merriman.—Mrs. Bishop was so much distorted in the pelvis, that it was found impossible for her to be delivered, till the child's head had been lessened by the perforator. Having several times successfully undergone this process, she was at last prevailed upon to have premature labour induced, when in the eighth month of pregnancy; but, the child presenting the nates, it was unfortunately dead born. Mrs. Bishop, however, suffered, comparatively, so little from this labour, and recovered so well and so speedily after it, that, in her next pregnancy, she was quite impatient for a repetition of the operation.

"On this occasion, the membranes were not pierced: but the connexion between the chorion and the uterus was destroyed, by means of the common long flat female catheter, carefully introduced between them. In consequence of this irritation, a muco-sanguineous discharge was produced, and the labour came on in two or three days. The child was born alive, and in health, and the placenta came away without any difficulty, and certainly without any suspicion of injury to the uterus. The mother recovered in the usual time, and was enabled to suckle her child, a fine boy. Between six and seven months after her delivery, and while the child was still living upon the breast, upon some slight strain, she suddenly felt something give way within her, and immediately afterwards was sensible of a weight or pressure low down in the vagina; upon which the late Dr. Rowley was sent for, who, upon examination, found the fundus uteri so low in the vagina as almost to protrude through the os externum. Dr. Rowley, finding matters in this situation, sent for Dr. Merriman, and they jointly endeavoured to re-invert the uterus; Dr. Denman likewise, and several other accoucheurs, saw the case; but no means that could be used were successful in restoring the parts to their natural state; and the patient remained with the uterus in

this state till her death, which occurred in about two years."

Mr. White, surgeon, of Paisley, after relating a case of inverted uterus which terminated successfully under his management, concludes as follows: As, in making the reduction in the above case, I experienced much inconvenience from the shortness and smallness of my fingers, I would beg leave to propose the trial of the following simple instrument, if the like difficulty should ever happen to any other practitioner. It consists of a bit of light wood, about fourteen inches long, not quite cylindrical, but slightly tapering from the ends to the middle, and the ends rounded, like the head of a walking-cane. The diameter of the one extremity is an inch, and the other an inch and three quarters; the one or the other to be employed as the particular circumstances of the case may seem best to suit. The whole of it is covered with smooth and soft leather, and the ends are thickly stuffed with wool or soft hair; so that they can hardly do any injury to the uterus, unless employed in the most inattentive and improper manner." Duncan's Med. Com. 1795.

Many writers, on the other hand, have suggested the propriety of amputating the uterus, when in a state of inversion; but, so great a dread has been generally entertained of such an operation, that, though cases have been cited from ancient authors to prove its possibility, yet in modern times, the excision of the uterus does not appear to have been attempted till of late years. Mr. Chevalier extirpated the uterus of a poor woman, in 1804, who lived many years afterwards: and other cases have been recorded by other surgeons. Notwithstanding, therefore, the incredulity of some writers, respecting the truth and accuracy of the cases cited, (and little doubt can be entertained, that mistakes have been committed on the subject,) the fact, that the operation has been several times safely performed, is fully established. The case furnished by Mr. Chevalier is given by Dr. Merriman, Synopsis, p. 286. with an engraving.

A case of favourable termination of parturition by the natural efforts, when there was complete *hernia of the uterus* has been related to the Royal Medical Society of Copenhagen, by Mr. Saxthorpe. There is not, it is suspected, a similar instance recorded in the annals of medicine. It was not precisely evident whether the uterus passed from the belly above or below Poupart's ligament. It reached nearly to the knee, on the right side. The mother declared that she felt the motions of the fœtus in it, as she had done in former pregnancies, when the uterus was within the abdomen. These motions were, towards the termination of the ordinary period of gestation, sensible to the physicians who examined her, on handling the tumour. The shape was precisely that of the uterus in ordinary pregnancies at the same period. The woman had had a tumour in the groin appear in her childhood, after a fall. Her last pregnancy had been four years previously. Soon after that, she remarked that the tumour was about the size of a turnip. About the usual epoch, pains like those of ordinary labour were experienced in the tumour; and this could be discerned contracting from the fundus. The mouth of the uterus (which could be felt as usual from the vagina, but not its neck) began to dilate; the head of the fœtus presented, and the labour was completed without the occurrence of any remarkable circumstance. The infant was dead; it was of the female sex, weighed five pounds and a half, was eighteen inches in length, and the head was five inches and a half in diameter from the occiput to the chin. The tumour was found to be much lessened in size immediately after the expulsion of the fœtus, and it could then be discerned that it did not escape from a natural opening, but between the fibres of the abdominal muscles. The history of this case is detailed in the London Medical and Physical Journal for March 1820. It terminated very fortunately: the delivery was effected on the 2d of October,

1817; and in twenty days the strength of the patient was completely re-established, and she returned home to her village.

Imperforated Uterus.—In the *Algemeine Medizinische Annalen* for 1819, a case is related by Dr. Bonisch of Leipzig, which is stated to have been an instance of want of mouth of the uterus. This point is, however, not well established. The subject was a woman who was married in her twenty fourth year to a healthy man; but, though they cohabited for eleven years, she did not become pregnant. She had every month the menstrual orgasm, and suffered much pain in the belly: but only a few drops of blood were evacuated from the vagina. After the death of her first husband she soon married again, and became pregnant. After she had been some time in labour, Dr. Bonisch was called to her. She was much exhausted. On making an examination, he could find no os uteri; but a spherical body presented in its place, which was evidently the uterus. He determined to make an artificial opening in this; which was effected. The head of the fetus presented, and was born alive. No very considerable quantity of blood was lost. No great degree of inflammation came on in the parts about the wound. The lochia were discharged from it in the ordinary way. The edges of the wound had healed at the end of eight weeks; leaving, however, an opening like an artificial os uteri. The mother has since been in good health, and has menstruated like other women; but, although three years had elapsed at the time this history was drawn up, she had not again become pregnant.

The want of the flow of the menses before the operation, and the appearance of them since, certainly somewhat favour the notion of the want of the existence of an os uteri: otherwise it might be considered merely as a case of retroversion of the uterus. The fact, however, of the favourable result of such an operation merits being recorded. *Dr. Hutchinson's Præmium to the 43d vol. of the London Med. Journal.*

Absence of the Uterus.—We can have little hesitation in referring the peculiarities of the female character and constitution to the action of the generative organs *taken all together*. But, although the great importance of the uterine system is so strenuously insisted on, and so universally admitted, that Van Helmont says *Propter uterum solum mulier est id quod est*;—yet we shall find, that, during the entire absence of the uterus, a woman may enjoy a good state of health, and perform all the functions of life except menstruation and conception; and live to a mature age, and marry, without being aware of the want of this important organ.

The history of this interesting case is related with much minuteness by Professor Stein, of Bonn in Prussia. A lady, twenty-four years of age, had been married five years without having ever menstruated; although the orgasm generally accompanying the appearance of the menses, with some distress about the pubes, had recurred at the ordinary periods. After having expected the establishment of this function until her hopes were almost lost, and perceiving her health to be on the decline, being affected with oppression of respiration, and occasional fits of fainting, she permitted a midwife to examine her, for the purpose of ascertaining if there existed any mechanical obstruction. A firm membrane, supposed to be the hymen in a state of unusual thickness, was detected; Professor Stein was consequently consulted. He describes the patient as presenting the most perfect characteristics of the female form: slender and delicate; with *full breasts*, a fair complexion, and an animated countenance, expressive of the finest sensibility: her manners were particularly delicate; and she seemed, indeed, to be a model for her species. On making a slight examination in the erect posture of the patient, the account of the midwife appeared to be correct; and the usual instruments were prepared for dividing the membrane in the ordinary way: but, on making pressure on it with the

finger and scalpel, it retreated inwards, about half the common depth of the vagina, and it was then discovered that this membrane formed a sort of sac. But, from the characteristic habit of the lady, and the maladies she had experienced, no suspicion of a want of the uterus was entertained: it was considered that the sac had been originally a plane membrane of the kind so commonly met with in the vagina of females, which had been stretched into its present form by sexual intercourse and by irritation, and from the same causes made to acquire the great thickness and firmness it presented. Difficulty attended the division of the end of this sac, from the firmness of its texture, and the narrowness of the vagina; but this was effected by making a perforation in it, and then bringing it down as far as possible by the finger introduced into the incision. A rather copious hemorrhage ensued. The absence of the uterus was now discovered: on introducing the finger beyond the opening in the sac, it encountered a soft, spongy, penetrable, substance, evidently a mass of cellular tissue. Some similar cases, which Professor Stein found by searching literary records, which we shall immediately notice, with a subsequent examination, confirmed him in his former conclusion. The wound united very well by the use of bandages, &c. and no serious accident ensued.

We shall here adduce the account given by Theden of a case precisely similar in character to that of Professor Stein; and then a description of the appearances discovered, on dissection, in two bodies, by Engel, and Schmucker.

Theden's case was that of a young woman who had never menstruated, although the orgasm had regularly been manifest. Marriage was advised, as a probable means for remedying this disorder: and it was accordingly resorted to. An obstruction of the vagina was then detected: but the husband had, before Theden was consulted on the case, distended the obstructing membrane into a sort of pouch of the size of a hen's egg: this was hanging without the external orifice of the vagina, and was removed by incision. On introducing the finger behind the pubes, a cavity was discovered, terminated by a mass of cellular texture, through which the pressure of the intestines was supposed to be discerned; but not the smallest evidence of the existence of a uterus could be discovered. The incised parts united very well, and no accident is said to have ensued.

Schmucker, in his *Vermischte Schriften*, speaks of a body that was brought to him, which had been found in a field, presenting, externally, the female characteristics: the breasts were remarkably prominent; but the genital parts were of small size, and the orifice of the vagina closed by a membrane, externally, apparently a continuation of the skin. The uterus and vagina were wanting; the place which the former should have occupied, was filled with a mass of loose cellular texture, in which the ovaries and fallopian tubes were situated. Engel's patient was also a woman whose habits were not known: it appears that the body accidentally came under his observation. The breasts were remarkably full; the orifice of the genitals was closed; there was neither vagina nor uterus: the ovaries and fallopian tubes were found attached to the bladder.

The physiological indications which those cases furnish had been already pretty well ascertained; but they serve to confirm the opinion that it is the *ovaries* in which the menstrual orgasm originates, and which, by their influence, give to the woman her characteristics in respect to form and manners. When the ovaries have been originally wanting, the hermaphroditical character of the body generally has been constantly present. A curious case in the *Philosophical Transactions* for 1805, in which the ovaria were deficient, shows that such a deficiency occasions the female to approach in some points to the male formation. The subject of this narrative died at the age of twenty-nine. "Having ceased to grow at ten

ten years of age, she was in stature not more than four feet six inches high. Her breadth across the shoulders was as much as fourteen inches, but her pelvis (contrary to what is usually observed in the proportions of the female skeleton) measured only nine inches from the os ilia across the sacrum. Her breasts and nipples never enlarged more than in the male subject; she never menstruated: there was no appearance of hair on the pubes, nor were there any indications of puberty, either in mind or body, even at twenty-nine years of age." The removal of the ovaries has been most rarely practised in the human subject: probably the only case in which it has ever been done is that recorded by Mr. Pott, where these bodies were contained in inguinal herniæ. A healthy young woman, aged twenty-three, large-breasted, stout, and menstruating regularly, had a painful tumour in each groin, near the abdominal muscles. The ovaria were removed (by mistake it is said) from these tumours by a surgical operation: "She has enjoyed good health ever since, but is become thinner and more apparently muscular; her breasts, which were large, are gone; nor has she ever menstruated since the operation, which is now some years." Pott's Works, vol. iii. p. 329. Here, then, we have fairly reached the end of our enquiries upon this part of our subject; for, without ovaries and without uterus, there can be no conception, no PARTURITION!

OF LABOURS attended with CONVULSIONS.

In some irritable constitutions, the women become convulsed in the course of the labour. This accident more frequently occurs with first than with subsequent children. At whatever time convulsions make their attack, they never completely leave the woman until the labour is over, and sometimes not until the next or subsequent day. In very mild cases, the brain seems but little affected by the convulsions, which partake of the nature of hysterical convulsions: these cases are easily curable, or give way spontaneously when the labour is completed. Of whatever nature, or from whatever causes, puerperal convulsions may proceed, they assist very much in forcing down the child.

At whatever period or state of convulsive labour the accoucheur may be called in, he will generally find it expedient to take away six, eight, ten, or twelve ounces of blood from the arm; and in the space of two hours after, (unless the child is coming into the world,) this should be followed by a clyster to empty the bowels. After the operation of the clyster, from twenty to thirty drops of the tincture of opium may be advantageously given, which will generally succeed in making the fits less frequent and violent. The labour must now be conducted in the same manner it would have been, if it had not been interrupted by the convulsions. If the child presents in a natural posture, and the pelvis of the woman is of the natural form and dimensions, it will be found that the convulsions have assisted much in dilating the os internum, and in accelerating the completion of the labour. If any other part than the head of the child presents, as soon as the internal orifice is sufficiently dilated, the accoucheur will pass his hand into the uterus, and turn the child, and bring it by its feet.

Sometimes, however, the convulsions become so extremely violent as to occasion extreme danger both to mother and child. The woman is quite insensible during the fit, which consists of violent distortions of the muscles which move the body, and of those of the eyes, the face, and the lower jaw. The fit, as it may be called, lasts in some cases only a few seconds, and in others for several minutes. After the fit has ceased, it sometimes happens that the patient remains in a comatose state; in other cases, the sensibility returns.

Thus, then, what in a mild form may be called *convulsions*, will now acquire the name of *epileptic fits*, for such

they really are, and occurring with dreadful frequency: and accordingly, Dr. Merriman, who, in the early editions of his Synopsis, names this order of labours *Dyslocia convulsiva*, now calls it *D. epileptica*; and he adds, "The cases, alone deserving the appellation of *puerperal convulsions*, which have fallen under my observation, have borne a very exact resemblance to the epilepsy; and this accords with the description of the complaint by the best authors on midwifery."

Dr. Hunter, Dr. Lowder, and other teachers of midwifery, used to state in their lectures, that more than half of the women died, who were attacked with convulsions in their labours. Dr. Parr, in his Medical Dictionary, states even a larger amount of fatal cases; he says that, "six or seven in ten elude the most active and best concerted measures." And Jacobs, in his *Ecole Pratique des Accouchemens*, says that it is always fatal; scarce an instance of recovery is known. In modern practice, the proportion of deaths is by no means so great.

It is probable, that hysterical paroxysms have sometimes been mistaken for the true puerperal convulsions; at least, if we may judge from the rapid cures, that have been said to be made by, as it seems, very inadequate means. It is therefore of importance to distinguish genuine puerperal convulsions from hysterical paroxysms, which they often very much resemble. They may be discriminated by bearing in mind, that in hysteria the pulse is rarely affected; the paroxysms come on without the usual premonitory symptoms of convulsions, and attack feeble irritable women rather than those who are plethoric and robust, the usual subjects of convulsion. The fit of hysteria is associated with *globus hystericus* and palpitation of the heart, and is not followed by coma.

The management of puerperal convulsions divides itself into two leading indications: First, to unload the vessels of the brain; and Secondly, to remove the exciting cause, whatever it may be.

1. To secure the first indication, says Dr. Conquest, the *lancet* must be considered as the sheet-anchor on which the practitioner must depend. It is of the greatest moment that the blood be abstracted early, rapidly, and abundantly; that the vessels of the brain may be brought into a state of collapse. If possible, on the accession of the premonitory symptoms, the temporal artery or the jugular vein should be opened; if not, a vein in both arms, and the incision should be so large that a considerable quantity of blood can be withdrawn in a short time. In this formidable disease, the quantity of blood must not be measured by ounces, but by the effects it may produce on the convulsions; and it will often be necessary to repeat the blood-letting again and again within the first few hours. Having unloaded the cerebral vessels in some measure, by the rapid and early detraction of from forty to fifty ounces of blood, should the symptoms not be suspended, from fifteen to twenty ounces may be removed by cupping-glasses applied to the nape of the neck.

If the patient is able to swallow, a pill containing from five to ten grains of calomel should be got down; or the calomel, mixed with moist sugar, may be put into the mouth, and it will be swallowed involuntarily. This should be followed by a solution of salts, every three or four hours, till sufficient stools are procured.

The use of *emetics*, on the attack of puerperal convulsions, has been reprobated in very strong terms by Mauriceau, Levret, and others. But, when there is good reason to suspect an overloaded stomach, an emetic seems to be so appropriate a remedy, that we need not hesitate to employ it. "I do not recollect (says Dr. Merriman) to have given medicines expressly for the purpose of exciting vomiting, but have sometimes seen vomiting take place in consequence of the dose of calomel, and sometimes spontaneously; and have always thought it was rather beneficial than otherwise. Dr. Bard, of New York, in his *Compendium of Midwifery* (1808), says, 8 R "after

"after having emptied the vessels by bleeding, and the bowels by clyster, an emetic will frequently be found of great use, particularly if the stomach is distended, or it should appear that the patient had eaten freely not long before the access of the fit."

The head should be shaved, and a cold wash should be kept constantly applied upon it. Dr. Denman recommended to have the face of the patient frequently dashed with cold water, by means of a bundle of feathers, more especially on each attack of the convulsions. Dr. Hamilton, of Edinburgh, says, that both this remedy and the vomiting aggravate the symptoms; but Mr. Hogben recommends, in addition, the "ringing a large bell, springing a watchman's rattle, or beating a drum, close to the woman's bedside."

In our opinion, the exhibition of nauseating doses of *antimonium tartarizatum* will be highly conducive to the reduction of vascular action; and with this intention may be conjoined with the purgative medicines.

2. The second indication is to be fulfilled after ascertaining the exciting cause, which it is often very difficult to do. It will always be prudent to empty the bladder and bowels; and it will sometimes happen, that, after one or two copious and extremely-offensive and dark-coloured motions have been obtained, the paroxysms cease. But the condition of the uterus is the point now demanding the most attentive consideration; and it is to be feared, that in many instances too much importance has been attached to the immediate emptying of this organ, when it has led to the omission of blood-letting and purging. The result of careful observations made on the influence of delivery over puerperal convulsions seems to be,

First. That, if the os uteri be rigid and undilated, any attempt to empty the uterus by the introduction of the hand into the uterus to expedite delivery, aggravates the convulsions; and, even when the mouth of the womb is open, such an attempt will often bring back the paroxysms.

Secondly. In most instances, the os uteri dilates rapidly in these mournful cases, or is easily dilatable; and in general, the parturient efforts are so powerful and frequent, that little advantage can be gained by any manual interference, until the head descends so low in the cavity of the pelvis, as to be easily embraced by the short forceps.

Thirdly. Should very urgent symptoms appear to justify delivery before the head of the child has descended so low as to be within the reach of the short forceps, either the long forceps or perforator are to be preferred to the introduction of the hand into the uterus, should the attempt to turn produce any recurrence of convulsions.

It does not always happen, that the convulsions cease upon the termination of the labour; on the contrary, they often continue after the birth of the child, and sometimes increase in violence, and at length produce death. If, however, the intervals between the fits become longer, a more favourable prognosis may be formed; but it will be expedient to continue our exertions in relieving the symptoms. The application of the cold wash to the head should therefore be persevered in: a blister may be applied to the back, to the insides of the thighs, or calfs of the legs: sinapisms may be applied to the feet; and, if the patient can swallow, aperient medicines, antifebriles, and light cordials, should be given. Great attention must be paid to the state of the bladder, as the patient sometimes suffers under an inability of expelling her urine; in which case, the catheter should be introduced twice a-day.

When at length the patient recovers, she remains generally insensible of all that has happened to her; her strength slowly returns, and eventually no trace remains of the disease, nor is there much danger of its recurring in a future labour. But Dr. Merriman mentions two or three cases of mania occurring, as soon as the convulsions

ceased, and remaining for some weeks, yet the patients ultimately got well.

Dr. Merriman has stated the results of 36 cases of puerperal convulsions which came under his care, and in which the lancet was used with great freedom, as here recommended. Twenty-eight of the women recovered; and "several of them, from apprehension of a similar attack in their next pregnancy, were bled at their own request, when approaching the full term; and to others it was recommended, on account of severe pains in the head; and there has been no instance of a return of convulsions in their future labours." Synopsis, p. 141. 3d edit.

OF UTERINE HEMORRHAGE.

Hemorrhage from the uterus is always an alarming occurrence. In the unimpregnated state, it frequently evinces a disease of that organ. In the early months of pregnancy it often terminates in abortion; in the latter months it is full of peril both to mother and child; and, even after labour has been accomplished with, apparently, the utmost success, it sometimes bursts forth with sudden and uncontrollable violence, and almost instantaneously deprives the mother of her life; so that there are no cases within the range of obstetric science that demand more prompt, judicious, and vigorous, treatment, than labours of this order.

There are some general rules for the management of uterine hemorrhage, applicable to all cases in which it may occur. The patient is to be kept perfectly cool, in a recumbent posture, in a state of great quietude. If costive, the bowels are to be opened by saline aperients, or clysters of cold water, or salt and water, or vinegar and water, in the proportion of two table-spoonfuls to a pint. The diet must be very simple, taken in very small quantities, and often repeated. No stimulants of any kind are to be allowed. Refrigerant, sedative, and restraining, medicines must be exhibited internally; and in the event of profuse discharge, the topical application of cold water and vinegar, iced water, or ice, to the uterine region, must be made. Other plans of management apply only to peculiar states of hemorrhage. Thus bleeding, which may be sometimes usefully employed in the hemorrhages of unimpregnated women, or in those of early pregnancy, must be cautiously used in the floodings which accompany labour, and are altogether inadmissible in the cases of placental presentations, and in the hemorrhages after delivery. And the *plumbi acetat*, and many other internal remedies, which are efficacious in restraining chronic hemorrhages, cannot be at all relied upon in the floodings of parturition.

The hemorrhages which accompany labour may be either, 1. *Accidental*, as the consequence of some occurrence which partially detaches the placenta from its connexion with the uterus, to which it is usually fixed at some part of the fundus or corpus uteri. 2. *Unavoidable*; as the consequence of the implantation of the placenta over the os and cervix uteri. 3. *Atonic*; i. e. from the want of contractile power in the uterus after the child is born.

1. *Accidental hemorrhage* may be brought on by various causes; such as, passions of the mind; violent exertions in jumping; dancing; coughing, &c. It has also followed a blow or fall; and the lifting of a heavy weight. The quantity of hemorrhage and the degree of danger greatly depend on the area of surface of the placenta detached from the uterus; the force of the general circulation; and the degree of pain; those cases being most dangerous in which there is little or no uterine contraction.

Sometimes the placenta will adhere to the uterus at every point of its circumference, whilst it is so loosened at its centre, that a quantity of blood may be poured out into the space thus formed sufficient to produce syncope, or even death; and yet there may be very little appearance

ance of discharge from the vagina. The following extract shows not only the possibility of this fact, but likewise that sometimes the loss of a quantity of blood, by no means excessive, will produce fatal consequences: "A very singular case of uterine hemorrhage occurred a few months ago in the practice of Mr. Saumarez, which was also seen by Doctors Denman and Dennison. A lady, of a weakly constitution and delicate habit, was attacked in the latter months of pregnancy with a slight discharge of blood from the vagina, not amounting all together to half an ounce, accompanied with alarming symptoms of exhaustion and debility. The os uteri was scarcely dilated to the size of a sixpence, and was in such a state of rigidity as precluded the possibility of affording any manual assistance. The lady in consequence died; and on examination after death, it was found that a separation of the centre of the placenta from the parietes of the uterus had taken place, whilst its edges were completely adherent, forming a kind of cul de sac, into which blood had been poured, to the amount of a pint and half, which had become coagulated within the cavity thus formed." *New Med. and Phys. Journal*, December 1813.

From whatever cause flooding may arise, it should always be viewed as a perilous symptom, and as one demanding prompt and active interference. The following general directions must be universally and rigidly observed. The woman should be laid on a mattress in a horizontal posture, having the pelvis raised higher than the shoulders by some support less yielding than a feather-pillow. The doors and windows should be opened, and the patient have no other covering than such as decency demands. No fire should be permitted to be in the room, and every talkative friend ought to be excluded. As little food as possible is to be given, and that neither warm nor spiced. In fact, every thing that can diminish the momentum of the circulation of the blood must be sedulously employed. The pubes, abdomen, and loins, must have cloths dipped in the coldest vinegar or salt water applied to them repeatedly; or pounded ice in a bladder may be allowed gradually to dissolve on these parts. In addition to these means, salt, or vinegar, and water cold, may be injected into the rectum; and a piece of ice, if it can be easily obtained, may be introduced into the vagina.

Diluted sulphuric acid may be given freely, either in rose-infusion, mint-water, weak cinnamon-water, or any other convenient liquid. But little reliance can be placed upon the other vegetable and mineral astringents; for, though efficacious in cases of *chronic* uterine hemorrhage, their astringent virtues are not sufficiently active in the sudden and violent hemorrhages which accompany the separation of the placenta during labour.

Bleeding from the arm was formerly practised in these cases, with a view of making a revulsion from the uterus; but, unless the pulse is very hard, strong, and active, it can hardly be required; at all events, where the flooding accompanies labour, blood-letting must be very cautiously employed, as it is likely, under many circumstances, to be more injurious than beneficial.

Fortunately, in many cases of sudden and accidental separation of the placenta, a disposition to expel its contents is immediately imparted to the uterus, and the expulsion is facilitated by the relaxation which the hemorrhage has produced. The action of the uterus tends likewise to suppress the hemorrhage; if therefore pains come on, if the flooding in consequence diminishes, and if the patient in some measure recovers her strength and spirits, it may not be necessary to have recourse to any further means of relief; but the patient must still be very carefully watched, for the hemorrhage may suddenly increase, and a very little additional loss of blood may prove fatal.

But, should the means employed to suppress the hemorrhage prove unavailing; should no pains come on, or should they be insufficient to restrain the flooding, and

the danger of the patient augments; something more must be attempted: and, in this perilous situation, two modes of proceeding have been proposed. First, to deliver the woman by turning the child in utero, and bringing down the feet; or, secondly, merely to rupture the membranes that the liquor amnii may escape, and thus the uterus, by contracting on its contents, will so far diminish the hemorrhage, that the patient may go on with safety until the natural uterine contractions expel the child.

The first method appears to be best adapted to those melancholy cases in which there is an absence of all contraction of the uterus, or in which the pains are extremely feeble and inefficient, with a relaxed condition of the cervix uteri. When these two dangerous attendants on uterine hemorrhage are present, the operation of turning often produces some contractile exertions of the uterus, by which the danger is materially lessened. The second method is applicable to those cases in which there are labour-pains; and, from the concurrent experience of practical accoucheurs, it may be depended on as successful.

2. *Unavoidable hemorrhage* is the name given by Dr. Rigby to that species which is produced when the placenta is attached over the cervix uteri, so as to block up the passage.—This species of hemorrhage was not generally understood till of late years. It was formerly supposed, when the placenta was found presenting, that, having been accidentally separated from the fundus, it had fallen by its own weight to the os uteri, which it closed up, so as to prevent the child from passing. More accurate observations and dissections have proved, that, when the placenta presents, it has been *ab origine* implanted over the cervix uteri, so that flooding very naturally occurs at any time after the fifth month, when the expansion of the cervix uteri lacerates those vessels which pass between it and the placental mass. Hemorrhage from this cause places the woman in most imminent danger; for, on the accession of pains which dilate the os uteri, other vessels are torn, and the bleeding recurs.

This is a case in which we ought never to confide in the powers of nature, because expulsive uterine efforts only augment the peril of the patient, as will be extremely evident from considering, or figuring to yourself, the position of the parts: the child's head presenting for delivery, but pressing upon the interposed placenta which fills up the passage. Dr. Hunter's 12th Plate is a representation of this case of unavoidable hemorrhage, which proved fatal. The engraving has been copied by Dr. Merriman and Dr. Conquest, whose works are in every body's hands; it has also been copied in Dr. Parr's Medical Dictionary, but (very unfortunately) to show the natural position of the foetus in utero at the commencement of labour!

We have seen that, in the preceding species, the *accidental*, the hemorrhage is checked at least, if not stopped, by the labour-pains; but, in this, every pain tends to produce more dilatation of the os uteri, and consequently a greater separation of the placenta, and an increase of the hemorrhage; it is therefore in vain to expect that the natural pains will effect the delivery. The interposition of art is called for, and must be timely applied, or the patient will be lost. In all cases then of attachment of the placenta over the os uteri, it is incumbent upon the accoucheur to make up his mind to the operation of turning the child, and bringing it into the world by the feet.

Here and there women do well without the interference of art, but much more commonly nature is unequal to the task, and the patient would be lost for want of timely assistance; so that all the best practical writers are unanimous on this point, that the case of a placenta adhering over the cervix uteri is not to be trusted to nature. "This practice is no longer a matter of partial opinion, on the propriety of which we may think ourselves
at

at liberty to debate; it has for near two centuries met the consent and approbation of every practitioner of judgment and reputation in this and many other countries." *Deuman.*

Should the flooding be such as threatens to prostrate the powers of the system, the operation ought not to be deferred, or one gush of blood may close the painful scene; and, whenever it becomes essential to the safety of the patient to proceed immediately, although the os uteri may not be open, it will be found in so dilatable a state as not to oppose any hindrance to the introduction of the hand into the uterus. When the hemorrhage occurs between the fifth and eighth months, it is usually not very formidable at first, so that, if the os uteri be not dilated or dilatable, the operation may generally be deferred for some hours with safety; whilst at the same time it is of the highest importance not to permit the woman to be exhausted by the loss of blood before turning is effected.

If, on examination per vaginam, every part of the os uteri be found covered by the placenta, and no point be found at which it is thinner than another, the fingers must perforate the substance of the mass, and, the hand of the accoucheur being passed through, the feet of the child are to be brought down through the aperture, and the woman delivered as soon as circumstances will admit. Sometimes the os uteri is only partially covered with the placenta, so that the hand can be passed by its edge to the membranes without difficulty. Whenever this can be accomplished, it should be preferred to the passage of the hand through the substance of the placenta.

In whatever way admission may be obtained into the uterus, the operation of turning is to be performed under the guidance of those directions which have been already given.

The child being extracted, the placenta is generally found quite separated: this may therefore be removed, and the practitioner should then satisfy himself that the uterus is duly contracted. The patient will require very assiduous attention after such a labour, and is generally very long before she recovers.

3. *Atonic hemorrhage.*—The disorder here referred to is not that loss of blood which very frequently attends the contraction of the uterus which expels the child, and at the same time loosens a small portion of the placenta; nor that which merely circulated through the uterus, and which on the complete detachment of the placenta, and the contraction of the organ, is expelled from its vessels, now so diminished in their size; but it is those successive gushes, or more insidious but not less dangerous stillicidium, of the vital fluid, which, if not arrested sooner or later, fatally exhausts the subject of them.

Torpor of the uterus, or irregular contraction of its fibres, is almost an essential feature of uterine hemorrhage occurring after the expulsion of the child; except in those cases which arise from the placenta being partially detached, whilst the mass being still adherent and retained in utero, prevents the complete contraction of the uterus.

Some women are so liable to floodings, as to be attacked with them after every labour: such patients should always have a bandage placed round their body, before they lie down on the bed for the purpose of being delivered. This bandage should be made with several straps, which may be gradually and sufficiently tightened as soon as the child is born: by this means profuse hemorrhage will often be prevented.

Although the loss of a small quantity of blood is common on the detachment and expulsion of the placenta, and does not demand interference; it is of the highest moment not to defer the adoption of energetic measures until formidable consequences begin to appear, because, if hemorrhage is allowed to proceed, although it may not immediately endanger the life of the patient, the constitution may be so enfeebled as to be unable to restore

itself to its former vigour; or the foundation may be laid for chronic and fatal disease.

The primary object in the management of those cases of flooding which result from a loss of contractile energy in the uterine fibres, is to re-excite the contractions of the uterus, if they shall have entirely ceased; and to quicken their activity if they be continued feebly. Whether then the placenta be detached or not, the practice is the same; for surely nothing can be more culpable than the dangerous custom of some men, who recommend "that the hand must be immediately introduced within the uterus to grasp the placenta, and instantly extract it." The consequences of such irrational practice is an augmentation of peril; for the very obvious reason, that the open mouths of a great number of vessels are exposed. In some rare instances, the placenta is thrown off, and lies loose in utero, preventing the complete contraction of the organ. Whenever that is the case, there can be no hesitation about the propriety of carefully withdrawing it; but not unless the uterus has firmly contracted on it.

Internal irritation of the uterus with the hand; and external pressure and friction, with the application of cold; are the principal remedial means on which our dependence must be placed, to re-excite the action of the uterus; and without which a woman is not secure. Whenever the uterus is found to be uncontracted, the hand is to be gently passed into it; and, when introduced, to be freely but tenderly moved about within its cavity. Whilst this is being done, an assistant may employ friction to the abdomen or loins, round which the broad bandage has been previously applied, that it may be gradually tightened without disturbing the patient; or, whilst the left hand of the accoucheur is in utero, the right may grasp the uterus externally; a measure which is often eminently conducive to the attainment of the object so much to be desired. The hand is never to be withdrawn from the uterus, until it begins to contract, except it be to empty the organ of coagula, which, by distending it, will frequently prevent its contractions altogether until they are removed.

In less dangerous cases of hemorrhage, the application of cold to the pubes, perineum, abdomen, and loins, will frequently arrest its progress. This remedy may be applied by cloths wrung out of cold vinegar or salt and water; or by the more impressive method of dashing the parts with cold mixtures; or by the still more efficacious use of pounded ice in a bladder, allowed to dissolve gradually on the abdomen; or a piece of ice introduced into the vagina or rectum, as directed in the first section.

Should there be irregular contraction of the muscular fibres of the uterus, either constituting the hour-glass contraction, when the circular fibres are affected with spasm about the centre of the organ; or the oviform contraction, when all the circular fibres act spasmodically, whilst those which take a longitudinal course appear to be more than usually relaxed; the hemorrhage will be checked by such means as relax spasm, and induce regular and universal contractile efforts. Flooding from this cause must be attacked by a full dose of opium, (not less than forty minims of the tincture, or three grains of the gum;) and immediately on the cessation of spasmodic action, which is manifested by the diminution of pain in the back, the hand of the accoucheur must be introduced into the uterus, for the purpose of gently dilating the stricture, emptying the organ of its coagula, and stimulating it to more healthy contraction.

Syncope, or fainting, is not an unfrequent consequence of flooding; and, although it is beneficial when contrasted with continued hemorrhage, yet it must ever be viewed as an evidence of danger, and as indicative of extreme loss of energy in the vascular system.

It may be here observed, that there are three important agents concerned in restraining uterine hemorrhage; —uterine

—uterine contraction; the formation of coagula, which block up the mouths of the bleeding vessels; and the contraction of the vessels themselves; for, although muscular irritability may have ceased, the contractility of the arteries continues. It is therefore of great importance not to interfere with either of these powers; and, as syncope never exists without that diminished action of the heart and arteries, which cannot send the blood to the brain or extremities with sufficient power to prevent a collapse of them, it becomes highly momentous to regard *moderate fainting* as a salutary symptom, because, during its continuance, the mouths of the vessels may and often do become so sealed by the formation of coagula, that hemorrhage ceases.

Syncope, then, being useful in checking the momentum of the circulation, and, as a consequence, in putting a stop to flooding, ought never to be rashly interfered with, as it too frequently is by the exhibition of large and repeated doses of brandy, and other powerful stimulants. Still a woman must not be permitted to die from exhaustion, if it can be prevented; and therefore, when extreme prostration of the vital powers exists with syncope, small and repeated doses of such stimuli as brandy, or ammonia, must be given. Under such circumstances, sprinkling cold water on the face and chest will sometimes rouse the almost ex-animate woman. Ammonia may also be applied to the region of the heart, whilst the flow of blood is invited back to the extremities by the application of warmth.

In a few words then, it must be admitted that the administration of stimulants and cordials to a woman in a greater or less degree exhausted by uterine hemorrhage, is one of the nicest points in obstetric practice; and, as a general rule, it may be laid down, that they are admissible but in few instances, and only to be exhibited to such an extent as may be necessary to support or to restore the circulation.

It is not unusual for a woman to be apparently doing very well for some little time after delivery; and yet, although the uterus shall have contracted in a great measure, blood may be poured out into its cavity so as to re-distend it, and, in consequence of the *coagula* blocking up the mouth of the womb, no hemorrhage shall appear per vaginam. Such a woman will complain of being faint, with tinnitus aurium; her countenance becomes pallid; nausea and vomiting, with extreme restlessness, sometimes follow; the pulse sinks; and if she be not speedily relieved, after a slight convulsive paroxysm, or one or two gasps, she expires.

Such symptoms naturally lead to an external and internal examination, which detect a re-distended uterus filled with coagulated and fluid blood. Under these circumstances, no time must be lost, or vacillating and inefficient treatment may soon place the patient beyond the reach of means. One hand should be immediately introduced within the uterus, to empty it of coagula, and to stimulate it to contract, whilst pressure is made on the abdomen, and the uterus grasped with the other. Besides this, such other means as have been already recommended to restrain the flow of blood, should be promptly and perseveringly adopted.

The exhibition of very large doses of opium, to restrain uterine hemorrhage, has been recommended by several deservedly-eminant accoucheurs. Both reason and experience appear to concur in condemning this practice; for, whilst it is admitted that under some circumstances opium is highly beneficial, its indiscriminate employment is undoubtedly fraught with mischief. The result of calm and dispassionate investigation on this subject is, that opium in large doses in cases of uterine hemorrhage generally does harm, by paralyzing the contractile energies of the uterine and arterial fibres; and that this valuable medicine is useful, and only useful, under the existence of some such circumstances as the following.

It is decidedly beneficial, when hemorrhage has gone

on until the vital powers have become reduced extremely low; and when, with other symptoms of exhaustion, the stomach manifests great *irritability*. It is no less valuable an agent, when hemorrhage is the consequence of irregular contraction of the uterine fibres, whether of the circular or longitudinal. In either of these cases, it is a very efficacious article of the materia medica; but it appears most dangerous to attempt to maintain its utility, or to rely on its efficacy, in cases of active and alarming uterine hemorrhage. When exhibited under the before-mentioned circumstances, to secure its full effect, it is necessary to give it in doses of four or five grains, repeating it every second or third hour whilst necessary, with a diminution of one grain from each successive dose.

Dr. Copland (Lond. Med. Journal, Aug. 1821.) says, "I strongly entertain the opinion that the oleum terebinthinæ is calculated to be of the most essential benefit in puerperal menorrhagia, or flooding, if given in a dose of an ounce or upwards. If exhibited in this quantity, I have no doubts of its influence in promoting the contractions of the uterus; and by these means, producing the contractions and varied inflections of the vessels, affords a mechanical, but at the same time a natural, obstruction to the flow of blood, and soon terminates the mischief. Against this most alarming of all natural hemorrhages, I also consider an enema of at least two ounces of this substance ought to be immediately administered. I recommend this, with the utmost confidence of success, to those whose practice affords them opportunities of putting it to the test of experience."

Lastly, some writers have strongly recommended to *plug-up* the vagina with tow, lint, a soft napkin, or other convenient substance: and thus to prevent the blood from escaping through that passage. The advantages of this practice must be very limited. It may be useful in some of the slighter hemorrhages, that occur in the early months of pregnancy, when the uterus has neither acquired any great size, nor is very distensible. But it can never be relied upon, after the uterus has acquired much bulk, or is capable of being largely dilated; for, however completely the *vagina* may be closed, as no pressure can be made upon the open vessels within the *uterus*, these might continue to pour out blood into the uterine cavity, sufficient to destroy the patient's life, though not a drop of discharge was visible without the vagina. The arteries of the uterus cannot be closed, except by a due degree of contraction of that viscus; whenever the uterus is in a distended state, the arteries will continue pouring blood; and, the greater the accumulation of coagula within it, so much the greater will be the amount of hemorrhage. The presence of the *plug* then, by preventing the escape of the coagula, so far from benefiting the patient, adds to her peril. The *plug*, therefore, is inapplicable in all cases where the bulk of the uterus exceeds that of a pregnancy of three or four months, or when the parietes are so easy of distension as to yield readily to the accumulation within it.

Mr. Bishoprick of York, in a letter to Dr. Duncan, gives the following account of a medicine which he has found highly efficacious in cases of uterine hemorrhage. "I have had considerable experience and success in the practice of midwifery in this city and its neighbourhood for more than forty years; and, having in that time met with many very troublesome, and some very dangerous, cases of uterine hemorrhage, I beg leave, through your useful repository, to communicate to the public, for the benefit of mankind, a medicine which I have found of great efficacy in relieving such cases. This consideration, I flatter myself, will render it not unworthy of attention, especially as the health of that class of patients, who are the subject of this complaint, is of the utmost consequence to the happiness and welfare of both themselves and families."

Before we copy the formula, we must observe, that no great reliance can be placed upon the power of any medicine

dicine in sudden and dangerous floodings, such as have been the subject of the preceding pages; but, where the symptoms are not very urgent, it may be useful: we give it, therefore, merely as a family-receipt.

"Take of burnt vitriolated copper, commonly called blue vitriol, eight ounces; of dragon's blood two ounces; of rectified spirit of wine two pints. Let the ingredients, reduced to powder, and put into a matras containing the spirit, be digested in a sand-heat for four days, shaking up the vessel three or four times a-day, and then let the tincture be decanted off clear for use. The burnt vitriolated copper is prepared in the same manner as the burnt alum, according to the directions of the College of Edinburgh, in their Pharmacopœia, by putting the ingredients into a crucible, and suffering it to remain upon the fire until it ceases to bubble.

"This preparation first came into my hands as a nostrum; and, finding it upon trial to afford relief beyond my expectation, I have never ventured to make any alteration in it. With respect to the dragon's blood, if the gum kino were substituted in its stead, it would be an improvement similar to that which was made by the Edinburgh College, when they reformed the prescription for the styptic powder, now called the Compound Powder of Alum.

"My usual mode of administering the tincture was by giving from forty to sixty drops in an ounce of red-port wine mixed with an ounce of water three or four times a-day. The doses have sometimes been enlarged, although not often, but generally without any inconvenience. The tincture, in some cases, may likewise be given with propriety, in draughts coinciding with the general intention. In these, the principal ingredient may be either nitre, neutralized salt of wormwood, or the Peruvian bark, at the discretion of the practitioner. Patients with delicate stomachs will sometimes, though rarely, be affected with a slight degree of nausea from the use of the tincture. In such cases it will be advisable to omit five or ten drops, more or less, of the former dose, until the medicine shall sit easily upon the stomach. I know of no other operative effect, except that it sometimes proves rather astringent.

"In cases of considerable uterine discharges continuing after natural labours or miscarriages, likewise in cases of menorrhagia, or the overflowing of the menses in non-pregnant women, I have experienced the most extraordinary good effects from the administration of this medicine. Some good effects have generally been perceptible in the course of a few days; and I have met with very few cases which were not materially relieved by it, of which a considerable number have been perfectly cured. Indeed, my reliance on the efficacy of the medicine has been such, that for more than thirty years past I have very seldom given it in any other vehicle than a little red port and water, or with any other medicine coinciding with the same intention during its use." Duncan's Med. Com. 1795.

OF LABOURS attended with violent EMOTIONS of the MIND.

Practitioners of all ages have agreed, that the action of the uterus is very much influenced by the mental powers. Evidences of this are to be found in many medical records; and the fact is presented to our view in many occurrences of common life. It is, therefore, to be considered of importance, that the mind of the parturient woman should be kept as easy and tranquil as possible. See p. 680.

Dr. Merriman was one day sent for in great haste, to one of the villages in the neighbourhood of London; on his arrival at the house of the patient to whom he was called, he found her undelivered and quite dead. At the moment, little information as to the cause of her death could be obtained; but some time afterwards the following particulars were communicated to him:

The woman had been servant to a lady, who was Dr.

Merriman's patient; and left her to marry a man, in business as a poulterer. She soon became pregnant, and made up her mind to be attended by the doctor she had been in the habit of seeing at her former mistress's labour. But, when she mentioned this her intention to her husband, he objected to it; alleging, that Dr. Merriman would not attend her at such a distance, unless he received a larger fee than it would be prudent in them to pay; and that there was living in their own neighbourhood a most respectable apothecary, who was a customer; and who, on that and other accounts, was a more proper person to be employed. A great deal of unpleasant altercation took place between the husband and wife upon this subject, which was frequently renewed, and the relations of both parties were appealed to on the occasion; all, or the majority, of whom thought the husband right in maintaining his opinion, and censured the wife as pertinacious and self-willed; so that she felt herself compelled, though very reluctantly, to give way; and the gentleman in question, who of course knew nothing of these family-disputes, was engaged to attend her; notwithstanding her constant declaration, that "she hated the very sight of him."

When the first symptoms of labour came on, and her nurse and some female friends were assembled, it was proposed that her accoucheur should likewise be sent for; but she begged that he might not, as she was sure she was not bad enough yet. After a time it was again proposed to send for him, but she still objected. Again and again her friends tried to prevail upon her to see him, but all in vain: if it had been her own doctor, as she termed it, she would willingly, she said, see him; but, as it was, Mr. J.— should not come near her till he was really wanted. At length, one of the women in the room, disgusted with so much obstinacy, went down stairs, and told the husband, that the presence of her medical attendant was absolutely required; and accordingly he was immediately sent for. Unfortunately, and certainly very inconsiderately, he was, on his arrival, without being announced, introduced at once into her room. The shock of thus suddenly and unexpectedly seeing the man against whom she had been long nourishing such a perverse dislike, occasioned her to scream out, and she fell back upon the bed in a fit, from which she never recovered. In the confusion which ensued, a messenger was sent in great haste to London for Dr. Merriman; but, as already stated, before he arrived at the house, the woman was quite dead. No attempt had been made to extract the child, nor could leave be obtained to open the body; so that the immediate cause of her death was never discovered; but that the sudden emotion was the exciting cause, seems unquestionable.

Such extreme cases as this rarely occur; but various kinds of mental excitements continually prevail, and without producing the more violent ill-consequences, tend however to disturb and interrupt the favourable process of child-birth. The influence of mental emotions over the act of parturition was strongly and very extensively exemplified, not long since, on the occasion of the sudden decease, immediately after delivery, of an illustrious and most amiable personage. And indeed that calamitous event was found to operate unfavourably on the minds of patients in a certain rank of life for some considerable time afterwards. The death of Dr. Croft, in consequence of having met with some untoward accidents, is fresh in every one's memory.

MANAGEMENT OF MOTHER and CHILD AFTER DELIVERY.

The following directions are chiefly from Dr. Conquest's Outlines of Midwifery.

Supposing the child and placenta to be expelled, the accoucheur being satisfied that the uterus is well contracted; the bandage which had been passed loosely round the abdomen previous to delivery is to be moderately tightened; and, after the removal of any coagula that may

may have escaped from the uterus, soft and well-aired napkins are to be applied to the labia pudendi, and above and below the nates, so as to be interposed between them and the wet clothes.

Presuming that neither hemorrhage or any other circumstance requires a state of absolute rest for a longer time, the woman may remain for half an hour in the same situation as when delivered; after which, her soiled linen may be removed, and the clean clothes, which had been previously passed round her chest, may be drawn down, and she very gently moved up in the bed by one assistant at her shoulders, and another at her feet. Whilst these things are done, the patient should be a *passive* being; and on no account be raised from her horizontal position, as hemorrhage, syncope, prolapsus, or inversion uteri, may be the consequence.

After this, she may take some simple nourishment. The room should be kept dark, cool, well ventilated, and free from talkative friends; and the medical man, on seeing her before leaving (it being presumed that he remains in the house until the woman is comfortably in bed), should enjoin strict quietude of body and mind. Dr. Merriman relates the circumstances of a fatal accident which arose from inattention to this advice: The aged mother of a patient, contrary to the advice of her friends, was determined to be present at the labour, and was very much agitated and terrified by her daughter's outcries, though the labour was perfectly natural, and unaccompanied by any alarming symptoms. Soon after the accoucheur had left his patient, quite safe as he supposed, she complained of being faint; and begged to have some hartshorn to smell. The trembling mother hastened to the bedside with a phialful in her hand, and, in her hurry and perturbation, poured the contents into her daughter's mouth and throat, as she lay on her back, and instantly suffocated her. Before the physician, who lived but in the adjoining street, could reach the house, she was quite dead; and, though means of recovery were diligently used, they failed of success.—Watts, in his *Reflections on slow and painful Labours*, p. 69, mentions two similar accidents, from one of which the patient recovered.

Nothing can be more irrational than the too-prevalent custom of exhibiting large and repeated doses of opium to a woman after delivery. It is true that a patient after labour is found in a state of fatigue and irritability, and may therefore be benefited by a single and moderate dose of this article; but the frequent repetition of it is decidedly injurious, not only by producing the ordinary unpleasant effects of opium, but more especially by its influence over uterine action, which it so enfeebles or suspends, as to counteract the efforts which it makes to expel coagula, and perfect its restoration to its original dimensions by those secondary and very salutary contractions termed *after-pains*, and for the removal of which opiates are so universally and so generally prescribed. These should rather be encouraged (than counteracted) by the occasional employment of friction over the uterine and lumbar region, and by the exhibition of a purgative, which during its operation materially assists and accelerates the contractile energies of the uterus.

On the second day subsequent to delivery, the bowels should be acted on by a common domestic enema, or by the exhibition of a moderate dose of castor-oil, or any other mild aperient. The early employment of purgatives also moderates the secretion of milk, by which the woman is saved from considerable suffering. Should it happen that the breasts become extremely tumid, hot, and painful, it will be necessary to act more freely on the bowels, so as to obtain several loose motions daily, and this object will be best secured by repeated doses of some saline aperient. In addition to this, the breasts must be kept very cool, and, every few hours, gentle friction of them should be enjoined on the nurse. This

may be performed by the hand, between which and the mammae there should be interposed a little hair-powder or oil; and the latter may be medicated by the addition of camphor, as in the *linimentum camphora*.

The bladder now and then does not perform its functions as it should after delivery; and this inability occurs sufficiently often to render it a part of the duty of an accoucheur, on his first visit, to inquire of the nurse into the state of this organ, and to reiterate his inquiries until he is convinced by the most unequivocal language, that his patient has really emptied the bladder, and not merely parted with a small quantity of urine by *stillicidium*; and, should any doubt remain on his mind, he should examine externally above the pubes.

Many women suffer during the remainder of their lives from the very general and reprehensible custom of indulging themselves too soon in an upright position; and even those who are solicitous to remain longer than is necessary in bed, often do themselves much mischief by a half-recumbent posture, presuming that, if the lower extremities are kept horizontal, the position of the trunk is unimportant. The absurdity of this opinion is so manifest, that it needs no refutation; nor can it excite surprise that procidentia uteri, sanious discharge, and subsequently leucorrhœa, should be the consequences of such mal-practice, when the relaxation of the passages, and the size and weight of the uterus, are considered. Still there can be no necessity for a woman to be confined under the bed-clothes for a month; and, if the horizontal posture of the pelvis and body be preserved, it may be done as well on the outside of the bed, or on a sofa.

The lochial discharge (or *cleansings*, as it is called by nurses) is a sanguineous secretion from the extremities of the secreting vessels of the uterus, which, being mixed with detached and decomposed filaments of the tunica decidua uteri, continues to flow from the passages from five to thirty days after parturition. At first, it is decidedly sanious, but in a few days it becomes much paler and brownish, or of a dirty green hue, so as to acquire among women, the term of "green waters." The quantity of this discharge varies very much in different women; in some being extremely scanty, especially in those who have lost much blood by uterine hemorrhage; whilst, in others, the secretion is so profuse as to require medical interference. The internal exhibition of the mineral acids, with catechu, often does good; and sometimes benefit is derived from a combination of myrrh and iron, as in the *mistura ferri composita*.

With respect to the *domestic* management of the puerperal woman, it is important to observe, that, for some time after delivery, her food should be less in quantity, and more simple in quality, than she was accustomed to before, because though a lying-in room is not absolutely a sick room, yet so sudden and so great is the change in the habits of the patient, perhaps from high activity to perfect quietude, that the same diet which she has previously taken could not now be borne without inconvenience.

It is customary to compel a woman under these circumstances to live almost exclusively on gruel or broths; and it is no uncommon thing for her stomach to be most involuntarily distended with several pints of these articles daily. The practice seems extremely irrational, and is often highly injurious. It frequently not only enfeebles the stomach, but, by keeping up constant perspiration, debilitates the whole system, and renders it very susceptible of cold; and is one cause of an immoderate secretion of milk, which becomes a source of great distress to the patient. For some days after delivery, therefore, whilst these articles may constitute a part of her diet, their quantity may be less, if in the middle of the day a light pudding, containing an egg or two, be substituted. The components may be varied until the woman

woman resumes the ordinary family-diet, which, if nothing unfavourable has occurred, she may begin to do about the tenth day.

The diet of a nurse should be simple, nutritious, and such as is easily digested. It is an established fact, that, if plain and nourishing, a mother may, with impunity to a child, gratify herself in any article of food, if she at first habituate her stomach to it; and it will rarely be found that any thing will disagree with an infant which agrees with herself.

It is a common prejudice, and a great error, that nurses should "live well," in the abused acceptation of the words. Nutritious diet is certainly necessary, but rich living renders the milk gross and indigestible. It is of some importance that food be taken frequently, and in small quantities, as the milk is secreted in a few hours, probably in about five, after the stomach receives its nourishment. The milk is then fit for the sustenance of the child; but, if secreted much longer, it becomes unfit, because the serum, or thinner parts, become absorbed, and those parts only which are digested with more difficulty remain in the breast.

There is an evil too generally prevalent, and most pernicious in its consequences on individuals and on society, and by no means confined to mothers in the lowest classes of the community, which cannot be too severely reprobated;—it is the wretched habit of taking wine or spirits to remove the languor present during pregnancy and suckling. It is a practice fraught with double mischief, being detrimental both to mother and child. The relief afforded is temporary, and is invariably followed by a greater degree of languor, which demands a more powerful stimulus, which at length weakens, and eventually destroys, the tone of the stomach, deteriorates the milk, and renders it altogether unfit to supply that nutriment which is essential to the existence and welfare of the child.

Some young mothers greatly increase their fatigue in suckling, by the awkward manner in which they place their children at the breast. A woman should use her child to such positions in giving it suck as are most easy to herself. If in bed, the child should take the breast as it lies, and not incommode the mother by obliging her to sit up in bed; because, without any benefit to the child, the mother's fatigue is greatly augmented. When up, the mother should by all means sit upright, and raise the child to her breast. The distorted posture so commonly seen in suckling, produces excessive pain in the back and limbs, without relieving the child in any respect.

Fretfulness, agitation, and violent emotions of the mind, invariably do injury to an infant at the breast. The milk becomes vitiated, its secretion very often diminished, or altogether suspended, and the little sufferers have in many well-authenticated instances fallen victims to the indulgence of these passions by the nurse or mother. Unless very peculiarly urgent reasons prohibit, *a mother should support her infant on the milk she herself secretes*. It is the dictate of nature, as well as of common sense and reason. Were it otherwise, it is not probable that so abundant a supply of suitable food would be provided to meet the wants of an infant, when it enters on a new state of existence. It is difficult to estimate the mischief resulting from infants being deprived of their natural nourishment; for, however near the resemblance may be between food artificially prepared and breast-milk, still reason and observation demonstrate the superiority of the latter to the former.

No children exhibit such unequivocal signs of health, or bear up so well under disease, as those that live exclusively on the breast. Wherever instinct and nature are permitted to teach, such is the course which they point out; and happy would it be for mankind, if parents would so far return to a state of nature, as to regulate their own diet, and that of their children, by her simple and salutary dictates. In many parts of the world where children attain to the greatest beauty and

vigour, they are not permitted to have any other nourishment but the mother's milk, till they have attained the age of twelve months; and some of the finest and most robust children to be seen in this country are those that are reared in a similar manner. And, as a further inducement, it should be remembered, that medical men concur in their opinion that very rarely does a constitution suffer from giving suck; whilst the health of many women is most materially improved by the performance of the duties of a nurse. Delicate females are generally strengthened by nursing, and many of the complaints incident to women are removed by it. Fewer women die whilst nursing than at any other period of life; and it is a very common observation that their spirits are more lively and uniform, their tempers milder and more even, and general feelings more healthy and pleasant, than under any other circumstances.

A very serious evil resulting from a woman neglecting this imperious duty, is the probability of her becoming more frequently pregnant than the constitution of most females can sustain without permanent injury. A woman who suckles her children, has generally an interval of a year and a half, or two years, between each confinement; but she who, without any adequate cause for the omission, does not nurse, must expect to bear a child every twelve months, and must reconcile her mind to a shattered constitution and early old age.

Presumeing that the laudable determination is formed to indulge the child with that nutriment which is designed for its support, it becomes necessary to state, that, unless very strong objections should exist, *twelve hours* should never elapse before the infant has been put to the breasts. Instinct directs it what to do; and the advantages of allowing it to suck soon after birth are many and important, both to the mother and child. By this commendable practice, the parent is generally preserved from fever, from inflamed and broken breasts, and from the distressing and alarming consequences resulting from these complaints.

If the breasts should not have secreted milk previous to delivery, the act of suckling will encourage and expedite the secretion. Thus the mother will be saved from much of the pain connected with distended breasts. Besides which, if the infant be not put to the nipple till the breasts become full and tense, the nipple itself will sometimes almost disappear, on account of its being stretched; and, without much and often ineffectual labour on the part of the child, it cannot be laid hold of; and even then the pain endured by the mother is exquisitely severe, and not unfrequently the cause of sore nipples.

It must be admitted that some mothers cannot suckle their infants. Still it should be attempted, unless it is altogether impossible; for, though a woman may not be able to persevere for any considerable time, yet suckling, if but for three or four weeks, may avert those local and general complaints which have been before named. Many nurses are too often discouraged when children are awkward in taking the breast, or when the nipples are flat and sore: but not unfrequently, if the mother has but resolution to make the attempt, she will be able to suckle, though she may have been foiled in two or three, or more, previous confinements. *Conquest, 173-182.*

Females are subject to what is called the *milk-abscess* during the whole period of suckling, but they are more especially liable to be affected with it immediately after delivery; and it is to the abscess which is wont to occur at this particular time that our remarks will be confined. The character of this abscess is phlegmonous, more or less; and its formation in the breast is attended by the same phenomena as the formation of phlegmonous abscess in any other part of the body. On the second or third day after delivery, when a copious secretion of milk has begun, the attack commences, and is marked by fullness, general tension with more or less hardness, and an uneasy sense of weight in one or other of the breasts: these

symptoms are shortly succeeded by tumour, heat, redness, pain in some part, very commonly the upper and outer, of the breast affected, together with symptomatic fever. Slight shiverings now quickly supervene, and the suppurative process is established. The abscess, if not interfered with by the officious surgeon, bursts spontaneously, usually between the ninth and fourteenth days; the matter then escapes, and all the symptoms, local and constitutional, are alleviated.

The treatment of milk-abscess is very simple; the less, indeed, is done the better. Emollient fomentations with scalded plant-leaves suffice for the inflammatory stage, and oatmeal or linseed poultice for the suppurative. The same kind of poultice should also be continued after the bursting of the abscess, and until it be perfectly healed, be the length of time what it may. Unguents and greasy dressings do not sufficiently encourage discharge; whence it happens that, where they are employed, inflammation and suppuration again take place, and these occasionally more than once; whereas, if the poultice be uninterruptedly continued, all does well. The indisposition of the milk-abscess to heal may possibly be owing to the great determination to the breasts during the first months of suckling; and, indeed, it is not unreasonable to suppose that nature keeps this as it were natural issue open, to counterbalance the dangerous plethora that might otherwise happen from the suppressed secretion of milk.

Such is the course, and such the treatment, of milk-abscess; but the point of the greatest moment, and to which we are anxious to draw the attention of the profession, is the *prevention* both of abscess and of inflammation. The frequency of milk-abscess in the human species, and the rareness of it in the brute creation, cannot fail to strike the observant mind. The just-yeaned lamb empties without difficulty the loaded dug of its parent ewe, and the fresh-dropped colt the distended udder of its dam; but the new-born infant, although healthful and strong, often strives in vain to draw milk from the gorged bosom of its mother. The attentive nurse applies it again and again, but without avail; the milk accumulates more and more, and inflammation and abscess succeed. The cause of failure is not with the infant, for it sucks well; the impediment, therefore, must exist on the part of the mother, and examination of the breast immediately discovers this to be the case; for the nipple is invariably found to be so *flat*, and imperfectly formed, as not to afford hold for the child. There is no reason, *in nature*, why the nipple in the human species should be so very often incompletely developed, while the teats of animals are, without exception, as far as we know, prominent and perfect. The only cause to which the defect can be attributed is the continued pressure, which, from the peculiarity of the female dress, (and of one part of it in particular, the stays,) the bosom is subjected to from childhood; and it is this pressure, without doubt, which prevents the full development of the nipple.

The imperfect nipple is the exciting, and distention of the lactiferous ducts the proximate, cause of milk-abscess: it is therefore manifest, that, if a proper nipple can be formed so as to admit of the milk being abstracted, abscess will be prevented. Now the formation of a good nipple is by no means difficult: so far, indeed, from this being the case, that we believe it is always practicable; and the means by which it can be accomplished is by the glass shield, or *breast-pump*. In a few hours after delivery, it is incumbent on the accoucheur to examine the patient's breasts, to ascertain whether or not the nipples are sufficiently prominent; and, if one or both prove otherwise, he should immediately set about to remedy the defect, for, by the early and repeated use of the pump, the nipple may be well drawn out before the secretion of milk takes place. The pump should be applied over the flat nipple, and the degree of exhaustion of the air from the glass should be regulated by the feelings of the patient: the nipple will protrude into the

mouth of the glass, and may be kept there two or three minutes; the pump is then to be taken off, and in the space of two minutes more to be again applied; and in this manner five or six times successively; and, on its being finally removed, suction should *instantly* be performed by the nurse for several minutes, for, unless it be done instantly, the nipple retires. The application of the pump must be repeated every three or four hours, as long as it may be required; taking care always that the nurse or infant suck that breast immediately on the removal of it. In this way the accoucheur will never fail to procure good nipples, and, by so doing, may preserve his patient from all the inconveniences and sufferings attendant on milk-abscess. It is true that all this gives the practitioner a great deal of trouble; but it is amply recompensed by securing to him the good wishes and interest of his patient, and by increasing his reputation. The pump is rarely had recourse to with any other view than to abstract milk from the breast; but to this end it is quite inadequate, which may be the cause why it is not in more general use. In using the pump, it is advantageous to anoint the fore-part of the breast with oil, for this very much facilitates the entrance of the nipple into the mouth of the glass, and preserves the skin from abrasion. *London Medical Journal*, Aug. 1821.

THE INFANT.—A medical man ought never to think it beneath him to direct a nurse or mother on those little attentions which a *new-born infant* demands on its being ushered into the world. The temperature which it leaves is about 98°; consequently care is required that it be not suddenly exposed to a reduced temperature, or to the heat and glare of a fire.

A receiver of fine flannel, with a square of old soft linen or calico tacked on its centre, should be in readiness for its removal when born. Flannel itself is too harsh for immediate contact with the delicate skin of an infant at first, though well adapted to keep up that degree of warmth which it brings with it.

Cold is very unfriendly to the tender state of an infant; and, though a child overheated by an immoderate load of clothes suffers from red-gum and other complaints, yet for a time warm clothing, with that quantity of animal heat which a mother's bosom communicates, are requisites for its comfort, and essential to its thriving. The modern refinement of cots, and the injurious apprehensions of children being overlaid, has banished many a weak and delicate infant from a nurse's bosom (its natural and best bed) to a crib, where it has passed night after night in cries, from its inability to generate sufficient heat of itself for its comfort, and eventually has fallen a victim to cold and neglect.

The mucus which covers the body of a child at its birth, is best removed by a soft sponge with warm water and soap. A nurse should not be over anxious to remove every particle at the first washing, because, by too much rubbing, the skin becomes irritated and inflamed, and, by the second attempt, the surface of the body may be thoroughly freed from this substance. This indeed is necessary, or perspiration becomes obstructed, and the skin liable to eruptive diseases.

Many nurses never wash the head of an infant after the first time, except with spirits. The omission of washing it is unjustifiable on every principle; and the custom of rubbing the head with spirits has nothing to recommend it, but, on the contrary, is the common cause of giving cold, on account of its speedy evaporation, which carries off heat that can never be spared. Let a mother rub a little spirits between her own hands and she will never allow the tender head of her babe to undergo the same operation.

The navel string may be wrapped round with a piece of soft and well-aired linen, and carefully laid down. Burnt rag is very objectionable: it is in no case of any use, and frequently produces inflammation, and an ulcer that heals with difficulty. Should an ulcer remain after

the funis drops off, which generally takes place in a few days, the part may be moistened with a little goulard-water, and afterwards have applied to it a little spermaceti or simple ointment, spread on lint. This may be renewed every time the child is dressed, till the wound is healed.

Were it not that the brutal practice of forcibly pressing out the fluid which distends the breasts of some new-born infants yet prevails, it would be unnecessary to refer to the unfeeling custom; nothing can justify it, for not one child in a hundred requires any attention on this point, and when it does the opinion of the medical attendant should be taken.

The object of *clothing* is to defend us from cold; and happy would it be for the rising generation if mothers and nurses could be convinced that this may be accomplished by light warm dressing, without confining the body by bandages, or loading it with covering weighty enough for half a dozen children; and surely nothing but a slavish adherence to custom can sanction a practice as absurd as hurtful—the ridiculous length of an infant's clothing, which in many cases by its weight produces deformity of the feet, and must always be a source of considerable pain to a feeble child. The ease and comfort of a child may be consulted and promoted by avoiding all unnecessary bandaging. Every species of swathing prevents the free performance of the various functions. Flexion and extension of the joints should be quite unrestrained; and clothing which in any degree impedes free motion, and thus counteracts, by its confinement, the natural efforts of a child, must be extremely injurious. The modern art of dressing not only impedes the growth of children, but most sensibly diminishes their enjoyment; for every attentive observer must have noticed the evident pleasure experienced by them when undressed and permitted to roll about free and unharnessed.

Treatment of still-born or weakly Infants.—1. Too many accoucheurs are in the habit of permitting what are called *still-born* children to be laid aside as dead, without any efforts to ascertain whether the vital principle is extinct, or whether animation is merely suspended.

Several very interesting and well-authenticated instances are recorded of infants born apparently dead, who, by persevering exertions, have been resuscitated, although, for nearly two hours after birth, the evidences of vitality were so indistinct, as to leave it doubtful whether or not they existed. Dr. Conquest thinks that nothing less than decomposition of animal structure should be deemed a justification for abandoning a still-born child; and, if this proof of its death be wanting, all the usual methods of restoring suspended animation should be had recourse to, and steadily persevered in for at least half an hour; for, even should there be no prospect of success, the attempt is always pleasing to the parents of the infant, and satisfactory to a feeling mind.

If there is no pulsation in the umbilical cord, the infant should be instantly separated from the mother, the cord being tied by a slip knot, and the body immersed in warm water. The lungs should be then distended with air, by means of a bag of elastic gum, or a common syringe, (the pipe of which is to be inserted into one nostril, while the other and the mouth are carefully closed,) and again emptied by gentle pressure on the breast. In this way an alternate distention and compression of the lungs should be continued for some time. Should the action of the heart be now perceived, the same means are to be continued, until the infant exhibits the usual marks of beginning respiration, when the artificial distention of the lungs is to be only occasionally repeated, and all pressure on the breast is to be avoided. But if, notwithstanding these means, the pulsation of the heart be not restored, the infant should be taken out of the warm water, placed before the fire, carefully rubbed, and then wrapped in warm flannel. A clyster, consisting

of a table-spoonful of spirits, and two or three table-spoonfuls of warm water, should then be administered, and the temples, nostrils, and teguments of the face round the mouth, should be gently touched with a feather dipped in vitriolic æther, or spirits of hartshorn.

But, secondly, if the pulsation in the cord of a still-born child is distinct and soft, and the infant has the natural appearance, so long as the placenta remains attached to the uterus, the child ought not to be separated from the mother. The body should be carefully wrapped in warm flannel, the nostrils and fauces should be touched with a feather dipped in vitriolic æther, and a little spirits rubbed on the breast. If the after-birth become detached, (which is known by the lengthening of the cord,) the child must be immediately separated, and the above means employed. Should the process of breathing commence after these means have been used for a few minutes, nothing else is to be done than keeping the infant warm, with its face freely exposed to the air. But should this not take place, the lungs are to be distended and again compressed, as in the first case. See Prof. Hamilton's Hints on the Diseases of Infants, &c.

2. Although alive when born, the infant, in some instances, lives only a short time. If the lips be pale, and the pulsation in the heart very feeble or slow, it may be suspected that this originates from some cause which is not cognizable to the senses. On the supposition that it arises from a deficiency of vitality, stimulants have been applied to the surface, as a little brandy, or spirits of hartshorn, rubbed on the ribs and spine, &c. and such means have occasionally proved efficacious, though in the majority of cases they fail. When the extremities are of a purple or bluish colour, and the breathing is impeded or unnatural, it is generally found that there is a defect in the heart or lungs, which is beyond the power of any remedy.

Children are not always born in a state of perfection in respect to the structure of their bodies; for sometimes they have deficient, superfluous, or misplaced, parts, natural passages closed, and various marks on the surface. Many of these imperfections admit of no remedy; while others may be easily rectified. The following are those which are most frequently met with.

Fissures in the lips not only constitute a remarkable deformity, but commonly prevent the child from sucking. They appear under various forms. Sometimes the fissure exists only in one lip, generally the upper one, and is occasioned merely by a division of the soft parts: in other cases there is a considerable loss of substance between the divided parts: in some instances, again, there are two fissures in one lip, or both lips are affected: and, in others, the fissure is not confined to the lips, but extends along the roof of the mouth. All these different species of the same deformity receive the general name of *hare-lip*.

The *tongue* is naturally bound down to the lower part of the mouth by a membranous cord, to prevent it from too great a degree of motion. Sometimes, however, the cord fixes it so much, that the infant cannot suck, in which case it is commonly said to be *tongue-tied*. Women very often imagine that their children have this defect, when it does not really exist: and perhaps one instance of it does not occur in several hundreds of those that are born. The disease may be always discovered by putting a finger gently into the child's mouth; for, if he be able to grasp it, as he would do the nipple in sucking, or if the tip of the tongue appear disengaged, the membrane does not require to be cut. The operation of dividing the *frænum*, trifling as it may appear, requires some caution, in order to avoid wounding the sublingual veins, and cutting too deep; for in the first case a fatal hemorrhage may ensue; and in the second, if the tongue is loosened too much, the tip may be turned back, and close up the throat; an accident that must soon occasion death. It may be discovered by the threatening suffocation

eration or convulsions, and by the introduction of the finger into the mouth, by which also the tongue may be pulled back, and the consequences avoided. This, however, is a very rare accident: it has been absurdly called "swallowing the point of the tongue." See Underwood on the Diseases of Children, vol. ii.

The *natural passages*, especially the anus, vagina, and urethra, are sometimes *imperfect*, preventing altogether, or in great part, the usual excretions. In some cases, a collection of mucus alone proves the obstacle; but, in others, membranous substances close up the passages; in which last instances, an operation will be requisite to open the parts, which must be performed by a skilful surgeon. In respect to the vagina, Dr. Underwood observes that he never found the external parts totally imperfect, there being always a small opening at the *meatus urinarius*: but the aperture to the vagina itself sometimes requires to be opened, either by the point of a lancet, or by the fingers only, which is generally easily effected, there being always a *raphe*, or line, where the natural opening should be. The anus is sometimes closed only by a thin membrane, so that the day after birth the meconium may be distinctly felt, and in a manner seen shining through it. A slight puncture with a lancet, and passing a bougie or the point of a finger into the bowel for two or three days afterwards, is sufficient to remove this impediment. But more commonly the imperfect anus is a melancholy case, allowing of no effectual remedy, as the gut often terminates in a cul-de-sac so high as not to be reached. The imperfect penis is not quite so common a case; but is not unfrequently suspected, when the aperture of the passage is merely stopped up by a little mucus. Under such circumstances, washing the part with warm milk and water, or at most a little assistance with a small probe, or any such blunt-pointed instrument, will be sufficient to open the passage. When the urethra is perfectly open nearly to the extremity, as often happens, it is necessary only to make a small aperture with a lancet, or a fine trocar, and to keep the part open by the occasional introduction of a slender bougie.

The *meconium* is that black viscid matter, which every infant discharges from the intestines for the first two or three days after birth; and many complaints have been ascribed to the undue retention of it, and consequently a great variety of purgative medicines have been recommended to be given, almost as soon as the child is born, with a view to expel it. But experience has taught, that the natural evacuant of this matter is the first milk of the mother, which is slightly laxative in its properties: the infant, therefore, should be put to the breast as soon after birth as the situation of the mother will allow. The absurd practice of compelling the child to devour a quantity of sugar and butter immediately on its entering the world, should be strictly forbidden. Yet something is necessary to carry off the contents of the bowels, when the milk will not effect it; and nothing answers better than about half a drachm of castor-oil, which may be repeated once or twice if found necessary; or, if preference be given to a formula, the following, although rather unchemical, combination may be prescribed. "R. Olei ricini. dr. iij. Syrupi rosæ dr. i. Misce pro mistura aperiente, cujus, cochleare minimum, quarta quaque-hora, donec alvus bene soluta fuerit, detur."

Jaundice, or, as the nurses term it, *yellow gum*, is among the diseases which take place within a few days after birth. It is preceded by drowsiness, and disinclination to suck, and is soon discovered by the universal yellowness of the skin. Sometimes the whites of the eyes appear yellow for a day or two before the other symptoms appear: the tinge of the skin is seldom deep, and the disease is more readily removeable than the jaundice of adults; but cases are occasionally met with, where the colour of the skin is of a dark yellow, the infant moans constantly, and convulsions follow, which at last destroy life. In regard to the treatment of this disease,

if the child seem to suffer no uneasiness, although its skin be quite yellow, and if the bowels be open, it will be unnecessary to administer any medicines. But, if he be unable to suck, and have a disposition to constant sleep, active measures should be adopted. These consist principally in evacuating the viscid matter, which probably clogs up the biliary ducts. An emetic of ipecacuan, and brisk laxatives, as of rhubarb, or frequent doses of a solution of manna, will then be found necessary, and their effects may be much promoted by the warm bath. When violent colic pains or convulsions accompany the yellow gum, there is reason to fear that the liver is diseased, and little can be expected from any remedy. See the article INFANT, vol. xi. p. 28, 9.

OF THE INSTRUMENTS USED IN DIFFICULT PARTURITION.

To determine on the necessity for instrumental interference, is one of the nicest points in the practice of midwifery; for, whilst the unnecessary employment of instruments cannot be too strongly reprobated, still no conduct ought to be more deprecated than that timid and cruel mismanagement, which permits an interesting female to struggle under fruitless efforts, till she sinks exhausted from such exertions, or is not delivered until irreparable mischief is done to the soft parts; in consequence of which, she may linger out a wretched existence for a few weeks or months; the victim of criminal procrastination.

To assist in forming an opinion on this momentous question, some such circumstances as the following may be noticed.

Should labour from any cause have proceeded until parturient action becomes so feeble as to be inadequate to expel the uterine contents, or should the *pains have altogether ceased*, then artificial aid is often justifiable. The cessation or diminution of pain referred to, is the consequence of original debility, or of an exhausted condition of the uterus from long-continued and fruitless contractile exertions; and must be distinguished from that *occasional and temporary* suspension of uterine efforts, which is not associated with any other unfavourable symptom, and which may often be removed by repose, nourishment, and abdominal and lumbar friction. Under these circumstances, *time* may be given, provided there be a little steady progress, the presenting part be loose in the pelvis; the vagina cool, and clothed with secretion; the mind tranquil; the powers of the system not exhausted; and the rectum and bladder capable of emptying themselves.

But, on the other hand, should the pains have been for many hours strong and expulsive; should the presenting part be firmly wedged in the pelvis, interrupting the functions of the bladder and rectum; surely common sense dictates that timely assistance should be given to prevent exhaustion or sloughing. Whenever then this state of things exists, with fever, restlessness, head-ache, vomiting, (the os uteri being fully dilated,) mental inquietude, abdominal tenderness, with heat, and dryness and pain about the vagina and os uteri—unless delivery be effected, low muttering delirium, feeble rapid and intermitting pulse, with cold clammy perspiration, will soon terminate the heart-rending scene.

Previous to describing each particular instrument, some general observations, which are equally applicable to the use of each of them, may be usefully made.

The bladder and rectum should, if possible, always be emptied: the former by the introduction of the catheter, and the latter by the exhibition of an enema. Instruments should never be introduced whilst the os uteri remains firm and undilated, or irreparable mischief may ensue.

The assistance given by instruments should always be afforded during a pain, that the uterus may be merely assisted in its exertions, and that it may be gradually emptied.

tied. Of course, if uterine contractions have ceased, all that can be done in this respect is to imitate nature by employing power with intervals of rest. Except under very peculiar circumstances, such as may occur in cases of hemorrhage, syncope, &c. the power employed should be rather steady than quick; and, if it secure perceptible advance of the child, however little the progress may be, it should be considered as satisfactory.

Instruments should always be introduced slowly and cautiously; and ought to be brought as nearly as possible to the temperature of the body, and well anointed, before being used.

The extracting power should be employed in the direction of the axis of the pelvis; so that, if the obstacle be at the brim, the handle of the instrument must be directed backwards against the coccyx; but, as the child advances, that part of the instrument grasped by the operator's hand should be gradually directed towards the pubes. Should the instrument, when used, give much pain, we may rest assured that some part of the mother is included in the grasp, and should immediately change the hold.

The instruments most approved in modern practice are represented on the annexed Plate.

1. The *velitis*, or lever, is a very simple instrument, although capable, in unskilful or incautious hands, of doing a great deal of mischief. It has been noticed at p. 683, and is represented at fig. 1. it is about 12 inches long. Of the comparative merits of this instrument and the following (the forceps), different writers and practitioners think very differently: some have lavished the highest encomiums on the one, and men equally eminent have bestowed the most unqualified approbation on the other. We are of opinion that, in general, the forceps effects the delivery better than the lever; but that, in a few rare instances, the lever is capable of effecting the delivery, though the forceps is not. As the lever is capable of being introduced more easily, and at an earlier period of the labour, (much earlier indeed than the case requires,) it is more frequently used unnecessarily, and of course hazardously, than the forceps. What has been stated, as an advantage in the lever, viz. the practicability of using it *secretly*, is one of its worst properties: for it is a sacred duty, which an accoucheur owes to his patients, as well as to himself, never to employ instruments secretly. He owes it to his patients, because there can be no security against the rash and improper use of instruments, unless the practitioner avows his intentions, and explains to the friends his reason for employing them: he owes it to himself, because, if the case requires the aid of instruments, he gains credit and reputation for his proficiency and skill.

2. The *short forceps* is a double lever, so constructed that the fulcrum of each blade is in the handle of the other. The forceps exhibited in the engraving, at fig. 2. differs somewhat from those in ordinary use in several important particulars. The *fenestræ* are so wide as to admit the protuberances of the parietal bones to pass through them, by which two very important objects are secured.

The first is, a *diminution of bulk*, because the alæ of the blades lie along the sides of the parietal bones, instead of adding to the size of the head, by being directly on or over them, as is inevitable with Smellie's and all similarly-constructed forceps, the alæ of which approximate too closely to permit any part of the cranium to pass through the fenestræ: in consequence of which, the difficulty of parturition (presuming it to consist in disproportion between the head and the pelvis) is materially augmented: and, also, instead of having the hard unyielding metal opposed to the soft parts of the mother, by which their safety is endangered, the prominences of the parietal bones passing through the fenestræ, when the forceps are well applied, will be in contact with the vagina; by which, it is obvious, there is much less pro-

bability of its sustaining injury, than from the blades of the forceps in ordinary use.

A second distinguishing feature of these short forceps is the curvature of the intermediate part between the blade and the handle, and which is intended to save the perineum from pressure and laceration. It is familiar to every practical man, that in many cases which require the employment of the forceps there is great danger of the perineum being torn, notwithstanding the utmost precaution on the part of the practitioner; particularly in that case in which the occiput, instead of being opposed to the symphysis pubis, is found descending along the hollow of the sacrum, (or in other words, the face inclined to the pubes;) and this, it need scarcely be observed, is one of the most common causes of protracted parturition demanding the aid of the forceps, presuming that the malposition of the head has been omitted to be rectified in the early stage of labour. If, in this malposition of parts, the forceps are well applied, the points will be directed forwards to the pubis, and the handles backwards towards the rectum, endangering, by pressure, the safety of the perineum. Now, the simple contrivance of a curvature in the shanks fully meets this serious evil, independent of the permission which it gives to the handles to be carried much further back than they could otherwise be, by which a firmer and more favourable hold is obtained of the child's head; and for want of which, in many instances, the points of the blades, instead of being directed over the cheeks and towards the chin, pass on, and even wound the neck of the infant.

This instrument measures, from the point of the blade to the extremity of the handle, 11½ inches. The blades are 5 inches in length, exclusive of the curve. Their greatest width is at the middle, and measures 2½ inches; the fenestræ at that part being 1½ inch wide; the opening at the points and shoulders being about half an inch. The alæ of the blades should not exceed a quarter of an inch in width; and the widest part, between the opposite blades, ought not to measure more than two inches and a half, or five-eighths. The shank of either blade is just two inches in length, extending from the shoulder of the blade to the locking-part of the handle, making the blades all together 7 inches in length. The handles are about 4½ inches in length. The one, which, when viewed with the concavity of its blade upwards, and with the convexity of the curvature in the shank to the left hand, has the lower three inches and a half of it so constructed as to be moveable by a screw, for the purpose of more easily introducing that upper handle in particular cases without changing the position of the woman.

It is necessary to the successful application of forceps, that the head or face present, that the labour be sufficiently advanced, and that there exist not a great disproportion between the diameter of the pelvis, and the head of the child. It should be remarked moreover, that no case is commonly esteemed eligible for the application of the lever or short forceps, unless the ear of the child can be distinctly felt; by which time it is presumed that the os uteri will be fully dilated, and the perineum somewhat relaxed: should the perineum be rigid, there will be great hazard of lacerating it, when the head is brought down. So careful have the best professors of midwifery been, to guard against an improper use of these instruments, that it has been laid down as a rule of practice; "That the forceps shall never be applied, till the ear of the child has been within reach of the operator's finger for at least six hours." This is a judicious rule, and ought to be generally adhered to, since very few cases indeed occur (hemorrhage and convulsions excepted) in which it would be unsafe to wait for six hours after the ear comes within reach of the finger: nor should recourse be had to instruments even then; if a probable chance exists of finishing the labour safely without them.

Parturition is now considered to be sufficiently advanced

Instruments used in difficult Parturition.

vanced for the application of the short forceps when the ear of the child can be felt, or, if that is impracticable, when the head of the child has descended within an inch of the os externum. But the *long forceps* may be used whenever the circle of the uterus is obliterated, or so much dilated that the head of the child is likely to emerge without producing laceration. When the diameter of the pelvis is not two inches and a half, no good can result from the use of the forceps; and, even in cases where the pelvis is of those dimensions, it will be requisite to use instruments the blades of which are not so wide apart as those in common use.

The following are the most approved rules for the application of the forceps. The hips of the patient should be placed quite on the edge of the bed, to obviate the inconvenience with which the upper blade would be introduced, if the mattress, &c. remained in the way. Then the accoucheur, kneeling down, and opposing himself to the axis of the pelvis, should carefully introduce the forefinger of his right hand over the ear of the child as far as possible; he should then pass the inferior blade of the forceps between his finger and the head of the child: if, in so doing, the point of the blade should come in contact with the ear of the child, the handle must be elevated till the point has passed over the obstruction, should be depressed again immediately, and pushed slowly forward, keeping the point closely in contact with the child to avoid inclining the os uteri. This blade is to be kept in its situation by the third and little fingers of the left hand, while the forefinger is inserted over the ear of the child, and after it the superior blade of the forceps, observing the same care, with regard to the ear and os uteri, as in the introduction of the inferior blade.

The next part of the operation consists in *locking* the instrument; in doing which, care must be taken not to include any of the soft parts, or of the hair; such an accident being productive of great pain. The locking of the blades is sometimes attended with difficulty; it is generally necessary to withdraw one or both of them a little way, and cross them in different directions until the stop or shoulder of each can be felt on the outside of the other. When thus fixed, the handles may be fastened together with a piece of tape, but not so tightly as to compress the head; and the operator may proceed to the extraction of the child; in the performance of which, particular attention must be paid to the different axes of the brim, cavity, and outlet, of the pelvis. When the obstruction is at the brim, (in which case the long forceps are used,) traction must be made with the handles of the instrument as near as possible to the anus; when in the cavity, force must be exerted in a direction a little way removed from the perineum; and, when at the outlet, the handles of the instrument should be pushed towards the pubis, and extraction performed close to the superior part of the vagina. In all these situations, a lateral motion should be conjoined with direct traction; and, during these exertions, the handles of the instrument should be held firmly for the purpose of compressing the head of the child. But, in all cases, the force at first used should be very moderate, and is to be increased as occasion may require; for, if the head advances at all, however slowly, with the force first applied, it need not be increased; because, as Dr. Denman has very truly observed, "a small degree of force continued for a long time, will in general be equivalent to a greater force hastily exerted, and with infinitely less detriment either to mother or child." An invaluable little work, entitled "*Aphorisms on the Application and Use of the Forceps and Vestis*," by Thomas Denman, M.D. should be in the hands, and impressed on the memory, of every practitioner in midwifery.

3. Of the *long forceps* we have met with no printed description but that by Dr. Conquest, who calls it "an invaluable instrument." It is not, however, a new discovery, as it was "originally employed by Levret; and,

although it has since been somewhat modified, and recommended by several respectable authors and lecturers, it is but little known, and much less estimated, or it would be employed by accoucheurs as a most important substitute for the perforator and crotchet, in many of those cases in which children are now destroyed."

This instrument is principally applicable; First, to those cases of deformity at the brim of the pelvis, in which the diminished capacity of the pelvis is from sacrum to pubes, and yet so slight, that a little power beyond what the uterus can employ would expel living children which are now almost universally sacrificed at the shrine of prejudice. Secondly, to those cases of hemorrhage, convulsions, &c. in which the head of the child is resting on the superior aperture of the pelvis; and in which, delivery, being essential to the well-doing of the mother, is now usually effected by opening the head of the child.

The long forceps, in contra-distinction to the short one, is to be applied over the occiput and face of the child, so that the convex edges of the blades may correspond to the concavity of the sacrum. When used, the power may be exerted laterally, or from side to side, with moderate traction, remembering that the axis of the brim of the pelvis requires the handles to be kept backwards towards the os coccygis; but, as the head descends, its most favourable position in relation to the pelvis must be secured. Dr. Conquest concludes, "It has been extremely gratifying to myself and to several highly-esteemed friends, to have been, by this means, instrumental already in rescuing not a few children whose heads had been condemned to be opened."

4. The *fillet*, or *lacque*, is very seldom used in modern practice. It consisted of a strip of strong cloth formed into a noose; and it was sometimes contrived with whalebone or steel, so as to be more easily passed over the chin, or round the neck of the child, and thus to give the operator the means of using much force to extract the head. Before the forceps became generally known, the practitioners of midwifery entertained a very high opinion of the merits of this instrument; as may be judged, from the care taken by different persons to inculcate a belief that they possessed a secret and superior method of forming and employing this contrivance; and also from the high price which was sometimes demanded for the sale of this supposed secret; which, in the case of Dr. Birch, was fool. It is impossible to divest oneself of the opinion, that there was frequently much of trick in the use of this contrivance; that the operator claimed for himself the merit of having effected the labour by his skill and address in employing an instrument, when in fact the patient was indebted to nature alone for her delivery; for it is sufficiently apparent that this kind of instrument was inadequate to the purpose of safely terminating the delivery in cases of real difficulty.

Probably there is no practitioner now living in England, who has witnessed the use of the fillet in natural presentations. The late Dr. Merriman, when young in practice, was engaged to attend a woman of her second child. In her first labour she was delivered by a midwife; the child came footling, and, after a very painful labour, it was still-born. When her second labour came on, which was preceded by a discharge of the liquor amnii, she sent for Dr. M. who, finding the pains to be very insufficient, left her. For two days little progress was made; but on the third the os uteri began to dilate, though very slowly, the head continuing very high in the pelvis. The loss of the first child having made the friends of this patient very anxious respecting her, it was proposed that another accoucheur should visit her; and, this being agreed to, Dr. R. a native of France, and an accoucheur of much celebrity, was sent for. On examining the patient, he gave it as his opinion, that she might be speedily delivered, if assisted by the fillet, and politely proposed that Dr. M. should endeavour to deliver with

that instrument; but he declined the offer, both because he was not convinced that any instrument was then required, and because he doubted whether the fillet could be applied or acted with. Dr. R. therefore proceeded to the operation himself.

A strong new fillet being procured, and the proper noose made, it was dexterously-enough introduced, and, though it put the woman to a great deal of pain, at length fixed, and drawn close round the neck of the child. The doctor then began pulling with considerable force; but, as the fillet galled his hands, he procured a common rolling-pin, round which he tied the ends of the fillet, and pulled again with very great force, till he exerted the whole of his strength, perhaps not judiciously enough waiting for, and taking advantage of, the pains. This exertion put the patient to inexpressible torture, but did not seem to answer the end proposed, as the head advanced but very little, and probably was turned to one side by the fillet; which, from the nature of its hold, could only draw in one direction, and that perpendicularly from the part to which the noose was fixed, which, whether on one side of the neck, over the occiput, or over the chin, must have a tendency to drag down that part first, and consequently, the head must be doubled on the neck, and the difficulty thereby increased, rather than diminished. That this was really the case, the event showed; for, by the prodigious force used in pulling, the fillet at length came away, bringing inclosed in its noose some of the skin and flesh, with one of the vertebræ of the neck.

This was an undeniable proof, that the fillet had actually cut off the child's head, which was left in the pelvis. There remained therefore no remedy, but to try what could be done by opening the head and extracting with the crotchets; and, luckily, the head was by this time so engaged in the bones of the pelvis, that it was not pushed back into the uterus by the attempt to perforate the skull. This perforation was made in one of the ossa parietalia, and not in the vertex, by which it plainly appeared, that the head had been drawn to one side by the fillet. At length, with much difficulty, the head was extracted, and the body easily followed. Immediately after delivery the lochia ceased, a violent fever with delirium came on, and the abdomen was prodigiously tumefied; on the second day the patient grew stupid and insensible, and in a few hours died.

Dr. Merriman has been frequently heard to say, that the screams of this poor woman, under the operation, were greater than he ever witnessed in any other case of labour. There is reason to believe this was the last time that the fillet, in natural presentations, was used in London.

In Hamilton's Elements of the Practice of Midwifery, (1775,) the extraordinary case of a young woman is recorded, who, when apparently in the agonies of death, was deserted by her medical attendant, after he had by some means separated the head of the fœtus from the body. This poor woman was afterwards delivered, first of the body, and then of the child's head, by Mr. Robert Smith, a celebrated surgeon at Edinburgh, and ultimately recovered. It is probable that the separation in this instance was effected by injudicious and violent force with a fillet.

The preceding instruments are those which do not, of necessity, injure either the mother or the child. The following are intended to destroy the life of the child for the purpose of preserving that of the mother.

5. The *perforator* is an instrument formed like scissors on a large scale, viz. about thirteen inches in length, and of proportionate thickness, with the edges rounded, that they may not cut, and with a guard, or projection, on each blade, about three inches from the points, to prevent their entering farther than is necessary into the skull of the child. Having pushed the perforator through one of the parietal bones of the head of the child, or through a suture, if one can be found, until stopped by the guard, the handles must be opened, and the instrument turned round, by which means the aperture in the skull will be enlarged in every direction, when the perforator may be withdrawn. See the Engraving, fig. 3.

The cases which require the perforator are those where the pelvis is so small at the brim, that the child's head cannot pass through it. Other causes do indeed sometimes render the perforator necessary: but the legitimate cause for using this instrument, is "distortion of the pelvis."

Presentations of the face now and then demand perforation of the cranium, to diminish its size. In these cases, the perforator should be introduced just above the nose, in the sagittal suture. When it becomes necessary to open the head after the lower extremities are expelled, the perforation must be made behind the ear.

6. The *crotchet* is contrived for extracting the cranium, after it has been broken down by the perforator. It is a very simple instrument, with a handle removeable by a spring, as represented at fig. 4. Sometimes a blunt hook may be advantageously substituted for it. But Dr. Conquest proposes to lay aside both the sharp and the blunt hook, and to introduce,

7. The *craniotomy-forceps*, invented by Dr. Davis, and improved by himself. This instrument, represented at fig. 5. is 12 inches in length. The blade which is applied externally to the cranium, and which is hollowed out, has fixed into it twelve sharp teeth, not rising above its edges. This blade is $4\frac{1}{2}$ inches in length from its point to the joint of the instrument, being half an inch longer than the inner blade, to carry up to any pendulous part of the os uteri, which might otherwise be included in the grasp. The opposite blade, which is to be introduced within the cranium, is only 4 inches in length: its hollow is filled with a piece of steel, having a convex surface perforated with twelve holes to receive the angular points of its antagonizing blade; so that, when the cranium is firmly pressed between them, the teeth transfix it, and secure a very commanding hold. The shanks are 5 inches in length, and curved, the concavity corresponding with the curve of the blades. This construction is intended to accommodate the instrument to the perinæum in those cases in which it must be endangered by pressure, if the shanks were straight, in consequence of the necessity which may exist for carrying the blades over and anteriorly to the pubes; thus this one instrument becomes adapted at once to ordinary cases, and to such as present unusual difficulty. The parts which may be more strictly called the handles, are not more than two inches and a half in length. The presumed superiority of these instruments over those in ordinary use, is fully treated of in p. 693, 4.

8. The *bistoury*, or *scalpel*, used in the division of the symphysis pubis, or in the cesarian operation, is nothing more than a small straight knife, similar to that which is employed in various other operations of surgery and anatomy. See, therefore, the article SURGERY.

PARTY, *f.* [*partie*, Fr.] A number of persons confederated by similarity of designs or opinions in opposition to others; a faction.—Division between those of the same *party*, exposes them to their enemies. *Pope*.—One of two litigants.—When you are hearing a matter between *party* and *party*, if, pinched with the cholick, you make faces like mummers, and dismiss the controversy more entangled by your hearing; all the peace you make in their cause is calling both *parties* knaves. *Shakespeare*.—If a bishop be a *party* to a suit, and excommunicates his adversary; such excommunication shall not bar his adversary from his action. *Ayliffe's Parergon*.—One concerned in any affair:

Freed and enfranchis'd; not a *party* to
The anger of the king, nor guilty of
The trespass of the queen.

Shakespeare.

Side; persons engaged against each other:

Our foes, compell'd by need, have peace embrac'd,
The peace, both *parties* want, is like to last. *Dryden.*

Cause; side.—Ægle came in, to make their *party* good. *Dryden*.—A select assembly.—If the clergy would a little study the arts of conversation, they might be welcome at every *party* where there was the least regard for politeness or good sense. *Swift*.

Let me extol a cat on oysters fed;
I'll have a *party* at the Bedford-head.

Pope.

Particular person; a person distinct from, or opposed to, another.—The minister of justice may, for public example, virtuously will the execution of that *party*, whose pardon another, for consanguinity's sake, as virtuously may desire. *Hooker*.—How shall this be compass'd? canst thou bring me to the *party*? *Shakespeare's Tempest*.—The imagination of the *party* to be cured, is not needful to concur; for it may be done without the knowledge of the *party* wounded. *Bacon's Nat. Hist.*—He that confesses his sin and prays for pardon, hath punished his fault: and then there is nothing left to be done by the offended *party*, but to return to charity. *Bp. Taylor*.—Though there is a real difference between one man and another, yet the *party*, who has the advantage, usually magnifies the inequality. *Collier on Pride*.—A detachment of soldiers: as, He commanded the *party* sent thither.—Opposite *party*; an usage perhaps peculiar to Spenser:

It often falls in course of common life,
That right long time is overborne of wrong,
Through avarice, or power, or guile, or strife,
That weakens her, and makes her *party* strong.
But justice, though her doom she do prolong,
Yet at the last she will her own cause right. *Fairy Qu.*

PARTY, in a military sense, a small number or detachment of men, horse or foot, sent upon any kind of duty; as into an enemy's country, to pillage; to take prisoners, and oblige the country to come under contribution. Parties are often sent out to view the roads and ways, get intelligence, seek forage, reconnoitre, or amuse the enemy upon a march; they are also frequently sent upon the flanks of an army, or regiment, to discover the enemy, if near, and prevent surprise or ambuscade.

Recruiting PARTY, a certain number of men, under an officer or non-commissioned officer, detached from their respective battalions, for the purpose of enlisting men.

Firing PARTY, those who are selected to fire over the grave of any one interred with military honours. The specific number of which the party is to consist depends upon the rank which the deceased held in the army: thus, the funeral of a field-marshal must be saluted with 3 rounds of 15 pieces of cannon, attended by 6 battalions, and 8 squadrons; that of a general, with 3 rounds of 11 pieces of cannon, 4 battalions, and 6 squadrons; and this was all the honour that could consistently be allowed at the funeral of Napoleon, ex-emperor of the French, May 10, 1821, at St. Helena.

The funeral of a colonel is saluted by his own battalion, or an equal number by detachment, with 3 rounds of small arms; that of a captain, by his own company, or 70 rank and file, with 3 rounds of small arms; that of a lieutenant, by 1 lieutenant, 1 serjeant, 1 drummer, 1 fifer, and 36 rank and file, with 3 rounds; that of an ensign, adjutant, surgeon, or quarter-master, by an ensign, a serjeant, and drummer, and 27 rank and file, with 3 rounds; that of a serjeant, by a serjeant, and 19 rank and file, with 3 rounds of small arms; that of a corporal, musician, private man, drummer, and fife, by 1 serjeant, and 13 rank and file, with 3 rounds of small arms.

Working-PARTIES. These consist of small detachments of men, under the immediate command and superintendence of officers, who are employed on fatigues which are not purely of a military nature. They are generally called *fatigue-duties*, being different from those of parade, or of exercise in the field. They principally consist in digging canals, repairing roads, working on fortifications, except such as may be constructed in the field, or upon actual service. An addition is made to their pay, as a reward for their labour, and a compensation for their extraordinary wear of necessaries; half of which should always be paid into the hands of the captains and commanding officers of companies, for this latter purpose. It has been judiciously observed, in a note to the treatise on Military Finance, that British troops might in time of peace be employed much oftener than they are on works of this nature, with equal advantage to the public and to themselves. This remark becomes more forcibly apposite since the adoption of canals through the country. *James's Mil. Dict.*

PARTY-COLOURED, *adj.* Having diversity of colours.—The leopard was valuing himself upon the lustre of his *party-coloured* skin. *L'Estrange*.

The fulsome ewes,
Then conceiving, did in yeanning-time,
Fall *party-colour'd* lambs. *Shakespeare's Merch. of Ven.*

From one father both,
Both girt with gold, and clad in *party-colour'd* cloth. *Dryden.*

Constrain'd him in a bird, and made him fly
With *party-colour'd* plumes a chattering pie. *Dryden.*

Four knaves in garb succinct, a trusty band,
And *party-colour'd* troops a shining train,
Draw forth to combat on the velvet plain. *Pope.*

Motley, in a figurative sense.—The mixture of fool and knave maketh up the *parti-colour'd* creatures that make all the bustle in the world. *Marq. of Halifax*.

PARTY-JURY, *f.* [In law.] A jury in some trials, half foreigners and half natives.

PARTY-MAN, *f.* A factious person; an abettor of a party.—The most violent *party-men* I have ever observed, are such as, in the conduct of their lives, have discovered least signs of religion or morality. *Swift*.

PARTY-WALL, *f.* Wall that separates one house from the next.—'Tis an ill custom among bricklayers to work up a whole story of the *party-walls*, before they work up the fronts. *Moxon*.

PARU, a fort of Brasil, in the jurisdiction of Para, on the north side of the river Amazon. Lat. 1. 50. S. lon. 54. 10. W.

PARU, or **GINIPEPE**, a river of Brasil, which runs into the Amazon near Paru.

PARUA, a river of Brasil, which runs into the Atlantic in lat. 13. 20. S.

PARUAH, [Heb. one that flourishes.] A man's name.

PAR/VAIM, in Scripture geography, either Parbacia in the land of Havilah, or Ophir. Perhaps Taprobane is the same as *Taph-parvaim*, "the Shore of Parvaim." From Parvaim king Solomon had the gold wherewith he overlaid the inside of his temple. 2 *Chron.* iii. 6.

PARVA'TI,

PARVA'TI, in the Hindoo mythology, is the consort of Siva, the personification of the destructive, or rather renovating or changing, power in their triad. The consorts of the Hindoo male divinities are termed their *sakti*, which means their energy, or active power. The females are thus co-equal to their spouses, and are endowed with the same attributes, and differ, sex excepted, very little from them. See MATRI, vol. xiv.

A history of the goddess Parvati, under her various forms and names, might be extended to volumes, and many volumes, we may say scores of volumes, have, in fact, been written thereon. The sacred romances called Puranas abound in legends relating to the origin and proceedings, the amours, quarrels, incarnations, battles, &c. of this all-producing, all-pervading, personification of Nature. She is said, like her lord, to have a thousand names; they are strung metrically together, and are recited by her votaries in their propitiatory adorations. *Parvati* means "mountain-born," she having, in one of her many terrestrial descents, sprung from such a parentage, as is noticed under the article MERA. In her name and character of Parvati, many magnificent temples are erected to her honour in different parts of India, especially on mountains and elevated situations. All mountains, as bearing a conical form, a form naturally assumed by fire, are typical of this goddess or her lord; he being a personification of that *destructive*, and, in its form of heat, *renovating* element. Throughout India, from Nepal to Ceylon, and from Siam to Surat, temples are raised to this extensively-worshipped couple; and their sectaries, under various names, still offer adoration in them. At Poona the principal temple is on a high hill called Parvati, or Parbutty, which gives a name to the quarter of the city in its neighbourhood. *Durga* is another of her names; and this name, meaning "difficult of access," is appropriately given to hill-forts, provincially corrupted into Droog or Durgam. Chittledroog, for instance, is corrupted from *Sita* and *Durga*, names of this goddess, which, in composition, and with a grammatical copulative, mean the Hill, or Inaccessible Place, of Sita. Chittagong is altered from *Sita Gao*, or *Gom*, the Town of Sita. Much of the geographical nomenclature of India is thus derivable from its mythological personages.

In her character of *Kaumari*, or the Virgin, Parvati corresponds, as she does likewise in many other instances, with the Taurican Diana. She may be identified similarly with most of the female deities of Greece and Rome, not in name merely, but in attributes and character. Most of those female deities are found, on minute inspection, to melt into one, as do those of India into Parvati; who is a personification of the Moon, as her consort Siva is of the Sun; co-equal emblems merely of "that infinitely greater Light, whence all proceeded, whither all must return, and which alone can illumine our intellects." This is the substance of the most sacred text of the Hindoo scripture. See O'M.

The attributes of *Durga* are conspicuous in the festival called by her name *Durgotsava*; and, in this character, we are told by sir W. Jones she resembles Minerva, "not the peaceful inventress of the useful and fine arts, but Pallas, armed with a helmet and spear: both represent heroic virtue, or valour united with wisdom; both slew demons and giants with their own hands; and both protected the wise and virtuous, who paid them due adoration."

"As the Mountain-born Goddess, or *Parvati*, she has many properties of the Olympian Juno; her majestic deportment, high spirit, and general attributes, are the same; and we find her on mount Kailasa, and at the banquets of the deities, uniformly the companion of her husband." In her character of Bhavani, sir W. Jones supposes the wife of Mahadeva, or Siva, to be as well the Juno Cinxia, or Lucina of the Romans, (called also by them Diana Solvizona, and by the Greeks *Ilythya*), as

Venus herself; not the Italian queen of laughter and jollity, who, with her nymphs and graces, was the beautiful child of poetical imagination, and answers to the Indian Rhemba, with her train of *Apjaras*, or Damsels of Paradise; but Venus Urania, so luxuriantly painted by Lucretius, and so properly invoked by him at the opening of a poem on Nature. Venus presiding over generation, and on that account exhibited sometimes of both sexes, (an union very common in the Indian sculptures,) as in her bearded statue at Rome; and perhaps in the images called *Hermathena*, and in those figures of her which had a conical form; for the reason of which we are left (says Tacitus) in the dark. "The reason," continues our author, "appears too clearly in the temples and paintings of Hindoostan, where it never seems to have entered the heads of the legislators or people, that any thing natural could be offensively obscene; a singularity which pervades all their writings and conversation, but is no proof of depravity in their morals."

The same highly-gifted author, in his Dissertation on the Gods of Greece, Italy, and India, identifies the Stygian or Tauric Diana, otherwise named Hecate, and often confounded with Proserpine, with *Kali*, a name and form of Parvati, in her character of wife of Kal, who corresponds with the Stygian Jove. Human victims, as well as the sacrifice of horses and bulls, enjoined by the Veda, being in the present age absolutely prohibited, kids are now offered to *Kali*, or the Black Goddess; and, to palliate the cruelty of the slaughter, which gave great offence to the Hindoo followers of milder tenets and practice, the Brahmans inculcate a belief, that the poor victims rise in the heaven of Indra, and become the musicians of his band. A cup, called by both Romans and Hindoos *patera* (see PATRA), a whip, or cord (see PASH), a sceptre, a child, a car drawn by peacocks and by lions, a turreted crown, a drum (called *dyndima* both in Greek and Sanscrit), a sphere, a torch, a lily or lotos, a serpent, a spear, a bow, with other common attributes, might be noticed as identifying the multifarious goddesses in question.

That the names just noted, as well as Urania, Isis, and many others, are in fact of the same goddess Nature, under different forms, there can be no doubt. The Pantamorphia Mater; Dea Jana, or Diva Jana, was easily made by the Romans into *Diana*. Devi-jenni, the teeming goddess; Viswa-jenni, the all-producing, are Sanscrit terms, applicable to Parvati in her character of *Prakriti*, or Nature. Juno may be derived from *Yoni*; Ceres from *Sri*, or in one case *Sris*; Anna Perenna, from *Ana-purna*, a name of Parvati, meaning, in Sanscrit, "abundance of food," or "one who fills with food." In this character she holds a ladle. Astarte, as well as Esther, Ashtaroth, and the Persian *Sitara*, meaning a star, or something fidereal, may be traced to *Ahtara*, another name of the Hindoo goddess, derived from a legend in which she was seated among eight points, and hence applied to the radii of a star. The learned antiquary Spon (Misc. Erud. Ant.) gives a print of a monument where Diana is called *Clatra*; her attributes are those of Parvati, one of whose names is *Kabratni*, the goddess of darkness, the origin possibly of its unmeaning synonyme. See the Asiatic Researches, vol. i. p. 221-275 of the London 8vo. edit.

A cone, mostly a black conical stone, is the phallic emblem of Siva, and of course of his consort Parvati. Western mythologists tell us of a black conical stone that fell from heaven; it was placed in a temple of Astarte, or the Moon, and itself adored as a type of the Sun. The Paphian goddess was also anciently symbolized by a cone. When Dr. Clarke, in his recently-published "Travels," describes some antiquities of the Holy Land, we might almost imagine that he was in the country of the Hindoos. He describes "a subterraneous conical temple, having no resemblance to any Christian temple, its situation under the pinnacle of a mountain, one probably of the three points

points of the Mount of Olives, (see MERU,) the highest of which was set apart for the worship of Astaroth," &c. (vol. ii. p. 578.) denoting strongly the Hindoo superstition having been anciently prevalent there. The pyramids of Egypt, Stonehenge in England, and many other antiquities now remote from its scenes, are referred, and with plausible arguments, to the same polytheistic source.

It is curious to see, in Dr. Clarke's plate delineating "the sacred pictures in use among the Kalmuck tribes," exact representations of Hindoo deities. In the figure that he properly styles, "Diva Triformis, Luna, Diana, and Hecate," we recognize, unequivocally, the Hindoo Parvati, in one of those many forms in which she is generally termed *Devi*, or the Goddess. *Devi Tri Sakti*, or "with three forms," or powers, is one of her names!

In Dr. Clarke's plate, she has her own mystical hieroglyphic, a type of the Yoni, on the forehead; collars, of skulls perhaps, round and pendent on her neck and belly; a glory, or nimbus, round her head; six-handed, holding a bow and arrow, the trisula or trident of Siva; a cone, or linga; the chakra, or discus of Vishnu; his club; the lotos, the cord, or pasha, of *Devi*, before referred to; and the Kalmuck divinity sits in one of *Devi*'s commonest positions, on a lotos-throne. Such a subject we should have expected to find in the Hindoo Pantheon, rather than in Russian travels. A representation is likewise given of "Osiris or Bacchus of the Kalmucks." This is also a Hindoo subject; but, being only two-handed, there is not much scope for attributes; it has the distinguishing forehead-mark, attitude, countenance, and character, of the Hindoo school. The next, "Hyperion or Phœbus of the Kalmucks," is a barbarous representation of Krishna, with the serpent Kaliya, and other Hindoo attributes. The "Terpsichore of the Kalmucks playing on the Balalaikas," is Saraswati with her Vina; (see the article MUSIC, vol. xvi. p. 381.) Dr. Clarke does not say where he obtained these subjects, nor in what degree they are honoured; but we see no reason to doubt their genuineness. They have found their way into Asiatic Tartary, through China probably; and would lead us to infer that the Kalmucks have, or have had, some Hindoo superstitions among them. Their name is easily traceable to the same source. *Kal-mu-ki* is pure Sanscrit, and means "black-faced," or "with the countenance of Kal;" a name that is applicable to Parvati in some of her characters; although we do not recollect any specific authority for giving her that appellation.

In her character of Parvati, she is usually seen in pictures in company with her spouse; and is represented as of perfect beauty, splendidly dressed and decorated; sometimes sitting on his knee, or on a carpet beside him, or on a tiger's or elephant's skin, presenting him *amrita* (ambrosia) in a golden goblet. Sometimes she is mounted with him on a white bull, with their reputed sons Kartikeya and Pollar.

Under her various forms and characters she is variously armed and arrayed. Sometimes she has four, eight, twelve, sixteen, and as far as thirty-two, arms. In the plates of the Hindoo Pantheon, she is represented upwards of fourscore times, in varied form and character; and legends are said to be found in the theogonical and mythological writings of the Hindoos, detailing her origin and achievements in each. In some plates of the work just alluded to, she is represented, from original subjects, pre-eminently placed as the supreme object of adoration; the chief of the gods, even the three persons of the Hindoo triad being among her votaries. Such pictures and sculptures may be ascribed to the sects who adore her exclusively as Nature.

The sectaries of this goddess, who, under different names, and adoring her under different forms, are numerous, have various symbolical marks by which they are distinguished. Generally speaking, perpendicular lines on the forehead distinguish the Saivas from the Vaishnavas, the latter having them horizontal. See the Engraving at p.

VOL. XVIII. No. 1277.

121 of the article HINDOOSTAN, vol. x. and farther particulars under the same article, p. 115-130.

PARVE'TI MON'S, in ancient geography, a chain of mountains described by Ptolemy, corresponding to the heights of Sulmandroog, lying south-east of Candahar, and being the southern boundary of the province of Paropamisus.

PAR'VICH, a small island in the Adriatic, near the coast of Dalmatia; fertile in grapes, olives, and mulberries.

PAR'VIS, *f.* [French. Menage derives the word from the Lat. *paradisus*, changing *d* into *v*; and shows abundantly that *paradisus* was used for a place or portico before a church.] A church-porch: applied to the mootings or law disputes among young students in the inns of courts, and also to that disputation at Oxford called *disputatio in parvisis*. A square kind of court before cathedrals, surrounded with piazzas. The *parvis*, or place of disputation in London, is supposed by Dugdale to have been called the *pervyse of Pawles*.—In the year 1300, children were taught to sing and read in the *parvis* of St. Martin's church at Norwich. *Warton's Hist. E. P.*

A sergeant of the lawe, ware and wise,
That often hadde yben at the *parvisse*.

Chaucer.

PAR'VITUDE, *f.* [from *parvus*, Lat.] Littleness; Minuteness. *Not used*.—The little ones of *parvitude* cannot reach to the same floor with them. *Glanville*.

PAR'VITY, *f.* [from *parvus*, Lat.] Littleness; minuteness. *Not used*.—What are these for fineness and *parvity* to those minute animalcula discovered in pepper-water. *Ray*.

PAR'ULIS, *f.* [from the Gr. *παρα*, and *ελον*, the gums.] An inflammation, or abscess, of the gums; a gum-boil.

PARU'R, a town of Hindoostan, in Cochin: ten miles east-south-east of Cranganore.

PAR'US, *f.* the TITMOUSE, or TOM-TIT; in ornithology, a genus of the order passeræ. Generic characters—Bill entire, narrow, somewhat compressed, stout, hard, sharpened, and beset at the base with bristles; nostrils in most of the species bare; tongue truncate, but split at the end into four distinct filaments; the toes are divided quite to their origin, the hind one large and strong.

These birds are found in almost every part of the old world, from the north of Europe to the south of India; and, of course, were known to the ancients. In Greek the titmouse is named *αριθαλος*; in old Latin, *parva*; in modern Latin, *parus*, *parix*, *mesjanga*. In Italy it is called *parula*; and in some districts *parizola*, *patascio*, &c. in France, *mésjange*; in Savoy, *mayenche*; in Germany, *mayss*, *meyslin*; the English, *titmouse*, has the same derivation, and probably, as Ray conjectures, alludes to the birds nestling in holes of trees, or walls, like mice.

The birds of this genus appear feeble, because they are small: but they are lively, active, and bold; they are perpetually in motion; they flutter from tree to tree; they hop from branch to branch; they creep along the bark; they climb the sides of walls; (this Vaillant absolutely contradicts;) they suspend themselves in all situations, often with their head downwards, in order to search every little cranny, and pick out the worms, the insects, or their eggs. They also feed on seeds; but, instead of breaking these in their bill, like the linnets and the goldfinches, almost all the titmice hold them under their little claws and peck them; they also pierce nuts, walnuts, &c. If a nut be suspended at the end of a thread, they will cling to it, follow the oscillations, and without quitting their hold they will continue to peck it. It has been observed that the muscles of their neck are very strong, and those of the head thick, which accounts in part for their manœuvres: their other motions imply great force in the muscles of the legs and toes.

Most of the European titmice occur in our climate;

8 X

but

but they are never so numerous as about the end of autumn; when those which live during the summer in the forests or on the mountains are driven, by the cold and snows, from their retreat, and descend in quest of food into the cultivated plains, near habitations. During all the winter months, and even in the beginning of the spring, they subsist on dry seeds, and on fragments of insects, which they find by ferreting the trees. They also crop the opening buds, and eat the caterpillars' eggs, particularly those which are seen round the small branches ranged like a series of rings, or the wreaths of a spiral: they also search for small dead birds, or such as are exhausted by disease, or entangled in snares, and, in short, all those incapable of resistance, though of their own species; they seize them with all the ferocity of the carnivorous tribes, pierce their skull, and feed upon the brains. Nor is this cruelty palliated by want; for (like the butcher-bird) they are guilty of it even when they are abundantly supplied with other food. In summer they eat not only almonds, walnuts, insects, &c. but all sorts of nuts, chestnuts, beech-mast, figs, the seeds of hemp, of panic, and other small seeds. It is observed that those bred in the cage are fond of blood, tainted meat, rancid fat, and tallow melted or burnt by the flame of a candle. It would seem that the state of domestication vitiates their taste.

In general, the titmice, though voracious, and fond of carrion, love society, and unite in numerous flocks; if they are parted by any accident, they mutually call on each other, and soon re-assemble. The unions which they annually form in the spring are of a closer nature, and are very productive. No genus of birds is so prolific as that of the titmice; and so well known is this fact in England, that it is usual to call a little prolific woman a titmouse. No birds attack the owl with such intrepidity; they are ever the first to dart on the nocturnal foe, and they aim constantly at the eyes; their action is attended with a swell of the feathers, and with a rapid succession of violent attitudes and rapid movements, which powerfully mark the bitterness of their rage. When they are caught, they bite keenly the finger of the bird-catcher, strike furiously with their bill, and invite, by their loud screams, the other birds of their species, which thus also fall into the snare, and in their turn decoy others. Lottinger affirms that, in the mountains of Lorraine, when the weather is foggy, forty or fifty dozens may be caught in a morning with no apparatus but a call, a small tent, and a cleft stick. They may also be ensnared with various gins, with the trap, with the noose, with lime-twigs, or with a small lark-net; or they may be intoxicated, as the ancients practised, with meal soaked in wine. Such are the numerous methods of destroying these small birds; and almost all of these are successfully employed. The reason is, that people who keep bees suffer much from the titmice, which make great havoc among these useful insects, especially when they have young. Their extreme vivacity drives them into every kind of snare, especially on their arrival; for at that time they are very tame, they lodge in the bushes, and flutter about the roads, allowing one to get near them; but afterwards they gain experience, and become more shy.

They lay from eighteen to twenty eggs: some deposit these in the holes of trees, which they round and smooth with their bill, and fashion them internally into the proper form; others lay them in ball-shaped nests, which are of a magnitude very disproportionate to so small a bird. We might also suppose that they previously reckon the number of the eggs, and that they anticipate the affection to their expected offspring. Hence the precautions used in constructing the nest, the solicitude which some species discover in suspending it from the end of a branch, and the attention in selecting the proper materials, such as slender grass, small roots, moss, thread, hair, wool, cotton, feathers, down, &c. They are able

to provide subsistence for their numerous family, which implies not only indefatigable activity, but much address, industry, and skill. If other birds attack their progeny, they will make an intrepid defence: will dart on the enemy; and courage renders their weakness formidable. It may be worth remarking, that the titmice bear some analogy to the ravens, the magpies, and the shrikes, in regard to the comparative force of their bill and their little talons, in their mustachoes round the bill, in their appetite for flesh, in their manner of tearing their food into morsels before they eat. The titmice also fight among themselves, and sometimes devour each other. If several titmice be successively put in the same cage, the one first domesticated will attack the new comers, and will endeavour to kill them, and suck their brains; a repast they are extremely fond of.

Gmelin enumerates thirty-two species; of which Dr. Turton has omitted one, but we do not know to what genus he has carried it. Vaillant has added four positive African species, and two doubtful ones.

1. *Parus bicolor*, the two-coloured titmouse: head crested, on the fore part black, body cinereous, beneath light rufous. In this species the head is furnished with a long pointed crest, or toupee; Pennant, therefore, calls it the toupet-titmouse. The bill is black, and on the forehead, just over it, is a black spot: legs lead-colour. The female differs from the male in having the belly and sides nearly white. This bird inhabits Carolina and Virginia, where it is found the whole year, and keeps chiefly in the woods; it is also met with in Denmark and the southern parts of Greenland, where it is called *avingarjak*. It flies swiftly; and during flight folds up the wing frequently, when it utters a weak note. Length six inches.

2. *Parus cristatus*, the crested titmouse: head crested; collar black; belly white. Length four inches and three quarters: bill blackish; forehead and sides of the head white. On the top of the head are long feathers, of a black colour, margined with white, which, when elevated, form a beautiful crest, pointed at the top; the chin and throat black, from which passes a line of black to the hind-head, bounding the white on the cheeks at the under part; on the ears an irregular spot of black; the upper parts of the body, wings, and tail, are rufous grey; the under parts white; the sides have a rufous tinge; legs lead-colour. This bird is found in many parts of France, especially in Normandy, and the districts between that and Sweden. It is in the deep forests that it is chiefly met with, especially among the evergreen trees, inasmuch that it is scented with their resinous odour. It is said to be fond of solitude; never mixing with other birds, nor in numbers even with its own species; and will not be tamed; whence its habits are little known. See the annexed Plate, fig. 1.

3. *Parus major*, the great titmouse, or ox-eye: head black, temples white, nape yellow. The head is curiously coloured; the beak is generally black, with strong hairs at its base; the head and throat are of the same colour, the belly of a yellowish-green; the back and coverts of the wings green, and the rump inclining to blue; the tail is black, but touched with blue at its exterior edges; insides dusky, legs lead-coloured. This species weighs little more than an ounce, though it is almost six inches in length. It is found in Europe, Asia, and Africa, and is very common in this country, frequenting gardens and orchards, where it does a deal of mischief, by picking off the tender buds of trees. The nest is made of moss, lined with hair, and placed in the hole of a wall, or of a tree. The female lays six or eight or ten eggs, which are white, spotted with a rusty kind of colour, and so exactly like those of a nut-hatch, as not to be distinguished from them. The common note of the great titmouse is a sort of chatter, but in the spring it assumes a greater variety, a shrill whistle, and a very singular noise, something like the whetting of a saw; but these

1. The Crested Titmouse. 2. the long-tailed, cock and hen. 3. the great-headed. 4. the four-coloured.

these cease with incubation. When kept in a cage it is really amusing to see with what quickness the titmouse darts at the fly or moth which comes imprudently within the circumference of his reach; if this kind of food be deficient, as it generally happens in winter, he then feeds upon several kinds of seed, and particularly that of the sun-flower, which he dexterously holds upright between his claws, and strikes powerfully with his sharp little bill, till the black covering splits, and yields its white contents to the hammering bird.

3. The cross-billed titmouse: olive-brown, beneath dirty-yellowish; head black, temples cinereous; the bill forked. This bird was killed once near Feverham in Kent; it had its bill crossed, as in the *Loxia curvirostra*.

4. *Parus ignotus*; the Norway titmouse: yellow-green; breast yellow, spotted with rufous; belly blue; vent yellowish. The tail is forked, and of the same colour as the back; the two middle feathers greenish; the two outer ones white on the outside; legs black; hind claw three times as long as the others. Found all over Norway.

5. *Parus cyaneus*, the azure titmouse: pale blue; under parts white, except an irregular oblong blue mark from the breast to the middle of the belly, and a blue stripe from the bill, through the eyes, to the hind-head, beneath which is a pale band; back and rump pale blue; upper tail-coverts deep blue; the ends white; wings varied with white, lead-colour, and blue; the first forming a band across the wing; quills brown; towards the tip white; tail blue; the outer edges of the feathers whitish. Legs and claws black; bill blackish; the tongue is bilobed, and each lobe is fringed with from three to five bristles. The total length of this bird is about five inches and a half: it is found throughout Russia and Siberia, and is frequently met with about the suburbs of St. Petersburg.

6. *Parus Americanus*, the creeping titmouse: bluish; temples, breast, and back, yellowish; sides purple. The upper mandible is brown, the lower yellow; head blue; a white spot over the eye, and another under it; upper part of the back yellowish-green; the rest of the upper parts, and tail, dusky blue; wing-coverts spotted with white, forming two bands of that colour on the wings; throat and breast yellow; on the lower part of the neck is a half-collar of black; belly white; sides marked with reddish spots; quills blackish, edged with bluish ash-colour; within white; tail blackish; the two middle feathers cinereous blue; the others edged with the same; legs yellowish. The female is merely black and brown. These birds are found chiefly in Carolina, where they remain all the winter, and creep up and down the bodies of trees in search of insects, on which they feed; they are also met with in Canada, and in other parts of America. Length, five inches.

7. *Parus caeruleus*, the blue titmouse: quill-feathers bluish, the primaries white on the outer edge; front white; crown blue. The bill is blackish; line from the bill to the eyes, and one surrounding the temples, black; the back is of a yellowish-green; wing-coverts blue; quill-feathers black, with dusky edge; tail blue, the middle feathers longer, body whitish-yellow beneath; legs and claws black. It is about four inches and a half long, and weighs less than half an ounce. This species would, probably, be much admired for its beauty, if it were less common. In winter it frequents houses, and will devour flesh very greedily; it is also a constant attendant where horse-flesh is kept for hounds, and in the farm-yard, being very fond of oats, which it plucks out, and, retiring to a neighbouring bush, fixes the grain between its claws, and hammers it with the bill, to break the husk. In summer it is very destructive to gardens and orchards, by biting off the buds of the blossoms, in search of insects; yet, as Albin observes, is useful in another manner, by destroying young caterpillars, and

the eggs of those insects which destroy the fruits. The female makes her nest in the holes of walls or trees, lining it well with feathers; lays a great number of small white eggs, at least fourteen or fifteen, some say twenty-two; but hatches only once a-year, unless the first nest is plundered. It forsakes its nest if the eggs are touched, or especially if one is broken; but, when the young are hatched, no bird defends them more courageously. She menaces every intruder in a singular manner, hissing like a snake, erecting all her feathers, and uttering a noise like the spitting of a cat, biting, at the same time, severely, if handled.

8. *Parus Sæbyensis*, the Sudermanian titmouse: size of the azure titmouse, and much resembling it: the general cast of the plumage is brilliant blue above, and white beneath, with a black spot under each of the eyes. This beautiful species inhabits the northern parts of Europe. It is found in Sudermania; also met with in great abundance in the northern woods of Siberia and Russia, and about Synbirk, in the government of Casan. It is migratory, appearing in winter about the houses in St. Petersburg. It twitters like a hedge-sparrow, but with a softer and sweeter note. This is omitted by Dr. Turton, in his translation of Gmelin's edition of Linnæus.

9. *Parus atricapillus*, the black-headed titmouse: cinereous, beneath white; cap and chin black. It inhabits Canada, in North America; is four inches and a half long; feeds on worms and insects, and is very patient of cold.

10. *Parus ater*, the colemouse: head black, back cinereous; hind head and breast white; the bill and chin are black; a broad black stripe beneath the eyes, from the bill to the neck; belly and vent reddish-white; wing-coverts grey, tipped with white; quill and tail-feathers brownish ash, edged with grey; leg and claws lead-coloured. It does not weigh much more than a quarter of an ounce; and is four inches in length. It has frequently been confounded with the next, but is not so common; it keeps more to the woods, seems to live entirely on insects, and has also a different note. It is found throughout Europe, and some say in America; but Vaillant affirms that not one of this genus inhabits the new world.

11. *Parus palustris*, the marsh-titmouse: head black, back cinereous, temples white. This is somewhat larger than the preceding, and differs but in very few particulars. The crown of the head is black, but no spot of white on the hind head; on the throat a small black spot, but not so large as in the last; upper parts of the body grey; wing-coverts plain; the under parts white; legs grey. It is common in England; and is found in Sweden, Italy, and most other parts of Europe: also in Siberia, Louisiana, and Japan. It lays up store of seeds against want, and is fond of low wet ground, in the holes of which it frequently nestles.

There are three varieties. α . Wings without the white bands. β . Body beneath and band on the hind-head white. γ . Crown black; nape yellowish.

12. *Parus Virginianus*, the Virginian titmouse: rump yellow; body cinereous. It inhabits Virginia and Carolina; and is five inches long. The bill is blackish, body above olive brown, beneath grey; legs and claws brown.

13. *Parus peregrinus*, the crimson-rumped titmouse: rump scarlet; body cinereous, beneath white. It is of the size of the *P. major*. The quill-feathers are brown; tail-feathers black, except the four middle ones, which are obliquely yellow on the hind part. This is a rare species, and its native country is unknown.

14. *Parus griseus*, the grey titmouse: general colour grey, crown of the head crimson. Native of Greenland.

15. *Parus Afer*, the black-breasted titmouse: plumage above dusky; sides of the head, and round the eye, white; on each side of the neck a stripe of the same; at the hind head.

head a spot of white; chin, throat, and breast, black; belly dirty white; quills brown; tail black; the outer web of the exterior feathers white; legs black. Total length, six inches. Said to be from the Cape; which Vaillant doubts, as he never met with it there.

16. *Parus caudatus*, the long-tailed titmouse: crown white; tail longer than the body. This is a very elegant and singular species. Its length is nearly five inches and a half; yet it does not weigh above a quarter of an ounce. The bill is very short, thick, and black; the irides hazel; top of the head white, mixed with grey; this is surrounded on the shoulders by a broad blackish circle, uniting at the back part, and inclining downwards; the sides of the head white, terminated with yellow; the under parts as far as the breast white, inclining to reddish; the sides of the back, the rump, the belly, and vent, are of a dull rose-colour, with some mixture of white; the smaller wing-coverts are black; the greater brown, edged with rose-colour; the quills dusky, with pale edges. The tail makes up above one half of the bird, being three inches and a half long; the feathers of unequal lengths; the four middle ones black; the third on each side the same, edged with grey; legs black.

No bird in England makes so curious and elegant a nest as this; it is generally of an oval shape, with a small hole in the side by way of entrance; the outer materials are moss, liver-wort, and wool, curiously interwoven, and completely lined within with the softest feathers; and "with so many of them," says Mr. Derham, "that I confess I could not but admire how so small a room could hold them; especially, that they could be laid so close and handfomely together, to afford sufficient room for a bird with so long a tail, and so numerous an issue as this bird commonly hath." Derham's *Physico-Theology*. The nest, thus constructed, is not suspended from a branch, as with some of this genus, but firmly applied on the fork of a bush, three or four feet from the ground. The female lays from ten to seventeen eggs, which are grey, with a mixture of reddish, but paler at the large end.

This bird appears to be common in most places, but particularly so in orchards and gardens; biting off the buds with great dexterity; is active and restless, flying backwards and forwards, and running up and down the branches in all directions with great facility. The brood keep together the whole winter, not separating till the spring invites them to pair and forward their race. They are recorded by authors as inhabitants of Sweden on the one hand, and of Italy on the other, and no doubt occupying the intermediate places. They are said to be very common in Siberia; and by their fulness of plumage, equalled only by the owl, one would imagine them able to bear the cold of the most rigorous climate. The pair figured in the annexed engraving, fig. 2, were brought from Sweden, and are remarkably full-feathered.

17. *Parus Capensis*, the Cape titmouse: head, neck, back, belly, and wing-coverts, pale cinereous grey; quills black, edged with white; tail black above, and white beneath; legs black. Bill black; irides red. This bird inhabits the Cape of Good Hope; and our books contain the history of its curious bottle-shaped nest; but Vaillant assures us that this kind of nest is never built by the titmouse, but by the pinc-pinc, a species of *Motacilla*, and that the titmouse sometimes seizes upon and inhabits it. To whomsoever the nest really belongs, we have given a faithful representation of it, and, according to Vaillant, of its real owner, on Plate VI. of the article *MOTACILLA*, vol. xvi. p. 103.

18. *Parus biarmicus*, the bearded titmouse: rufous; crown hoary; tail longer than the body; head bearded; vent black. It is about six inches and a quarter long. The bill is orange-colour; irides yellow; head pale ash; beneath the eye is a tuft of black feathers, ending in a point, not unlike a mustachoe or whisker; the hind part of the neck, and upper part of the back, are of an orange-bay or rufous colour; throat white; breast flesh-

coloured; belly, sides, and thighs, like the back, but paler; vent black; tail two inches and three quarters long, of a cuneiform shape; and nearly the same colour with the back; the outer feather is very short, dusky at the base, and nearly white at the end; the second nearly the same, but the end only white for a little way, the third only so just at the tip; legs black. The female differs from the male in wanting the whiskers under the eyes; the crown of the head is ferruginous, spotted with black; and the vent-feathers are not black, but of the same colour as the rest of the under parts.

This species is found in Schonen in Sweden; but is shy, and rarely seen. It is very common about the Caspian Sea, and Palus Mæotis, and among the rushes of the rivers which fall into them; but in no high latitudes in Asia; nor is it found in Siberia. These birds inhabit England also; but are observed only in marshy situations, where reeds grow, on the seeds of which it feeds, as well as on small insects. They are frequent in the marshes among the reeds between Erith and London; and are again met with in some marshy places near Gloucester, as well as among the tracts of reeds near Cowbit in Lancashire. In these places they are supposed to breed; the nest is composed of soft downy materials, suspended between three reeds very ingeniously drawn together. Kramer says, the nest is built among the willows, and is of the shape of a purse, made of soft downy materials, such as the down of the greater cat's-tail, or that of the asp, hanging the nest on a branch. This bird is said to be very common in Denmark; and Buffon supposes, that a pair of these, having escaped from the cage of the counts of Albemarle, founded their colony in England. This may have been the case in respect to those of Erith, being on the borders of the Thames, but does not so well account for their being elsewhere; and Latham thinks they are indigenous to us, and have been *so ab origine*; and that it is merely owing to their frequenting such places only where reeds grow, that they are so little known; for, as they seldom go farther than a few yards from the reed-beds, it is no way surprising that they were not earlier observed. The reed-beds frequently cover many acres of ground; these grow in the water, so as to be overflowed at every tide; and few persons ever go near them except in the time of cutting, which they do in boats; for, except at very low tides, one can scarcely set a foot-step within their boundaries.

Vaillant says this bird belongs to the fig-eaters, *Motacilla*: Edwards calls it the least butcher-bird. It was first described by Albin as a titmouse; but Gmelin has adopted the decision of Edwards, and calls it *Lanius Antiquanus*. See Edwards, Plate LV. and the article *LANIUS*, vol. xx. p. 55.

19. *Parus Sinensis*, the Chinese titmouse: rusty-brown; head and neck paler; quill-feathers and long tail brown, edged with black. It inhabits China; is not quite four inches long. The bill is black; the legs are red.

20. *Parus Malabaricus*, the Malabar titmouse: grey above; throat black; breast, belly, and vent, the colour nearly of red orpiment; wing-coverts black, with a pale red spot on some of the lower ones; the second quills are black; the next to them half-red, half-black; the greater quills black; the two middle tail-feathers are black; the others pale red half way from the base, the other end black; the under tail-coverts pale rufous; legs black; bill black, eyes red. The female has the colours less bright; all the under parts rufous yellow; but the spot on the wings and rump are the same as in the male. Inhabits the coast of Malabar; and is nearly six inches long. See *MUSCICAPA parus*, vol. xvi. p. 262, 3.

21. *Parus alpinus*, the Alpine titmouse: black, beneath pale rufous spotted with black; from the base of the bill to the neck there is a white line; hind-claw very long. It inhabits the alpine parts of Persia, and is about the size of the *P. caudatus*.

22. *Parus Sibiricus*, the Siberian titmouse: grey-brown, beneath

beneath whitish; belly rufous-grey; lower part of the neck black in the middle; sides pale rufous. It is found in Siberia, and is about five inches long.

β. *P. abdomine crisloque albis*. This differs in the length of the tail, as well as in the chin and throat; the black on which is not so broad, nor is the white which borders it so conspicuous; the belly also has no rufous tinge; vent white. This was brought home in one of our circumnavigating ships, but from what particular region is uncertain.

23. *Parus kniafcik*, the white titmouse: plumage on the upper parts white; beneath, ocular line, and collar, livid. Inhabits the oak-forests of Siberia.

24. *Parus Hudsonius*, the Hudson's-bay titmouse: reddish-brown; back cinereous; throat black; band under the eyes and breast white; sides rufous. It inhabits Hudson's Bay, and is about five inches and a half long; weight only half an ounce. Bill black; head ferruginous brown; beneath the eyes a white streak; back greenish ash-colour; breast and belly white; sides of the belly ferruginous; wings brown; quills edged with cinereous; tail rounded at the end, coloured as the quills; rump rufous white. All the feathers of this bird are long and loose, and of a black colour at the base, being only tipped with the colours above mentioned: legs black; middle and hind claws twice as long as the others. The male and female are alike. This bird braves the severest winters of Hudson's Bay: Forster informs us, that it breeds about our settlements there, and lays five eggs. It is frequent among the juniper-bushes, and is called by the natives *peche-ke-ke-shih*. It builds in the month of June; and makes a nest of grass, lined with soft feathers: the young fly the beginning of July. In the summer it subsists on flies and insects, and in the winter on berries and feeds.

25. *Parus macrocephalus*, the great-headed titmouse: black: breast orange; belly yellowish; head tumid; spot on the front and wings, and two outmost tail-feathers, white. It is about four inches and a half long. The bill is small, pale, and furnished with bristles at the base; the head very full with black feathers, appearing very disproportionate to the size of the bird; neck and back dusky black; on the forehead, just over the bill, a spot of white; on the wing a bar of white; under part buff yellow, with a mixture of black on the thighs; tail black, long, and rounded in shape; the two outer feathers white, with the ends black, divided obliquely; the next white within near the tip; legs dusky brown. See the Plate, fig. 3. The female is pale brown above; all beneath yellow; the bill and spot over it are as in the male; quills dusky. Found by Capt. Cook in Queen Charlotte's Bay, New Zealand; and called there *mirro mirro*.

β. It varies with the breast entirely of a bright scarlet.

26. *Parus Novæ Seelandiæ*, the New-Zealand titmouse: red-ash, beneath rufous-grey; eyebrows white; two middle tail-feathers black; the lateral ones in the middle with a square black spot. It is five inches long. The bill is brown, tipped with black; legs dusky-black. It was found at Dusky-bay, New Zealand; where it is called *toe-toe*.

27. *Parus pendulinus*, the penduline titmouse: head ferruginous; ocular band black; quill and tail-feathers brown, and edged on each side ferruginous. It is about four inches and a half long: it inhabits Europe and Siberia, frequenting watering places for the sake of aquatic insects, on which it feeds. These birds display great art in the construction of their nests; they employ the light down found on the buds of the willows, the poplar, on thistles, and the dandelion: with their bill they entwine this filamentous substance, and form a thick close web, almost like cloth: this they fortify externally with fibres and short roots, which penetrate into the texture, and, in some measure, compose the basis of the nest: they line the inside with the same down, but not woven, that their young may lie soft: they shut it above to confine the

warmth, and they suspend it with hemp, nettles, &c. from the cleft of a small pliant branch over some stream, that it may rock more gently, assisted by the spring of the branch. In this situation the brood are well supplied with insects, which constitute their chief food, and, at the same time, they are protected from their enemies. The nest sometimes resembles a bag, and sometimes a short purse. The aperture is made in the side, and is almost always turned towards the water. It is nearly round, and only an inch and a half in diameter; and is frequently surrounded by a brim. These nests are found in the fens of Bologna, Tuscany, Lithuania, Poland, and Germany. The peasants regard them with superstitious veneration, one of them being usually suspended near the door of each cottage, as a charm against lightning.

28. *Parus Narbonensis*, the Languedoc titmouse: rufous-grey; crown hoary; wings and tail blackish, edged with rufous; primary quill-feathers edged with white. It inhabits France, and in manners it may vie with the preceding, being not inferior in regard to the construction of the nest, which is large in respect to the size of the bird, being in shape like, and not much less than, the egg of an ostrich; the longest diameter is six inches, the shortest three and a half. It fixes this nest on a forked twig of the poplar, surrounding it with wool, employing the downy part of the poplar-flower, and such other materials as the last species makes use of. This is likewise open only on one side; but the entrance is still more curious, for it constructs a kind of portico over it, projecting almost three quarters of an inch, whereby there is an additional security against the accidents of wind, rain, and other inconveniences. It is called at Languedoc the *wild canary-bird*. Its length is about four inches.

29. *Parus cela*, the Guiana titmouse: black; bill white: spot on the wings and base of the tail yellow. It inhabits Guiana.

30. *Parus amatorius*, the amorous titmouse: blackish-blue; longitudinal spot on the middle of the wings half yellow, half rufous. Five inches and a half long. It inhabits Northern Asia, and is remarkable for the mutual affection of the two sexes. The bill is black at the base, and tipped with orange.

31. *Parus coccineus*, the scarlet titmouse: cinereous; breast, spot on the wings, rump, and lateral tail-feathers on the hind part, scarlet. The bill and legs black, vent yellowish.

32. *Parus Indicus*, the Indian titmouse: above cinereous, beneath ferruginous; chin and throat dirty white; limbs dirty brown. It inhabits India.

African Species from Vaillant.—Monsieur Le Vaillant is of opinion, that many birds have been included in this genus, which have no reference to it whatever. He says that the species described by Kolbe as inhabiting the Cape are not to be found there, and that he has omitted the three species which really are African tirmice. All the birds that Sonnerat describes as tirmice, Vaillant rejects entirely; and about three parts of those of other authors, and especially all those said to be found in America; for he positively asserts, that the titmouse is not at all an inhabitant of the new continent.

He denies what Brisson asserts, that the tongue of the titmouse is pointed like a hair-pencil, and that it climbs trees like the woodpeckers. The tongue of the titmouse is cut square, and terminates in four thin sharp fibres at equal distances; these are useful in getting out of the shell the seeds which the bird has already broken with its bill; these fibres are cartilaginous he says, and have no similarity to bristles, or the hairs of a pencil. He then proceeds to give the marks by which, he says, they are really distinguished; and describes the only three species he met with from the most southern point of Africa to the tropic.

The tirmice have a muscular body, very fleshy in proportion to their height; their feet are strong, and generally thick; the tarsus is short; the toes long and hooked,

proper for fastening themselves to any thing, and indeed they hold very tight with their strong claws. The bill is thick at the base; the upper mandible somewhat convex; the lower is as strong as the upper, and both are a little flattened at the sides, and end together in a rounded point. The bill, which is strong of itself, acquires additional force by its position, since it is so fixed as to answer exactly to the middle of the head, which is round, and of remarkable solidity by the thickness of the cranium. The forehead is much raised; the base of the bill is shaded by some stiff feathers directed forwards, and partly hiding the nostrils. The titmice do not crush the seeds they feed upon; they break them, and pick out the inside; they have even strength enough in their bill to pierce the shell of a nut or an almond, and draw all the kernel by bits through the hole. They also feed upon caterpillars, spiders, butterfly-eggs, and upon soft insects in general, which they find upon the leaves of trees, or pick from under the bark, which they can remove with their bill while they cling to the trunk; and this has made several naturalists suppose they had the faculty of climbing like the woodpeckers, though they really cannot change their position without spreading their wings, and taking a short flight, or at least a sidelong jump, but never without a motion of the wings; a mode very different from the climbing of woodpeckers.

They hide their young with great care, making their nest out of sight, in the hole of a tree or cleft of a rock, or in an old wall. They lay a great many eggs, and always retire into holes to sleep; they also accumulate a winter store of provisions. As for their habits, they are lively, alert, ever in motion; it is supposed they consume a deal of food, as they are always foraging. They are heard at the very dawning of day, and are the last of the diurnal birds that retire; so that the nocturnal birds of prey make great destruction among them; and to this they are the more exposed by their own desperate courage, for they will attack an owl without hesitation. If they kill their enemy, they directly break the skull with the bill, and feed upon the brains. They are naturally cruel, like the shrikes. Buffon has seen some tamed ones attack any weaker birds that were put into the cage, kill them, and suck their brains. In this propensity the African species, according to Vaillant, are exactly similar. He adds, that they are not shy, but may be easily caught in any snare; that they are easily tamed, and show a certain degree of attachment towards those who feed and attend them.

33. *Parus niger*, the black titmouse: size of the *P. major*. It is entirely black, except a few white streaks upon the wings and tail; the head and back are however of a more decided black than the front and under parts of the body. The tail-quills are black for the most part; but the lateral ones have a broad white edging along their outer barbs, and their tips are white; the interior ones have less and less white as they come nearer the two middle feathers, which are entirely black; the two outer quills are a little shorter, the rest equal in length. The wing reaches about one third the length of the tail; its larger quills are a brownish black, slightly edged with white; the mid-quills have a broader edging, and the last broader still, for upon them the border forms a long white stripe; the great coverts are black edged with white; the mid-coverts entirely white; the smaller ones entirely black; so that the wings are agreeably variegated with black and white. The bill is black; eyes dark brown; nails brown, feet and legs lead-colour. The female is rather smaller than the male, and not of such a jetty black, especially on the breast, where there is an appearance of grey, which becomes lighter as you approach the under-coverts of the tail, which are tipped with white. In the young birds, the borderings have a rufous tint, the black of the upper surface is rather inclined to brown, and of the under parts to grey. These birds retire every evening to the holes of trees, where their nest is placed,

which is made of twigs lined very nicely with wool; the eggs are six to eight in number, and entirely white. The song is precisely the same as that of the *P. major*; which last, however, is never found in Africa. The black titmouse is plentiful near the Sondag and Swart-kop rivers, and in Caffraria; but not on the west coast, or near the Cape.

34. *Parus variegatus*, the variegated titmouse: in shape and general characters this resembles the preceding, but is somewhat smaller. Found only in the mimosa-thickets of Camdeboo, where it is called *Malabartje*, or "little Malabar," on account of its black head. Though smaller than the preceding, the bill is rather longer. At first sight it might be mistaken for a female or young male of the last species. The top of the head is black; and also the back of the neck, where the black is bounded by a large white spot, forming a half-collar; a broad white stripe goes from each corner of the mouth, and covers the cheeks, runs upwards underneath the eyes, (which are brown,) and downwards till it meets the white on the bottom of the neck, and thus encloses the jet-black covering of the throat; the black covers the entire throat, and falls down like the corner of a handkerchief on the breast, whence the white runs along the middle of the body as far as the belly. The back, scapulars, and mantle, are blue-grey or slate-colour; so are the flanks, but somewhat lighter than the back. The wing-quills are brown black, lifted with white; this lift is broader as the feathers are higher up on the back; the great and middle coverts are also brown, with broad white edgings; but the small feathers of the pinions are of the same blue-grey as the back. The upper tail-coverts are black; the under ones light grey, edged with white. The tail is, in general, black, but the outer quill on each side is edged and tipped with white; the second pair have a narrower edging, the rest are only white at their tips. The bill is brownish black; legs and feet bluish, nails almost black. The female is rather smaller. The white edgings are not so visible, being of a less pure white; the head and throat are of a brown black; and all the grey parts have a slight tint of rufous. In the young bird, the throat is still more brown, and the grey parts fawn-colour. Its nesting is not known.

β. There is a variety of this species, with white wings and tail, and the throat spotted with white. It was in company with eight others of the same species, and was the only one so marked. It was a male, bearing its first plumage; it never had moulted.

35. *Parus fuscus*, the brown titmouse: this is the smallest African species, and the only one Vaillant met with about the Cape, and in the colony. It inhabits the rocks and mountains, and is about the size of the *P. ceruleus*, or blue titmouse: it has the same shrieking note, at the same time that it utters the *gra-gra gra-gra* of the other two African species we have mentioned, which last seems to be common to all the titmice when they see any thing that surprises them, a mischievous animal or a bird of prey. When we say all the titmice, we must be understood to mean only those which Vaillant allows to be such.

The brown titmouse of Africa prefers rocky and mountainous places, concealing its nest very carefully in a hole: the nest is very large, consisting of moss, much wool, and some feathers; the eggs are from eight to fourteen in number. Similar to the titmice of Europe, the smallest species lays the greatest number of eggs.

The head, neck, throat, and breast, are black: the large black patch on the breast goes tapering as far as the belly; a white stripe goes from the corners of the mouth, widens a little on the cheek, runs down the sides of the neck, separating the black of the throat from that of the hind-head, at the bottom of which there is also a little white spot. The feathers at the base of the bill, and those which cover the nostrils, are white. The back and scapulars are brown; so are the large wing-feathers, but blacker

black on their inner barbs; the mid-quills are edged with white, as well as the large and middle coverts, which are the blackest parts of the wing. The tail, except the white fringe which borders all the feathers of it at the tip, and a white line along the outermost feather on each side, (which also are somewhat shorter than the rest,) is dark brown, as are the upper coverts of the same. The flanks, lower belly, and under tail-coverts, are of a beautiful rufous grey. The bill is black; eyes and nails brown; the feet are lead-colour. The wings, when at rest, reach about half-way the tail. The female is somewhat smaller than the male, but so like that it is impossible to distinguish them.

36. *Parus albagena*, the white-cheeked titmouse: this was given to Vaillant by M. Temminck of Amsterdam, who received it from Batavia. It is about the size of the preceding, and shaped like the blue titmouse. The top of the head is black, as is the back of the neck, below which appears a small patch of white; from the corner of the mouth proceeds a white patch which covers the cheek, but reaches no farther than the ear, which it spreads over. The throat, front of the neck, and breast, are black; which black, instead of widening as in the preceding species, grows narrower from the lower part of the neck before, where it joins on the sides the black of the hind-head, and terminates at the belly. The scapulars, mantle, back, and upper tail-coverts, are of a bluish-grey; the same colour runs along the edges of the wing-quills, which are black; the larger wing-coverts are edged and broadly tipped with white. The three lateral tail-feathers on each side are white, and graduated or tapered, i.e. the outer is the shortest, and the two others successively longer; the rest of the feathers are entirely black. The sides, belly, and under tail-coverts, are whitish. The bill is brown grey; the claws black, the feet lead-colour. The wings when at rest extend about one-third the length of the tail. Its habits are not known.

37. *Parus dubius*, the black-cap: this and the following were received by Vaillant from Ceylon. They resemble in some respects the titmice; but he says do not properly belong to that genus. The bill is nearly of the same shape, but longer in proportion. The tongue is entire, cartilaginous, and pointed; different therefore from that of the titmouse, which is truncated, and ends in four points. The legs are not so large, the claws weaker, the nails not so hooked; which denote different habits. The bones of the head are not so strong, the head not so round, the forehead flatter. In other respects the shape of the body, wings, and tail, and the size also, agree nearly with the *P. major*, or great titmouse: but the wings are not so long, for on the black-cap they hardly exceed the setting-on of the tail. The head is entirely black; the rest of the upper surface, including the wings and tail, is olive-green, inclining to yellow on the rump; the lateral tail-quills are spotted with white at their extremities. The throat, front of the neck, and the whole of the under parts, are yellow; the bill is blackish, legs and feet brown.

As these were dried specimens which Vaillant received, he can speak no further but upon conjecture. The eyes he imagines were brown; the food, insects only. He describes and figures another individual, which he supposes to have been the female of this species, or at least a variety. It was somewhat smaller, and the colours lighter; the head tan-colour; the upper surface of the body, wings, and tail, dun-colour, with various shades of yellow; the tail tipped with white; the under parts of the body delicate pale yellow; bill, legs, and feet, brownish.

38. *Parus quadricolor*, the four-coloured titmouse: this differs still more from the titmice; the bill being longer and thinner than in the last; in this respect it makes a nearer approach to the *Motacilla*, or warbler; yet it has not the weak slender body and long legs of these; the legs are short, and toes thick, like the titmice.

Its habits are not known, Vaillant having received it from Columbo, the chief town of Ceylon; but he presumes that it feeds on insects like the preceding. In size it is somewhat smaller than the great titmouse. The top of the head and hind part of the neck are entirely covered with a black capuchin, which covers the eyes also; the back and scapulars are grass-green. The wing-quills are black, edged with yellow; the great and middle coverts fringed with white at the extremities. The tail is also black, and outwardly edged with yellow; the feathers of an equal length. The throat, front of the neck, breast, sides, and under tail-coverts, are of a beautiful jonquil-yellow, melting into green towards the legs and lower-belly. The bill is almost entirely black, only the sharp edges of the mandibles are yellowish; the nails are black, the feet brown. Though a doubtful species, we have added it to our Plate, on account of its beauty: see fig. 4.

The female is somewhat smaller. The top of the head, back of the neck, mantle, scapulars, rump, and tail, are olive-green; and all the front of the body, from the throat to the under tail-coverts, is of a fainter yellow than in the male. The yellow edging of the wing-quills is broader; but the white on the tips is not so pure, being shaded with olive. This (female) Vaillant ascribes to the bird described by Brisson under the name of *figuier du Bengale*, our *Motacilla tiphia*, or green Indian wag-tail, vol. xvi. p. 85. The species might occur at Ceylon as well as at Bengal. Klein has described the same, No 17. p. 75. and Edwards, vol. ii. Plate 79. See Vaillant's Hist. Nat. des Oiseaux d'Afrique, tome iii. p. 153-197.

PARU'SHA, a name applied by the Hindoos to several of their deities. The word seems to mean "the primeval person, or man;" and in some fables it is related that he was produced by the Creator at the formation of the world, with Prakriti, a personification of Nature. The allegorical union of these two powers, male and female, has furnished endless fancies for Hindoo metaphysicians, who, among such fancies, describe an allegorical immolation of this primeval being; sometimes making Parusha the victim; sometimes Brahma, or Narayana. In the Veda called *Yajur*, or *Yajush*, the necessary ceremonies for the sacrifices called *Ashwamedha* and *Purushamedha*, are laid down; but they are not, as the words imply, really sacrifices of horses and men. In the first mentioned, 609 animals of various kinds, domestic and wild, including birds, fish, and reptiles, are made fast; the tame ones to twenty-one posts, and the wild ones in the intervals between them; and, after certain prayers, the victims are let loose without injury. In the other, a hundred and eighty-five men of various specified tribes, characters, and professions, are bound to eleven posts; and, after a certain hymn concerning the allegorical immolation of Narayana has been recited, these human victims are liberated unhurt; and oblations of butter are made on the sacrificial fire. This mode of performing the *Ashwamedha* and *Purushamedha* as emblematical ceremonies, not as real sacrifices, is taught in this Veda; and the interpretation is fully confirmed by several rituals, and by commentators, one of whom assigns as a reason, "because the flesh of victims, which have been actually sacrificed, must be eaten by the persons who offer the sacrifice: but a man cannot be allowed, much less required, to eat human flesh." This passage is cited by Mr. Colebrooke from memory: he adds, "It may be hence inferred, or conjectured at least, that human sacrifices were not authorized by the Veda itself; but were either then abrogated and an emblematical ceremony substituted in its place, or they must have been introduced in later times on the authority of certain Puranas and Tantras, fabricated by persons, who in this, as in other matters, established many unjustifiable practices on the foundation of emblems and allegories which they misunderstood." *As. Res.* vol. viii. p. 437.

PARUTA (Paolo), a noble Venetian, known as a writer

writer in history and politics, was born in 1540. He succeeded Contarini as historiographer of the republic in 1579, and afterwards filled various offices in the state. He was employed in several embassies, was made governor of Brescia, and finally was elected a procurator of St. Mark. With a high character for wisdom, integrity, and zeal for the public good, he died in 1598, at the age of fifty-eight. The works of this writer are, 1. A Funeral Oration to the Praise of those who fell in the Battle of Curzolari in 1571. 2. Della Perfezione della Vita Politica, 1582, 4to. 3. Discorsi Politici, published by his sons in 1599, 4to. 4. A History of Venice from 1513 to 1551, with the Addition of the War of Cyprus in 1570-72, 4to. 1605. This work is written in Italian; and is accounted, for the exactness and skill of the narrative, and the judiciousness of the remarks, one of the best works of that class in the language. He had begun to write it in Latin, in imitation of the style of Sallust, and is said to have finished four books in that tongue. A new edition of it was given by Apostolo Zeno in 1703.

PARUTA (Filippo), a learned antiquarian, was a noble of Palermo, and secretary to the senate of that city, where he died in 1629. He wrote several works; but is principally known by his "Sicilia descritta con Medaglie," published in 1612 at Palermo. This work, afterwards augmented by Leonardo Agostini, was printed at Rome in 1649, and at Lyons in 1697. Havercamp published a Latin edition of it in three volumes, folio, 1723, which makes part of the Italian Antiquities of Grævius and Burmann. *Gen. Biog.*

PAR'WAN, a town of Candahar: sixty miles north-west of Cabul.

PARWI'DA, a town of Sweden, in Tavastland: forty-five miles north-north-east of Jamio.

PAR'WIS, a town of the county of Tyrol: eighteen miles west-north-west of Innspruck.

PAR'XU, *f.* in botany. See CESTRUM.

PAR'YRS, a mountain of North-Wales, in the island of Anglesea, about nine miles in length, and half as much in breadth; apparently wild, waste, and barren in the extreme, but abounding in the richest mines of copper and lead ore, in the latter of which is found a mixture of silver; the bed of copper-ore is supposed to be the largest known in the world. It is two miles south-east of Amlwch.

PARYSA'TIS, a Persian princess, wife of Darius Ochus, by whom she had Artaxerxes Memnon, and Cyrus the younger. She was so extremely partial to her younger son, that she committed the greatest cruelties to encourage his ambition, and she supported him with all her interest in his rebellion against his brother Memnon. The death of Cyrus, at the battle of Cunaxa, was revenged with the grossest barbarity; and Parysatis sacrificed to her resentment all such as she found concerned in his fall. She also poisoned Statira the wife of her son Artaxerxes; and ordered one of the eunuchs of the court to be dead alive, and his skin to be stretched on two poles before her eyes, because he had, by order of the king, cut off the hand and the head of Cyrus. These cruelties offended Artaxerxes, and he ordered his mother to be confined in Babylon; but they were soon after reconciled, and Parysatis regained all her power and influence till the time of her death. *Plut. in Art.*

PARZANE'GA, a town of Italy, in the department of the Serio: fifteen miles east-north-east of Bergamo.

PAS, *f.* [French.] Precedence; right of going foremost.—In her poor circumstances, she still preserved the mien of a gentlewoman; when she came into any full assembly, she would not yield the *pas* to the best of them. *Arbutnot.*

PAS, a town of Prussia, in Bartenland, ten miles north-east of Raftenburgh.

PAS, a town of France, in the department of the Straits of Calais: thirteen miles south-west of Arras, and six east of Dourlens.

PAS. See PASZBERG.

PAS (Manasses de), Marquis de Feuquieres, was the posthumous son of Francis de Pas, who was slain at the battle of Ivry. He was born at Saumur in 1590, and distinguished himself as an able general and negotiator. At the siege of Rochelle he was taken prisoner, was continued in confinement nine months, and was ransomed in exchange for general Ekenfort, two colonels, and 18,000 crowns. The reduction of the city of Rochelle has been attributed chiefly to him. He was afterwards ambassador to the court of Sweden and Germany, where he displayed great talents. In 1635 he commanded the army in conjunction with the duke of Saxe-Weimar. He died in 1640. His Negotiations in Germany were printed in 1753, in 3 vols. 12mo.

PAS (Anthony de), Marquis de Feuquieres, grandson of the above, was one of the greatest generals of his time. He signalized himself at the battle of Stafarde, at the taking of Suza, and other strong places in Italy; but he was so severe a disciplinarian, that it was a common saying, that De Pas must be the bravest man in the world, since he slept every night in the midst of a hundred thousand enemies. He was governor of Verdun; and in 1689 he was made, on account of his great talents, a field-marshal. He died in January 1711, aged 63. His Memoirs were printed in 4 vols. 12mo. *Moreri.*

PAS DE CALAIS'S. See STRAITS OF CALAIS.

PAS-EP-A', the chief of the Lamas, particularly eminent for having invented characters for the Moguls. He was much esteemed by the Chinese, though the literati exclaimed against the manner in which the people demonstrated their affection. There is still at Pekin a *myau*, or temple, built in honour of Pas-ep-a in the time of the Mogul emperors. He died in 1279. *Encyc. Brit.*

PA'SA, or FE'SA, a town of Persia, in the province of Farfistan: sixty-eight miles south-east of Schiras, and 235 south-south-east of Ispahan. Lat. 29. 10. N. Lon. 53. 40. E.

PASAGIN'ANS, or CIRCUMCISED, in ecclesiastical history, a singular sect, which sprung up in Lombardy towards the close of the 12th century. This sect, like several others that subsisted about the same time, had the utmost aversion to the dominion and discipline of the church of Rome; but it was distinguished, at the same time, by two religious tenets that were peculiar to itself. The first was a notion, that the observance of the law of Moses, in every thing except the offering of sacrifices, was obligatory upon Christians; in consequence of which its followers were circumcised, abstained from those meats the use of which was prohibited under the Mosaic economy, and celebrated the Jewish sabbath. The second point that distinguished this sect was advanced in opposition to the doctrine of three persons in the divine nature; for the Pasaginians maintained that Christ was no more than the "first and purest creature of God." Nor will their adoption of this opinion seem very surprising, if we consider the prodigious number of Arians that were scattered throughout Italy long before that period.

PASA'KA, BUXADEVAR, or BUXADUAR, a town of Asia, in the country of Bootan: sixty miles south-south-east of Tassafudon. Lat. 26. 48. N. Lon. 89. 30. E.

PASAKAM'ENITZ, a town of Bohemia, in the circle of Chrudim: eight miles west-north-west of Politzka.

PASAL', a town of Africa, in the kingdom of Fonia. Lat. 12. 40. N. lon. 15. 36. W.

PASAN'GA, a small island in the Eastern Indian Sea, near the west coast of Sumatra. Lat. 5. 10. S.

PASAR', a town of Hindooostan, in the Carnatic: twenty-one miles west of Tiagar.

PASAR'GADA, in ancient geography, a town of Asia, in Persia. The name signifies the Camp of the Persians; and the town was founded by Cyrus on the very spot where he had conquered Astyages. The kings of Persia were always crowned there; and the Pasargadae were

PASCAL.

Engraved for the Encyclopædia Londinensis, 1721

were the noblest families of Persia, in the number of which were the Achæmenides. *Herodot. c. 123.*

PASAR'NA, a town of Asia, in Armenia Minor, at some distance from the Euphrates, in the Lavinian prefecture.

PASCAGOO'LA, a river of West Florida, which runs into the gulf of Mexico, forming a bay at its mouth, in lat. 30. 23. N. lon. 88. 30. W.

PASCAL (Blaise), a very distinguished French mathematician and philosopher, was born at Clermont in Auvergne, in the year 1623. His father, who was president of the court of aids in his province, was also a man of considerable learning, and an able mathematician. As Blaise was his only son, so great was his affection for him, that in the year 1631 he relinquished his official situation and settled at Paris, in order that he might himself undertake the employment of being his tutor. From his infancy young Pascal gave evidence of a very extraordinary capacity. What we are told concerning his manner of learning the mathematics, and his rapid progress in that science, is very astonishing. His father, perceiving in him an extraordinary inclination to reasoning, was afraid lest the knowledge of the mathematics should prevent him from learning the languages. He therefore resolved to keep from him, as much as he could, all notions of geometry, locked up all the books that treated of it, and refrained even from speaking of it in his presence. Yet he could not refuse to give this general answer to the importunate curiosity of his son: "Geometry is a science which teaches the way of making exact figures, and of finding out the proportions between them;" but at the same time he forbade him to speak or think of it any more. The slight idea which had been thus conveyed to him of the science occupied young Blaise's thoughts, who was now only twelve years of age, and led him in his hours of recreation to make figures on the chamber-floor with charcoal, the proportions of which he sought out, laying down definitions and axioms, and then going on to demonstrations. So far had he proceeded with his enquiries, that he had come to what was just the same with the thirty-second proposition of the First Book of Euclid, when he was one day surprised by his father in the midst of his figures, who asked him what he was doing. He replied, that he was searching for such a thing, which was just that proposition of Euclid. When asked afterwards how he came to think of this, he answered that it was because he had found out such another thing; and so, going backwards, and using the names of *bar* and *round*, he at length came to the definitions and axioms which he had formed to himself. From this time young Pascal had full liberty to indulge his genius in mathematical pursuits, and was furnished by his father with Euclid's Elements; of which he made himself master in an incredibly short time, without any assistance. So wonderful was his proficiency in the sciences, that at the age of sixteen he wrote a Treatise on Conic Sections, which, in the judgment of the most learned men of the time, was considered to be a great effort of genius. Des Cartes, who had been in Holland for a long time, having read it, added his opinion to the universal verdict in its praise; but, when informed of the age of the author, he rather chose to believe that it was the production of M. Pascal the father, than to admit that so young a person was capable of writing a book with such strength of reasoning. At the age of nineteen, our young mathematician had contrived his admirable Arithmetical Machine, furnishing an easy and expeditious method of making all sorts of arithmetical calculations without any other assistance than the eye and hand. This was esteemed a very wonderful thing, and would have done credit to any man versed in science, and much more to such a youth. About this time the state of his health becoming impaired, owing most probably to the intemperance of his studious application, he was obliged to suspend his labours for the space

of four years. At the age of twenty-three, having seen Torricelli's experiment respecting a vacuum and the weight of the air, he directed his attention to those subjects, and made several new experiments. He likewise made many experiments with syphons, syringes, bellows, and all kinds of tubes, using different fluids, such as quicksilver, water, wine, oil, &c. and, having published an account of them in 1647, dispersed his work through all countries. These experiments, however, only ascertained effects, without demonstrating the causes. Pascal knew that Torricelli conjectured that those phenomena which he had observed were occasioned by the weight of the air, though they had formerly been attributed to nature's abhorrence of a vacuum; but, were Torricelli's theory true, he concluded that the liquor in the tube of the barometer ought to stand higher at the bottom of a hill than at the top of it. In order to ascertain the fact, he made an experiment at the top and bottom of a mountain in Auvergne, called le Puy de Dome, the result of which gave him reason to conclude that the air was indeed heavy. Of this experiment he published an account, of which he sent copies to most of the learned men in Europe. He also repeated it at the top and bottom of several high towers, as those of Notre Dame at Paris, St. Jacques de la Boucherie, &c. and always remarked the same difference in the weight of the air at different elevations.

M. Pascal, being now fully convinced of the general pressure of the atmosphere, drew many important and useful inferences from this discovery. He also composed a large treatise, in which he fully explained the subject, and answered the objections which were preferred against that theory; but afterwards, considering it to be too prolix, he divided it into two small treatises, one of which he entitled a Dissertation on the Equilibrium of Fluids; and the other, an Essay on the Weight of the Atmosphere. These treatises were not published till after the author's death.

The reputation which M. Pascal had acquired by his scientific labours, occasioned his being frequently consulted by some of the greatest mathematicians and philosophers of the age, who applied for his assistance in the resolution of various difficult questions and problems. Among other subjects on which his ingenuity was employed, was the solution of a problem proposed by father Mersenne, which had baffled the penetration of all who attempted it. This problem was, to determine the curve described in the air by the nail of a coach-wheel, while the machine is in motion: which curve was then called a *roullette*, but is now commonly known by the name of cycloid. As a spur to genius, M. Pascal offered a reward of forty pistoles to any one who should give a satisfactory answer to it. No person having succeeded, he published his own solution at Paris; but, as he now began to grow disgusted with the sciences, he would not send it into the world under his own name, but prefixed to it that of A. d'Ettonville. This exertion of his genius was a triumph over all the old mathematicians of Europe; and it was made in circumstances which cannot but excite astonishment. For his sister informs us, that he made the discovery, as it were, in spite of himself, and to his own great surprise, while passing sleepless nights in his bed, tormented by severe paroxysms of the tooth-ache. Before this time he had drawn up a table of numbers, which, from the form in which the figures in it are disposed, he called his "Arithmetical Triangle." Of this table he has been spoken of as the inventor; but Dr. Hutton has shown, in the first volume of his Mathematical Tracts, that such a table of numbers, and many properties of them, had been treated of more than a century before by Cardan, Stifelius, and other arithmetical writers.

When M. Pascal was in the twenty-fourth year of his age, and the highest expectations were entertained of the advantages to science from his future labours, he all at once renounced the study of the mathematics and natu-

ral philosophy, as well as all human learning, and devoted himself wholly to a life of mortification and prayer. This change was occasioned by his reading the books of some of those ascetic religionists who unnaturally make the height of virtue to consist in an abstinence from the enjoyment of those blessings which a kind Providence affords, and strangely consider the miseries which his creatures inflict upon themselves, to be the most acceptable sacrifice which they can offer to a benevolent Deity. From this time he renounced all pleasure and all superfluity; and to this system he adhered in the illnesses to which he was frequently subject, being of a very infirm habit of body. He not only denied himself the most common gratifications, but he also took without reluctance, and even with pleasure, either as nourishment or as medicine, whatever was disagreeable to the senses; and he every day retrenched some part of his dress, food, or other things, which he considered as not absolutely necessary. Though his continual infirmities obliged him to use very delicate food, and though his servants employed the utmost care to provide what was proper, he never relished what he ate, and seemed indifferent whether they brought him what was good or bad. He entertained no strong affection for those whom he loved; and advised others not to suffer any person to love them in a very high degree; since, by entertaining and cherishing such an ardent affection, a man possesses a heart which belongs only to God. He occasionally wore an iron girdle full of points next to his skin; and, when any vain thought came into his mind, or he took pleasure in any circumstance, he gave himself some blows with his elbow, to increase the violence of the smart, and by that means put himself in mind of his duty. During the latter years of his life, his principal relaxation from the rigorous system which he prescribed to himself, consisted in visits which he paid to the churches where some relics were exposed, or some solemnity observed; and for that purpose he had a spiritual almanac, which informed him of the places where particular services were performed.

But, notwithstanding that M. Pascal thus abstracted himself from the world, he was not entirely indifferent to what was passing in it; and he even interested himself in the contest between the Jesuits and the Jansenists. Taking the side of the latter, he wrote his celebrated "Provincial Letters," published in 1656, under the name of Louis de Montalte, in which he ably employed his talents of wit and humour in ridiculing the former. Voltaire says, "these letters may be considered as a model of eloquence and humour. The best comedies of Moliere have not more wit than the first part of them; and the sublimity of the latter part is equal to any thing in Bossuet." He also pronounces Pascal the first of the French satirists; and maintains that Despreaux must be considered as only the second. In another place, speaking of this work of Pascal, he says, that "examples of all the various species of eloquence are to be found in it. Though it has now been written almost an hundred years, yet not a single word occurs in it favouring of that vicissitude to which living languages are so subject. Here then we are to fix the epoch when our language may be said to have assumed a settled form." These letters have been translated into almost all the European languages. Of all the books which were published against the Jesuits, none did them more harm, nor vexed them more, than these productions of M. Pascal's pen. Numerous were the answers to them which they caused to be distributed; but, notwithstanding the efforts of the apologists for the society, and the decrees of condemnation against the work which they procured to be passed by the parliament of Aix, and the council of state, the Provincial Letters maintained their ground, interesting the more serious readers by their solidity, and by their pleasant and comical turns of wit engaging all the party of laughers on their side.

M. Pascal was only about thirty years of age when the

Provincial Letters were published; yet he was exceedingly infirm; and, as his disorders increased so much afterwards, that he considered himself to be hastening to the close of life, he gave up all further thoughts of literary composition. With the view also of spending the remainder of his days in retirement and pious meditation, he broke off all his former connexions, changed the place of his abode, and spoke to no one, not even to his own servants, whom he hardly ever admitted into his room. He made his own bed, fetched his dinner from the kitchen, and carried back the plates and dishes in the evening; so that he employed his servants only to cook for him, to go on a few unavoidable errands, and to do such things for him as he was incapable of performing himself. Nothing was to be seen in his chamber but two or three chairs, a table, a bed, and a few books. It had no kind of ornament whatever; he had neither a carpet on the floor, nor curtains to his bed. These circumstances, however, did not prevent him from occasionally receiving visits; and, when his friends appeared surprised to see him thus without furniture, he replied, that he had what was necessary, and that any thing more would be superfluous, unworthy of a wise man. M. Pascal had now given up all intense study, and lived in the most temperate manner; yet his health continued rapidly to decline, and his disorders so enfeebled his organs, that his reason became in some measure affected. In these circumstances he met with an accident which produced an unfavourable impression upon his imagination, not to be effaced, excepting during short intervals, by the soothing persuasions of his friends and of his confessor. In the year 1654, the state of weakness to which he was reduced having alarmed his physicians, they prescribed to him taking the air and gentle exercise. As he was one day crossing the Seine at the bridge of Neuilly, in a coach and four, the two leading horses became unmanageable at a part where the parapet was down, and plunged over the side into the river. Happily, their weight broke the traces, by which means the other horses and the carriage were extricated on the brink of the precipice. The effect on the feeble and languishing frame of M. Pascal may easily be conceived. It was with great difficulty that he was recovered at all from a long swoon; and he was never reinstated in the calm possession of his mental faculties. He always imagined that he saw a deep abyss on the left side of him, and he would never sit down till a chair was placed there, to secure him from danger. He also persuaded himself that he had a kind of vision; the particulars of which he preserved in a memorandum on a piece of paper, which he always carried about him between the cloth and lining of his coat. After languishing for some years in this imbecile state of body and mind, M. Pascal died at Paris Aug. 19, 1662, when about thirty-nine years of age.

To M. Pascal's extraordinary and diversified talents, the particulars which we have related, and the works which he left behind him, bear sufficient testimony. They do so likewise to the ardour of his piety, and exemplariness of his morals. That his ideas of perfection in the religious and moral character were not unmixed with superstition, and enforced a servile rigour and austerity of conduct, is to be attributed to the influence of that creed which had been taught him in his infancy. His heart was the seat of the purest benevolence; and his exertions in alleviating the miseries and contributing to the happiness of the unfortunate and indigent, were limited only by the extent of his fortune. Though his abilities entitled him to assume an air of superiority, he never displayed that haughty and imperious tone which is too commonly observable in men of shining talents, but was distinguished by uncommon modesty and humility. And he was also distinguished by the admirable patience with which, during his long illness, he edified and surprised all persons who were about him. In company, he was remarkable for the amiableness of his behaviour, and for his easy, agreeable, and instructive conversation. He possessed

possessed a natural kind of eloquence, which was in a manner irresistible. He intended to have written a work against atheists and unbelievers in Christianity; and collected materials for that purpose, which he did not live long enough to digest. These consisted of reflections upon devout, moral, and other subjects connected with the evidences of the Christian religion, which were written down by him at different times, on the first piece of paper which he could find; and he commonly set down only a few words of each sentence, as he penned them merely for his own use. After his death, these pieces of paper were found filed upon different pieces of string, without any order or connexion; and, being exactly copied as they were written, they were afterwards arranged and published in thirty-two chapters, under the title of "*Pensées de M. Pascal sur la Religion et sur quelques autres Sujets*," 12mo. They have been translated into the English and various other languages; and have been deservedly admired as the precious remains of a great man, which exhibit striking traits of his sublimity of genius, beautiful turn of sentiment, as well as force and elegance of expression. At the same time we must acknowledge, that some opinions occur in them, relative to the condition of human nature, and the proceedings of the divine government, which appear to us to be utterly irreconcilable with just and rational views of religion, and to reflect dishonour on the wisdom and benevolence of the Deity. On some of these Voltaire has made able animadversions in his *Lettres Philosophiques*.

The works of M. Pascal were collected together, and published in five volumes, 8vo. in 1779, at the Hague, and at Paris; consisting of the articles mentioned in the preceding narrative, and some pieces which had till then remained only in manuscript. This collection was given to the public by the abbé Bossu, whose eulogium on the author we present to our readers: "This extraordinary man," says he, "inherited from nature all the powers of genius. He was a geometrician of the first rank, a profound reasoner, and a sublime and elegant writer. If we reflect that, in a very short life, oppressed by continual infirmities, he invented a curious arithmetical machine, the elements of the calculation of chances, and the method of resolving various problems respecting the cycloid; that he fixed in an irrevocable manner the wavering opinions of the learned concerning the weight of the air; that he wrote one of the most perfect works existing in the French language; and that in his *Pensées* there are passages, the depth and beauty of which are incomparable; we can hardly believe that a greater genius ever existed in any age or nation." The celebrated Bayle pronounces M. Pascal to have been "one of the sublimest geniuses whom the world ever produced—a prodigy; and," says he, "if I might be so bold as to use the expression, I would call him, a paradoxical individuum of the human species; that is, we are almost inclined to doubt that he was born of a woman, like the man mentioned by Lucretius: *Ut vix humana videatur stirpe creatus*."

We shall conclude with extracting what Mr. Dugald Stewart has said of this distinguished writer in his "*General View of Philosophy*," prefixed to the Supplement to the *Encyclopædia Britannica*.

The name of Pascal (that "prodigy of parts," as Locke calls him) is more familiar to modern ears than that of any of the other learned and polished anchorites, who have rendered the sanctuary of Port-Royal so illustrious; but his writings furnish few materials for philosophical history. Abstracting from his great merits in mathematics and in physics, his reputation rests chiefly on the *Provincial Letters*; a work from which Voltaire, notwithstanding his strong prejudices against the author, dates the *fixation* of the French language. The enthusiastic admiration of Gibbon for this book, which he was accustomed from his youth to read once a-year, is well known; and is sufficient to account for the rapture with which it never fails to be spoken of by "the erudite vul-

gar" (*eruditum vulgus*, Pliny, lib. ii.) in this country. I cannot help, however, suspecting, that it is now more praised than read in Great Britain; so completely have those disputes, to which it owed its first celebrity, lost their interest. Many passages in it, indeed, will always be perused with delight; but it may be questioned, if Gibbon himself would have read it so often from beginning to end, had it not been for the strong hold which ecclesiastical controversies, and the Roman Catholic faith, had early taken of his mind. In one respect, the *Provincial Letters* are well entitled to the attention of philosophers; inasmuch as they present so faithful and lively a picture of the influence of false religious views in perverting the moral sentiments of mankind. The overwhelming ridicule lavished by Pascal on the whole system of jesuitical casuistry, and the happy effects of his pleasantries in preparing, from a distance, the fall of that formidable order, might be quoted as proofs, that there are at least some truths, in whose defence this weapon may be safely employed; perhaps with more advantage than the commanding voice of Reason herself. The mischievous absurdities which it was his aim to correct, scarcely admitted of the gravity of logical discussion; requiring only the extirpation or the prevention of those early prejudices which choke the growth of common sense and of conscience: and for this purpose, what so likely to succeed with the open and generous minds of youth, as ridicule, managed with decency and taste; more especially when seconded, as in the *Provincial Letters*, by acuteness of argument, and by the powerful eloquence of the heart? In this point of view, few practical moralists can boast of having rendered a more important service than Pascal to the general interests of humanity. Were it not, indeed, for his exquisite satire, we should already be tempted to doubt, if, at so recent a date, it were possible for such extravagancies to have maintained a dangerous ascendancy over the human understanding.

The unconnected fragment of Pascal, entitled "*Thoughts on Religion*," contains various reflections which are equally just and ingenious: some of which are truly sublime; and not a few which are false and puerile: the whole, however, deeply tinged with that acetic and morbid melancholy, which seems to have at last produced a partial eclipse of his faculties. Voltaire has animadverted on this fragment with much levity and petulance; mingling, at the same time, with many very exceptionable strictures, several of which it is impossible to dispute the justness. The following reflection is worthy of Addison; and bears a strong resemblance in its spirit to the amiable lessons inculcated in his papers on Cheerfulness: "To consider the world as a dungeon, and the whole human race as so many criminals doomed to execution, is the idea of an enthusiast; to suppose the world to be a seat of delight, where we are to expect nothing but pleasure, is the dream of a Sybarite; but to conclude that the earth, man, and the lower animals, are, all of them, subservient to the purposes of an unerring Providence, is, in my opinion, the system of a wise and good man." *Spectator*, No. 381 and 387.

Underneath the Portrait which accompanies this article, a hand from heaven is seen filling out of a small phial the lamp of Pascal's short life. We take this opportunity of supplying our omission of explaining the allegorical Entablature which accompanies the Portrait of old PARR, which alludes to a life as much lengthened beyond the usual standard as the other falls short of it: there, Clotho and Lachesis spin on the life of Parr, while Atropos seems totally to forget or to neglect the use of her scissors. See p. 637.

PASCALANK, a river of North-Carolina, which runs into Albemarle Sound in lat. 36. 6. N. lon. 76. 32. W.

PASCALIA, *f.* [so named by Professor Ortega, probably to commemorate some botanist.] In botany a genus of the class syngenesia, order polygamia-superflua, natural

natural order compositæ oppositifoliæ, *Linn.* (corymbifæræ, *Juss.*) *Essential Characters*—Receptacle chaffy; seeds pulpy; down a toothed border; calyx imbricated.

Pascalina glauca, a single species. Native of Chili. Root perennial; stem erect, eighteen inches high, slightly branched in the upper part only; leaves opposite, sessile, smooth, glaucous; the lower ones ovate, with angle-like teeth, three-ribbed, veiny; the upper ones lanceolate, narrow, three-ribbed, obscurely toothed towards the base. Flowers yellow, solitary at the summits of the stem and branches. The pulpy or drupaceous seeds appear to render this genus, as Willdenow observes, very distinct. *Ortega*, Dec. iv. 39.

PASCALINI, or PASQUALINO (John-Baptista), an Italian engraver, was born at Cento, a village near Bologna, A.D. 1600, and frequented the school of Cyrus Ferri; though he does not appear to have made any meritorious progress in painting. He engraved a great number of prints from various Bolognese painters, but particularly from his countryman Guerchino; whose bold spirited style in drawing with a pen he attempted to imitate with the graver, but he did not possess sufficient command of that instrument to succeed, neither is it at all adapted to such a purpose. The etchings of Pascalin, according to Huber, always convey the idea of original compositions; but this praise Mr. Landseer does not think him entitled to. Those among them which deserve most commendation, are—St. Felix, a Capuchin, kneeling before the Virgin and Infant Christ, folio; St. Diego, from L. Caracci, marked J. B. Centensis; a large folio print of The Death of St. Cecilia, from Dominichino; The Aurora, a large print lengthways, on two plates, from the celebrated picture of Guido, which has since been finely engraved by Giacomo Frey, and also by Audenarde.

PASCATA'QUA. See PISCATAQUA.

PASCH, *f.* [παῤῥχε, Sax. *pascha*, Gr. from the Heb. *paschah*.] The passover.—The *paske* was full nygh, a feast day of the Jewis. *Wicliffe's John* vi.—What feast it was, is questionable; whether the *pasch*, or whether pentecost. *Bp. Hall's Contempl.*—The feast of Easter. *Bullokar*.

PASCH-EGG, *f.* An egg dyed or stained, presented, about the time of Easter, in several parts of the north of England, to this day, to young persons; corruptly called in Cumberland *pace*-egg; in Northumberland, according to Mr. Brand, *paske*-egg. Of the great antiquity of this custom, and of its usage among various nations, see an account in Brand's *Popular Antiquities*, vol. i. p. 142.—Holy ashes, holy *pace*-eggs, and flanes; palmes, and palme-boughs. *Bechive of the Romish Church*. 1579.

PASCH-FLOWER. See PASQUE-FLOWER.

PASCHAL, *adj.* [Fr. from *pascalis*, Lat.] Relating to the Jewish passover.—It was an essential part of the *pascchal* law, that the lamb should be slain. *Pearson on the Creed*.—Relating to the Christian Easter.—That this dispute [concerning the feast of Easter] might never arise again, these *pascchal* canons were then established. *Wheatly on the Comm. Prayer*.

PASCHAL I. (Pope), a Roman by birth, who flourished in the ninth century, became a presbyter of the church, and abbot of the monastery of St. Stephen. In the year 817, upon the death of pope Stephen V. he was elected his successor, by the unanimous suffrages of the senate, the clergy, and people. Immediately after his elevation to the pontifical throne, he sent his nomenclator Theodore into France, to carry the tidings of his elevation to the emperor Louis, who sent him assurances of his protection, and confirmed the grants which had been made by his father and grand-father to the holy see. No sooner was his election known in the East, than letters were sent to him from the monk Theodore Studita, and the other defenders of image-worship, containing grievous but very exaggerated complaints of the persecution which they suffered from the ICONOCLASTS (see the article); and exhorting him to assemble a council for the purpose of anathematizing those heretics. This measure he re-

fused to adopt; but sent letters to the complainants, confirming them in their adherence to their usual practice; and, to comfort them under their sufferings, he assured them that to be martyrs on account of images was in fact to be martyrs on account of Christ; and that the same reward was reserved in heaven for those who suffered under the image-breaking emperors as was conferred on those who suffered under the Pagan emperors for the sake of Christ. In the year 818, Paschal built a monastery at Rome for the Greek monks who had fled from Constantinople, and the other cities of the East, rather than renounce the worship of images. In the year 823, Lotharius, the eldest son of the emperor Louis, who had taken him for his partner in the empire, came to Rome, where he was received with every possible mark of respect and distinction, and crowned by him emperor and king of Italy. Scarcely had the monarch returned to France, before a messenger arrived from Rome with the intelligence, that two of the chief officers of the Roman church, distinguished by their zealous attachment to the interests of France, had been apprehended soon after his departure, and carried to the Lateran palace, where their eyes were first cruelly pulled out, and they were then beheaded. Shocked and incensed at such barbarity, the emperor Louis sent commissioners to Rome, to examine whether the pope was implicated in that black affair. After a strict enquiry, so different and contradictory were the depositions of the witnesses who came before them, that they could not with any certainty declare the pope either innocent or guilty of the murders. They, therefore, acquiesced in an offer which Paschal made of declaring his innocence upon oath. He could not, however, be persuaded to deliver up the assassins, alleging that they were his own servants, and in fact guilty of no crime or injustice, since the persons whom they had put to death had long deserved that punishment by their treasonable practices. Not long afterwards the pope was seized with a dangerous illness, to which he fell a sacrifice in February 824, after a pontificate of rather more than seven years. From a conviction that, notwithstanding his oath, he was in fact privy to the assassination which his servants had perpetrated, the Romans would not allow him to be interred with his predecessors in the Vatican; and he remained unburied till his successor caused his remains to be deposited in one of the churches which he had rebuilt. Three Letters, which are attributed to him, are inserted in the seventh volume of the Collect. Concil. but doubts of their genuineness are entertained by catholic critics.

PASCHAL II. (Pope), originally called *Rainerius*, or *Raginerus*, was a Tuscan by nation, and was educated in the monastery of Cluny, where he embraced the monastic life while he was very young. At the age of 20, he was sent by his abbot to Rome on business relating to the monastery, when Gregory VII. who was then on the pontifical throne, struck with his talents and behaviour, retained him at his court; and, in a short time, he was ordained priest, and soon after was promoted to the dignity of cardinal, with the title of St. Clement. In 1099, upon the death of pope Urban II. the cardinals, bishops, and clergy, of Rome, having assembled in the church of St. Clement, determined to elect cardinal Rainerius; he wished to escape, and withdrew himself; but, being discovered, he was brought back, and unanimously placed on the pontifical throne. On the following day his consecration took place, when he assumed the name of Paschal II. His first object was effectually to crush his rival Guibert, who had maintained the name of pope for nearly twenty years, and had given considerable trouble to three of his predecessors, Gregory VII. Victor III. and Urban II. He had, indeed, been finally driven from Rome by pope Urban, but still continued master of his bishopric of Ravenna. From this city he was compelled to fly by Paschal's troops; upon which he retired to Citta di Castello, or, as others say, to the mountains of

Abruzzo,

Abruzzo, where he died suddenly. Immediately after information of his death was brought to his friends, they chose one Albert in his room; but he was apprehended on the very day of his election, and confined to the monastery of St. Lawrence. In his room Guibert's party elected a Roman, named Theodoric; who within between three and four months fell into Paschal's hands, and was shut up in the monastery of Cava near Palestrina. Lastly the same party elected an archpriest, called Magninulph, who took the name of Silvester IV. but, the interest of Paschal prevailing, he was forced to quit Rome, and died soon afterwards.

Paschal, having now triumphed over all his rivals, and seeming to be firm and secure in the possession of the apostolical chair, began the exercise of his pontifical office by sending legates into France, to remonstrate with king Philip on account of his living in open adultery with Bertrada, wife of Fulk count of Anjou, and to cut him off from the body of the church, should not their admonitions have the effect of reforming him. The legates, finding that the king paid no regard either to their exhortations or menaces, summoned a council to assemble at Poitiers; and, having acquainted the assembly of the inefficacy of their endeavours to retrieve the king from his wickedness, with their approbation excommunicated that prince and his adulterous concubine. In the year 1101, the pope, knowing that Anselm, archbishop of Canterbury, was wholly in his interest, attempted to introduce the legatine power into England; and sent over Guido, archbishop of Viënné, with the character of his legate *à latere*; but, when king Henry and the nation understood that he was commissioned to exercise in this kingdom the same uncontrolled power over all persons, laymen as well as ecclesiastics, which had been displayed in other countries, but was altogether unprecedented in England, they would not acknowledge him, nor was he allowed to exercise any function of his office.

In the year 1102, Paschal assembled a council at Rome, in which the decrees of his predecessors against investitures were confirmed, and the pope himself, with great solemnity, and in the presence of an immense multitude, pronounced the sentence of excommunication against the emperor Henry IV. This prince was afterwards glad to abdicate his throne in favour of his son Henry V. Upon the death of the former, the pope held a council, in which decrees were passed which re-united the whole of Lombardy to the apostolical see, from which all that country, excepting the places held by the counts Matilda, had been separated ever since the year 1080, when it declared in favour of the antipope Guibert.

By this time the pope had the mortification to find, that the new emperor was determined, equally with his predecessors, to maintain his right to investitures; the pope, therefore, to strengthen his own hands, sought an alliance with Philip of France, whom he had, some time previously to this, absolved from the sentence of excommunication. In 1107 the pope presided in a council at Troyes, consisting of the bishops from many places, who proved themselves to be wholly subservient to the ambition of the court of Rome, by confirming all the decrees relating to the pretended papal right to investitures. In 1110 a compromise took place; and in the following year Henry set out for Rome, at the head of a numerous army, to be crowned. He was received with every mark of respect; but, when the conditions of the treaty were to be mutually fulfilled, the German and Italian bishops present protested unanimously against parting with their estates, which they said the pope had no right to dispose of. This produced a warm altercation between the king and the pope, Paschal declaring that he would not proceed with the coronation unless the monarch immediately ratified his part of the treaty. Henry, in reply, ordered his guards to arrest the pope and all his cardinals, thinking that, by this measure, he should compel Paschal to crown him. Two of the cardinals contrived to escape in

disguise, and they animated the citizens of Rome to fly to arms, to rescue their pontiff. A civil contention took place, in which the friends of the pope were repulsed with great slaughter. After Paschal had been prisoner about two months, the monarch swore, in the presence of his army, that, if he did not fulfil the articles of agreement, he would put him, and all his adherents, to death. The pope was still unmoved, till the cardinals, and other prisoners, begged him to yield for their sakes, and to prevent the calamities which must otherwise fall upon the church. The articles of agreement were accordingly signed, and the monarch received a papal bull, confirming to him the right of investiture. Things being thus settled, the pope and Henry proceeded to the church of St. Peter, where the king was crowned emperor of the Romans by the pope, with the usual solemnity; soon after which that prince took his leave of his holiness, and returned to Germany. Paschal's reception at Rome was highly mortifying: he was accused of having sacrificed the rights of the church, and the dignity of his station, to his own safety. He affected great contrition, and sanctioned the excommunication of the emperor. Hostilities were carried on by both parties till 1117, when Henry resolved to bring matters to a crisis, and set out a second time for Italy, at the head of a numerous army. The contests now were carried on with great violence till the beginning of the following year, when the pope died, after a reign of about eighteen years and a half, which he spent in incessant efforts for extending the power, and promoting the aggrandisement, of the papal see. More than 100 of his Letters, and some fragments of his Decrees, are inserted in the 10th vol. of the Collect. Concil.

PASCHAL III. (Pope or Antipope), originally known by the name of *Guy de Crema*, was probably a native of the city whence he derived his surname. He was promoted to the sacred college by pope Adrian IV. who sent him into Germany as legate to appease the resentment of the emperor Frederic Barbarossa, which he had provoked by his exorbitant and arrogant claims to the temporal power and authority. He was not successful in the object of his mission; on the death of Adrian, in 1159, the cardinals were divided into two parties, the greater number of whom declared the election to have fallen upon Alexander III. while the minority, in which Guy was one, gave votes for cardinal Octavian, who had long aspired to the pontificate, and was even prepared to support his pretensions by an armed force. A double election took place, and the two rivals were consecrated by their respective partizans, on which occasion Octavian assumed the name of *Victor*. Supported by the emperor, he retained the pontifical dignity till his death in 1164, when cardinal Guy was chosen his successor, and took the name of Paschal III. This election was confirmed by the emperor; and, in 1166, Paschal was acknowledged in the character of sovereign pontiff by the bishops and princes of the empire at the diet of Wurtzburg. The Romans, however, declared for Alexander, and received him with the same honours which had been paid to his predecessors. A furious contest was excited; but at length the greater part of the Romans submitted, and acknowledged Paschal as lawful pope. He died in 1168, after he had held the title about four years. One of the chief acts which he performed in this character was the canonization of Charlemagne in the year 1165; but, as the Roman church classes Paschal among the antipopes, it does not agree to the honours of sainthood which are paid to that prince. *Platina et Anastasius de Vita Pont. Cave's Hist. Lit. vol. ii. Mosh. Hist. Eccl. sæc. xii.*

PASCHASIUS-RAD'BERT, a celebrated French monk in the ninth century, to whose writings protestant controversialists trace the origin of the doctrine of transubstantiation, is most generally spoken of in ecclesiastical history under his *prænomen*, on which account we have assigned him to this department of our alphabetical list. He was a native of Soissons; and, being deserted in his

infancy by his relations, was brought up by the charity of the nuns of Our Lady of Soissons, in an out-house dependent on their convent. When he had grown to man's estate, he embraced the monastic life among the Benedictines of the abbey of Corbie, where he applied with great diligence to his studies, distinguished himself in the polemic conferences and disputations of his time, and wrote several books. So high was the reputation which he acquired for learning and virtue, that he was elected abbot of his monastery in the year 844, when he was only in deacon's orders, his humility preventing him from entering into the order of priesthood. He did not retain this situation, however, for any considerable length of time; but, in consequence of some differences which took place between him and the religious of his house, resigned his dignity, and returned to the condition of a simple monk, spending the remainder of his life in the exercise of the cloister, close study, and the composition of various works. He died in the year 865.

Dupin says, that he "was a man of great piety and learning, who wrote in a clear, neat, and elegant, style. He was well-read both in ecclesiastical and profane authors. He possessed good natural abilities; only it may perhaps be said, that he was rather too mystical." Mosheim describes him as one "who was constantly employed either in inventing or patronizing the most extravagant fancies." The first work which he gave to the public was a treatise "concerning the Sacrament of the Body and Blood of Christ," composed by him in the year 831. In this performance he pretended to explain with precision the doctrine of the church on this head, maintaining that, after the consecration of the bread and wine in the Lord's supper, nothing remained of these symbols but the *outward figure*, under which the body and blood of Christ were really and locally present; and that the body of Christ thus present in the eucharist, was the *same body that was born of the Virgin, that suffered upon the cross, and was raised from the dead*. That this doctrine was then new, may be concluded from the great astonishment which it excited, and the general opposition which it met with from the learned men of the age, among whom were Rabanus Maurus, Ratramn, or Bertramn, John Scotus Erigena, Heribald, and others. In Mosheim the reader may meet with a concise and judicious abstract of the controversy to which this publication gave rise. Among the variety of impressions which it has undergone, the most accurate is that published by Father Martenne, in the ninth volume of his "Ampliss. Collect. Vet. Scriptor." In the year 846, Paschasius published a treatise, entitled "De Partu Virginis Lib. II." intended to support an opinion propagated at that time by certain German doctors, that Christ was born in a manner quite different from those general and uniform laws of nature that regulate the birth of the human species. He maintained, that the virgin Mary, having conceived without concupiscence, was free from the pains of child-birth, and was even delivered without any opening of the womb, Jesus having passed through her flesh as it is supposed that he did through the door into the room where his disciples were assembled after his resurrection, though the door was shut. When Ratramn opposed this opinion, Paschasius charged him with denying the virginity of Mary. During many years this curious performance appeared under the name of Ildephonsus archbishop of Toledo, till father d'Achery, when he edited it in the twelfth volume of his Spicilegium, after having collated different manuscripts, proved that it was the production of Paschasius. He was the author of many other pieces, all which were collected and published by father Sirmond in 1618, in folio; and they may likewise be found in the ninth volume of the Bibl. Patr. *Cave's Hist. Lit.* vol. ii. *Priestley's Hist. Christian Church*, vol. iii. *Gen. Biog.*

PAS'CHIUS (George), a learned German Lutheran divine and professor, was the son of a tradesman at Dant-

zic, where he was born in the year 1661. When he had completed his academic studies, he travelled for improvement in Germany, France, and England. In the year 1701, he obtained the appointment of professor of moral philosophy at Kiel in Holstein; and in 1706, he was nominated professor extraordinary of divinity in the same university. He died in the following year, about the age of fifty-six. He was the author of various publications, abounding in uncommon erudition, but said to want method and arrangement; some of which are highly commended for their useful tendency, and others as affording much entertainment from the curious discussions contained in them. His first and principal work was published in 1695, entitled "Tractatus de Novis Inventis, quorum accuratori Cultui Faciem prætulit Antiquitas," which afterwards appeared in a new and enlarged form in 1700, under the title of "Inventorum nov-antiquorum." It is a work replete with profound enquiries, and calculated to exalt former times at the expense of the present. The author attempts to prove, that the knowledge of the moderns has been imperceptibly borrowed from the rich stores of ancient wisdom, and that our boasted inventions are only improvements on the discoveries of the ancients. In endeavouring to establish his point, he has brought forward a number of interesting facts relating to the history and progress of the arts and sciences. One of the other works of this author was entitled "De fictis Rebus publicis," being a treatise on the imaginary republics of Plato, sir Thomas More, and Campanella. The titles of his other pieces may be found in the General Biography, to which we refer.

PASCOMA'YO, a seaport of Peru, in the bishopric of Truxillo, and jurisdiction of Lana, at the mouth of a river of the same name. Lat. 7. 20. S.

PASCUARO. See PASQUARO.

PA'NEWALK, a town of Anterior Pomerania, situated on the Ucker, by means of which the inhabitants carry down their goods to the Great Haff. Near the town are some iron-works: twenty-one miles west of Old Stettin, and sixty-six fourth-fourth-east of Stralsund. Lat. 53. 30. N. lon. 13. 57. E.

To PASH, *v. a.* [from the Teut. *perffen*, (which means to press,) in Dr. Johnson's opinion; from the Su. Goth. *basa*, to beat, in Serenius's. It is more probably from the Greek verb, *πασω, παίσω*, to strike. Or it may be another form of *push*. Todd.] To strike; to crush; to push against; to dash with violence.—He was *pushed* on the pate with a pot. *Barret's Alv.*—They their heads together *pusht*. *Drayton*.

Thy cunning engines have with labour rais'd
My heavy anger, like a mighty weight,
To fall and *push* thee dead.

Dryden.

PASH, *f.* A blow; a stroke.—Learn *push* and knock, and beat and mall. *How to choose a good Wife*, 1602.—A face, according to sir T. Hanmer, whose authority Dr. Johnson follows, with the etymology of *paz*, Spanish, a kiss; but, in the passage cited, the word means nothing more than *push*; a *push*, in some places denoting a young bull-calf pushing out his horns; and a mad *push*, a mad-brained boy:

Thou want'st a rough *push*, and the shoots that I have,
To be full like me.

Shakespeare's Wint. Tale.

PASH, or PA'SHA, *f.* in mythology, is an attribute or implement of several of the deities of the Hindoos. It seems to be an implement of punishment, a whip or lash to chastise, or cord to strangle, sinners. A doubled cord is often seen in the hand of Parvati, in any of her terrific or avenging characters, and it is to such characters that the pasha is chiefly confined. In Hindoo books the pasha is frequently mentioned, and it is generally distinguished by the name of the deity to whom it is attributed. Thus the Varuna-pasha is the cord of Varuna, the Hindoo Neptune. "Varuna (says Menu) most assuredly binds

the guilty in fatal cords;" ch. xi. v. 308. "The Dherma-pasha, the dreadful Kala-pasha, and the highly valued Varuna-pasha," are mentioned in the Ramayana, as part of the "weapons, missile and manual," with which the gods armed Rama for the war of Lanka. They severally mean the cords of Justice, of Death, and of Varuna.

PASHA. See BASHAW, vol. ii.

PASHA'NA BE'ADY, *f.* A name given by the people of the East Indies to a kind of fibrous talc, found in the sides of the mountains, and used in medicine with them. They calcine it, and then powder and boil it in milk, and give half a dram for a dose mixed in milk, for the gravel and stone. *Chambers.*

PASH'UR, [Heb. one that multiplies.] A man's name.

PASICANA, in ancient geography, a town of India, on this side of the Ganges. *Ptolemy.*

PASID'IUM, a town of Asia, in Syria, situated on the sea-coast, west of Mount Casius.

PASI'GA, a river which rises in the province of Darien, and runs into the bay of Panama.

PASIGRAPHY, [from *πας*, all, and *γραφω*, I write.] The art of writing on any subject whatever, so as to be universally understood by all nations upon earth. On the subject of an universal character, see the article LANGUAGE, vol. xii. p. 203.

PASIHAN', one of the smaller Phillippine islands, near the west coast of Leyta. Lat. 10. 35. N. lon. 124. 12. E.

PAS'IN. See BADKIS, vol. ii.

PASINEL'LI (Laurentio), an Italian painter and engraver, was born at Bologna in the year 1629, and died at Parma in 1700. His instructors in the rudiments of art were Andrea Barone and Simon Cantarini; but he also frequented the school of Flaminio Torre. From Bologna he went to Turin, and from thence to Mantua and to Venice. At Mantua he was employed by the duke in the adornment of his castle at Monmirola; but at Venice, struck with the superiority which he perceived in Paul Veronese, his style of painting, and his notions of art in general, underwent a complete revolution. He afterwards returned to Bologna and established a school.

Cochin, in his Italian Tour, speaks highly of Pasinelli's picture of the Resurrection, in the church of St. Francis; and his few prints are sought after with justifiable avidity by the connoisseurs: they are chiefly from his own compositions.

PASIPE'DA, in ancient geography, a town of India, on the bank of the Ganges, and on this side of it, between Pisca and Sufcana. *Ptolemy.*

PASIPH'AE, in fabulous history, a daughter of the Sun and of Perseis, who married Minos II. king of Crete. She disgraced herself by her unnatural passion for a bull, which, according to some authors, she was enabled to gratify by means of the artist Dædalus. See MINOTAUR, vol. xv. Pasiphae had four sons by Minos; Castreus, Deucalion, Glaucus, and Androgeus; and three daughters, Hecate, Ariadne, and Phædra.

PASI'RIS, a town of European Sarmatia, on the bank of the river Carcinite, between Torocca and Hercabum. *Ptolemy.*

PASITHEA, one of the Graces, also called *Aglai*.—One of the Nereides.

PASITIGRIS, a name given to the junction of the Euphrates and Tigris, at the mouth of the Persian Gulf.

PAS'KA, a town of Africa, in the kingdom of Fonia, where the king keeps a garrison. The town is surrounded with six rows of palisadoes, and contains about a hundred inhabitants.

PASKARE'TI, a town of Mingrelia: twenty miles north-north-east of Anarghia.

PASKATA'QUIES, a river of Massachusetts, which runs into Penobscot bay.

PAS'KAU, a town of Moravia, in the circle of Prerau: eight miles east of New Titschein.

PAS'LAKEN, a town of Prussia, in Bartenland: ten miles south-east of Bartenstein.

PAS'MAN, an island in the Adriatic, near the coast of Dalmatia, fifteen miles in length, and two in breadth. It produces abundance of wine and oil; and contains seven villages. Lat. 44. 8. N. lon. 15. 56. E.

PAS'NAGE. See PANNAGE.

PASO FERREIRA, a town of South America, in the government of Buenos Ayres: 340 miles north-north-west of Buenos Ayres.

PASO DE PESCA'DO, a town of South America, in the province of Tucuman: fifty miles north of St. Miguel de Tucuman.

PASOLA'TO, a river of Sicily, which runs into the sea on the south coast in lat. 36. 49. N. lon. 13. 32. E.

PASOM'DSO, a lake of Thibet, about fifty miles in circumference. Lat. 29. 42. N. lon. 94. 24. E.

PASPALUM, *f.* [apparently from *πασπαλη*, an ancient name for millet, which kind of grain this grass resembles in the appearance of its small round seeds; but *πασπαλη*, *παιπαλη*, is also a name for any fine meal or flour, as Professor Martyn remarks.] In botany, a genus of the class triandria, order digynia, natural order gramina, or grasses. Generic characters—Calyx: glume of two membranous, equal, almost-orbicular, slightly-concave, valves, containing one floret, the inner one flattest, turned from the dilated unilateral receptacle. Corolla: of two, roundish, cartilaginous valves, the size of the calyx, externally convex, inflexed at the base. Nectary of two membranous scales at the base of the germen. Stamina: filaments three, capillary, the length of the calyx; antheræ ovate. Pistillum: germen superior, roundish; styles two, capillary, the length of the corolla; stigmas pencil-shaped, hairy, coloured. Pericarpium: none, except the permanent closed glumes. Seed solitary, roundish, compressed, convex at one side, coated by the permanent cartilaginous corolla.—*Essential Character.* Calyx of two valves, nearly orbicular, single-flowered; corolla of the same size and shape, compressed; stigmas pencil-shaped; seed coated with the hardened corolla; common receptacle unilateral.

Mr. Brown remarks, that this genus is very closely related to Panicum, inasmuch that if, in those species of the latter which have an unilateral spike, the outer valve of the calyx be suppressed, it makes a real Paspalum. Such a defect does, according to this botanist, actually take place in some few, in which, however, either the nectariferous scales, as Linnæus thought them, or a very minute valve within the inner valve of the calyx, do indeed sometimes occur; but so likewise is a small valve, on the outside of the least convex valve of the corolla, sometimes observable, says Mr. Brown, in Paspalum orbiculare. There is a peculiar aspect of neatness arising from the more or less perfectly orbicular form, and regular arrangement, of the flowers which characterises the genus before us. Linnæus at first referred such of its species as he knew to Panicum; but in Syst. Nat. ed. 10. he gives the generic character of Paspalum at length, for the first time, enumerating four species, which were all he then knew. He subsequently confused the history of the first of them in such a manner, that it could not be developed but by investigation of his specimens and manuscripts. He erred at first in considering the genus as diandrous, but this is corrected in his Species Plantarum. It is very remarkable, that of two genera so alike in character, the species of one (Panicum) should be scattered all over the world, while of the genus before us, Paspalum, not one is found in Europe.

With the additions made by Dr. Smith, president of the Linnæan Society, we have now twenty-eight species.

1. Paspalum dissectum, or cut paspalum: spikes alternate, sessile, with a leafy broad rough-edged receptacle; flowers smooth, slightly elliptical, three-ribbed; leaves smooth; stipule membranous, beardless. Native of North America; sent to Linnæus by Kalm. Stem leafy, bent

at

at the joints. Leaves linear-lanceolate, striated, a little rough at the edges, with long, rather tumid, smooth sheaths. Stipule jagged, unaccompanied by any hairs or bristles. Spikes three or four on the upper part of the stem, which scarcely rises above the leaves, each rather more than an inch long. Common stalk, or receptacle, of each spike, much dilated, linear, exactly even, leafy, striated, rough-edged, one-eighth of an inch, or more, in breadth, having at its inner side a strong angular longitudinal rib, bearing numerous alternate flowers, in two rows, on short stalks. The calyx-glumes are exactly but broadly elliptical, rather tumid, pale, with three fine green ribs, perfectly smooth and naked.

2. *Paspalum setaceum*, or bristly paspalum: spikes one or two, on long straight stalks, with a narrow wavy receptacle; flowers mostly in pairs, on short winged divided partial stalks, slightly obovate, smooth, scarcely ribbed; leaves downy above; stipule hairy. Sent from Lancaster, Pennsylvania, by the Rev. Dr. Muhlenberg. The stem is erect, slender, and smooth, terminated by one spike two inches long, on a slender stiff naked stalk, many inches in length, whose base is enfolded by the very long sheath of the upper leaf, from which often proceeds another similar, but shorter-stalked, spike. The upper leaf, at least, is much shorter than its sheath, lanceolate, clothed above with soft hairs. Michaux says his plant grows in dry situations in South Carolina.

3. *Paspalum debile*, or weak paspalum: stem weak, bristle-like at the top; leaves hairy; spike mostly solitary, slender; flowers solitary, alternate, slightly downy, slightly obovate. Native of maritime situations, in Carolina and Georgia. This seems by Michaux's character, which is all that is known of it, to be akin to the last.

4. *Paspalum conjugatum*, or joined paspalum: spikes two, terminal, equal, nearly sessile; receptacle narrow, even, with a wavy rib; flowers solitary, very numerous, alternate, imbricated, ovate, acute, ribbed, fringed with long soft hairs. Common in the West Indies, in moist pastures. Linnæus obtained a specimen from Browne's Herbarium, which he confounded with the first species, though nothing can be more distinct. It is a larger species than any of the foregoing, with broad, taper-pointed, often downy, leaves. Stipule hairy. Spikes slender, a little divaricated, each nearly four inches long, of innumerable crowded alternate small yellowish ovate acute flowers, each on a short stalk; their calyx ribbed, remarkably fringed with long lax white hairs. Swartz says this is called, in the West Indies, *four gras*; and is not eaten by cattle.

5. *Paspalum ciliatifolium*, or fringed-leaved paspalum: leaves dilated, downy, finely serrated, fringed; spikes one or two, terminal, elongated; flowers in pairs, somewhat obovate, very obtuse, smooth, forming three rows. Native of Carolina. This seems akin to the last.

6. *Paspalum præcox*, or early paspalum: erect, smooth; leaves linear, elongated; spikes alternate, remote; flowers short, obovate, even and smooth. Native of North America, from Carolina to Florida.

7. *Paspalum læve*, or smooth paspalum: erect, very smooth; leaves shortish, with compressed sheaths; spikes several alternate; flowers in two ranks, ovate, somewhat orbicular, even and smooth. Native of Georgia. These three species are from Michaux, Boreal-Amer. vol. i. p. 44. We give them as distinct species, because we cannot, from the above short definitions, refer them to any in Linnæus or Willdenow. The 3d, 12th, and 13th, species are in the same predicament; indeed the North-American *Paspala* are but imperfectly known.

8. *Paspalum scrobiculatum*, or dimpled paspalum: spikes alternate, with a leafy broad rough-edged receptacle; flowers alternate, orbicular, on simple dilated stalks, many-ribbed, dimpled at the base externally. Native of the East Indies, in watery places. Root-perennial, of many long blackish branched fibres. Stem near two feet high, clothed with ribbed smooth leaves;

having long purplish sheaths, hairy at the bottom. Spikes few and distant; their receptacle flat, near a quarter of an inch wide, minutely fringed. Flowers not unlike hemp-seed in size and aspect, very numerous, alternate, imbricated in two rows, each on a short dilated close-pressed partial stalk, and very nearly orbicular.

9. *Paspalum polystachyum*, or many-spiked paspalum: spikes numerous, crowded; flowers smooth, orbicular; outer valve of the calyx five-ribbed; leaves flat, smooth, with a thin finely-toothed margin. Gathered by Mr. Brown in the tropical part of New Holland. This species is described by him as too-nearly related to the last, except that the dimples in the base of the calyx are wanting.

10. *Paspalum villosum*, or hairy paspalum: spikes alternate, with a hairy receptacle; flowers alternate, elliptical, three-ribbed, villose. Found by Thunberg, near Nagasaki in Japan, flowering in July. Stem three feet high, smooth. Leaves roughish to the touch, striated, naked. Spikes three or four, inclining all one way. Flowers crowded, in two rows only, about the size of *P. scrobiculatum*, but more oblong, and hairy.

11. *Paspalum virgatum*, or rod like paspalum: spikes rather numerous, alternate, hairy at the base; flowers in pairs, somewhat obovate; the tumid valve of the calyx fringed. Native of meadows in Jamaica. Perennial. About the size of *P. scrobiculatum*; but differs in having smaller, obovate, fringed, flowers, which, being disposed in pairs along the narrow wavy receptacle, make four rows instead of two; each glume has a central rib, with a marginal one at each side, and the concave one is finely fringed in the upper part.

12. *Paspalum floridanum*, or flowery paspalum: erect; lower leaves hairy; upper ones smooth, with long sheaths, upright; spikes few, erect; flowers in two rows, nearly orbicular, smooth naked. Native of Florida and Georgia. This, says Michaux, is akin to *P. virgatum* of Linnæus. We know nothing of it but from the above character, which is essentially different in almost every point from the *virgatum*. Michaux adds that the flowers are rather large.

13. *Paspalum plicatulum*, or plaited paspalum: erect, very smooth, and naked; leaves elongated; spikes numerous, alternate, upright; flowers in three rows, short, ovate, naked; the flatter valve of the calyx transversely corrugated at the margin. Native of Georgia and Florida. The leaves are narrow; flowers reddish.

14. *Paspalum panicum*, or panic-like paspalum: spikes very numerous, crowded, hairy at the base; flowers in four rows, orbicular, even, and naked. Gathered in Jamaica by W. Wright, M. D. A very fine and handsome species, whose dense and very-numerous spikes, crowded together in one common spike, a foot long, give, with their copious little round flowers and seeds, some idea of *Panicum italicum*, except that the whole is erect and unilateral. The leaves are long, near two inches broad in some parts, tapering to a rough-edged point, but otherwise very smooth to the touch, and finely ribbed. Each partial spike is two inches, or more, in length, with a flat rather-narrow receptacle, bearing a few scattered hairs throughout, and very hairy at its base. Flowers disposed in four rows, on shortish capillary stalks, almost perfectly orbicular, of a light tawny hue, the calyx-valves even and smooth, each with a central rib, but no others, except at the very edge. This grass was formerly known, in the Bankian Herbarium, by the expressive name of *Paspalum polystachyum*; now appropriated by Mr. Brown to our 9th species, which, from his description, must be very unlike the present.

15. *Paspalum paniculatum*, or panicked paspalum: spikes numerous, crowded, somewhat whorled, spreading every way, hairy at the base; flowers in alternate pairs, orbicular, even, slightly hairy; receptacle very narrow. Sloane says this grows in several plantations in Jamaica,

1. Stolcniferous Paspalum. 2. Fringed Sparrow-wort.

on a moist clay soil. The leaves are an inch wide, hairy on their upper side, as well as about the stipule on both sides; their sheaths long, smooth, ribbed. Flowers numerous, small, rather loosely disposed in alternate pairs, on twin or combined stalks; their glumes very nearly orbicular, obtuse, somewhat hairy, single-ribbed.

16. *Paspalum repens*, or creeping paspalum: spikes numerous, crowded, somewhat whorled, spreading every way, naked at the base; flowers alternate, elliptical, acute; leaves and receptacle rough. Native of Surinam, according to Bergius, who describes the stem a foot or more in length, striated, smooth, jointed, leafy, creeping by means of fibrous roots thrown out at the joints. Leaves linear-lanceolate, acute, scarcely a finger's length, striated, downy, dark green, with a sheathing base, which in his figure and description is represented as flying off from the stem, probably in consequence of drying or pressure; the upper sheaths are smooth, the lower roughish with minute points. Flowers ranged alternately, but solitary, and not in pairs, each on a short stalk.

17. *Paspalum stoloniferum*, or stoloniferous paspalum: spikelets spiked; rachis waved; flowers alternate, directed one way; stem knee-jointed, prostrate at the base, and stoloniferous. Root perennial, fibrose, whitish. Culm flexuose, smooth, cylindric, two feet high, solid, rooting at the knots; branches alternate. Leaves lanceolate, smooth, slightly streaked, a little waved at the edge, often three inches long, and eight lines wide. Sheath a little shorter than its internode, stipuled and russet at the top: each sheath, besides the part of the stem which belongs to it, incloses the rudiment of another stem. Stipule very short, ciliate, whitish. Spike simple, five or six inches long. Common peduncle or rachis alternate, membranaceous, ciliate at the edge, seven or eight lines long, and a line wide, bearing on its lower surface as far as eighteen flowers; pedicel flattened, scarcely a line in length; calyx russet; valves oblong, ciliate at the point, very much waved on the sides, principally at the base; the upper convex, the lower concave; antheræ elongated, twin, reddish. Germen oval, very small and smooth. Styles the length of the corolla; stigmas nearly the same length, white and very hairy; they issue from the flower and bend to each side at the time of fecundation. Seed covered by the corolla, and of the same size and colour with it: truncate at the top of the convex side, and a little grooved on the flat side: substance horny, semitransparent. It differs from this genus only in having the corolla shorter than the calyx, and the filaments longer than the flower. It is a native of Peru, whence it passed into Spain and France. It has been cultivated with success at Paris. The seeds have been in part abortive; but, as it runs at the root, it may be easily increased. The height and abundance of its stems, the size of its leaves, and the succulence of all its parts, render it a proper grass for cultivation. But these grasses from hot countries never are found to answer in England.

This species, which is very particularly described and figured in the Linn. Transf. vol. ii. by Mons. Louis Bosc, is represented on the annexed Plate, fig. 1. of the natural size, the stem being cut off in the middle on account of the height. The parts are also exhibited in separate figures beneath; where *b* is a front view of one of the spikelets of the natural size; *c*, the same magnified; *d*, back view of the same; *e*, common peduncle, magnified; *f*, an expanded or blowing flower attached to the common peduncle; *g*, the calyx seen from above; *h*, under view of the same; *i*, the corolla; *k*, the pistil and stamens.

18. *Paspalum corymbosum*; spikes several, alternate, corymbose; the lower ones longest; flowers alternate, nearly orbicular, smooth, almost sessile; receptacle wavy; leaves and sheaths hairy. Gathered by Dr. Afzelius at Sierra Leone. The lower part of the stem is decumbent, Vol. XVIII. No. 1278.

and bent at the joints; the rest erect, leafy, about eighteen inches high. Leaves rather narrow, and sharp-pointed.

19. *Paspalum orbiculare*; spikes alternate, distinct, bristly at the base; flowers alternate, nearly orbicular, smooth; their outer glume three-ribbed; leaves flat; thickened and toothed at the margin; gathered by Forster in the Society Islands; by Mr. Brown in the tropical part of New Holland, as well as near Port Jackson.

20. *Paspalum pubescens*, or downy paspalum: spikes alternate, distinct, sessile; flowers ovate, downy; their outer glume three-ribbed; leaves flat, hairy, and rough above, thickened and toothed at the margin. Gathered by Mr. Brown, in the tropical part of New Holland.

21. *Paspalum littorale*, or shore-loving paspalum: spikes two or three, alternate, downy at the base; flowers ovate, acute, smooth; leaves involute, naked; stem compressed. Found by Mr. Brown and Dr. White in the tropical regions of New Holland, as well as near Port Jackson.

22. *Paspalum hirsutum*, or shaggy paspalum: spikes about two; alternate; flowers many-nerved, smooth; leaves, sheaths, stem, and partial flower-stalks, hairy. Sent from China by Bladh. The stems are erect, leafy, hairy in their upper part. Leaves flat, ribbed, hairy all over, as well as their sheaths, which are bearded at the top. Spikes nearly erect, alternate, two only in Retzius's specimen; their receptacles leafy, narrower than in *P. scrobiculatum*. Flowers in two rows, alternate, smooth, with three or five ribs, on hairy stalks.

23. *Paspalum kora*: spikes two or three, alternate, hairy at the base; flowers orbicular, smooth, five-ribbed; stem and leaves smooth; stipule hairy. Native of the East Indies; sent from Tranquebar, by the Rev. Dr. Rottler.

24. *Paspalum distichum*, or two-spiked paspalum: spikes two or three, alternate; flowers ovate, acute, smooth, three-ribbed; receptacle straight; leaves smooth, as well as the stem; stipule hairy. Native of moist grassy pastures in the West Indies. The stem is simple, near two feet high, decumbent at the base, very smooth. Leaves flat, according to Swartz; involute when dry, taper-pointed, smooth; with long smooth sheaths, crowned with a hairy stipule, and not (as Swartz says) hairy at the base. Spikes usually two, one above the other, sometimes three, an inch and a half long, with a linear, even, straight, flat, smooth, rather-glaucous, receptacle. Flowers twenty or thirty, alternate, crowded, nearly sessile, ovate, acute, pale, concave on the outside, with three ribs: antheræ dark purple; stigmas blue.

25. *Paspalum longiflorum*, or long-flowered paspalum: spikes two, terminal, equal, on short stalks; flowers ovate, pointed, smooth, three-ribbed; receptacle zigzag; root creeping; stems erect; leaves smooth; stipule hairy. Native of the East Indies; sent from Tranquebar, by the Rev. Dr. Rottler. This has a long creeping root, like *Carex arenaria*, throwing up, like that, many stems, hardly a span high, slender, smooth, leafy, rarely branched. Flowers ten or twenty, situated and shaped nearly as in the last, but rather more elongated and more pointed, slightly convex rather than concave at the back. The habit and aspect of this grass resemble *Panicum dactylon*; and it appears destined, like that, to grow in loose blowing sand, which the many-branched fibres of its roots are calculated to bind together and to fix, thus performing a very important service in the economy of nature.

26. *Paspalum vaginatum*, or sheathed paspalum: spikes two, terminal, equal, on short stalks; flowers ovate, pointed, smooth; receptacle somewhat zigzag; stem creeping, bent at the joints, branched; stipule hairy. Native of pastures, on a clay soil, in Jamaica. Our only source of information concerning this species describes the roots as numerous and thread-shaped; stem a foot high.

27. *Paspalum filiforme*, or *filiform paspalum* : spike mostly solitary, linear, very slender; flowers very numerous, on short stalks, elliptical, three-ribbed; leaves brittle-shaped, channelled. Common in dry open fields in the West Indies: communicated by Dr. Swartz. This species is known from all the rest by its extremely slender habit. It is two feet high, and grows in tufts. The stem is quite smooth, almost capillary, but rigid and erect. Leaves long, straight, almost equally slender; convex and smooth beneath; channelled above. Spike two or three inches long, with a very narrow slightly-zigzag receptacle, covered on one side with a double row of closely-imbriated small smooth elliptical flowers: antheræ yellow; stigmas bluish.

28. *Paspalum decumbens*, or *prostrate paspalum* : spikes solitary, on long capillary solitary or aggregate stalks; flowers nearly orbicular, pointed: leaves ovato-lanceolate, hairy. Gathered in dry sandy mountainous situations, on the west side of Jamaica, by Dr. Swartz. The stems are procumbent, about a foot long, branched, leafy, slender, smooth, bent at the joints, apparently compressed, though described as cylindrical. Leaves rather broad, clothed, more or less, on both sides, with soft scattered hairs. Flower-stalks from one to five, from the sheaths of some of the upper leaves, rather shorter than the leaf, capillary, loosely spreading, simple, angular, downy. Flowers from sixteen to twenty, loosely imbricated, in two rows, on short stalks, slightly obovate, or very nearly orbicular, quite smooth; convex and almost hemispherical, with slight furrows, on one side; quite flat, even, and ribless, on the other. This flat side is accompanied at the base with a small abrupt scale, or imperfect glume, like what Mr. Brown mentions in *P. orbiculare*; which appears to us to bring the present species very near indeed to *Panicum*. The receptacle is narrow and convex, smooth, except at the base; by no means of the leafy dilated form usual in *Paspalum*.

PASPARDO, a town of Italy, in the department of the Adda and Oglio: four miles north of Breuo.

PASPA'YA, a town of South-America, in the viceroyalty of Buenos Ayres: sixty miles south of La Plata.

PASQUA, a town of Mexico, in the province of Xalisco, situated at the mouth of a river which runs into the Pacific Ocean: forty-five miles west-north-west of La Purification. Lat. 20. 5. N.

PASQUARO, or UTZILA PASQUARO, a town of Mexico, and now capital of Mechoacan, situated on the south side of a large lake abounding in fish. The population consists of 500 families of Spaniards and Mulattoes, and 2000 families of Indians, chiefly occupied in sugar-mills, and the neighbouring copper-mines: 120 miles west of Mexico. Lat. 19. 50. N.

PASQUE-FLOWER, *f. [pulsatilla, Latin.]* See ANEMONE.—The wild anemone is called *pasque-flower*, from the paschal solemnity of our Saviour's death. *Stukely's Palæogr. Sacra.*

PASQUETANK, or PASQUOTANK, a county of North-Carolina, north of Albemarle Sound, with 7674 inhabitants, including 2295 slaves.

PASQUETANK, a river of North-Carolina, which rises in Disnal Swamp, and runs into Albemarle Sound.

PASQUIER (Stephen), a celebrated lawyer and man of letters, was born at Paris in 1528. Having been educated for the bar, he was, at a proper time, admitted an advocate in the Parliament of Paris, and became distinguished as one of the most eloquent pleaders of his time, as he really was one of the most learned men of the age. He shone particularly in the causes which he pleaded against the Jesuits, who, he contended, ought not only to be excluded from the university, but banished wholly from the kingdom. The first part of the sentence was obtained, chiefly through his means; for the latter, the times were not yet ripe. One of Pasquier's chief objections to this society was the infringement made by its vow upon the royal authority, of which he was always a

most zealous supporter. His loyalty was rewarded by Henry III. with the post of advocate-general of the chamber of accounts, which he exercised with great credit, and transmitted to his eldest son. Notwithstanding the warmth of his pleadings, and his satirical vein in writing, he was mild and benevolent in private life, of pleasing manners, and lively conversation. He married three wives; and his reasons are assigned in a Latin epigram:

The first for her person; the next for her purse;
The third for a warming-pan, doctress, and nurse.

And this, we believe, may be pretty well applied to most second and third marriages. Having enjoyed all these comforts, he died, at length, with great composure, in 1615, at the age of eighty-seven. Pasquier was a copious writer both in verse and prose. His poems are in the Latin and French languages: the former reckoned by much the best, as is generally the case with those who have no real genius for poetry, the want of which is best concealed under the veil of a dead language. The subject of one of his French poems, which became the parent of a whole collection of verses, affords a remarkable example of the sportive levity which in that nation mixes itself with the most serious concerns and characters: happening to descry a flea upon the bosom of mademoiselle des Roches at the great assizes of Poitiers in 1588, he wrote some lines on the occasion, which set to work all the Latin and French poets in France, and produced a miscellany entitled, "*La Puce des Grands Jours de Poitiers.*" The most important of Pasquier's works is his "*Recherches sur la France,*" of which he himself published seven books, and three more were added after his death from his papers. The best edition is that of 1665, folio. His "*Letters,*" of which the best edition is that of du Chesne, in 5 vols. 8vo. 1619, are also full of curious anecdotes and remarks. His "*Catechisme des Jesuites,*" octavo, 1602, is a very severe and rather coarse attack upon the founders and principles of that author, against which he was ready to adopt the most exaggerated and improbable tales. It cannot be denied, however, that he entertained just ideas of the probable consequences of their political system. One of his unavowed writings was "*Exhortations aux Princes, &c. pour obvier aux Séditions qui semblerent nous menacer pour le Fait de la Religion,*" 8vo. 1552; the object of which is to prove the necessity of permitting the free exercise of both religions.

NICHOLAS, second son of Stephen Pasquier, a master of requests, left a volume of Letters, replete with historical anecdotes. *Gen. Biog.*

PASQUIL, PASQUIN, or PASQUINA'DE, *f.* [from *Pasquino*, a statue at Rome, to which they affix any lampoon or paper of satirical observation. See PASQUIN.] A lampoon.—The *pasquils*, lampoons, and libels, we meet with now-a-days, are a sort of playing with the four-and-twenty letters, without sense, truth, or wit. *Taller.*—The *pasquinade* was a witty one, but the event turned the point of it against the party by which it was made. *Lord Lyttleton on the Conv. of St. Paul.*

The Grecian wits who satire first began,
Were pleasant *pasquins* on the life of man. *Dryden.*

To PASQUIL, or PASQUIN, *v. a.* To lampoon.—They are grievously vexed with these *pasquilling* libels and satires. *Burton's Anat. of Mel.*—Not that any man desires to see himself *pasquined* and affronted. *Dryden's Ded. of the D. of Guise.*

PASQUILLER, *f.* A lampooner.—Adrian the sixth, pope, was so highly offended and grievously vexed with *pasquillers* at Rome, that he gave command that statue should be demolished. *Burton's Anat. of Mel.*—Any triebolary *pasquiller* is licensed to throw dirt in the faces of sovereign princes, in open printed language: but I hope the times will mend. *Howell's Letters.*

PASQUIN, a mutilated statue at Rome, in a corner of the

the palace of the Urfini. It takes its name from a cobbler of that city, called *Pasquin*, famous for his sneers and gibes, and who diverted himself by passing his jokes on all who went by his shop. He soon became famous; and, had he had time to *publish*, he would have been the Peter Pindar of his day. But his genius seems to have been satisfied to rest on his shop-board. Some time after his death there was found under the pavement of his shop the statue of an ancient gladiator, well cut, but maimed and half-spoiled; this they set up in the place where it was found, and by common consent inscribed it with his name. Since that time all satires are attributed to that figure; and are either put into its mouth, or pasted upon it, as if they were written by *Pasquin redivivus*; and these are addressed by *Pasquin* to *Marforio*, another statue at Rome. When *Marforio* is attacked, *Pasquin* comes to his assistance; and, when *Pasquin* is attacked, *Marforio* assists him in his turn; that is, the people make the statues speak just what they please.

MARFORIO'S is a statue that lies at its whole length, and in a different quarter of the city. It represents, according to some, the *Panarian Jove*; according to others, the river Rhine, or the Nar; but the origin of the name is not known. *Curiosities of Lit.* vol. i.

PASQUINA'DE, *f.* See PASQUIL.

To PASS, *v. n.* [*passer*, Fr. *passus*, a step, Lat. from the Heb. *pasahh*.] To go; to move from one place to another; to be progressive. Commonly with some particle.—If I have found favour in thy sight, *pass* not away from thy servant. *Gen.* xviii. 3.—While my glory *passeth* by, I will put thee in a cleft of the rock, and will cover thee while I *pass* by. *Exod.* xxxiii. 22.—Thus will I cut off him that *passeth* on, and him that returneth. *Ezek.* xxxv. 7.—This heap and this pillar be witness, that I will not *pass* over to thee, and that thou shalt not *pass* over it and this pillar unto me for harm. *Gen.* xxxi. 52.—An idea of motion not *passing* on, is not better than idea of motion at rest. *Locke*.—If the cause be visible, we stop at the instrument, and seldom *pass* on to him that directed it. *Wake's Prep. for Death*.

Tell him his long trouble is *passing*
Out of this world. *Shakespeare's Hen.* VIII.

Heedless of those cares, with anguish stung,
He felt their fleeces as they *pass'd* along. *Pope*.

To go forcibly; to make way:
Her face, her hands, were torn
With *passing* through the brakes. *Dryden*.

To make a change from one thing to another.—Others, dissatisfied with what they have, and not trusting to those innocent ways of getting more, fall to others, and *pass* from just to unjust. *Temple's Miscell.*—To vanish; to be lost.—He hath also stablished them for ever and ever; he hath made a decree which shall not *pass*. *Pf.* cxlviii. 6.

Trust not too much to that enchanting face;
Beauty's a charm, but soon the charm will *pass*. *Dryden*.

To be spent; to go away progressively.—We see, that one who fixes his thoughts very intently on one thing, so as to take but little notice of the succession of ideas that *pass* in his mind, whilst he is taken up with that earnest contemplation, lets slip out of his account a good part of that duration, and thinks that time shorter than it is. *Locke*.—To be at an end; to be over:

Their officious haste,
Who would before have borne him to the sky,
Like eager Romans, ere all rites were *pass'd*,
Did let too soon the sacred eagle fly. *Dryden*.

To die; to pass from the present life to another state:
The pangs of death do make him grin;
Disturb him not, let him *pass* peaceably. *Shakespeare*.

To be changed by regular gradation.—Inflammations are translated from other parts to the lungs; a pleurisy easily

passeth into a peripneumony. *Arbuthnot*.—To go beyond bounds. *Obsolete*.—Why this *passes*, Mr. Ford: you are not to go loose any longer; you must be pinioned. *Shakespeare*.—To be in any state.—I will cause you to *pass* under the rod, and I will bring you into the bond of the covenant. *Ezek.* xx. 37.—To be enacted.—Many of the nobility spoke in parliament against those things, which were most grateful to his majesty, and which still *passed* notwithstanding their contradiction. *Clarendon*.

Among the laws that *pass'd*, it was decreed,
That conquer'd Thebes from bondage should be freed.
Dryden.

To be effected; to exist. Unless this may be thought a noun with the article suppressed, and be explained thus: It came to the *pass*, that.—I have heard it enquired, how it might be brought to *pass* that the church should everywhere have able preachers to instruct the people. *Hooker*.—When the case required dissimulation, if they used it, it came to *pass*, that the former opinion of their good faith made them almost invisible. *Bacon's Ess.*—To gain reception; to become current: as, This money will not *pass*.—Though frauds may *pass* upon men, they are as open as the light to him that searches the heart. *L'Estrange*.—False eloquence *passeth* only where true is not understood, and nobody will commend bad writers that is acquainted with good. *Felton on the Classics*.—To be practised artfully or successfully:

This practice hath most shrewdly *pass'd* upon thee;
But, when we know the grounds and authors of it,
Thou shalt be both the plaintiff and the judge. *Shakespeare*.

To be regarded as good or ill.—He rejected the authority of councils, and so do all there formed; so that this won't *pass* for a fault in him, till 'tis proved one in us. *Atterbury*.—To occur; to be transacted.—If we would judge of the nature of spirits, we must have recourse to our own consciousness of what *passes* within our own mind. *Watts's Logic*.—To be done.—Zeal may be let loose in matters of direct duty, as in prayers, provided that no indirect act *pass* upon them to defile them. *Bp. Taylor's Rule of Living Holy*.—To heed; to regard. *Not in use*.

As for these silken-coated slaves, I *pass* not;
It is to you, good people, that I speak,
O'er whom, in time to come, I hope to reign. *Shakespeare*.

To determine finally; to judge capitally:
Though well we may not *pass* upon his life,
Without the form of justice; yet our pow'r
Shall do a courtesy to our wrath. *Shakespeare*.

To be supremely excellent:
Sir Hudibras's *passing* worth,
The manner how he fallied forth. *Hudibras*.

To thrust; to make a push in fencing.—To see thee fight,
to see thee *pass* thy puncto. *Shakespeare*.

They lash, they foin, they *pass*, they strive to bore
Their corsets. *Dryden*.

To omit to play:
Full piteous seems young Alma's case,
As in a luckless gamester's place,
She would not play, yet must not *pass*. *Prior*.

To go through the alimentary duct.—Substances hard cannot be dissolved, but they will *pass*; but such, whose tenacity exceeds the powers of digestion, will neither *pass* nor be converted into aliment. *Arbuthnot*.—To be in a tolerable state.—A middling sort of man was left well enough to *pass* by his father, but could never think he had enough, so long as any had more. *L'Estrange*.

To Pass away. To be lost; to glide off.—Defining the soul to be a substance that always thinks, can serve but to make many men suspect, that they have no souls at all, since they find a good part of their lives *passing* away without thinking. *Locke*.—To vanish.—The heavens shall *pass* away

away with a great noise, and the elements shall melt with fervent heat. 2 *Pet.* iii. 10.

To PASS, *v. a.* To go beyond.—As it is advantageable to a physician to be called to the cure of a declining disease; so it is for a commander to suppress a sedition which has *passed* the height: for in both the noxious humour doth first weaken, and afterwards waste to nothing. *Hayward.*—To go through: as, The horse *passed* the river.—To go through: in a legal sense.—Neither of these bills have yet *passed* the house of commons, and some think they may be rejected. *Swift.*—To spend; to live through.—We have examples of such *pass* most of their nights without dreaming. *Locke.*

The people, free from cares, serene and gay,
Pass all their mild untroubled hours away. *Addison.*

To impart to any thing the power of moving.—Dr. Thurston thinks the principal use of inspiration to be, to move or *pass* the blood from the right to the left ventricle of the heart. *Derham's Phys. Theol.*—To carry hastily.—I had only time to *pass* my eye over the medals, which are in great number. *Addison on Italy.*—To transfer to another proprietor, or into the hands of another.—And *passed* his business into other hands. *Doddridge's Fam. Expos.*

He that will *pass* his land,
As I have mine, may set his hand
And heart unto this deed, when he hath read;
And make the purchase spread. *Herbert.*

To strain; to percolate.—They speak of severing wine from water, *passing* it through ivy-wood. *Bacon's Nat. Hist.*—To vent; to pronounce.—How many thousands take upon them to *pass* their censures on the personal actions of others, and pronounce boldly on the affairs of the public. *Watts.*—To utter ceremoniously.—Many of the lords and some of the commons *passed* some compliments to the two lords. *Clarendon.*—To utter solemnly; or judicially.—All this makes it more prudent, rational, and pious, to search our own ways, than to *pass* sentence on other men. *Hammond.*—To transmit; to procure to go.—Waller *passed* over five thousand horse and foot by Newbridge. *Clarendon.*—To put an end to.—We'll *pass* the business privately and well. *Shakespeare.*—To surpass; to excel.—Whom dost thou *pass* in beauty? *Ezek.* xxxii. 19.

Martial, thou gav'st far nobler epigrams
To thy Domitian, than I can my James:
But in my royal subject I *pass* thee;
Thou flattered'st thine, mine cannot flatter'd be.
B. Jonson.

The ancestor and all his heirs,
Though they in number *pass* the stars of heav'n,
Are still but one. *Davies.*

To omit; to neglect; whether to do or to mention.—I *pass* their warlike pomp, their proud array. *Dryden.*

If you fondly *pass* our proffer'd offer,
'Tis not the rounder of your old fac'd walls
Can hide you. *Shakespeare's K. John.*

I *pass* the wars that spotted linxes make
With their fierce rivals. *Dryden.*

To transgress; to transgress.—They did *pass* those bounds, and did return since that time. *Burnet's Theory.*—To admit; to allow.—The money of every one that *passeth* the account, let the priests take. 2 *Kings*, xii. 4.

I'll *pass* them all upon account,
As if your natural self had don't. *Hudibras.*

To enact a law.—How does that man know, but the decree may be already *passed* against him, and his allowance of mercy spent? *South.*—Could the same parliament, which address'd with so much zeal and earnestness against this evil, *pass* it into a law? *Swift.*—To impose fraudulently:

The indulgent mother did her care employ,
And *pass'd* it on her husband for a boy. *Dryden.*

To practise artfully; to make succeed.—Five of my jests, then stol'n, *pass* him a play. *B. Jonson's Epigr.*—Time lays open frauds, and after that discovery there is no *passing* the same trick upon the mice. *L'Estrange.*—To send from one place to another: as, *Pass* that beggar to his own parish.

To PASS away. To spend; to waste.—The father waketh for the daughter, lest she *pass* away the flower of her age. *Eeelus.* xlii. 9.

To PASS by. To excuse; to forgive.—However God may *pass* by single sinners in this world; yet, when a nation combines against him, the wicked shall not go unpunished. *Tillotson.*—To neglect; to disregard.—Certain passages of scripture we cannot, without injury to truth, *pass* by here in silence. *Burnet's Theory.*

To PASS over. To omit; to let go unregarded.—It does not belong to this place to have that point debated, nor will it hinder our pursuit to *pass* it over in silence. *Watts.*

Better to *pass* him o'er, than to relate
The cause I have your mighty fire to hate. *Dryden.*

PASS, *f.* [from the verb.] A narrow entrance; an avenue.—The straight *pass* was damm'd with dead men. *Shakespeare's Cymbeline.*—Truth is a strong hold, fortified by God and nature, and diligence is properly the understanding's laying siege to it; so that it must be perpetually observing all the avenues and *passes* to it, and accordingly making its approaches. *South.*—Passage; road.—The Tyrians had no *pass* to the Red Sea, but through the territory of Solomon, and by his sufferance. *Ralegh.*

Pity tempts the *pass*;
But the tough metal of my heart resists. *Dryden.*

A permission to go or come any where: a passport.—A gentleman had a *pass* to go beyond the seas. *Clarendon.*

Give quiet *pass*
Through your dominions for this enterprize. *Shakespeare.*

An order by which vagrants or impotent persons are sent to their place of abode.—Push; thrust in fencing.—The king hath laid that, in a dozen *passes* between you and him, he shall not exceed you three hits. *Shakespeare.*

With seeming innocence the crowd beguil'd;
But made the desperat'st *passes* when he smil'd. *Dryden.*

State; condition.—I could see plate, hangings, and paintings, about my house, till you had the ordering of me; but I am now brought to such *pass*, that I can see nothing at all. *L'Estrange.*—Matters have been brought to this *pass*, that, if one among a man's sons had any blemish, he laid him aside for the ministry, and such an one was presently approved. *South.*

In my feare of hospitable Jove,
Thou did'st to this *pass* my affections move. *Chapman.*

PASS, in a military sense, a strait and difficult passage which shuts up the entrance into a country. A particular passage, or road, by which persons, especially armed bodies of men, may go from one country into another.—Of this description are the *passes* through the Pyrenees, which separate Spain from France. They are five in number; viz. First *pass* at Bayonne in France, which is always passable, leading to Fontarabia, in the Bay of Biscay. Second *pass* at Perpignan, a town of Roussillon in France, which is also passable at all times, leading through Bellegarde to Figueras in Catalonia. Third *pass*, passable from May to October, leading to Pampeluna, the capital of Navarre in Spain. Fourth *pass*, passable for muleteers only, leading through Verdun, a strong town of Armagnac, in France, to Jacca, or Xacca, and Saragossa, in Arragon. Fifth *pass*, very difficult and little used, leading through Venasque into Catalonia. It may, however, be said, that there are only two military *passes* of material consequence

consequence to both countries, viz. PERPIGNAN in France, on the side of the Mediterranean sea, leading to Figueras, Rosas, and Barcelona; and PAMPOLUNA, which is covered by Fontarabia, from Bayonne, on the Atlantic. *James's Mil. Dict.*

PASS, among miners, a kind of open trough, consisting of two or three bottom boards, and two side ones, set slopewise; through which the ore slides down into the coffer of the stamping-mill. *Chambers.*

PASSABLE, *adj.* [Fr. from *pass.*] Possible to be passed or travelled through or over.—His body is a *passable* carcass, if he be not hurt. It is a thoroughfare for steel. *Shakespeare's Cymbeline.*—Antiochus departed in all haste, weening in his pride to make the land navigable, and the sea *passable* by foot. 2 *Macc.*—Supportable; tolerable; allowable.—White and red, well mingled on the face, make what was before but *passable*, appear beautiful. *Dryden.*—Capable of admission or reception.—In counterfeits, it is with men as with false money; one piece is more or less *passable* than another. *L'Esrange.*—Popular; well received. *This is a sense less usual.*—Where there is no eminent odds in sufficiency, it is better to take with the more *passable*, than with the more able. *Bacon.*—A man of the one faction, which is most *passable* with the other, commonly giveth best way. *Bacon's Essays.*

PASSABLY, *adv.* Tolerably; moderately.—Other towns are *passably* rich, and stored with shipping; but not one very poor. *Howell.*

PASSACAGLIO, *f.* [Ital. *passacaille.* Fr.] A slow dance, resembling the chaconne; the only difference is, that it is generally somewhat slower, and more pathetic: on this account, the *passacaglii* are almost always composed in the minor key. *Brossard.*

PASSA'DO, *f.* [Italian.] A push; a thrust.—A duellist, a gentleman of the very first house; ah! the mortal *passado.* *Shakespeare's Rom. and Jul.*

PASSADUNKE'AG, a considerable branch of the river Penobscot.

PASS'AGE, *f.* [French.] Act of passing; travel; course; journey.—Live like those who look upon themselves as being only on their *passage* through this state, but as belonging to that which is to come. *Atterbury.*—Though the *passage* be troublesome, yet it is secure, and shall in a little time bring us ease and peace at the last. *Wake.*

In souls prepar'd, the *passage* is a breath
From time t' eternity, from life to death.

Harte.

Road; way.—Human actions are so uncertain, as that seemeth the best course, which hath most *passages* out of it. *Bacon.*—The land-enterprise of Panama was grounded upon a false account, that the *passages* towards it were no better fortified than Drake had left them. *Bacon.*

Is there yet no other way besides
These painful *passages*, how we may come
To death, and mix with our connatural dust. *Milton.*

The *passage* of a river is a ford or bridge. *Judg. xii. 16.* On land, a *passage* often signifies a narrow way between mountains, lakes, &c. such as the *passages* of Michmas and Abarim, that were rendered narrow by the hills or rocks on each side. 1 *Sam. xiii. 23. Jer. xxii. 20.*—The Persian army had advanced into the straight *passages* of Cilicia, by which means Alexander with his small army was able to fight and conquer them. *South.*—Entrance or exit: liberty to pass.—*Passage* (passagium) is properly over water, as *way* is over land. And thus, *passagio* is the name of a writ directed to the keepers of the ports to permit a man to pass over sea, who has the king's leave. *Jacob's Law Dict.*

You shall furnish me
With cloake, and coate, and make my *passage* free
For lov'd Dulichius. *Chapman.*

The state of decay. *Not in use.*

VOL. XVIII. No. 1278.

Would some part of my young years

Might but redeem the *passage* of your age! *Shakespeare.*

Intellectual admittance; mental acceptance.—I would render this treatise intelligible to every rational man, however little versed in scholastic learning, among whom I expect it will have a fairer *passage* than among those deeply imbued with other principles. *Digby.*—Occurrence; hap:

It is no act of common *passage*, but
A strain of rareness.

Shakespeare.

Unsettled state; aptness by condition or nature to change the place of abode.—Traders in Ireland are but factors; the cause must be rather an ill opinion of security than of gain: the last entices the poorer traders, young beginners, or those of *passage*; but, without the first, the rich will never settle in the country. *Temple.*

In man the judgment shoots at flying game;
A bird of *passage*! lost as soon as found;
Now in the moon perhaps, now under ground. *Pope.*

Incident; transaction.—This business, as it is a very high *passage* of state, so it is worthy of serious consideration. *Hayward.*

Thou dost in thy *passages* of life
Make me believe that thou art only mark'd
For the hot vengeance of heav'n. *Shakespeare's Hen. IV.*

Management; conduct.—Upon consideration of the conduct and *passage* of affairs in former times, the state of England ought to be cleared of an imputation cast upon it. *Davies on Ireland.*—Part of a book; single place in a writing.—A critic who has no taste nor learning, seldom ventures to praise any *passage* in an author who has not been before received by the public. *Addison's Spect.* As to the cantos, all the *passages* are as fabulous as the vision at the beginning. *Pope.*

How commentators each dark *passage* shun,
And hold their farthing candle to the fun. *Young.*

A game at dice, to be played at but by two, and performed with three dice.—800l. a year; but let it pass, for *passage* carried away the most part of it, a plague of fortune. *The Hog hath lost his Pearl.*

PASSAGE, or *Right of Passage*, is an imposition, which some princes exact in certain narrow close places of their territories, either by land or sea, on all vessels and carriages, and even sometimes on persons as passengers coming in or going out of ports, &c. The *passage* of the Sound (that famous freight, which carries us out of the German into the Baltic sea) is the most celebrated *passage* in Europe. The dues thereof belong to the king of Denmark, and are paid at Elsinore or Cronenburg.

PASS'AGE, a town of South America, in the government of Tucuman, on a river of the same name: 116 miles north of St. Miguel de Tucuman.

PASS'AGE (Great), one of the Virgin islands, in the West Indies, about seven miles long, and two wide: twelve miles east of Porto Rico.

PASS'AGE (Little), one of the Virgin islands, near Great Passage Island.

PASS'AGE CANAL, an inlet in Prince William's Sound. Lat. 60. 48. N. lon. 212. 15. E.

PASSAGE FORT, a small town of Jamaica, situated in the road between Port Royal and Spanish Town, seven miles south-east of the latter, and at the mouth of the river Cobre, where it has a fort, with ten or twelve guns. It has a brisk trade, and contains about 400 houses, the greatest part of them houses of entertainment.

PASSAGE ISLAND, a small island at the entrance of a channel from the North Pacific Ocean, among the Philippine islands; about twenty miles east from the island of Leyta. Lat. 10. 44. N. lon. 125. 27. E.

PASSAGE ISLAND, a small low island in the gulf of Georgia, at the entrance into Howe's Sound. Lat. 49. 21. N. lon. 237. 3. E.

PASSAGE ISLANDS, two small islands among the Virgin-islands, in the West Indies, near the coast of Porto Rico.

PASSAGE POINT, a cape on the coast of Patagonia, in the Straits of Magellan. Lat. 15. 53. S. lon. 73. 40. W.

PASSAGE ROCK' (North), a rock in Prince William's Sound, about two miles and a half north-north-west from the north point of entrance into Port Chalmers, Montague's Island.

PASSAGE ROCK' (South), a rock in Prince William's Sound, half a mile west from the north point of entrance into Port Chalmers.

PASSAGES (Los), a seaport town of Spain, in Guipuscoa, with a good harbour, well sheltered by mountains, with sufficient depth of water for a fifty-gun ship: three miles east of St. Sebastian. Lat. 43. 10. N. lon. 2. W.

PASSA'IC, a river of America, which rises in New Jersey, and runs into Newark Bay four miles east-south-east of Newark; in lat. 40. 43. N. lon. 74. 8. W.

PASSA'IS, a town of France, in the department of the Orne: six miles south-west of Domfront.

PASSALORHYN'CHITES, in ecclesiastical history, a sect of Montanists, in the second century, who made profession of perpetual silence, and, the better to maintain it, kept the thumb continually upon the lips; founding their practice on that of the Psalmist, *Set a guard, O Lord, on my mouth*. St. Jerome mentions his having met with some of them in his time. *Chambers*.

PASSAMAN, a town on the west coast of the island of Sumatra, near the Equator.

PASSAMAQUODDY, a town and river of America, near which is the division-line between the British province of New Brunswick and the United States. The island of Campo Bello, in the North Atlantic Ocean, is at the middle or west passage of the bay, in lat. 44. 50. N. and lon. 66. 46. W. The distance from Cross-isle, Machias, to West Passamaquoddy-head, is nine leagues north-east by east; and from the head over the bar to Allen's isle, north-north-east two leagues. Three rivers fall into the bay; the largest of which is called by the Indians the *Seodich*, but by De Mons and Champlaine, *Etchemina*. Its main source is near Penobscot river; and the carrying-place between the two rivers is only three miles.

PASSAMEZZO, *f.* [from the Ital. *passer*, to walk, and *mezzo*, the middle.] A flow dance, differing little from the action of walking.—As a galliard consists of five paces, or bars, in the first strain, and is therefore called a *cinqüe pace*, the *passamezzo*, which is a diminutive of the galliard, has just half that number, and from that peculiarity takes its name. *Chambers*.

PASSANGAN, a town on the north coast of the island of Sumatra. Lat. 4. 45. N. lon. 97. 2. E.

PASS'ANT, *adj.* [French.] Cursory; careless.—What a severe judgment all our actions (even our *passant* words, and our secret thoughts) must hereafter undergo. *Barrow*.

PASSANT, in heraldry, a term applied to a lion or other animal in a shield, appearing to walk leisurely: for most beasts, except lions, *trippant* is frequently used instead of *passant*.

En PASSANT, *adv.* [French.] By the way; slightly; in haste. This affected term has long been in use among us.—Reflecting upon this Egyptian prayer, or apology rather, made in the name of the dead, we may *en passant* observe both a touch of pharisaical arrogance and self-justification. *Transl. of Plato's Apol. of Socrates, &c.* 1675.

PASSA'RA, a town of the island of Borneo, on the west coast: eighty miles south-west of Borneo.

PASSAR'GE, a river of Prussia, which runs into the Frisch Haff in lat. 54. 23. N. lon. 19. 42. E.

PASSAR'GOS (Los), a small island in the Grecian Archipelago, between the coast of Nátolia and the island of Scio. Lat. 38. 17. N. lon. 26. 14. E.

PASSA'RO, a town of Sicily, in the Val di Noto: thirty miles south of Syracuse, and thirteen south-west of Noto.

PASSARON', a town of the Morea: eighteen miles south of Argos.

PASSAROT'TI (Bartolomeo), an Italian engraver and painter, was born at Bologna in the year 1540, and died in the same city in 1592. Bartolomeo was the most eminent of the numerous family of artists of his name; and excelled both in historical subjects and portraits. Huber claims for him the honour of having been the founder of the celebrated Academy at Bologna, where the Carracci so much distinguished themselves. He was a painter of great merit, and Ph. Thomassin, C. Cort, Aug. Carracci, and many other artists, have engraved after his pictures. He likewise produced many etchings from his own designs, and from those of F. Salviati, and P. Perugino.

PASSAR'OWITZ, a town of European Turkey, in Servia, near the river Morava; well known for a peace concluded there, in the year 1718, between Charles VI. and Achmet III. thirty-three miles east-south-east of Belgrade, and forty-four west of Orsova.

PASSARU'AN, or PASSAROWAN, a town of the island of Java, and capital of a kingdom, situated on the north-coast: the chief trade is in cotton. The houses are neatly built; and the country appears to be well cultivated. The produce of this settlement is rice, of which they export large quantities. There are but few Dutch here; the Javanese are numerous, and their chief lives with considerable splendour. They have good roads, and posts are established along the coast; and it appears to be a busy and well-regulated settlement: thirty miles west of Panarucan. Lat. 7. 36. S.

PASSAU', a city of Germany, in the circle of Bavaria, and capital of a bishopric and principality of the same name, on the Danube, where it receives the Inn and the Ilz. It consists of three towns: namely, of that which is properly called *Passau*, and lies betwixt the rivers Danube and Inn; of the *Imstadt*, which stands on the other side of the Inn, being joined with the former by means of a bridge, and standing on the side of the ancient town of Boiodurum; and lastly of the *Ilzstadt*, which lies on the north side of the Danube, where it receives into it the Ilz. The last of these rivers runs betwixt the Ilzstadt and the mountain of St. George, on which stands the castle of Oberhaufz. From this fortress a bridge leads over the Danube into the road to Passau. The city, on those sides of it which are surrounded by the water, is without the walls, but towards the land-side of Bavaria is fortified both with ramparts and ditches.

Passau enjoys a very good situation for trade. It remained under the power of the Romans, till after the year 475, when it was taken by the Alemanni. After that it fell under the dominion of the Franks, and continued under the government of the dukes of Bavaria. In the year 999, the emperor Otho III. made it subject to the bishop. In 1552, the religious peace, which is usually called *The Treaty of Passau*, was concluded here soon after the advantage gained by Maurice elector of Saxony against the emperor Charles V. As this treaty is considered by the German Protestants as the basis of their liberty, it may not be improper to insert here some of its principal articles. By the three first it was stipulated, that Maurice and the confederates should lay down their arms, and should lend their troops to Ferdinand king of the Romans, the emperor's brother, to defend Germany against the Turks; and that the landgrave of Hesse should be set at liberty. By the fourth, it was agreed, that the rule of faith, called INTERIM, (see vol. xi. p. 166.) should be considered as null and void; that the contending parties should enjoy the free and undisturbed exercise of their religion, and a diet should be assembled, within six months, to determine all the present disputes; and that this religious liberty should continue always, if it should be found impossible to come to an uniformity in doctrine and worship. It was also resolved, that

that all those who had suffered banishment, or any other calamity, on account of their having been concerned in the league or war of Smalcald, should be reinstated in their privileges, possessions, and employments; that the Imperial Chamber of Spire should be open to Protestants as well as Catholics; and that there should be always a certain number of the Lutheran persuasion in that high court.

The bishop of Passau was formerly suffragan of Salzburg; but, from the year 1728, only dependent on the see of Rome. As a prince of the empire, his assent in the imperial matricula was 18 horse and 70 foot, or 528 florins; to the chamber at Wetzlar he paid 94 rix-dollars, 62½ kruitzers. In 1802, part of the bishopric beyond Iltz and the Inn, towards Austria, was given to the Grand Duke of Tuscany. It is eighty-two miles east-north-east of Munich, and 120 east of Vienna. Lat. 48. 34. N. lon. 13. E.

PASS'AVANT, a town of France, in the department of the Marne: six miles south of St. Menesould.

PASS'AVANT, a town of France, in the department of the Doubs: four miles south of Baume les Dames, and thirteen east-north-east of Besançon.

PASS'AVANT, a town of France, in the department of the Maine and Loire: six miles east-south-east of Vihiers, and fifteen south-west of Saumur.

PASSAVAN'TE (James), an Italian dominican monk, was descended from a noble family, and born at Florence, where he died in 1357. His name is celebrated in Italy, on account of his being the author of a treatise on genuine repentance, entitled, "Le Specchio della vera Penitenza," which was published for the first time in the year 1595, quarto. What entitles it to our notice is the circumstance, that the famous Academy de la Crusca directed an edition of it to be printed in 1681, which was its seventh impression, and received their *imprimatur* as a beautiful exemplar of chaste and elegant Italian style. In 1725, it was again reprinted at Florence, in quarto. *Gen. Biog.*

PASS'AWAY, a town of Hindoostan, in the circar of Jyengar: thirty miles east of Parasaoli.

PASSE, or DE PASSE, a family of Dutch engravers, of whom the elder came to England from Utrecht early in the seventeenth century, and introduced a better taste, and a neater and more elaborate style of engraving, than had hitherto been practised in England.

CRISPIN DE PASSE, the patriarch of the family, was a man of letters, studious, and of a liberal mind. Holland's Heroologia was embellished and published at his expense; and in the preface to a drawing-book, published by him at Amsterdam, in the year 1643, (after his departure from England,) he discovers some knowledge in geometry and perspective; gives directions for the proportions of the human body; for drawing in the academy by lamp-light, and for the use of the lay-figure in studying draperies; and details the proportions of horses, lions, and other quadrupeds, and of birds and fishes. In the same preface he says of himself, that he applied early to the study of the arts; and mentions Reubens, Bloemart, and other distinguished contemporary artists, as his friends and encouragers: but he appears also to have looked with advantage at the neater productions of the German school of engraving. The following is a tolerably just estimate of his powers as an artist, and is from the pen of the late Mr. Strutt. "Passe worked entirely with the graver, in a neat clear style, which has much originality; and, excepting some little stiffness which frequently appears, and the want of harmony with respect to the distribution of the light and shadow, (a fault which prevailed at the time in which he lived,) his best works possess a very considerable share of merit, especially his portraits, many of which he drew from the life; and the far greater part of his historical and emblematical subjects are engraved from his own compositions. He drew the human figure very correctly, and marked the

extremities with a degree of exactness not usually found in the works of those masters who employed themselves upon small subjects.

Crispin, the eldest son, produced but few prints; and hence it has been supposed that he either died young, or quitted the profession of engraving. The principal of these are the portraits of Frederic elector palatine, and Johannes Angelius Werdenhagen, both from his own drawings; but the date of the latter, 1630, shows that he lived at least to the age of thirty years; and three plates from the History of Lazarus. A fourth plate from this history, which completes the set, was engraven by De Passe the elder.

The works of *William*, the second son, who resided chiefly in London, were somewhat more abundant, but consist chiefly of portraits; among which are those of Robert Dudley earl of Leicester; Robert Devereux earl of Essex, and George Villiers duke of Buckingham, both on horseback; and Frances, duchess of Richmond, &c. all of quarto dimensions. King James I. with his family, inscribed "Triumphus Jacobi Regis Augustæ qui ipsius scrolis;" James I. with prince Henry of Wales, &c. folio. A set of the Five Senses, with each a Latin verse, in quarto; a family of gypsies, dated 1621, in folio; and a family-piece, supposed to be that of the palatine, where the youngest child is represented playing with a rabbit, folio size.

Simon, the youngest of the sons of Crispin, resided also for some time in England, where he was employed by Hilliard, who was the Reynolds of his day, and for whom he engraved the portraits of most of the royal family of England. He was afterwards employed by the king of Denmark, and probably died at Copenhagen. The latest of his works executed in England are dated 1613. They chiefly consist of portraits, with some few devotional subjects and book-ornaments.

The works of *Magdalen*, the first female engraver we read of who practised the art in England, are not equal to the best of those of her brethren. In three plates from Ovid's Metamorphoses, which she has engraved after pictures by Elsheimer, she has judiciously imitated the style of Goudt; but has not produced the same forcible effect, nor attained the same exquisite degree of finish. Lists of the numerous portraits and other engravings by his family, may be seen in Lord Orford's Catalogue, and Mr. Strutt's Dictionary of Engravers; and in the royal library at Paris, before the revolution, was a collection of their works in two or three large volumes. The monograms of William, Simon, and Magdalen, de Passe, will be found on the preceding Plate.

PASSE-PAR-TOUT, *f.* [French.] A master-key; a key that opens several locks.

PASSE-VOLANT, *f.* [Fr. from *passer*, to pass, and *volant*, flying.] A man that is not really in the service, but who stands to be mustered for the purpose of completing the *supposed* number of effectives in a regiment, or on-board a ship of war. They are likewise called *faggots*.

Passe-volans likewise mean those wooden pieces of ordnance which are made to resemble real artillery, and fill up the vacant places in a ship. These were first adopted by the French, in consequence of a regulation which was made by M. de Pontchartrain, when he became minister of the marine department. He gave orders that no vessels, except such as carried 16 guns, should sail to and from America: in order to comply, at least in outward appearance, with this regulation, the merchants had recourse to *passe-volans*, or wooden guns; this invention has been adopted by other nations, for the purpose of deceiving an enemy as to the strength and probable resistance of small ships of war, privateers, &c.

PASSEHENDAELE, a town of the kingdom of the Netherlands, in the province of West Flanders. Before the peace of 1815, it was a town of France, in the department of the Lys, and chief place of a canton, in the district of Ypres. The place contains 2664 inhabitants.

PASSEMAN'T,

PASSEMANT (Claude Simeon), an able French optician and mathematical instrument-maker, was born at Paris in the year 1702. As his parents were not endowed with the gifts of fortune, he found it necessary to support himself by his own industry, and wrote for some time in an attorney's office. Afterwards he served as clerk to a woollen-draper; and then carried on the business of a haberdasher on his own account. Having married, he committed the care of his shop to his wife, and directed his attention to the study of natural philosophy, optics, and astronomy, which he had cultivated from his youth at his leisure hours; and he also devoted much of his time to the construction and improvement of mathematical instruments, for which a strong mechanical turn well qualified him. In 1738, he published "A Treatise on the Construction of *reflecting* Telescopes, from sixteen Inches to six Feet and a Half in Length," the largest of which were equal in power to such *refracting* instruments as were then known, supposing them to be carried to the length of an hundred and fifty feet. Some time afterwards he published, "The Description and Use of Telescopes, Microscopes, &c." of his own invention. He constructed an astronomical pendulum, crowned with a moving sphere, which represented the revolutions of the planets in a manner that exactly corresponded with the astronomical tables. This machine was presented to Louis XV. and was formerly to be seen in the royal apartments at Versailles. He made a similar instrument for the Turkish emperor, which showed the rising and setting of the sun and moon. He also furnished the king of France with sets of instruments for making experiments in optics, and other branches of science; a burning mirror of 45 inches diameter, which melted silver in three seconds; time-pieces, &c. This able artist died suddenly in 1769, about the age of sixty-two, equally respected for his integrity and amiable character as for his talents. *Gen. Biog.*

PASSENBERG. See **PASZBERG.**

PASSENGER, *f.* [*passager*, Fr.] A traveller; one who is upon the road; a wayfarer.—Apelles, when he had finished any work, exposed it to the sight of all *passengers*, and concealed himself to hear the censure of his faults. *Dryden's Dufresnoy.*

The nodding horror of whose shady brows
Threats the forlorn and wandering *passenger*. *Milton.*

One who hires in any vehicle the liberty of travelling.—The diligent pilot in a dangerous tempest doth attend the unskilful words of a *passenger*. *Sidney.*

PASSENHAM, a village in Northamptonshire, one mile south-west of Stoney Stratford in Buckinghamshire. This is said to be the place where king Edgar placed a garrison to guard the passage over the Ouse against the Danes from Northampton.

PASSER, a river of the Tyrolese, which runs into the Adige near Meran.

PASSER, *f.* One who passes; one that is upon the road.—Under you ride the home and foreign shipping in so near a distance, that, without troubling the *passer* or borrowing Stentor's voice, you may confer with any in the town. *Carew.*

Then, like a matron, butcher'd by her sons,
And cast beside some common way a spectacle
Of horror and affright to *passers* by,
Our groaning country bled at every vein. *Rowe.*

PASSERA'T (John), an ancient French poet and man of letters, was born in 1534 at Troyes in Champagne. After studying law at Bourges under Cujas, he repaired to Paris, and taught the belles-lettres in the colleges of the university. In 1572 he succeeded Peter Ramus as professor-royal of eloquence. His lectures were much frequented by the most cultivated persons in the capital, and he received marks of esteem from Charles IX. and Henry III. The disorders of the League caused him to

shut up his school, till the entry of Henry IV. into Paris in 1594. Being at Espernay when that place was besieged by the prince of Condé, who threatened to put the inhabitants to the sword, he was deputed by them to that prince, who pardoned them at his request. He had the misfortune to lose an eye from the stroke of a tennis-ball, and this accident aggravated the naturally severe and gloomy expression of his countenance; but nothing could be more amiable than his temper, or gayer than his conversation. He was particularly patronized by Henry de Mesmes, who gave him an apartment in his house, which he occupied for thirty years. He was extremely ardent in study, and often passed days together without a regular meal. This excess of application brought on a paralytic disorder, under which he sunk in 1602, at the age of sixty-eight.

This author is principally known by his Latin and French verses. The Latin are chiefly distinguished by their purity and facility, and by the elegant turn which he gives to common thoughts. His French poems, published in 1606, octavo, consist chiefly of short pieces, which, notwithstanding the language is antiquated, are still read with pleasure on account of their ingenious thoughts and simple graces. His metamorphosis of a man into a bird is particularly admired, and served as a model to la Fontaine in his tales. He joined Rapin in composing the verses of the Satire Menippée, against the Leaguers. He also wrote, 3. *De Cognatione Litterarum*, 1606, 8vo. a work on ancient orthography. 4. *Orationes et Præfationes*, 1606, 1637, 8vo. 5. *Commentaries on Catullus, Tibullus, and Propertius*. 6. A Translation of the *Bibliotheca of Apollodorus*. *Moreri.*

PASSE'RES, *f.* [from *passer*, Lat. a sparrow.] The name of the sixth and last order of birds. See the article **ORNITHOLOGY**, vol. xvii. p. 766.

PASSE'RI (Giambatista), an eminent antiquarian, was born at Farnese in 1694. He was destined to the profession of the law; but his inclination led him to the study of antiquities, which he pursued with assiduity during a four-years' residence at Rome. Returning thence to Todi, where his father practised physic, he collected the monuments of antiquity in that place and its vicinity. In 1726 he turned his attention to Etruscan antiquities, and collected a great number of lamps, which he arranged in classes. In 1738, having lost his wife, he entered into the ecclesiastical order, and obtained the office of vicar-general of Pesaro, which he exercised for many years with zeal and fidelity. His death, in 1780, was occasioned by a fall from his carriage. He was the author of a great number of works, among which are the following: 1. *Lucernæ fictiles Musæi Passerii*, 3 vols. a description of the earthen lamps in his collection. 2. A Discourse on the History of the Fossils of the District of Pesaro. 3. *Picturæ Etruscorum in Vasculis, in unum collectæ, Dissertationibus illustratæ*, 3 vols. He wrote a great number of learned dissertations in the different journals of Italy. At the time of his death, the first volume of an extensive work of his, entitled "Thesaurus Gemmarum Selectissimarum," was printing at Rome. *Gen. Biog.*

PASSERINA, *f.* [from *passer*, a sparrow; a name which has been applied to some plants, on account of the resemblance of their leaves to the tongue of a small bird. But Linnæus, who has chosen this appellation for the genus that now bears it, cites Plukenet for saying it is so called because the fruit represents the head of a little bird with its beak; see Linn. Hort. Cliff. 146. The resemblance is not very striking; but the name is preferable to that given by Clusius to the same genus, *Sanamunda*, supposed to be derived from *sano*, to heal, and *munda*, clean; though he adopted it from the Moors of Grenada, who were accustomed to use some of this tribe as a purge.] **SPARROW-WORT**; in botany, a genus of the class octandria, order monogynia, natural order of vercueulæ, (thymelææ, *Juss.*) Generic characters—Calyx: none. Corolla: one-petalled, shrivelling; tube cylindrical,

cal, slender, ventricose below the middle; border four-cleft, spreading: segments concave, ovate, blunt. Stamina: filaments eight, bristle-shaped, the length of the border, placed upon the point of the tube; antheræ subovate, erect. Pistillum: germen ovate, within the tube of the corolla; style filiform, springing from the side of the very point of the germ, the same length with the tube of the corolla. Stigma capitate, hispid all over with villose hairs. Pericarpium: coriaceous, ovate, one-celled. Seed: single, ovate, acuminate at both ends, with the points oblique.—*Essential Character.* Calyx none; corolla four-cleft; stamina placed on the tube; seed one, corticate.

1. *Passerina filiformis*, or filiform sparrow-wort: leaves linear, convex, imbricate in four rows, (three-cornered, acute;) branches tomentose, (flowers racemed. *Thunberg.*) This rises with a shrubby stalk five or six feet high, sending out branches the whole length, which, when young, grow erect, but, as they advance in length, they incline towards a horizontal position, but more so when the small shoots at the end are full of flowers and seed-vessels. The branches are covered with a white down like meal, and are closely beset with very narrow leaves in four rows, so that the young branches seem as if they were four-cornered. The flowers come out at the extremity of the young branches, from between the leaves on every side; they are small and white, so that they make no great appearance. The seed-vessels are small, and seem withered and dry. The tube of the corolla is the length of the germen. The floral leaves have a wide membranaceous rim at the base, which is not the case in the rest. It is a native of the Cape of Good Hope, whence it was first brought to the gardens in Holland. Mr. Miller cultivated it here in 1752. It flowers from June to August.

2. *Passerina hirsuta*, or shaggy sparrow-wort: leaves fleshy, smooth on the outside; stems tomentose. This has shrubby stalks, which rise to a greater height than the former; the branches grow more diffused, and are covered with a mealy down. Leaves imbricate, short, thick, succulent, smooth and green on the outside, but downy on the inner. Flowers small and white, like those of the former, and appearing about the same time. Native of Spain and Portugal, Provence, Italy, and the Levant.

3. *Passerina ericoides*, or heath-like sparrow-wort: leaves linear even subimbricate, corollas globular. This has so entirely the appearance of an *Erica*, that, at first sight, no one would doubt of its being one. It has the stature of the first species. The branchlets are pubescent. The leaves short (like those of *Erica*), ovate-oblong, fleshy, opposite, the floriferous one subcordate. Native of the Cape of Good Hope.

4. *Passerina capitata*, or headed sparrow-wort: leaves linear, smooth, heads peduncled, tomentose. Leaves scattered. Heads terminating, globular. Flowers many, white, sessile without a tube. Native of the Cape of Good Hope.

5. *Passerina ciliata*, or fringed sparrow-wort: leaves lanceolate, ciliate; branches naked, flowers sub-solitary. This has a shrubby stalk, rising five or six feet high, sending out many branches which are naked to their ends, where they have oblong leaves, standing erect, and having hairy points. The flowers are small, and come out among the leaves at the end of the branches; Linnæus remarks, that the flowers are purple, with the throat villose. Native of the Cape of Good Hope, not of Europe. The history of this species is extremely confused, as the late Mr. Dryander has shown in the *Linn. Trans.* ii. 234. that excellent botanist and critic having been able to prove rather what it was not than what it was. The plant described in Hort. Cliff. is merely *Struthiola virgata*, with which it seems three others are confounded in the Cliffortian collection. The Herbarium of Linnæus has no specimen. We can, therefore, only depend on Burmann's synonym, which Linnæus uni-

formly cited, and which he has marked in his copy of Burmann's book. Of this the young branches are square. We cannot learn why Willdenow defines the stem as villose. The leaves are sessile, opposite, crossing each other in pairs, ovato-lanceolate, acute, entire, many-ribbed, half an inch, or more, in length, smooth, except a dense silky marginal fringe. Flowers solitary, with a slender tube, about twice the length of the leaf. Burmann's figure has all the appearance of a *Gnidium*. The representation on the preceding Engraving, fig. 2, is from Seba.

6. *Passerina uniflora*, or one-flowered sparrow-wort: leaves linear, opposite, (lanceolate even;) flowers terminating, solitary; branches smooth. This has a shrubby stalk, seldom rising more than a foot high, dividing into many branches, which are slender, smooth, and spread out on every side. Leaves dark-green, having the appearance of those of the fir-tree, but narrower. The flowers are larger than those of the former, and the upper part of the petals is spread open flat; they are of a purple colour, and appear about the same time as the former. There are eight stamens at the throat of the corolla, and eight rudiments of antheræ lie concealed at the bottom. Native of the Cape of Good Hope.

7. *Passerina anthyllodes*, or hairy-headed sparrow-wort: leaves oblong, villose; flowers in heads. 8. *Passerina spicata*, or spiked sparrow-wort: leaves ovate, villose; flowers lateral sessile. 9. *Passerina laxa*, or loose-branched sparrow-wort: leaves ovate hairy, flowers in heads, branches loose. These were found at the Cape of Good Hope by Thunberg.

10. *Passerina grandiflora*, or great-flowered sparrow-wort: very smooth, leaves oblong acute, concave, wrinkled on the outside, flowers terminating sessile solitary. Native of Africa. Recently introduced, says Mr. Curtis, from the Cape. It flowered in 1794, at Mess. Lee and Kennedy's, and forms a small neat shrub, like *Phyllica ericoides*.

11. *Passerina Gnidia*: two-stamened, very smooth; leaves lanceolate acute. The leaves are more rigid, and very like those of the *Gnidia*. Native of New Zealand, in the fissures of rocks, by the sea-coast, and at the tops of mountains.

12. *Passerina pilosa*, or hairy sparrow-wort: two-stamened, hairy; leaves linear, blunt. Native of New Zealand.

13. *Passerina prostrata*, or prostrate sparrow-wort: two-stamened, hairy; leaves ovate. Native of New Zealand, on dry mountains. These diandrous *Passerinas* have the smell of *Syringa* flowers, and are evergreen. They are not separated from their natural genus, though the number of stamens be less. The *Struthiolæ* might have been referred to this genus, had it not been for the nectaries. *Daphne* also agrees with *Passerina*.

14. *Passerina cephalophora*, or great-headed sparrow-wort: leaves three-cornered, in four rows; heads woolly.

15. *Passerina linoides*, or flax-like sparrow-wort: leaves linear-lanceolate, smooth, three-ribbed; flowers terminating, solitary. 16. *Passerina nervosa*, or ribbed sparrow-wort: leaves lanceolate, smooth, three-ribbed; flowers in heads. 17. *Passerina fetosa*, or bristly sparrow-wort: leaves lanceolate, smooth, five-nerved; flowers in heads, bristly on the outside. 18. *Passerina stricta*, or rigid sparrow-wort: leaves ovate-hirsute, flowers in heads, branches rigid. 19. *Passerina pentandra* or pentandrous sparrow-wort: leaves ovate-hirsute, spike ovate terminating. Natives of the Cape of Good Hope, where they were found by Thunberg.

Propagation and Culture. These shrubs from the Cape of Good Hope may be increased by cuttings during the summer months, planted in a bed of loamy earth, and closely covered with a bell or hand glass to exclude the air, shading them from the sun, and refreshing them now and then with water. They will take root in about two months, when they may be planted each in a small pot

filled with loamy earth; placing them in the shade till they have taken new root: then remove them into a sheltered situation, there to remain till October, when they must be placed in the green-house, and treated as myrtles. Those also which produce seeds, or when they can be procured, may also be propagated that way. Sow them in autumn, soon after they are ripe, in small pots filled with light earth, plunged into an old bark-bed, under a common frame in winter. The plants will come up in the spring, and may be treated like the cuttings; but the seedling plants will grow more erect, and make a handfomer appearance. The second sort will live abroad in common winters, in a dry soil and warm situation; but in hard frosts, the plants are frequently destroyed; one or two, therefore, should be kept in pots, and sheltered in winter. See GNIDIA, LACHNEA, LINUM, STELLERA, and STRUTHIOLE.

PASSERO, or PASSERI (Bernardino), an Italian artist, was born at Rome some time about the year 1542, and resided there most part of his life. In painting he possessed some talent, and appears to have imitated the Zuccheri; but the attitudes of his figures are, to a certain degree, forced and uneasy. In the Abecedario he is called an universal engraver, but for what reason is not known, unless it means, that he occasionally practised all the branches of that art which were then in vogue. It is certain that he has engraved a considerable number of prints, which, in general, he first etched, and afterwards finished with the graver, in a bold, easy, and loose style. His works prove him to have been a man of ability; but his drawing is not always correct, nor are the characters of his heads always beautiful, or well chosen. The following are the names of a few of his works, which are by no means uncommon: A Holy Family, where the Virgin is represented with a Bohemian bonnet, dated 1583, in 4to. The Life of St. Bruno, represented on several middling-sized upright plates, in 4to. and a considerable number of Holy Families, Madonnas, and other pious subjects.

PASSERO'E, a river of Prussia, which runs into the Frisch Haff a little below Braunberg.

PASSER'G, a town of Prussia, in the province of Nantangen, on the Frisch Haff: twenty-two miles south-west of Brandenburg.

PASSER'G, a river of Prussia. See PASSARGE.

PASSERON ISLANDS, a cluster of small islands, in the Indian Sea, near the coast of Africa. Lat. 11. 10. S.

PASSEROT'TI (Bartolomeo), an artist of Bologna, was a pupil of Zuccari, and a very ingenious painter; one of whose works (a picture of Tityus) was mistaken by the connoisseurs of Bologna for a painting of Michael Angelo; and whose portraits were thought by Guido to have nearly approached those of Titian. He was a skilful draftsman; and aided in forming the Carracci, particularly Agostino, who made his lines in his penned drawings the guide of his graver. He composed a book on anatomy and symmetry; but was not always guided by his own directions; allowing his better talents to bend to facility of execution, and looseness of manner.

PASSIBILITY, *f.* [*passibilité*, Fr. from *passible*.] Quality of receiving impressions from external agents.—The last doubt, touching the *passibility* of the matter of the heavens, is drawn from the eclipses of the sun and moon. *Hakewill on Providence.*

PASSIBLE, *adj.* [Fr. from *passibilis*, Lat.] Susceptive of impressions from external agents.—Theodoret disputeth with great earnestness, that God cannot be said to suffer; but he thereby meaneth Christ's divine nature, against Apollinarius, which held even Deity itself *passible*. *Hooker.*

PASSIBLENESS, *f.* Quality of receiving impressions from external agents.—It drew after it the heresy of the *passibleness* of the Deity; the deity of Christ was become, in their conceits, the same nature with the humanity that was *passible*. *Brerewood.*

PASSIDAGPOUR, a town of Hindoostan, in Oude: twenty-four miles north of Manickpour.

PASSIFLO'RA, *f.* [a name altered by Linnæus from the *Flos Passionis* of preceding authors. This was applied to the beautiful genus in question, known universally at present by the appellation of passion-flowers, because the instruments of Christ's passion were thought to be represented in the parts of fructification: the five stamens were compared to his five wounds; the three styles, more aptly, to the nails by which he was fixed to the cross; the column which elevates the germen to the cross itself, or to the pillar to which he was bound; and the rays of the nectary to his crown of thorns.] In botany, a genus of the class gynandria, order pentandria, Linn. (pentandria trigynia, Schreb. *Thumb. &c.* monadelphia pentandria, Swartz, *Willd. Cavan.*) natural order of cucurbitaceæ. Generic characters—Calyx: perianthium five-parted, flat, coloured. Corolla: petals five, femilanceolate, flat, blunt, of the same size and form with the calyx. Nectary: a triple crown; the outer longer, encircling the style within the petals, more contracted above. Stamina: filaments five, awl-shaped, fastened to a column at the base of the germ, and united at bottom, spreading. Antheræ incumbent, oblong, blunt. Pistillum: germen roundish, placed on the apex of a straight cylindrical column. Styles three, thicker above, spreading; stigmas capitate. Pericarpium: berry fleshy, subovate, one-celled, pedicelled. Seeds: very many, ovate, arilled. Receptacle of the seeds triple, growing longitudinally to the rind of the pericarp.—*Essential Character.* Styles three; calyx five-leaved; petals five; nectary a crown; berry pedicelled.

The species of this genus are numerous. Linnæus, in his dissertation de *Passiflorâ*, published in 1745, and reprinted in the first vol. of his *Amœnitates*, describes 22, with imperfect indications of 18 more. The leaves of those twenty-two, on which the specific differences chiefly depend, are there very neatly engraved. Twenty-six species are given in Sp. Pl. ed. 2. and 28 only in the 14th edition of Syst. Veg. Lamarck, in his Dictionary, (Grenadille,) has 35. Cavanilles in his tenth dissertation describes 44, of which 31 are there figured. Willdenow has 46. We have now 58.

These beautiful plants were unknown till the discovery of America; and it is remarkable that every described species is exclusively of South-American or West-Indian origin, except two found in Virginia and Florida, one in the remote counties of New Caledonia and Norfolk-island, and one in Cochinchina. The whole are disposed in four sections, by the forms of their leaves.

I. Leaves undivided.

1. *Passiflora ferratifolia*, or notch-leaved passion-flower: leaves ovate ferrate. This is a perennial shrubby species; the stems are round; the younger ones very slightly villous, and climbing very high: the footstalks of the leaves are furnished with two pair of glandules: the leaves are ovate, smooth, and slightly ferrated round their whole outline: the peduncles are one-flowered and solitary. The calyx is outwardly green, inwardly whitish; petals pale purple; the filaments of the nectary deep purple at their base, from thence bluish, and at length pale; antheræ yellow; stigmas greenish. The flowers have an extremely agreeable odour. Mr. Miller has wholly omitted this species in his descriptions, though he has inserted it in his list of species. Native of the West Indies. Introduced in 1731, by William Houstoun, M. D. It flowers from May to October.

2. *Passiflora pallida*, or pale passion-flower: leaves ovate quite entire, petioles biglandular. Stem perennial, long, round, branching, climbing by solitary tendrils. Leaves smooth, opposite. Flowers pale, large, axillary, two together: corolla five-petalled, flat, with a crown; berry egg-shaped, small. Native of Brasil, the island of Dominica, and Cochinchina.

3. *Passiflora*

Copper-coloured Passion-flower.

Engraved for the Encyclopædia Londinensis 1801.

3. *Passiflora cuprea*, or copper-coloured passion-flower: leaves ovate, commonly quite entire; petioles equal. This has slender three-cornered stalks, which send out tendrils at each joint, fastening themselves to any neighbouring support by them, and climbing to the height of twelve or fourteen feet. Leaves about two inches long, and one inch wide, of a light green colour; on slender petioles, an inch in length, from which arise three longitudinal veins, one running through the middle of the leaf, the other two diverging to the sides, but drawing towards each other again at the point. Flowers axillary, on slender peduncles, an inch long: calyx composed of five oblong narrow purplish leaves; within which are five narrower petals of the same colour, turning back after they have been some time expanded. The column in the middle of the flower is very long and slender, supporting a round germ, from the base of which spread out five slender stamens. Fruit oval, about the size of a sparrow's egg, changing to a purple colour when ripe; and filled with oblong seeds inclosed in a soft pulp.

Linnaeus remarks, that the leaves are ovate, but the older ones subcordate; that the young ones are scarce apparently ferrate; and that the glands on the petioles are hardly visible. According to Dillenius, the stem attained the height of three cubits in three years from the seed, with few branches. Leaves close, rigid, smooth, deep green above, somewhat paler underneath. Petals of an obsolete purple colour, or such as is seen on polished copper; whence the trivial name. Crown very small; rays short, rigid, smooth, saffron-coloured, very dark violet and shining at the base, not spreading out but converging, and in the centre a cavity full of clear honey-juce; styles purple, green at the end; filaments also purple. The flowers open in the evening, and last a day or two; but have no smell. It grows naturally in the Bahama islands, whence Mr. Catesby sent the seeds to England. The annexed Plate is copied from him.

4. *Passiflora tiliaefolia*, or lime-leaved passion-flower: leaves cordate, quite entire, petioles equal. With a perennial root, and a climbing stem of about a finger's thickness. Flowers red; the nectaries red with a white ring; the fruit globose, and variegated with red and yellow, and having a sweet pulp. Native of South America, about Lima; found there by Feuillée.

5. *Passiflora maliformis*, or apple-fruited passion-flower: leaves cordate-oblong, quite entire; petioles biglandular, involucre quite entire. Stem thick, triangular, by slender tendrils thrown out at every joint, rising to the height of fifteen or twenty feet: at each joint is one leaf, six inches long, and four broad in the middle, of a lively green, and thin texture, having a strong mid-rib, whence arise several small nerves, diverging to the sides, and curving up towards the top. The cover of the flower is composed of three soft velvety leaves, of a pale red, with some stripes of a lively red colour; the petals are white, and the rays are blue. The flowers being large make a fine appearance, but they are of short duration; there is however a succession on them for some time. Fruit roundish, the size of a large apple, yellow when ripe, having a thicker rind than any of the other sorts; inclosing a sweetish pulp, in which are lodged many oblong black seeds, of a brownish colour, a little rough to the touch. It grows naturally in the West Indies, where the inhabitants call it *Granadilla*. The fruit is served up there in deserts. Linnaeus says it is a native of Dominica and Tortuga. In the Kew Catalogue it is said to be a native of Dominica; and to have been cultivated by Mr. Miller in 1731.

6. *Passiflora quadrangularis*, or square-stalked passion-flower: leaves oval, subcordate, smooth, many-nerved; petioles glandular; stem membranaceous four-cornered, stipules oval-oblong. Stem almost simple, thick, membranaceous at the four corners, somewhat hispid. Leaves petioled, five or six inches long, entire, somewhat rugged, but without any pubescence. Flowers very large, en-

compassed by a three-leaved involucre, the leaves of which are roundish, concave, entire, smooth, pale; petals red within, white on the outside; styles purple; stigmas black, bifid within. Fruit shaped like an egg, shining, greenish-yellow, larger than a goose's egg, smelling sweet, having a soft spongy rind, a finger in thickness, brittle, whitish, insipid: the pulp succulent; of a watery colour, and sweetish smell, and very pleasant taste, sweet and gently acid, contained in a membrane or bag, which may be easily separated from the rind. Native of Jamaica and other islands of the West Indies, in woods. Jacquin says he did not find it wild any-where, but in gardens every-where; to the ornament of which it contributes very much, by forming large and very close arbours in a few months. It is attended however with this inconvenience, that these arbours serve to shelter venomous serpents, which lurk there to seize on little animals that come for the fruit, of which they are very fond. The fruit is brought to table whole, and is much esteemed; and the pulp taken out of the rind, with or without the seeds, first put into wine. The French call it *granadille*; and Browne, the *granadilla vine*.

β. Jacquin has a variety, which he names *P. sulcata*. It perfectly resembles the *quadrangularis*, except in the size and form of the fruit, which is roundish, frequently larger than a child's head, and marked with a circular transverse groove, deep enough to lay a finger in. It grows on Terra Firma. *P. quadrangularis* was cultivated by Mr. Miller in 1768, and flowers in our stoves in August and September.

7. *Passiflora alata*, or wing-stalked passion-flower: leaves ovate subcordate, even, few-nerved; petioles glandular; stem membranaceous, four-cornered; stipules lanceolate ferrate. This is very like the preceding, but smaller in every part; generally with four glands only on the footstalks; not more than five or six curved transverse ribs on each side of the principal one. The flowers are very agreeably and powerfully fragrant; the upper sides of the petals and calyx of a peculiar deep scarlet red; the rays erect, as long as the petals, variegated with purple, white, and crimson, incurved at the points. No fruit has ever been produced in England. The plant is propagated by cuttings, and is a great ornament to a stove. We must observe that the flower-stalks, cylindrical when fresh, become triangular in drying. It is a native of the West Indies, and according to the Kew Catalogue, was introduced in 1772, by Mr. William Malcolm. There is a plant of this species in the hot-house of the botanic garden at Hull, in full bloom; (Sept. 1821.) Our representation, Plate II. fig. 1. is from Curtis's Botanical Magazine.

8. *Passiflora laurifolia*, laurel-leaved passion-flower, or water-lemon: leaves ovate, quite entire; petioles biglandular, involucre toothed. Stem suffrutescent, with very divaricating filiform branches. Jacquin describes it as a woody plant, smooth all over; the younger branches round and green. Leaves some acute, others obtuse, shining, flat. Peduncles solitary. Flowers very handsome and odoriferous. Leaflets ovate, acute, greenish, either quite entire, or having a few teeth; calyxine leaflets pale green on the outside, variegated pale and flesh-colour within; petals rose-coloured within, pale without; crown elegantly variegated transversely with white, purple, and violet. Fruit three inches long, with a coriaceous, yellow, soft, tough rind, containing a watery sweet tasteful juice, having a peculiar fine smell. In the West Indies they suck this pleasant juice through a hole in the fruit. The French call it *pommes de liane*, and the English *honey-suckle*. Browne says it is cultivated in many parts of America for the sake of its fruit, which is very delicate, and much esteemed by most palates; it is about the size of a hen's egg, and full of a very agreeable gelatinous pulp. He calls his fourth species *water-lemon*; and informs us that it is a native of Jamaica, frequent in the woods, and supplying the wild hogs

hogs with a great part of their food in the season. Jacquin says it grows every-where in the island of Martinico; Merian (who has figured it beautifully), in Surinam; it is pretty general in the West Indies. Mr. Bentick introduced it here in 1690. It flowers in June and July. This and the two preceding are particularly described and figured in the Linn. Trans. vol. ii.

9. *Passiflora coccinea*, or scarlet passion-flower: leaves ovate, somewhat heart-shaped, sharply serrated, nearly smooth; footstalks with four or six glands. Bractes elliptical, concave, obtuse, as long as the calyx. Observed by Aublet in Guiana, flowering in August, when also he gathered the fruit, which he describes as divided into three cells, full of a pleasant eatable pulp. The strong sharp serratures of the leaves distinguish this from all the rest of the present section. Cavanilles, who saw specimens in Jussieu's collection, says they are downy beneath when young; and he also represents the large inflated bractes as serrated throughout; Aublet figures them entire. The flowers are of a brilliant red, with orange rays.

10. *Passiflora mucronata*, or pointed passion-flower: leaves heart-shaped, obtuse, reticulated, smooth, entire; footstalks with two glands; stipules and bractes broad-ovate, pointed, entire, flat; stem cylindrical. Gathered by Commerçon at Rio Janeiro. The texture of the leaves is like *laurifolia*; but their form is ovate, heart-shaped at the base; the young ones elegantly speckled.

11. *Passiflora glandulosa*, or glandular passion-flower: leaves ovate acute, reticulated, smooth, entire; footstalks with two glands; bractes much shorter than the tube of the calyx, with two glands at their base; nectary extremely short. Gathered by Mr. Stoupey in Cayenne. Fruit the size and shape of a hen's egg.

12. *Passiflora multiflora*, or many-flowered small passion-flower: leaves ovate-oblong, entire, downy on both sides; flower-stalks aggregate, hairy; petals none. This has slender stalks, sending out many small branches, and climbing to the height of twenty-five or thirty feet; by age they become woody towards the bottom, and their joints are not far asunder. Leaves on short slender petioles, three inches and a half long, and two broad in the middle, rounded at the base, but terminating in a point at top, smooth, entire, and of a lively green colour. Germ oval, swelling to the size of a pullet's egg, and changing to a pale yellow when ripe. The flowers have an agreeable odour, but seldom continue twenty hours open: there is a succession of them from June to September, and sometimes the fruit will ripen here. It grows naturally at Vera Cruz in New Spain, where it was found by Dr. Houstoun, who sent the seeds to England in 1731. It had been before found by Plumier in the island of Dominica.

13. *Passiflora angustifolia*, or narrow-leaved passion-flower: leaves subcordate, lanceolate, entire; petioles biglandular; flowers solitary. Native of Jamaica.

14. *Passiflora adulterina*, or oval-leaved tubular passion-flower: flower-leaves oblong-oval, entire; flowers tubular; calyxes three-leaved. Stem angular, lanuginose all over. Flowers solitary, peduncled, pendulous, purple. Native of New Grenada, where it was found by Mutis.

II. Leaves two-lobed.

15. *Passiflora perfoliata*, or perfoliate passion-flower: leaves oblong, transverse, embracing, petioled, dotted underneath; crown simple, many-parted. Stem herbaceous, climbing and twining, three-cornered, subdivided, striated, pubescent. Flowers middle-sized, scarlet. Native of Jamaica, in dry hedges near the coast, on the southern side of the island; flowering in the middle of summer.

16. *Passiflora rubra*, or red-fruited passion-flower: leaves cordate, lobes acuminate, submentose underneath; stem villose. Stem herbaceous, twining round, grooved, hirsute, red. Flowers alternate, nodding, on solitary one-flowered peduncles. Native of the West Indies. Cultivated

in 1748, by Mr. Miller; it flowers in April and May.

17. *Passiflora normalis*, or compass-leaved passion-flower: leaves emarginate at the base; lobes linear, blunt, divaricate, the middle one obsolete mucronate. This has slender angular stalks, which rise twenty feet high, sending out many branches. The flowers and tendrils come out from the same joints: the former are of a pale colour and small; fruit egg-shaped, ovate, purple, the size of small grapes. Native of South America. Mr. Miller says it was found by Dr. Houstoun, growing naturally at La Vera Cruz.

18. *Passiflora murucuja*, or tubular-crowned passion-flower: leaves ovate, undivided at the base, dotted underneath; nectary one-leaved. Stem herbaceous, grooved, smooth. Flowers in pairs, axillary, scarlet, large. Berry ovate, the size of a pigeon's egg, pedicelled. According to Browne, it is of an oblong oval form, about the size of a large olive, and flesh-coloured when ripe. Both the syrup and decoction of the plant are much used in the leeward parts of Jamaica, where it is frequent; and it is said to answer effectually all the purposes for which syrup of poppies and liquid laudanum are generally administered. The flowers are most in use; they are commonly infused in, or pounded and mixed immediately with, wine or spirits; and the composition is generally thought a very effectual and easy narcotic. Browne names it *bull-hoof*, or *Dutchman's laudanum*, which are probably the vulgar names of the country. It is a native of the West Indies.

19. *Passiflora vespertilio*, or bat-winged passion-flower: leaves rounded at the base and glandular; lobes acute, divaricate, dotted underneath. This has slender roundish stalks, less than a straw, and of the same thickness from top to bottom, of a brownish-red colour, dividing into many slender branches. Leaves shaped like the wings of a bat when extended, about seven inches in length, or rather breadth; from the base to the top not more than two inches and a half, the upper ones smaller, the middle wider, and the lower narrower, smooth and somewhat shining; the colour in the upper ones pale, in the middle deeper, in the lower darker green, with two purple tubercles or glands towards the base, where they are connected with the petiole. Flowers on short round peduncles from the axils of the middle and upper leaves, white, and about three inches in diameter when expanded: calyx greenish on the outside, whitish within; petals somewhat smaller, white; rays very long and white, twisted in the middle; at the base of these others more slender, like hairs; next to them a ring of white plaited scales collected into a short tube, from the middle of which arises the short purple column supporting the germ, which is green and of an oblong spheroidal form. The flowers are without scent, open in the evening or during the night, in the month of July, and finally close about eight or nine o'clock in the morning. Dr. Sherard received it from the Amsterdam garden, without any notice of its original place of growth. It is, however, a native of the West Indies. Mr. Miller, who cultivated it about the same time, says that it was discovered by Mr. Robert Millar, growing naturally near Carthagena, in New Spain.

20. *Passiflora lunata*, or crescent-leaved passion-flower: leaves dotted, at the base slightly cordate, and having two glands; outer rays of the nectary club-shaped, compressed, obtuse. Stems several, above thirty feet high in a cultivated state, roundish and woody at the base. Flowers axillary, two together, drooping; opening early in the day, and smelling like honey. Mr. Sowerby remarks that the flower is much smaller than in *quadrangularis*, *alata*, *laurifolia*, and *cærulea*; and is remarkably different in having but one row of principal rays, and that of a quadrangular form; with the operculum or cover of the nectary curiously plaited; but this is a common case with the still smaller ones. (Linn. Trans. vol.

ii.) It was gathered at Vera Cruz by Dr. Houstoun, who sent seeds of it to Mr. Miller. It was also found by Dr. Wright in Jamaica.

21. *Passiflora clypeata*, or peltate bat passion-flower: leaves smooth, peltate, five-ribbed, with two rounded pointed widely-spreading lobes. Of this we have an incomplete specimen in the Herbarium of the younger Linnæus, marked as from the West Indies, and a single leaf sent by Mutis from New Granada, and called in his letter "*Passifloræ folium magnum*." This last expands six inches; the former are smaller and younger. The stem is slender, angular. Footstalks an inch or more in length, with two cup-like glands near the base, and, in one instance, two at the top. Leaves truly peltate, the stalk being inserted above a quarter of an inch from the base; five strong radiating ribs spring from its insertion; with two much smaller, directed towards the base. Both sides are smooth, reticulated with innumerable veins; lobes very broad, rounded with short points; in the leaf from Mutis only, there is a shallow minutely-pointed intermediate lobe; but that character is sometimes found to be variable in this tribe. No traces of flowers are to be seen.

22. *Passiflora oblongata*, or oblong-leaved passion-flower: leaves oblong, dotted beneath, rounded at the base; with two erect, lunate, very short, terminal lobes, and a minute intermediate bristle. Gathered by Swartz on shrubby hills in Jamaica. The stem is rough and rigid, climbing by its tendrils to a great height. Leaves stalked, two or three inches long, entire, three-ribbed, veiny, thin, smooth; paler beneath, with a double row of remote dots. Flowers solitary, rather large.

23. *Passiflora capsularis*, or capsular passion-flower: leaves cordate, oblong, petioled. Stalks slender, rising to twenty feet high when supported, and dividing into many weak branches. Leaves four inches long and three broad, ending at their points in two horns, in some more acute than in others, several of them appearing as if cut a little hollow at the top, like those of the tulip-tree: they are of a deep green on their upper side, but pale underneath, and stand on short footstalks. Peduncles very slender, an inch and a half long, purplish. Flowers, when expanded, not more than an inch and a half in diameter, of a soft red colour, with little scent. Fruit small, oval; when ripe, purple. Native of Jamaica; whence Dr. Houstoun sent the seeds to England.

24. *Passiflora contrayerva*, or horse-shoe passion-flower: leaves smooth, without glands, somewhat heart-shaped, with two obtuse, oblong, pointless, slightly-spreading lobes; footstalks without glands or stipules; stem angular, calyx spreading. Hernandez says this plant is found in various parts of the country of Mexico; and the root is famous for its medicinal virtues, being sweetish, with some pungency and fragrance, and considered as a powerful counter-poison, deobstruent, cordial, &c. three ounces of the bruised root being a dose. Hence the appellation of *contrayerva*, which it possesses in common with *Dorstenia*, and some other reputed counter-poisons. Hernandez describes the leaves as shaped like a crescent, or a horse-shoe: they are about an inch long, his figure being scarcely half the natural size: he represents three dots, like nails, on their disk, which he says are yellow. The stems are slender, angular, twining, and climbing by tendrils. Flowers shaped like a carnation, but much smaller, and of many colours; berries globular, dark chestnut-coloured. This seems to have been confounded by Linnæus with *normalis*, N° 17.

III. Leaves three-lobed.

25. *Passiflora rotundifolia*, or round-leaved passion-flower: leaves roundish, three-lobed only at top, dotted underneath; nectary simple. Stem suffrutescent at bottom, subdivided, angular, grooved. Leaves semiovate, three-nerved, veined, smooth on both sides, marked behind longitudinally with pellucid dots: lobes terminated by very small bristles; the middle one a little larger than

the others. Flowers nodding, pale green, inodorous. Germ roundish. Berry egg-shaped. It is distinguished from the other species by its rounded leaves slightly three-lobed at top only. Jacquin says it is very common in the woods about Carthagena in New Spain. Swartz found it in coppices on the southern side of Jamaica; flowering at the beginning of the year. According to the Kew Catalogue, it was introduced in 1786.

26. *Passiflora orbiculata*, or orbicular tubular-crowned passion-flower: leaves roundish, with three very shallow obtuse lobes; dotted beneath, but not at the base; footstalks without glands; petals none; nectary tubular, abrupt, undivided. Native of Hispaniola. Given by Thouin to the younger Linnæus. The leaves of this rare species much resemble the last, but the lobes are very obtuse, the middle one broadest; in a young state the under side is downy, and always very much reticulated with prominent veins. Flowers in pairs, crimson, the size of murucuja, N° 18, and with the same undivided nectary, but no petals.

27. *Passiflora oblongata*, or oblong passion-flower: leaves elliptic, subtrilobate in front, dotted underneath; lobes sharpish, the middle one shortest. Native of Jamaica.

28. *Passiflora punctata*, or dotted passion-flower: leaves roundish, slightly heart-shaped, with three shallow obtuse lobes, and many rows of dots at the back, but not at the base; footstalks without glands; calyx flat; rays spreading half the length of the petals. Gathered by Feuillée in a garden at Malambo, a suburb on the north of Lima: he never met with this plant elsewhere. Cavanilles saw it in flower at Paris. Linnæus had not seen it: his description in the Mant. and Syst. Veg. copied by Willdenow, being taken from our *lunata*, which is the *punctata* of Ait. Hort. Kew. ed. 1. The leaves are broader and shorter than in the two last described, and more copiously dotted at the back. Flowers solitary, with a flatly expanded calyx, whitish ovate petals, and violet rays, tipped with bright yellow, which are much shorter than the petals, and somewhat club-shaped. Fruit rather oval, with a sweet pulp.

29. *Passiflora lutea*, or small yellow passion-flower: leaves heart-shaped, three-lobed, obtuse, smooth; footstalks downy, without glands; flowers in pairs; petals half the breadth of the calyx. Root creeping, sending up many weak stalks three or four feet high. Leaves shaped like those of ivy, and almost as large, but of a pale green and very thin consistence. Flowers dirty yellow, not larger than a sixpence when expanded. Native of Virginia and Jamaica; cultivated here in 1714; flowers in May and June.

30. *Passiflora parviflora*, or small-flowered passion-flower: leaves smooth, lobes ovate entire, the middle one more produced; petioles biglandular; stem herbaceous. Native of Jamaica.

31. *Passiflora pannosa*, or cloth-leaved passion-flower: leaves heart-shaped, unequally three-lobed, bluntish, downy on both sides, as well as the stalks, tendrils, and branches; petals none; germen bristly. Native of the West Indies. The form and size of the leaves are like *rubra*, N° 16. and some of them have but two lobes, as in that; but most have a broad central lobe, as long as the others. Every part is pubescent like *rubra*, and the germen bristly; but the flowers are otherwise totally unlike that species, scarcely a quarter so large, destitute of petals, and with a very small nectary; though their stalks bear conspicuous finely three-cleft bractes, which *rubra* wants.

32. *Passiflora glauca*, or glaucous-leaved passion-flower: leaves cordate, smooth, lobes ovate, equal; petioles glandular; stipules semi-ovate. The whole plant is very smooth and even. Leaves glaucous underneath, undotted. Flowers sweet. Native of Cayenne. Introduced in 1779, by Messrs. Kennedy and Lee.

33. *Passiflora minima*, or dwarf passion-flower: leaves smooth,

smooth, lobes lanceolate, quite entire, the middle one more produced; petioles biglandular; stem even, suberous at bottom. Stem twining, simple, becoming corky at the base with age, round, smooth. Flowers small, whitish. It is nearly allied to *P. suberosa*; but differs in the lobes of the leaves being narrow and divaricated: the stem herbaceous, becoming like cork only when old; and the flowers smaller.

Mr. Sowerby remarks, (Linn. Transf. ii.) that, though this has its name from its smallness, there are others nearly if not quite as small, and not well distinguished; that several of them have no involucre, though there is a joint on the peduncle, or, as he has it, between the peduncle and the pedicel; and that they have but five petals, consequently nothing that serves as a calyx. He thus describes the flower of this species: peduncle cylindrical; pedicel also cylindrical, curved a little, thickest at the flat base of the flower; petals lanceolate, turned back; principal rays cylindrical, spreading, curved back; imperfect rays mostly clubbed, sometimes bifid; operculum plaited and fringed at the edge. Nectary as in *lunata*, except that at the ridge of the protuberating bank are some small regular roundish glands, or imperfect rays. Native of Curassao, and Jamaica. Introduced in 1790 by Mr. Benthick. It flowers in July.

34. *Passiflora heterophylla*, or narrow-leaved passion-flower: leaves undivided, linear-oblong, and three-lobed, smooth, quite entire; petioles biglandular. Native of the West Indies. Introduced about 1773. It flowers from June to September.

35. *Passiflora suberosa*, or cork-barked passion-flower: leaves sub-peltate; lobes ovate-entire; petioles biglandular; stem suberose. This rises with a weak stalk to the height of twenty feet: as the stalks grow old, they have a thick fungous bark like that of the cork-tree, which cracks and splits; the smaller branches are covered with a smooth bark. Leaves smooth, on very short petioles: the middle lobe is much longer than the lateral ones, so that the whole leaf is halbert-shaped. The flowers are small, of a greenish-yellow colour. Fruit egg-shaped, dark purple when ripe. Native of the West Indies. Cultivated in 1759 by Mr. Miller. It flowers from June to September.

36. *Passiflora peltata*, or peltate spreading-lobed passion-flower: leaves peltate, smooth, three-ribbed, with three deep, equal, oblong, spreading lobes; footstalks with two glands; flowers solitary, without petals. Found in hedges in the Antilles, according to Plumier; few other botanists have seen it. The peltate insertion of the footstalks, and the large deeply three-lobed leaves, mark this species. Its flowers are twice the size of *P. suberosa*, with longer and straighter rays. Fruit much the same.

37. *Passiflora hederacea*, or peltate ivy passion-flower: leaves peltate, ovate, smooth, five-ribbed, three-lobed; footstalks with two glands; flowers solitary, without petals. From the same country as the last, where Plumier only appears to have seen it. The leaves are peltate and five-ribbed, exactly as in our *clipeata*, N° 21. but of a very different outline, rounded at the base, and terminating in three rather spreading but not deep lobes: their size and appearance, except having but three lobes, is like our broadest variety of *Hedera helix*, called Irish ivy. Flowers like the preceding.

38. *Passiflora viridiflora*, or tubular-green passion-flower: leaves peltate, smooth, with three deep obovate lobes; tube of the calyx as long as its segments; petals and bractes wanting. Gathered by Louis Née, near Acapulco, flowering in February. The leaves have seven radiating ribs, and three deep lobes, of which the middle one especially is greatly contracted at the base; each two or three inches long. A curious species, known only from the work of Cavanilles.

39. *Passiflora reflexa*, or reflexed passion-flower: leaves peltate, smooth, with three deep, spreading, obtuse, lobes; their sinuses and stalks glandular; tube of the ca-

lyx as long as its segments; bractes ovate, veiny. Gathered by Louis Née near Panama. About the size of the preceding.

40. *Passiflora holosericea*, or silky-leaved passion-flower: leaves ovate, three-lobed, downy on both surfaces, with a recurved tooth on each side at the base. The stalks rise twenty feet high, dividing into many slender branches, covered with a soft hairy down. Leaves shaped like the point of a halbert, three inches long, and an inch and a half wide at the base, light green, soft and silky to the touch, standing obliquely to the footstalks. Flowers an inch and a half broad; petals white; rays purple, with a mixture of yellow. Fruit small, roundish, yellow when ripe. Discovered by Dr. Houltoun, growing naturally at Vera Cruz; and therefore was introduced before 1733, in which year he died. It flowers most part of the summer.

41. *Passiflora hirsuta*, or hairy passion-flower: leaves villose, the lower smooth above; lobes oblong, quite entire, the middle one more produced; petioles biglandular. Native of the West Indies. Introduced in 1778, by Mr. Gilbert Alexander: it flowers in September.

42. *Passiflora foetida*, or stinking passion-flower: leaves cordate, hairy; involucre capillary-multifid. The stalks rise five or six feet high, when supported; they are channelled and hairy. The middle lobe of the leaf is three inches long, and one and a half broad; the two side-lobes are short, but broad; they are covered with short brown hairs. Flowers on strong hairy peduncles, two inches long; calyx composed of slender hairy filaments, wrought like a net, longer than the petals, and turning up round them; they are white, and of short duration. Fruit roundish-ovate, about the size of a golden pippin, of a yellowish-green colour, inclosed in the netted calyx. The whole plant has a disagreeable scent when touched, grows naturally in most of the islands of the West Indies, where the British inhabitants call it *love in a mist*, which is one vulgar name of *Nigella damascena*, that it resembles in the involucre. It was cultivated by Mr. Miller in 1731; and flowers in July and August.

43. *Passiflora ciliata*, or ciliated passion-flower: leaves smooth, ciliate-ferrate; the middle one very long; petioles not glandular. Native of Jamaica. Cultivated in 1783, by Mrs. Norman. It runs to a great height, and has dark-green glossy leaves; the involucre is composed of three leaves divided into capillary segments, each terminating in a viscid globule: the pillar supporting the germen is bright purple, with darker spots: the petals are greenish on the outside and red within. The crown consists of four rows of radii, which are varied with white and purple. The leaves of this species vary occasionally; and Mr. Curtis suspects it to be a variety of *P. foetida*.

44. *Passiflora ferrulata*, or finely-ferrated passion-flower: leaves three-lobed, very minutely serrated; the middle lobe longest; footstalks with two glands; bractes distinct, entire. Gathered by Jacquin at Carthage: he compares it with *incarnata*, N° 45. from which he says it is very certainly distinguished by the leaves not being cut away close to the side-ribs at the base, and by the minuteness of their serratures. The flowers are variegated with purple and white, delightfully fragrant, two inches and a half wide.

45. *Passiflora incarnata*, rose-coloured passion-flower, or maycock: leaves ferrate, equal; petioles biglandular. Root perennial. Stalks annual, slender, rising four or five feet high. At each joint one leaf, on a short footstalk, having mostly three oblong lobes, but the two side ones are sometimes divided part of their length into two narrow segments, and thus becoming five-lobed; they are thin, of a light green, and slightly ferrate. The flowers are produced from the joints of the stalk, at the footstalks of the leaves, on long slender peduncles, in succession as the stalks advance in height during the summer-months: calycine leaflets oblong, blunt, pale green; petals white, with a double circle of purple rays, the rays

of the lower circle, longest. The flowers have an agreeable scent, but are of short duration, opening in the morning, and fading away in the evening. Fruit as large as a middling apple, changing to a pale orange-colour when ripe; inclosing many oblong rough seeds, lying in a sweetish pulp. It grows naturally in Virginia and other parts of North America, and was the first known in Europe of all the species, but was not very common in the English gardens till of late years. It was cultivated here in 1629, according to Parkinson, who has given a good figure and description of it, with a copy of the Jesuit's sophisticated figure to contrast with his own, and a copious abuse of their attempts to deceive mankind.

46. *Passiflora aurantia*, or Norfolk-island passion-flower: leaves smooth, dotted beneath, with three spreading bluntish lobes; rounded at the base; calyx somewhat tubular, longer than the petals; nectary tubular, abrupt, lobed, surrounded with upright rays. Native of New Caledonia and of Norfolk island. It flowers copiously in a stove in summer, requiring a light dry soil. The leaves are sometimes slightly five-lobed. Flowers orange, the tube of their nectary green, longer than the purple upright rays which surround it. The nectary is very peculiar, being, like the whole flower, shaped much as in *P. murucuja*, No 18, but nevertheless accompanied with rays; its orifice moreover is lobed or jagged.

47. *Passiflora cuneifolia*, or wedge-leaved passion-flower: leaves deeply three-lobed, serrated, acute; three-ribbed, with two glands, at the base; bractes distinct, elliptical, entire; calyx flat; rays not half so long as the petals. Native of America. Seen by Cavanilles in Thonin's Herbarium. The specific characters distinguish it from *incarnata*, which it greatly resembles.

48. *Passiflora sanguinea*, or blood-coloured passion-flower: leaves deeply three-lobed, serrated, acute, without glands; bractes distinct, lanceolate, with glandular teeth; calyx downy, its tube half as long as the segments; rays half the length of the petals; stamens linear, flat. Gathered by Smeathman in the West Indies. A very fine species. The branches, and all the stalks, are downy; tendrils smooth. Flowers near three inches broad; as far as can be judged from the dried specimen, they appear of a rich deep red.

49. *Passiflora peduncularis*, or long-stalked passion-flower: leaves with three rounded serrated lobes; bractes combined, tubular, downy; calyx downy, its tube nearly equal to the segments; rays very minute; stem square. Gathered by Louis Née, in several places in Peru, flowering in March. The square stem, which is slightly downy, and the bractes united into an ovate, obtuse, slightly notched, and three-cleft, tube, full half as long as the tube of the calyx, are characteristic of this species, which is one of Jussieu's genus *Tafconia*, like the four following. The leaves of this are rather broader than long, their lobes broad and rounded, equally serrated; glaucous, and in some degree downy, at the back. Flower-stalks near four inches long, being twice the length of the leaves. Flowers rose-coloured, large and handsome, externally downy; their petals elliptical, an inch long, a little shorter than the calyx. Fruit globose, rather downy, one inch and a half in diameter.

50. *Passiflora trifoliata*, or three-leaved passion-flower: leaves ternate, elliptical, downy, entire; bractes distinct, toothed; tube of the calyx as long as the segments, tumid at the base; rays very minute. Native of Peru and Chili, where it was found by Louis Née, flowering in March and April. Remarkable for its truly ternate leaves. Flowers rose-coloured, large and handsome, like the last, but with a longer calyx-tube, whose base is inflated and umbilicated.

51. *Passiflora pennipes*, or wing-footed passion-flower: leaves three-lobed, serrated, acute; woolly beneath; bractes distinct, serrated; tube of the calyx as long as the segments; rays half as long as the petals; stipules

deeply pinnatifid. Found by Louis Née in various parts of Chili, from whence also we have a specimen, gathered by Mr. Menzies. The leaves are three-cleft more than half way, reticulated, serrated, two or three inches long; very smooth, and bright green, above; their backs, like the branches and stalks, clothed with dense white woolly pubescence. Flowers much larger than in the last, of a pale rose-colour, very finely downy externally, as is also the germen.

52. *Passiflora tomentosa*, or downy long-tubed passion-flower: leaves three-lobed, serrated; downy on both sides; bractes combined, tubular; tube of the calyx thrice as long as the segments. Gathered long ago, by Joseph de Jussieu, in Peru. His specimens were seen in his celebrated nephew's herbarium at Paris, by Lamarck, and Cavanilles, from whose publication only our knowledge concerning this magnificent plant is derived. The respective proportions of the flower and its minute rays agree with our third species; but the whole flower appears to be larger. The leaves have three broad moderately deep lobes, and, like the rest of the plant, are clothed with fine short down. The flower expands three inches, and is said to be rose-coloured; its tube is five inches long. Fruit ovate-oblong, soft, full of yellow eatable pulp. The Peruvians know this plant by the name of *taçô*.

53. *Passiflora mixta*, or smooth-leaved long-tubed passion-flower: leaves with three or five lobes, serrated, acute; smooth on both sides; bractes combined, tubular; tube of the calyx thrice as long as the segments. Sent by Mutis from New Granada to Linnæus, along with drawings, in Indian ink, of this and our third species. The present differs from the last in having smooth more-deeply-lobed leaves, whose side-lobes are occasionally slightly divided; but that such a circumstance is accidental, may be presumed, not only from the coincidence of every other part, but because there are always five ribs more or less apparent. The footstalks bear about six glands, and are rather downy; the flower-stalks, tubular bractes, and especially the outside of the calyx, are finely and densely pubescent. Flowers rose-coloured or purplish, a little smaller than those of *P. tomentosa*, with much the same sort of nectary. Fruit obovate, with a slight longitudinal furrow.

Dr. Smith collects from this species and *P. adulterina*, that the flower of *passiflora* is ten-petalled; and that what Linnæus calls the involucre is the calyx. Jussieu, on the contrary, calls the whole the calyx, and asserts the *Passiflora* to have no corolla. In most of the species the involucre cannot properly be regarded as a perianth, and even in this species it is permanent, and in the fruiting state at a considerable distance from the fruit. Nothing could be greater acquisitions to our conservatories than these tubular passion-flowers, whose seeds the Spaniards surely might obtain with great ease, and which would probably prove almost hardy in our climate, like the elegant *Fuchsia*, *Cobæa*, and other late discoveries, from the same country.

54. *Passiflora racemosa*, or branched passion-flower: leaves subpeltate, emarginated at the base, smooth, three-lobed, the lobes ovate-acute, very entire, the middle one longest; petioles four-glanduled; flowers terminal, racemed. Root perennial; stem thick, obconic, inodorous; the whole plant smooth. Leaves alternate, from two to four inches apart, broad, fleshy, smooth on both sides. Flowers very large and beautiful, but without smell. Inhabits shady woods about the city of Rio Janeiro and elsewhere in Brasil; where it flowers in November and December. Discovered by Mr. Woodford, who carried it to Lisbon, and communicated it to F. A. Brotero, professor of botany in the university of Coimbra; who has described it very minutely in the Linn. Transf. vol. xii. for 1817. where it is accompanied by an engraving.

IV. Leaves with many segments.

55. *Passiflora cœrulea*, common or blue passion-flower: leaves deeply palmate, in five entire smooth segments. This rises in a few years to a great height with proper support: it may be trained up more than forty feet high. The stalks will grow almost as large as a man's arm; and are covered with a purplish bark, but do not become very woody. The shoots often grow to the length of twelve or fifteen feet in one summer; and, being very slender, must be supported, otherwise they will hang to the ground, intermix with each other, and appear very unightly. At each joint is one leaf, composed of five smooth entire lobes; the middle one, which is longest, is almost four inches long, and one inch broad in the middle; the others are gradually shorter, and the two outer lobes are frequently divided on their outer side into two smaller ones. Their footstalks are near two inches long, and have two embracing stipules at their base; and from the same point issues a long clasper or tendril. The flowers come out at the same joint with the leaves, on peduncles almost three inches long: the outer cover (or involucre) is composed of three concave ovate leaves, of a paler green than the proper leaves of the plant, and are little more than half the length of the calyx; the leaflets of which are oblong, blunt, pale green; the petals are nearly of the same shape and size, and stand alternately between them. Column about an inch long; germ oval; styles purplish, near an inch long; rays of the crown in two circles; the inner, which is the shortest, inclines towards the column; the outer, which is near half the length of the petals, spreads open flat upon them, and is purple at bottom, but blue on the outside. Fruit egg-shaped, the size and shape of the Mogul plum, and when ripe of the same yellow colour, inclosing a sweetish disagreeable pulp, in which are lodged oblong seeds.

This beautiful species is represented on the Plate II. fig. 2. It is a native of Brasil; and, though not brought to Europe till long after the *incarnata*, has now, from its much greater hardness, and facility of culture, taken the place of that, and is generally dispersed throughout the more temperate parts of Europe. In Italy, Spain, Portugal and the Levant, it combines with the jasmine, more especially, to form luxuriant bowers; and in those countries bears abundance of orange-coloured fruit, as well as fragrant and beautiful flowers. With us it only blossoms in the open air; requiring protection for its roots and stems against hard frosts. Loureiro speaks of *P. cœrulea* as wild about Canton in China; and there is a narrow-leaved rather tender variety, known in our stoves, reported to have come from that country, or the East Indies. But we are inclined to suspect both may originally have gone thither from Europe or the Brasils. Each flower lasts only one day; but there is a copious succession.

56. *Passiflora filamentosa*, or long-rayed blue passion-flower: leaves palmate, in five acute serrated segments; footstalks with two sessile glands; bractes distinct, serrated; rays longer than the corolla. Native of America. Cavanilles described it from the garden of the late duke del Infantado, to whose family he was preceptor. The glands of the footstalks agree with those of *serulata*, No 44. but the shape of the leaves, and their coarser serratures, as well as the serrated bractes, materially differ. From *incarnata* and *cuneifolia*, the only species besides with which it can be compared, it is distinguished by the leaves not being cut away close to the ribs at the base, as well as by the situation of the glands on their stalks, and the presence of other glands in the sinuses. The leaves we understand to be smooth; their side-lobes much smaller than the others. Flower coloured somewhat like the *cœrulea*; furnished with five rows of rays, of which the outermost extend beyond the calyx and petals. Fruit globose, with white viscid pulp.

57. *Passiflora ferrata*, or many-lobed serrated passion-

flower: leaves palmate, in five or seven very deep serrated segments; footstalks with several glands; bractes combined, entire. Gathered by Plumier in Martinico, in one place only, near St. Mary's river. Cavanilles saw a specimen in Jussieu's collection, and there is one without flowers, in that of the younger Linnaeus; but this very magnificent species is unknown in our gardens. The flowers equal even those of *quadrangularis* in magnitude and splendour, and the broad many-lobed leaves, whose under side is somewhat downy, are much more handsome. Plumier says the shoots are as large, hard, and knotty, as those of a vine, spreading widely over the trees and bushes, which they decorate with verdant foliage. The flower-bud, invested with its large, ovate, pale purple-veined bractes, combined at their base, and entire at their margin, is as big as a hen's egg. The calyx has a broad funnel-shaped base; its segments are of a violet-colour, like the petals, but much broader, each about one inch and a half long. Rays about the same length, very numerous, thick, and somewhat angular, in a double row, the outermost shortest, each ray whitish at the point, violet in the middle, paler from thence to the base, with five violet bands. The tube of the calyx is internally lined with short red-headed glandular rays. Fruit as big as an orange, with a thick coat. Plumier did not meet with it ripe, but it seems much like that of the *quadrangularis* in colour and structure. The flowers are fragrant.

58. *Passiflora pedata*, or curled passion-flower; leaves pedate, of seven serrated acute leaflets; bractes distinct, serrated; rays twisted. Found by Plumier, by the roadside near Miragoan in Hispaniola, and nowhere else. Leaves remarkable for being pedate, as in *Helleborus niger*, consisting of seven, almost entirely distinct, elliptic-lanceolate, acute, single-ribbed, sharply-serrated leaflets, of a fine shining-green, the central one three or four inches long. Flowers surpassing all the rest, according to Plumier, in size, fragrance, and brilliancy of colours. Calyx pale green, dotted on the inside with red; petals blue; rays in one principal row, spreading, longer than the petals, deep red, with two or three white bands, their extremities of a fine violet, tapering, zigzag, and twisted; column, stamens, and styles, white, speckled with red. Fruit globose, like a small gourd, the size of a moderate apple, speckled with shades of green. Mr. Masson is recorded as having sent this noble plant to Kew in 1781, from the West Indies; but there is no account of its flowering, and we fear it is now lost.

Propagation and Culture. All the perennial sorts, which are natives of the hot parts of America, require a stove to preserve them here, without which they will not thrive; for, although some of the sorts will live in the open air during the warm months in summer, yet they make but little progress; nor will the plants produce many flowers, unless the pots in which they are planted are plunged into the tan-bed of the stove, and their branches are trained against an espalier. The best way to have them in perfection, is to make a border of earth at the back of the tan-bed, which may be separated by planks to prevent the earth from mixing with the tan; and, when the plants are strong enough, they should be turned out of the pots, and planted in this border; adjoining to which, should be a trellis erected to the top of the stove; against this the stalks must be trained, and as they advance they will form a hedge to hide the wall of the stove; and their leaves continuing green all the year, together with their flowers which will be plentifully intermixed in summer, will have a very agreeable effect.

These plants are propagated by seeds, which should be sown upon a good hot-bed in the spring; and, when the plants are fit to remove, they should be each planted in a small pot filled with good kitchen-garden earth, and plunged into a bed of tanner's bark, observing to shade them from the sun till they have taken new root; then they must be treated like other tender plants from the same

Common Passion-flower.

Wing-stalked Passion-flower.

Engraved for the Encyclopædia Londinensis 1845.

same countries. When they are too high to remain under the glasses of the hot-bed, they should be turned out of the pots and planted in the stove, in the manner before-mentioned. As these plants do not often perfect their seeds here, they may be propagated by laying down their branches; which if done in April, they will put out roots by the middle of August, when they may be separated from the old plants, and either planted in pots to get strength, or into the border of the stove, where they are to remain.

Some of these sorts may also be propagated by cuttings; these should be planted into pots about the middle or latter end of March, and plunged into a moderate hot-bed, observing to screen them from the sun, and refresh them with water gently as often as the earth may require it; and in about two months, or ten weeks, they will put out roots, and may then be treated as the seedling plants.

The yellow passion-flower (N^o 29.) may be propagated by its creeping roots, parted in April, and planted where they are to remain. This lived many years in a south-west border in the Chelsea garden; but in the year 1740 all the plants were killed by the frost.

N^o 45 is usually propagated by seeds which are brought from America, for the seeds do not often ripen in England. The seeds should be sown upon a moderate hot-bed, which will bring up the plants much sooner than when they are sown in the open air, so that they will have more time to get strength before winter. When the plants are two or three inches high, they should be carefully taken up, and each planted in a separate small pot filled with good kitchen-garden earth, and plunged into a moderate hot-bed to forward their taking new root; after which they should be gradually inured to bear the open air, to which they should be exposed in summer, but in the autumn they must be placed under a garden-frame to screen them from the frost; but they should have the free air at all times in mild weather. The spring following some of these plants may be turned out of the pots, and planted in a warm border, where, if they are covered with tanner's bark every winter to keep out the frost, they will live several years, their stalks decaying in the autumn, and new ones arising in the spring, which in warm seasons will flower very well. If those plants which are continued in pots are plunged into a tan-bed, some of them may produce fruit; and, if the stalks of these are laid down in the beginning of June, into pots of earth plunged near them, they will take root by the end of August.

The common or blue passion-flower may also be propagated by seeds, which should be sown in the same manner as those of the 45th sort, and the plants treated in the same way till the following spring, when they should be turned out of the pots, and planted against a good-aspected wall, where they may have height for their shoots to extend, otherwise they will hang about and entangle with each other, so as to make but an indifferent appearance; but, where buildings are to be covered, this plant is very proper for the purpose. After they have taken good root in their new quarters, the only care they will require, is to train their shoots up against the wall, as they extend in length, to prevent their hanging about; and, if the winter proves severe, the surface of the ground about their roots should be covered with mulch to keep the frost from penetrating the ground; and, if the stalks and branches are covered with mats, pease-haulm, straw, or any such light covering, it will protect them in winter against severe frosts; but this covering must be taken off in mild weather, otherwise it will cause the branches to grow mouldy, which will be more injurious to them than the cold. In the spring the plants should be trimmed, when all the small weak shoots should be entirely cut off, and the strong ones shortened to about four or five feet long, which will cause them to put out

strong shoots for flowering the following year. This plant is also propagated by laying down the branches, which in one year will be well rooted, may be taken off from the old plants, and transplanted where they are designed to remain. The cuttings of this will also take root, if they are planted in a loamy soil not too stiff, in the spring, before they begin to shoot. If these are covered with bell or hand glasses to exclude the air, they will succeed much better than when they are otherwise treated; but, when the cuttings put out shoots, the air should be admitted to them, otherwise they will draw up weak, and spoil, and they must be afterwards treated as the layers. Those plants which are propagated by layers or cuttings, do not produce fruit so plentifully as the seedling plants. If in very severe winters the stalks of these plants are killed to the ground, the roots often put out new stalks the following summer, therefore they should not be disturbed: and, where there is mulch laid on the ground about their roots, there will be little danger of their being killed, although all the stalks should be destroyed.

PASSIGNA'NO, a town of Italy, in the Perugiano, on the north side of the lake: twenty-two miles north-west of Perugia, and eight south-east of Cortona.

PASS'ING, *part. adj.* [from *pass.*] Supreme; surpassing others; eminent:

No strength of arms shall win this noble fort,
Or shake this puissant wall, such *passing* might
Have spells and charms, if they be said aright. *Fairfax.*

It is used adverbially to enforce the meaning of another word. Exceeding.—Oberon is *passing* fell and wroth. *Shakespeare.*

She was not only *passing* fair,
But was withal discreet and debonaire.

Dryden.

PASSING-BELL, *f.* The bell which was wrung or tolled at the hour of departure, to obtain prayers for the passing soul: it is now used for the bell which rings immediately after death.—When any christian bodie is *passing*, that the bell be tolled, and that the curate be speciallie called for to comforte the sicke person; and, after the time of his passing, to ring no more but one short peale; and one before buriall, and another short peale after the buriall. *Advert. for due Order, &c. in the 7th year of queen Elizabeth.*—The learned physician Smith thus distinguishes the ceremony while the person is dying, and after he is dead.—The tolling of a *passing-bell* may put him and all his friends in mind, that he is shortly going the way of all flesh: the stinging of the *passing-bell*, or rather the ringing out of the knell, gives notice unto all that he is gone. *K. Solomon's Portr. of Old Age. 1666.*

Before the *passing-bell* begun,

The news through half the town was run.

Swift.

PASSING MEASURES, *f.* A slow Spanish dance.—Pry'thee sit still; thou must dance nothing but the *passing-measures*. *Brewer's Lingua.*

PASSING NOTES, or TRANSIENT NOTES, *f.* in music, are those which *pass* between the essential notes of the fundamental harmony. Passing-notes proceed either gradually or by skips; and are either accented or unaccented. In the different parts of a movement, or in the divisions of a bar, the uneven numbers 1, 3, 5, 7, 9, 11, imply accented, and the even numbers 2, 4, 6, 8, 10, 12, unaccented, notes; thus of two equal notes the 1st is accented, and the 2d unaccented; of four equal notes the 1st and 3d are accented, and the 2d and 4th unaccented. Discords introduced in this way, are not subject to the usual treatment of other discords, but are brought in without preparation.

The most beautiful melodiés in modern music are formed by the intermixture of essential and passing notes on a simple ground bass. See *Transition*, in the article MUSIC, vol. xvii. p. 334.

PASS'ING-PLACES, *f.* in canal-navigation, are certain places wider than the ordinary breadth of the canal, for boats to turn occasionally, or to lie in while others pass.

PASS'ING-TICKET, *f.* A kind of *permit*, being a note or check which the toll-clerks on some canals give to the boatmen, specifying the lading for which they have paid toll.

PASSINGLY, *adv.* Exceedingly.—I pursue *passingly* [in the present version, "beyond measure"] the church of God. *Wicliffe*, *Gal.* i. 13.—Cardinal Pole having heard a certain preacher of great name, who arrogated much to himself, and did *passingly* please himself; he was asked what he thought of the man; Pole answered, I would that he would first preach unto himself, and then afterward to others. *Canden's Remains*.

PASSION, *f.* [Fr. from *passio*, Lat.] Any effect caused by external agency.—A body at rest affords us no idea of any active power to move; and, when set in motion, it is rather a *passion* than an action in it. *Locke*.—Susceptibility of effect from external action.—The differences of mouldable and not mouldable, scissible and not scissible, and many other *passions* of matter, are plebeian notions, applied to the instruments men ordinarily practise. *Bacon*.—Violent commotion of the mind.—All the art of rhetoric, besides order and perspicuity, only moves the *passions*, and thereby misleads the judgement. *Locke*.

Passion's too fierce to be in fetters bound,
And nature flies him like enchanted ground. *Dryden*.

I am doubtful, lest
You break into some merry *passion*,
And so offend him. *Shakespeare*.

Anger.—The word *passion* signifies the receiving any action in a large philosophical sense; in a more limited philosophical sense, it signifies any of the affections of human nature; as love, fear, joy, sorrow: but the common people confine it only to anger. *Watts*.—Zeal; ardour.—Where statesmen are ruled by faction and interest, they can have no *passion* for the glory of their country, nor any concern for the figure it will make. *Addison on Medals*.—Love.—For your love, you kill'd her father: you confessed you drew a mighty argument to prove your *passion* for the daughter. *Dryden and Lee's Oedipus*.

He, to grate me more,
Publickly own'd his *passion* for Amestris. *Rowe*.

Survey yourself, and then forgive your slave,
Think what a *passion* such a form must have. *Granville*.

Eagerness.—Abate a little of that violent *passion* for fine cloaths, so predominant in your sex. *Swift*.—A plaintive love-song.—My meditations are loaded with metaphors, songs, and sonnets; not a one shakes his tail, but I sigh out a *passion*. *Albumazar*.—Emphatically, the last suffering of the Redeemer of the world.—He shewed himself alive after his *passion*, by many infallible proofs. *Acts* i. 3.

PASSION, is a word of which, as Dr. Reid observes, the meaning is not precisely ascertained, either in common discourse or in the writings of philosophers. In its original import, it denotes every *feeling* of the mind occasioned by an extrinsic cause; but it is generally used to signify some *agitation* of mind, opposed to that state of tranquillity in which a man is most master of himself. That it was thus used by the Greeks and Romans, is evident from Cicero's rendering *passio*, the word by which the philosophers of Greece expressed it, by *perturbatio* in Latin. In this sense of the word, passion cannot be itself a distinct and independent principle of action; but only an occasional degree of vehemence given to those dispositions, desires, and affections, which are at all times present to the mind of man; and that this is its proper sense, we need no other proof than that passion has al-

ways been conceived to bear analogy to a storm at sea, or a tempest in the air.

With respect to the number of passions of which the mind is susceptible, different opinions have been held by different authors. Le Brun, a French writer on painting, justly considering the expression of the passions as a very important as well as difficult branch of his art, has enumerated no fewer than twenty, of which the signs may be expressed by the pencil on canvas. That there are so many different states of mind producing different effects which are visible on the features and the gestures, and that those features and gestures ought to be diligently studied by the artist, are truths which cannot be denied; but it is absurd to consider all these different states of mind as *passions*, since *tranquillity* is one of them, which is the reverse of passion.

Mr. Haslam very judiciously asks, "Why should the most *active* characteristics of our nature be termed *passions*? The word seems properly employed in *Passion-week*, the period commemorative of Christ's *passion*, or suffering. But we are said to fly or fall into a passion, and then passion gets the better of us. For the softer sex we conceive the most delicate, refined, and honourable, *passion*; yet every one allows the dreadful consequences which ensue from an indulgence of our *passions*, and most persons agree that *passion* carried to excess, constitutes *madness*." *Observations on Madness*, p. 33, 4.

In propriety, all those motions whereby the soul is carried towards any thing, as Love, Ambition, Revenge, &c. are rather *actions* than *passions*. Those motions by which the soul finds itself interrupted in its actions, as Grief, &c. are the only real *passions*.

The common division of the passions into Desire and Aversion, Hope and Fear, Joy and Grief, Love and Hatred, has been mentioned by every author who has treated of them, and needs no explication; but it is a question of some importance in the philosophy of the human mind, whether these different passions be each a degree of an original and innate disposition, distinct from the dispositions which are respectively the foundations of the other passions, or only different modifications of one or two general dispositions common to the whole race.

The former opinion is held by all who build their system of metaphysics upon a number of distinct internal senses; and the latter is the opinion of those who, with Locke and Hartley, resolve what is commonly called instinct into an early association of ideas. That without deliberation mankind instantly feel the passion of fear upon the apprehension of danger, and the passion of anger or resentment upon the reception of an injury, are truths which cannot be denied; and hence it is inferred, that the seeds of these passions are innate in the mind, and that they are not generated, but only swell to magnitude on the prospect of their respective objects. In support of this argument, it has been observed that children, without any knowledge of their danger, are instinctively afraid on being placed on the brink of a precipice; and that this passion contributes to their safety long before they acquire, in any degree equal to their necessities, the exercise of their rational powers. Deliberate anger, caused by a voluntary injury, is acknowledged to be in part founded on reason and reflection; but, where anger impels one suddenly to return a blow, even without thinking of doing mischief, the passion is instinctive. In proof of this, it is observed, that instinctive anger is frequently raised by bodily pain, occasioned even by a stock or a stone, which instantly becomes an object of resentment, that we are violently incited to crush to atoms. Such conduct is certainly not rational, and therefore it is supposed to be necessarily instinctive.

With respect to other passions, such as the lust of power, of fame, or of knowledge, innumerable instances, says Dr. Reid, occur in life, of men who sacrifice to them their ease, their pleasure, and their health. But it is absurd to suppose that men should sacrifice the end to what they

they desire only as means of promoting that end; and therefore he seems to think that these passions must be innate. To add strength to this reasoning, he observes that we may perceive some degree of these principles even in brute animals of the most sagacious kind, who are not thought to desire means for the sake of ends which they have in view. But it is in accounting for the passions which are disinterested that the advocates for innate principles seem most completely to triumph. As it is impossible not to feel the passion of pity upon the prospect of a fellow-creature in distress, they argue, that the basis of that passion must be innate; because pity, being at all times more or less painful to the person by whom it is felt, and frequently of no use to the person who is its object, it cannot in such instances be the result of deliberation, but merely the exertion of an original instinct. The same kind of reasoning is employed to prove that gratitude is the exercise of an innate principle. That good offices are, by the very constitution of our nature, apt to produce good-will towards the benefactor, in good and bad men, in the savage and in the civilized, cannot surely be denied by any one in the least acquainted with human nature. We are grateful not only to the benefactors of ourselves as individuals, but also to the benefactors of our country; and *that*, too, when we are conscious that from our gratitude neither they nor we can reap any advantage. Nay, we are impelled to be grateful even when we have reason to believe that the objects of our gratitude know not our existence. This passion cannot be the effect of reasoning, or of association founded on reasoning; for, in such cases as those mentioned, there are no principles from which reason can infer the propriety or usefulness of the feeling. That *public spirit*, or the affection which we bear to our country, or to any subordinate community of which we are members, is founded on instinct, is deemed so certain, that the man destitute of this affection, if there be any such, has been pronounced as great a monster as he who has two heads.

This reasoning has certainly great force; and, if authority could have any weight in settling a question of this nature, we know not that name to which greater deference is due than the name of him from whom it is taken. Yet it must be confessed that the philosophers, who consider the affections and passions as early and deep rooted *associations*, support their opinion with very plausible arguments. We have attended with much solicitude to the actions of children; and have no reason to think that they feel terror on the brink of a precipice till they have been repeatedly warned of their danger in such situations by their parents or their keepers. Every person knows not only that they have no original or instinctive dread of fire, which is as dangerous to them as any precipice; but that it is extremely difficult to keep them from that destructive element till they are either capable of weighing the force of arguments, or have repeatedly experienced the pain of being burnt by it. With respect to sudden resentment, we cannot help considering the argument which is brought in proof of its being instinctive, as proving the contrary in a very forcible manner. Instinct is some mysterious influence of God upon the mind, exciting to actions of beneficial tendency: but can any benefit arise from wreaking our impotent vengeance on a stock or a stone? or is it supposable that a Being of infinite wisdom would excite us to actions so extravagantly foolish? We learn from experience to defend ourselves against rational or sensible enemies, by retaliating the injuries which they inflict upon us; and, if we have been often injured in any particular manner, the idea of that injury becomes in time so closely associated with the means by which it has been constantly repelled, that we never receive such an injury—a blow for instance—without being prompted to make the usual retaliation, without reflecting whether the object be sensible or insensible. So far from being instinctive does resentment appear to us, that we think an attentive observer may easily per-

ceive how the seeds of it are gradually infused into the youthful mind; when the child, from being at first a timid creature shrinking from every pain, learns by degrees to return blow for blow and threat for threat.

But, instead of urging what appears to ourselves of most weight against the instinctive system, we shall lay before our readers a few extracts from a dissertation on the origin of the passions, by a writer whose elegance of language and ingenuity of investigation do honour to the school of Hartley. "When an infant is born (says Dr. Sayers), there is every reason to suppose that he is born without ideas. These are rapidly communicated through the medium of the senses. The same senses are also the means of conveying to him pleasure and pain. These are the hinges on which the passions turn: and till the child is acquainted with these sensations, it would appear that no passion could be formed in his mind; for, till he has felt pleasure and pain, how can he desire any object, or wish for its removal? How can he either love or hate? Let us observe then the manner in which love and hatred are formed; for on these passions depend all the rest. When a child endures pain, and is able to detect the cause of it, the idea of pain is connected in his mind with that of the thing which produced it; and, if the object which occasioned pain be again presented to the child, the idea of pain *associated* with it arises also. This idea consequently urges the child to avoid or to remove the object; and thus arises the passion of dislike or hatred. In the same manner, the passion of liking or love is readily formed in the mind of a child from the association of pleasant ideas with certain objects which produced them. The passions of hope and fear are states of the mind depending upon the good or bad prospects of gratifying love or hatred; and joy or sorrow arises from the final success or disappointment which attends the exertions produced by love or by hatred. Out of these passions, which have all a perceptible relation to our own good, and are universally acknowledged to be selfish, all our other passions are formed." *Disquisitions Metaphysical and Literary.*

Thus have we stated the two opposite theories respecting the origin of passions in the mind, and given our readers a short specimen of the reasonings by which they are supported by their respective patrons. Were we called upon to decide between them, we should be tempted to say, that they have both been carried to extremes by some of their advocates, and that the truth lies in the middle between them. "It is impossible (says Dr. Price,) but that creatures capable of pleasant and painful sensations, should love and choose the one, and dislike and avoid the other. No being who knows what happiness and misery are, can be supposed indifferent to them, without a plain contradiction. Pain is not a *possible* object of desire, nor happiness of aversion." To prefer a greater good, though distant, to a less good that is present, or to choose a present evil, in order to avoid a greater future evil, is indeed wise and rational conduct; but to choose evil ultimately, is absolutely impossible. Thus far then must be admitted, that every being possessed of sense and intellect necessarily desires his own good as soon as he knows what it is; but, if this knowledge be not innate, neither can the desire. Every human being comes into the world with a capability of knowledge, and of course with a capability of affections, desires, and passions; but it seems not to be conceivable how he can actually love, or hate, or dread, any thing, till he know whether it be good or ill, safe or dangerous. If, therefore, we have no *innate ideas*, we cannot possibly have *innate desires or aversions*. Those who contend that we have, seem to think, that without them reason would be insufficient, either for the preservation of the individual or the continuation of the species; and some writers have alleged, that if our affections and passions were the mere result of early *associations*, they would necessarily be more capricious than we ever find them. But this objection seems to arise from their not rightly understanding the theory

theory of their antagonists. The disciples of Locke and Hartley do not suppose it possible for any man in society to prevent such associations from being formed in his mind as shall necessarily produce desires and aversions; far less do they think it possible to form associations of ideas utterly repugnant, so as to desire that as good which his senses and intellect have experienced to be evil. Associations are formed by the very same means, and at the very same time, that ideas and notions are impressed upon the mind; but, as pain is never mistaken for pleasure by the senses, so an object which has given us only pain is never associated with any thing that makes it desirable. We say an object that has given us only pain, because it is possible to form such an association between life and the loss of a limb, as to make us grateful to the surgeon by whom it was amputated. Associations being formed according to the same laws by which knowledge is acquired, it by no means follows that passions resulting from them should be more capricious than they are found to be; and they certainly are sufficiently capricious to make us suspect that the greater part of them has this origin, rather than that they are all infused in the mind by the immediate agency of the Creator. If man be a being formed with no innate ideas, and with no other instinctive principles of action than what are absolutely necessary to preserve his existence and perpetuate the species, it is easy to perceive why he is placed in this world as in a state of probation, where he may acquire habits of virtue to fit him for a better. It is likewise easy to perceive why some men are better than others, and why some are the slaves of the most criminal passions. But all this is unintelligible, upon the supposition that the seeds of every passion are innate, and that man is a compound of reason and of instincts so numerous and various as to suit every circumstance in which he can be placed.

If passions be the result of early *associations*, it is of the utmost consequence that no improper associations be formed in the minds of children, and that none of their unreasoned desires be gratified. Upon this theory it seems indeed to depend almost wholly upon education, whether a child shall become a calm, benevolent, steady, and upright, man; or a passionate, capricious, selfish, miscreant. By teaching him to resent every petty injury, the seeds of irascibility are sown in his mind, and take such root, that before the age of manhood he becomes intolerable to all with whom he must converse. By exciting numberless desires in his youthful mind, and instantly gratifying them, you make him capricious and impatient of disappointment; and in representing other children as in any degree inferior to him, you inspire him with the hateful passion of pride. According to the instinctive theory, education can only augment or diminish the strength of the passions; according to the other theory, it is the source of by far the greater part of them. On either supposition, parents should watch with solicitude over the actions of their children; but they will surely think themselves obliged to be doubly watchful, if they believe, that through their neglect their children may acquire hateful passions, to which, if properly educated, they might have remained strangers through their whole lives. And let it be remembered, that this solicitude should begin at an early period; because the mind is susceptible of deep associations much sooner than is sometimes imagined. Without this susceptibility, no language could be learned; and therefore a child, by the time he learns to speak, may have planted in his mind the seeds of passions, on the just regulation and subordination of which depends, in a great measure, the happiness of mankind.

External Signs of the Passions.—So intimately connected are the soul and body, that every agitation in the former produces a visible effect upon the latter. There is, at the same time, a wonderful uniformity in that operation; each class of emotions and passions being invariably at-

tended with an external appearance peculiar to itself. These external appearances, or signs, may not improperly be considered as a natural language, expressing to all beholders emotions and passions as they rise in the heart. Hope, Fear, Joy, Grief, are displayed externally: the character of a man may be read in his face; and beauty, which makes so deep an impression, is known to result, not so much from regular features and a fine complexion, as from good-nature, good-sense, sprightliness, sweetness, or other mental qualities, expressed upon the countenance. Though perfect skill in that language be rare, yet what is generally known is sufficient for the ordinary purposes of life. But by what means we come to understand the language, is a point of some intricacy. It cannot be by sight merely; for, upon the most attentive inspection of the human visage, all that can be discerned are, figure, colour, and motion, which, singly or combined, never can represent a passion nor a sentiment: the external sign is indeed visible; but to understand its meaning, we must be able to connect it with the passion that causes it; an operation far beyond the reach of eye-sight. Where then is the instructor to be found that can unveil this secret connexion? If we apply to experience, it is found, that, from long and diligent observation, we may gather, in some measure, in what manner those we are acquainted with, express their passions externally; but, with respect to strangers, we are left in the dark; and yet we are not puzzled about the meaning of these external expressions in a stranger, more than in a bosom companion. Further; had we no other means but experience for understanding the external signs of passion, we could not expect any uniformity, nor any degree of skill in the bulk of individuals; yet matters are so much better ordered, that the external expressions of passion form a language understood by all, by the young as well as the old, by the ignorant as well as the learned: we talk of the plain and legible characters of that language; for undoubtedly we are much indebted to experience, in deciphering the dark and more delicate expressions. Where then shall we apply for a solution of this intricate problem, which seems to penetrate deep into human nature? Undoubtedly, if the meaning of external signs be not derived to us from sight, nor from experience, there is no remaining source whence it can be derived but from Nature.

We may then venture to pronounce, with some degree of confidence, that man is provided by nature with a sense or faculty that lays open to him every passion by means of its external expressions. And we cannot entertain any reasonable doubt of this, when we reflect, that the meaning of external signs is not hid even from infants: an infant is remarkably affected with the passions of its nurse expressed on her countenance; a smile cheers it, a frown makes it afraid: but fear cannot be without apprehending danger; and what danger can the infant apprehend, unless it be sensible that its nurse is angry? We must therefore admit, that a child can read *anger* in its nurse's face; of which it must be sensible intuitively, for it has no other mean of knowledge. We do not affirm, that these particulars are clearly apprehended by the child; for, to produce clear and distinct perceptions, reflection and experience are requisite: but that even an infant, when afraid, must have some notion of its being in danger, is evident.

That we should be conscious intuitively of a passion from its external expressions, is conformable to the analogy of nature: the knowledge of that language is of too great importance to be left upon experience; because a foundation so uncertain and precarious, would prove a great obstacle to the formation of societies. Wisely, therefore, is it ordered, and agreeably to the system of Providence, that we should have Nature for our instructor.

Such is the philosophy of lord Kames, to which objections unanswerable may be made. It is part of the instinctive

sensitive system of metaphysics, which his lordship has carried farther than all who wrote before him, and perhaps farther than all who have succeeded him in this department of science. "That a child intuitively reads anger in its nurse's face," say the objectors, "is so far from being true, that for some short time after birth it is not terrified by the most menacing gestures. It is indeed absolutely incapable of fear till it has suffered pain; and, could we constantly caress it with what is called an *angry look*, it would be cheered by that look, and frightened at a smile. It feels, however, the effects of anger, and is soon capable of observing the peculiarity of feature with which that passion is usually accompanied; and these two become in a short time so linked together in its tender mind, that the appearance of the one necessarily suggests to it the reality of the other.

"Should it be said that a loud and sudden noise startles a child immediately after birth, and that, therefore, the infant must be instinctively afraid, the fact may be admitted, without any necessity of admitting the inference. The nerves of an infant are commonly very irritable; and a strong impulse on the *auditory* nerves may agitate its whole frame, without inspiring it with the passion of fear. The loud noise is in all probability not the sign of approaching danger, but the immediate cause of real pain, from which the infant shrinks as it would from the prick of a pin or the scorching of a candle."

Manifold and admirable are the purposes to which the external signs of passion are made subservient by the Author of our nature.

1. The signs of internal agitation displayed externally to every spectator, tend to fix the signification of many words. The only effectual means to ascertain the meaning of any doubtful word, is an appeal to the thing it represents; and hence the ambiguity of words expressive of things that are not objects of external sense; for in that case an appeal is denied. Passion, strictly speaking, is not an object of external sense: but its external signs, are: and, by means of these signs, passions may be appealed to with tolerable accuracy; thus the words that denote our passions, next to those that denote external objects, have the most distinct meaning. Words signifying internal action and the more delicate feelings, are less distinct.

2. Society among individuals is greatly promoted by that universal language. Looks and gestures give direct access to the heart; and lead us to select, with tolerable accuracy, the persons who are worthy of our confidence. It is surprising how quickly, and for the most part how correctly, we judge of character from external appearance.

3. After social intercourse is commenced, these external signs, which diffuse through a whole assembly the feelings of each individual, contribute above all other means to improve the social affections. Language, no doubt is the most comprehensive vehicle for communicating emotions: but in expedition, as well as in power of conviction, it falls short of the signs under consideration, the involuntary signs especially, which are incapable of deceit. Where the countenance, the tones, the gestures, the actions, join with the words in communicating emotions, these united have a force irresistible. Thus all the pleasant emotions of the human heart, with all the social and virtuous affections, are, by means of these external signs, not only perceived, but felt. By this admirable contrivance, conversation becomes that lively and animating amusement, without which life would at best be insipid: one joyful countenance spreads cheerfulness instantaneously through a multitude of spectators.

4. Diffocial passions, being hurtful by prompting violence and mischief, are noted by the most conspicuous external signs, in order to put us upon our guard: thus anger and revenge, especially when sudden, display themselves on the countenance in legible characters. The ex-

ternal signs, again, of every passion that threatens danger, raise in us the passion of fear; which frequently operating without reason or reflection, moves us by a sudden impulse to avoid the impending danger.

5. These external signs are remarkably subservient to morality. A painful passion, being accompanied with disagreeable external signs, must produce in every spectator a painful emotion: but then, if the passion be social, the emotion it produces is attractive, and connects the spectator with the person who suffers. Diffocial passions only are productive of repulsive emotions, involving the spectator's aversion, and frequently his indignation. This artful contrivance makes us cling to the virtuous and abhor the wicked.

6. Of all the external signs of passion, those of affliction or distress are the most illustrious with respect to a final cause, and deservedly merit a place of distinction. They are illustrious by the singularity of their contrivance; and also by inspiring sympathy, a passion to which human society is indebted for its greatest blessing, that of providing relief for the distressed. A subject so interesting deserves a leisurely and attentive examination. The conformity of the nature of man to his external circumstances is in every particular wonderful: his nature makes him prone to society; and society is necessary to his well-being, because, in a solitary state, he is a helpless being, destitute of support, and, in his distresses, destitute of relief: but mental support, the shining attribute of society, is of too great moment to be left dependent upon cool reason; it is ordered more wisely, and with greater conformity to the analogy of nature, that it should be enforced even instinctively by the passion of sympathy. Here sympathy makes a capital figure; and contributes, more than any other means, to make life easy and comfortable. But however essential the sympathy of others may be to our well-being, one beforehand would not readily conceive how it could be raised by external signs of distress; for, considering the analogy of nature, if these signs be agreeable, they must give birth to a pleasant emotion, leading every beholder to be pleased with human woes: if disagreeable, as they undoubtedly are, ought they not naturally to repel the spectator from them, in order to be relieved from pain? Such would be the reasoning beforehand; and such would be the effect were man purely a selfish being. But the benevolence of our nature gives a very different direction to the painful passion of sympathy, and to the desire involved in it: instead of avoiding distress, we fly to it in order to afford relief; and our sympathy cannot be otherwise gratified but by giving all the succour in our power. Thus external signs of distress, though disagreeable, are attractive; and the sympathy they inspire is a powerful cause, impelling us to afford relief even to a stranger, as if he were our friend or relation.

To conclude: the external signs of passion are a strong indication, that man, by his very constitution, is framed to be open and sincere. A child, in all things obedient to the impulses of nature, hides none of its emotions; the savage and clown, who have no guide but pure nature, expose their hearts to view, by giving way to all the natural signs. And, even when men learn to dissemble their sentiments, and when behaviour degenerates into art, there still remain checks, that keep dissimulation within bounds, and prevent a great part of its mischievous effects: the total suppression of the voluntary signs during any vivid passion, begets the utmost uneasiness, which cannot be endured for any considerable time: this operation becomes indeed less painful by habit; but, luckily, the involuntary signs cannot, by any effort, be suppressed, or even dissembled. An absolute hypocrisy, by which the character is concealed and a fictitious one assumed, is made impracticable; and nature has thereby prevented much harm to society. We may pronounce, therefore, that nature, herself sincere and candid, intends that mankind should preserve the same character,

by cultivating simplicity and truth, and banishing every sort of dissimulation that tends to mischief.

The annexed Engraving contains sixteen figures of the external expressions of the passions, from the drawings of Le Brun: for, though the arms, and indeed every part of the body, serve likewise, by their quick, languid, and variously-diversified, motions, to express the passions of the soul; yet this difference is most conspicuous in the face.

Fig. 1. *Tranquillity*.—This is the natural expression of the countenance, and may be taken as a standard from which the changes in the following figures are derived.

2. *Joy*.—Very little alteration is remarked in the face of those that feel within themselves the sweetness of joy, or Joy with *Tranquillity*. The forehead is serene; the eye-brow without motion, elevated in the middle; the eye pretty open, and with a laughing air; the eyeball lively and shining; the corners of the mouth turn up a little; the complexion is lively; the cheeks and lips are red.

3. *Admiration*—causes but little agitation in the mind, and therefore alters but very little the parts of the face: nevertheless the eyebrow rises; the eye opens a little more than ordinary; the eyeball placed equally between the eyelids appear fixed on the object; the mouth half opens, but makes no sensible alteration in the cheeks.

4. The motions that accompany *Admiration with Astonishment* are hardly different from those of simple *Admiration*, only they are more lively and stronger marked: the eyebrows more elevated; the eyes more open; the eyeball further from the lower eyelid, and more steadily fixed: the mouth is more open, and all the parts in a much stronger emotion.

5. In *Rapture*—the head inclines to the right side; the eyeballs and eyebrows rise directly up; the mouth half opens, and the two corners are also a little turned up: the other parts remain in their natural state.

6. *Love*.—Chaste love causes the most delightful expression of countenance, to which an engraver can hardly do justice. The head inclines to the left side; the lips are gently dissevered, though the mouth cannot be said to be open; and the spirits being in motion give a lively glowing colour.

7. *Hatred or Jealousy*—wrinkles the forehead; the eyebrows are sunk down and knit; the eye-ball is half hid under the eyebrows, which turn toward the object; the side next the nose sinks down, and the other side rises very much; the nostrils rise, and draw towards the eyes, and make wrinkles in the cheeks; the mouth shuts, its sides sinking down, and the under-lip is pushed out beyond the upper one.

8. An object hated sometimes causes *Horror*; and then the eyebrow knits, and sinks a great deal more. The eyeball, placed at the bottom of the eye, is half covered by the lower eyelid; the mouth is half open, but closer in the middle than the sides, which being drawn back, makes wrinkles in the cheeks; the face grows pale, and the eyes become livid; the muscles and the veins are marked.

9. The violence of *Terror*, or *Affright*, alters all the parts of the face: the eyebrow rises in the middle; its muscles are marked, swelled, pressed one against the other, and sunk towards the nose, which draws up as well as the nostrils; the eyes are very open; the upper eyelid is hid under the eyebrow; the white of the eye is encompassed with red; the eyeball fixes toward the lower part of the eye; the lower part of the eyelid swells and becomes livid; the muscles of the nose and cheeks swell, and these last terminate in a point toward the sides of the nostrils; the mouth is very open, and its corners very apparent; the muscles and veins of the neck stretched; the hair stands on end; the colour of the face, that is, the end of the nose, the lips, the ears, and

round the eyes, is pale and livid; and all ought to be strongly marked.

10. *Despair*.—The forehead wrinkles from the top to the bottom; the eyebrows bend down over the eyes, and press one another on the sides of the nose; the eye seems to be on fire, and full of blood; the eyeball is disturbed, hid under the eyebrow, sparkling and unfixed; the eyelid is swelled and livid; the nostrils are large, open, and lifted up; the end of the nose sinks down; the muscles, tendons, and veins, are swelled and stretched; the upper part of the cheeks is large, marked, and narrow towards the jaw; the mouth, drawn backwards, is more open at the sides than in the middle; the lower lip is large and turned out; they gnash their teeth; they foam; they bite their lips, which are pale, as is the rest of the face; the hair is straight, and stands on end.

11. The effects of *Anger* show its nature. The eyes become red and inflamed; the eyeball is staring and sparkling; the eyebrows are sometimes elevated and sometimes sunk down equally: the forehead is very much wrinkled, with wrinkles between the eyes; the nostrils are open and enlarged; the lips pressing against one another, the under one rising over the upper one, leaves the corners of the mouth a little open, making a cruel and disdainful grin.

12. In this figure it has been endeavoured to combine the expression of *Anger mixed with Fear*.

13. *Laughter*,—which is produced by joy mixed with surprise, makes the eyebrow rise towards the middle of the eye, and bend towards the sides of the nose; the eyes are almost shut, and sometimes appear wet, or shed tears, which make no alteration in the face; the mouth, half open, shows the teeth; the corners of the mouth, drawn back, cause a wrinkle in the cheeks, which appear so swelled as to hide the eyes in some measure; the nostrils are open, and all the face is of a red colour.

14. The alterations that *Weeping* occasions are strongly marked. The eyebrows sink down towards the middle of the forehead; the eyes are almost closed, wet, and drawn down towards the cheeks; the nostrils swelled; the muscles and veins of the forehead appear; the mouth is shut, and the sides of it are drawn down, making wrinkles on the cheeks; the under lip, pushed out, presses the upper one: all the face is wrinkled and contracted; its colour is red, especially about the eyebrows, the eyes, the nose, and the cheeks.

15. The lively attention to the misfortunes of another, which is called *Compassion*, causes the eyebrows to sink towards the middle of the forehead; the eyeball to be fixed upon the object; the sides of the nostrils next the nose to be a little elevated, making wrinkles in the cheeks; the mouth to be open; the upper lip to be lifted up and thrust forwards; the muscles and all the parts of the face sinking down, and turning towards the object which excites the passion.

16. *Acute Pain*—makes the eyebrows approach one another, and rise towards the middle; the eyeball is hid under the eyebrows; the nostrils rise, and make a wrinkle in the cheeks; the mouth half opens, and draws back; all the parts of the face are agitated in proportion to the violence of the suffering, whether mental or bodily, or both.

The influence of the passions on the thoughts and language, is a matter of universal experience and observation. When any subject presents itself to the mind with sufficient force to excite a passion, or very strong affections, all the powers of the imagination become immediately active, the whole soul is engaged upon its object, and the whole train of ideas is turned into a channel correspondent with the view we entertain of them. This state of mind not only manifests itself by gestures, looks, and tones, correspondent with the nature of the passion, but it has a characteristic influence upon the language and expressions employed to give vent to the passion,

External Signs of the Passions; from Le Brun.

passion, as it is emphatically termed. Upon the first impulse, the thoughts are tumultuous and confused; but, as the *passion* approaches somewhat nearer to an *affection*, the mind recovers in some degree its power over itself; though still, as it continues to feel strongly, it is eager to do justice to its feelings, by the strength, pertinency, and impetuosity, of its language. Impetuosity equally despises precision or detail: it eagerly seizes upon tropes and figures the most concise and the most suited to its new conceptions. When passions and emotions give place to more permanent affections, language becomes less vehement and more diffuse. Nature has accommodated the mode of utterance to the character of the passion; thus it has rendered Joy loud and vociferous, producing strong exclamations mixed with triumphant laughter. Sorrow communicates a plaintiveness to the voice, best adapted to wailings and lamentations. Anger is loud and turbulent; the voice rises with the passion in order to strike terror and silence opposition. Fear is oppressed and breathless, or screams aloud for help. Love is soft, soothing, insinuating, and gentle; sometimes assuming the plaintiveness of sorrow, sometimes the vivacity of hope, and the transports of joy.

The nature of the passions and affections indulged, and of the objects by which they are excited, and the degree of influence and permanency which they are allowed to exert upon us, constitute the moral characters of men; pointing out their innocence, their excellencies, or their defects. By *character* is generally understood the kind of reputation acquired by the prevalent disposition or temper, which suggests almost every motive, and takes the lead in almost every action; and *moral character* refers to that prevalent temper which relates to moral obligation, respecting either ourselves or others. The cardinal affections of Love and Hatred, in themselves, possess neither merit nor demerit. It is neither a duty, nor a possibility, to divest ourselves of them. The passions, emotions, and affections, which are immediately consequent upon these, or may be deemed simple modifications of them, are also inseparable from our nature, and are both unavoidable and innocent: such as Joy, Contentment, Hope, Desire, Fear, Sorrow, Anger, Repentment, &c. Virtue, however, directs, restrains, and controls their influence.

There is another distinction of the passions and affections, as they relate to the moral character, indicating a scale of comparative merit and demerit. Some are innocent simply, as Hope, Joy, moderate Grief. Some are laudable, as Contentment, Satisfaction, Complacency. Others are deemed peculiarly noble; thus the virtue of Benevolence is much more dignified than any of the affections that originate and terminate in *self*. And in the different branches of this virtue there are also degrees of excellence. But sentiments of this kind are familiar and obvious to the reader, and it is needless to enlarge. Upon the whole it appears, that character depends upon the prevalent use or abuse of certain propensities or affections of our natures. Those who select and cultivate the most beneficial, are the best of characters; those who are habituated to the most injurious, are the worst.

With regard to the influence of the passions and affections on happiness, we may observe, that, although the desire of good is in reality the cause of every passion, emotion, and affection, yet the immediate effects of each on our sensations are correspondent to its own specific nature. The influence of some is productive of temporary well-being; while others are comfortless, irksome, or productive of a great degree of wretchedness. Love, placed upon a deserving object, and recompensed with a reciprocal affection, Joy, Ecstasy, Complacency, Satisfaction, Contentment, lively Hope, are decidedly sources of personal enjoyment. The social affections of Benevolence, Sympathy, Compassion, and Mercy, are also other ingredients of happiness, from a less selfish and more refined source than the preceding. Every species of bene-

volence possesses the quality our great dramatic poet has ascribed to a merciful disposition:

The quality of mercy's not restrain'd:
It droppeth as the gentle rain from heaven
Upon the land beneath. It is twice blest'd;
It blesses him that *gives*, and him that *takes*.

Emotions and affections of another class are of the unquiet and irritating class: as the whole family of Anger. The emotions and affections of Fear, Dread, Horror, Despair, are of the most shocking and tremendous class. Excessive Jealousy, Envy, Remorse, Despair, Shame, arising from the detection of guilt, are misery unmixed. Surprise, Wonder, Astonishment, principally receive their complexion from the subjects that inspire them: and they are introductory to happiness or misery according to the nature of the cause that excites them.

On the importance of studying the passions, Mr. Colman thus writes: "It is according as the passions are exercised on good or bad objects that we rise into respectability or sink into contempt; that we enjoy happiness or suffer misery. An attention, therefore, to the workings of our own minds must be of considerable importance. The study of the passions is as necessary as the study of anatomy to a surgeon; for it is, in a moral view the anatomy of the heart, whereby it may be discovered whether our minds are in a sound state or not." The great object which we ought to propose to ourselves is to acquire a firm and composed mind, to obey religion and truth, and to listen calmly to the voice of conscience and reason. To govern the passions or affections, we should first ascertain the proper object of their pursuit, and then restrain them in that pursuit, lest they should go beyond the bounds of reason. Perhaps the due regulation of them may require great resolution, much self-denial, and long perseverance. But by continued exertions, with a dependence on the divine aid, we may at length obtain a complete conquest over our evil passions, and know how to guide and improve the use of those which are good.

We will give but one instance in illustration of the benefit and necessity of moderating and governing even the laudable passions, and it shall be taken from the first emotion (as we may say) that appears on our engraving; *Joy*. Joy, kept within due bounds, strengthens the body and mind, and exhilarates the animal spirits; not kept within due bounds, how fatal may be its effects! Pliny informs us, (lib. vii. §. 7.) that Chilo the Lacedæmonian died upon hearing that his son had gained a prize in the Olympic games. Valerius Maximus tells us, (lib. ix. cap. 12.) that Sophocles, the tragic writer, in a contest of honour, died in consequence of a decision being pronounced in his favour. Aulus Gellius (Not. Attic. lib. iii. cap. 15.) mentions a remarkable instance of the effects of what may be termed accumulated joy, in Diagoras, who expired at the instant when his three sons were crowned in the same day as victors; the one as a pugilist, the other as a wrestler, and the third in both capacities. Livy also (lib. 22. cap. 7.) mentions the instance of an aged matron, who, while she was in the depth of distress, from the tidings of her son's having been slain in battle, died in his arms from the excess of joy upon his safe return. We are also told by the Italian historian Guicciardini, that Leo X. died of a fever, occasioned by the agitation of his spirits, on his receiving the joyful news of the capture of Milan, concerning which he had entertained the most painful anxiety.

To PASS'ION, *v. n.* [*passionner*, old Fr.] To be extremely agitated; to express great commotion of mind. *Obsolete.*

'Twas Ariadne *passioning*
For Theseus' perjury and unjust flight. *Shakespeare.*

PASS'ION-FLOWER, *f.* See PASSIFLORA.—The *passion-flower*, or Virginian climber: the first of these names

names was given it by the Jesuits, who pretended to find in it all the instruments of our Lord's passion. *Note to Cowley.*

PASS'ION-SUN'DAY. The fifth Sunday in Lent has in the Romish church the appellation of Passion-Sunday, which latter title the sixth or Palm Sunday bears in the reformed calendar, from the circumstance of the death or passion of our Saviour being commemorated in the week of which Palm (or our Passion) Sunday is the first day. The Latins are stated to have called this fifth Sunday in Lent *Passion Sunday*, instead of the sixth, thereby anticipating its true station by a week, because they had established ceremonies for the latter, appropriate to its other name of Palm Sunday, which precluded the performance of the rites deemed applicable to the solemn occasion from whence they denominated their Passion Sunday: rites which they formerly carried to an excess of superstition, not surpassed by any of their usages. In the north of England there are yet to be found some vestiges of the superstitious observances of this day, which, before the Reformation, were general throughout the kingdom. Among other of the old ceremonies, soft beans were distributed as a kind of dole, to denote this season of grief; a custom perhaps derived from Pagan Rome, offerings of that species of pulse having been deemed by the Heathens peculiarly propitious in appeasing the ghosts of the departed. Instead of beans, our northern countrymen use grey pease in their repast of this day, especially in Northumberland: in some places they are first parboiled, and then parched; in other districts, they are only parched: and the day is still known by the name of Care or Carling Sunday, in Durham and the adjoining counties; a title it once universally bore in England, though now no longer noticed in our calendar, signifying a day of especial care, or devotional attention. The serving-up of beans or of grey-pease, as a repast on this day, is a sufficient evidence of mortification and abstinence, without seeking for any hidden meaning or superstitious tradition.

PASSION WEEK. The week immediately preceding Easter, of which the sixth Sunday in Lent, or Palm Sunday, is the first day. See the preceding article.

PASSIONARY, *f.* [*passionaire*, old Fr. *passionarius*, low Lat.] A book describing the sufferings of saints and martyrs.—It is collected from Bede, Alfred of Beverley, Malmesbury, Giraldus Cambrensis, Higden's Polychronicon, and the *Passionaries* of the female saints, Werburg, Ethelred, and Sexburgh, which were kept for public edification in the choir of the church. *Warton's Hist. E. P.*

PASSIONATE, *adj.* [*passionné*, Fr.] Moved by passion: feeling or expressing great commotion of mind.—Thucydides observes, that men are much more *passionate* for injustice than for violence; because the one coming as from an equal seems rapine; when the other proceeding from one stronger is but the effect of necessity. *Clarendon.*—Men, upon the near approach of death, have been roused up into such a lively sense of their guilt, such a *passionate* degree of concern and remorse, that, if ten thousand ghosts had appeared to them, they scarce could have had a fuller conviction of their danger. *Atterbury.*—Easily moved to anger.—Homer's Achilles is haughty and *passionate*, impatient of any restraint by laws, and arrogant in arms. *Prior.*

To PASSIONATE, *v. a.* To affect with passion. *Obsolete.*

Great pleasure, mix'd with pitiful regard,
That godly king and queen did *passionate*,
Whilst they his pitiful adventures heard.

Spenser.

To express passionately:

Thy niece and I want hands,
And cannot *passionate* our tenfold grief
With folded arms.

Titus Andronicus.

PASSIONATELY, *adv.* With passion; with desire, love or hatred; with great commotion of mind.—Who-

ever *passionately* covets any thing he has not, has lost his hold. *L'Estrange.*—If sorrow expresses itself never so loudly and *passionately*, and discharge itself in never so many tears, yet it will no more purge a man's heart than the washing of his hands can cleanse the rottenness of his bones. *South's Sermons.*—I made Melesinda, in opposition to Nourmahal, a woman *passionately* loving of her husband, patient of injuries and contempt, and constant in her kindness. *Dryden.*—Angrily.—They lay the blame on the poor little ones, sometimes *passionately* enough, to divert it from themselves. *Locke.*

PASSIONATENESS, *f.* State of being subject to passion.—Vehemence of mind.—To love with some *passionateness* the person you would marry, is not only allowable but expedient. *Boyle.*

PASSIONED, *adj.* Disordered; violently affected:

Great wonder had the knight to see the maid
So strangely *passioned*.

Spenser.

Expressing passion:

By lively actions he gan bewray
Some argument of matter *passioned*.

Spenser.

PASSIONEI (Dominico), cardinal, was born of a noble family at Fossombrone in the duchy of Urbino, in 1682. He was educated at the Clementine college in Rome, where he began to collect the copious library which he afterwards rendered so useful to men of learning. In 1706 he visited Paris, and contracted an acquaintance with all the eminent scholars of that metropolis, especially Mabillon and Montfaucon. He went to Holland in 1708, where he did not confine himself to objects of literature, but essayed his talents as a negociator. The belligerent powers in the Spanish-succession war had sent their deputies thither to treat of peace; and pope Clement XI. who could not have a nuncio in that country, secretly commissioned Passionei to take care of the interests of the holy see. His efforts were successful in procuring the evacuation of the papal territories by the German troops. He was recompensed in 1713 by the posts of privy chamberlain and domestic prelate to that pope. In 1714 he was sent to the congress at Basil, and in 1715 to Soleure; and in both those legations he displayed equal zeal and dexterity, and obtained the approbation of Clement, who, in 1719, nominated him secretary to the College of Propaganda. The succeeding pontiff, Innocent XIII. made him titular archbishop of Ephesus, and appointed him to the nunciature of Switzerland, which he kept till 1730. He was then sent by Clement XII. as nuncio to the court of Vienna, where he was highly distinguished by the emperor Charles VI. and prince Eugene. In this situation he had the credit of effecting by his pious labours the conversion to the Roman-catholic religion of the learned Eccard (see vol. vi. p. 223.) and the prince of Wirtemberg. In 1738 he was made secretary of the briefs, and honoured with the purple, and at the same was incorporated in all the congregations of Rome. Benedict XIV. entrusted him with the most important affairs, and in 1755 nominated him to the office of librarian of the Vatican. He exerted himself in augmenting the riches of this celebrated collection, and extended its usefulness by his correspondence. The Academy of Inscriptions and Belles-lettres chose him in the same year one of its foreign associates. This cardinal died of an apoplexy in 1761, at the mature age of seventy-nine. He was justly regarded as a great benefactor to learning, by the generous assistance he afforded to its votaries, and the liberal communication of his literary treasures. He was himself a writer: he joined Fontanini in a revision of The Liber diurnus Romanorum Pontificum; and wrote some Scriptural Paraphrases and Translations, and a Funeral Oration on Prince Eugene. He also compiled the "Acta Legationis Helveticae," folio, an useful guide to future nuncios. His nephew Benedict Passionei published at Lucca, in 1765, a volume

volume in folio, containing all the Latin and Greek inscriptions collected by this cardinal. *Gen. Biog.*

PASS'IONLESS, *adj.* Not easily moved to anger; cool; undisturbed.—An honest, noble, wary, retired, and *passionless*, woman. *Shelton's Don Quixote*.—The stricter examination of a now *passionless* judgement. *Instruct. for Oratory*.

PASS'IR, a town on the east coast of the island of Borneo, on a river which runs into the straits of Macassar, about 45 miles from its mouth, with two fathoms water. The town contains about 300 wooden houses, chiefly inhabited by merchants, who carry on a great deal of trade. The sultan, a Malay prince, has a house and wooden fort a little way from the river. Lat. 1. 57. S. lon. 116. 10. E.

PASS'IVE, *adj.* [*passif*, Fr. *passivus*, Lat.] Receiving impression from some external agent.—As the mind is wholly *passive* in the reception of all its simple ideas, so it exerts several acts of its own, whereby, out of its simple ideas, the other is formed. *Locke*.—The vis inertia is a *passive* principle by which bodies persist in their motion or rest, receive motion in proportion to the force impressing it, and resist as much as they are resisted: by this principle alone, there never could have been any motion in the world. *Newton's Optics*.

High above the ground
Their march was, and the *passive* air upbore
Their nimble tread.

Milton's P. L.

Unresisting; not opposing:

Not those alone, who, *passive*, own her laws,
But who, weak rebels, more advance her cause. *Pope*.

Suffering; not acting.—[In grammar.]—A verb *passive* is that which signifies passion, or the effect of action: as, *doceor*, I am taught. *Clarke's Lat. Gram.*

PASSIVE OBEDIENCE, a doctrine held by the non-jurors, or high-churchmen, who maintained, that it was never lawful for the people, under any provocation or pretext whatever, to resist their sovereign. This doctrine has been warmly opposed by many, who think it both lawful and necessary, in certain circumstances, and in cases of an urgent and momentous nature, to resist the prince for the happiness of the people. In the present advanced state of civil and religious liberty, this doctrine is now almost exploded in our country.

PASSIVE PRAYER, in the language of mystic divines, is a total suspension of the intellectual faculties, in virtue whereof, the soul remains, of itself, and as to its own power, impotent with regard to the producing of any effects. The *passive* state, says Fenelon, is only *passive* in the same sense as contemplation is so; i. e. it does not exclude peaceable disinterested acts, but only unquiet ones, or such as tend to our own interest. In the *passive* state, the soul has not properly any activity, any sensation of its own: it is a mere infinite flexibility of the soul, to which the feeblest impulse of grace gives motion.

PASSIVE VERBS. The English verbs become *passive*, by taking the auxiliary verb *I am*, in lieu of *I have*, with which the active are conjugated; the French, by *Je suis*, in lieu of *J'ay*; the Italian, by *Io so*, for *Io ho*, &c. Latin verbs become *passive*, by changing their terminations; as *amor* for *amo*, &c. *amari* for *amare*, &c. English verbs *passive* are nothing else, in effect, but the verb *I am* in all its inflexions, joined to the participle *passive*; as, "I am praised;" in Latin *laudor*; in French, *Je suis loué*; "I have been praised," *J'ay été loué*, *Laudatus sum*, &c.

Mr. Harris, who considers all verbs, that are strictly so called, as energies, distinguishes active and passive verbs in the following manner. Every energy, he says, is naturally situate between two substantives; an energizer, which is active, and a subject, which is passive. Hence then, if the energizer lead the sentence, the energy follows its character, and becomes what we call a

verb active. Thus we say, *Brutus amat*, Brutus loves. On the contrary, if the passive subject be principal, it follows the character of this too; and becomes what we call a verb passive. Thus we say, *Portia amatur*, Portia is loved.

PASSIVELY, *adv.* With a passive nature:

Though some are *passively* inclin'd,
The greater part degenerate from their kind. *Dryden*.

Without agency.—A man may not only *passively* and involuntarily be rejected, but also may, by an act of his own, cast out or reject himself. *Pearson*.—[In grammar.] According to the form of a verb passive.—A verb neuter is englished sometimes actively, as *curro*, I run; and sometimes *passively*, as *ægroto*, I am sick. *Lilly*.

PASSIVENESS, *f.* Quality of receiving impression from external agents:

You know a spirit cannot wounded be,
Nor wear such marks of human *passiveness*. *Beaumont*.

Passibility; power of suffering.—We shall lose our *passiveness* with our being, and be as incapable of suffering as heaven can make us. *Decay of Chr. Piety*.—Patience; calmness.—Gravity and *passiveness* in children is not from discretion, but phlegm. *Fell*.

PASSIV'ITY, *f.* *Passiveness*.—An innovated word, Dr. Johnson says; citing only the authority of Cheyne. It had been in use long before Cheyne's application of it, and has not been neglected since. *Todd*.—From this *passivity* in the mines and gallsies, to attain to a joy and voluptuousness in the employment. *Hammond*.—Some things are less active and more passive than others, are not so capable of enjoyments delectable unto others, and more subject to impressions distasteful to their particular nature: which *passivities* and displeasure are not simply evils, because they do suit the degree of the particular natures of those subjects, being also ever overbalanced with other pleasing activities and enjoyments. *Barrow on the Creed*.—There being no mean between penetrability and impenetrability, between *passivity* and activity, these being contrary and opposite, the infinite rarefaction of the one quality is the position of its contrary. *Cheyne's Philos. Principles*.—*Passivity* can only in the order of nature be consequent upon activity, as much as effect can only be consequent upon cause. *A. Baxter on the Soul*.

PASS'LESS, *adj.* Having no passage:

Behold what *passless* rocks on either hand,
Like prison-walls about them stand.

Cowley.

PAS'SO, a town of Portugal, in the province of Beira: seven miles east-south-east of Lamego.

PASSO'DI MOI'A, a town of Naples, in Capitanata: seventeen miles west-south-west of Viesta.

PASS'OVER, *f.* [*pass* and *over*.] A feast instituted among the Jews in memory of the time when God, smiting the first-born of the Egyptians, *passed over* the habitations of the Hebrews.—The Jews' *passover* was at hand, and Jesus went up. *St. John*, ii. 13.—The Lord's *passover*, commonly called Easter, was ordered by the common law to be celebrated every year on a Sunday. *Ayliffe's Parergon*.—The sacrifice killed.—Take a lamb, and kill the *passover*. *Exod.* xii. 21.

The *passover* was celebrated on the fourteenth day of the moon next after the vernal equinox, or the 14th day of the first month of the ecclesiastical year, which commenced with the flight of the Israelites out of Egypt; and which had the two names of Abib and Nisan. On the 14th day at even, the paschal lamb was to be killed and eaten; and from thence the feast was to be kept seven days, till the 21st. *Exod.* xii. 6, 8, 15. *Lev.* xxiii. 5, 6.

In the time of Joshua, Samuel, Hezekiah, and Josiah, and after the return from Babylon, it was kept with great care. See *Josh.* v. 2. *Chron.* xxx. 2. *Kings* xxiii. *Ezra* vi. 19. Perhaps, after the blood of the *passover*-lambs came to be sprinkled on the altar, they no more

9 H. sprinkled.

sprinkled it on their doors. It is certain, from the instance of our Saviour, that they did not that night confine themselves to their houses.

This feast was called, by the ancient Latins and Greeks, *pascha*, not from *πασχω*, "I suffer," as Chrysostom, Irenæus, and Tertullian, imagine, but from the Hebrew *פסח*, *pesach*, "passage, leap;" the design of the feast being to commemorate the destroying angel's *passing-over* the houses of the Israelites, when he entered in, and destroyed the first-born in those of the Egyptians. *Exod. xii. 27.*

The Greeks, some of the Catholic doctors, and several considerable critics, from the thirteenth, eighteenth, and nineteenth, chapters of St. John, take occasion to conclude, that Jesus anticipated the day marked for the passover in the law; but the authority of three evangelists seems to evince the contrary. (See Whitby's Dissertation on this subject, in an appendix to the fourteenth chapter of St. Mark.) He, no doubt kept it on the very night on which the other Jews observed it; otherwise his adversaries, who so eagerly fought for matter of accusation, would have fixed on this.

The Jews still observe a kind of passover, mingling most of the ancient rites with many modern inventions. Thus we are told that, after the destruction of Jerusalem, the Jews found it requisite to make a law that the first two days of the passover should be kept with peculiar strictness, instead of one; and, also the seventh and eighth days, instead of ending on the seventh; so that, according to this regulation, the passover is now kept eight days. All the other festivals which, before that time, were celebrated only one day, are now ordered to be observed two days, *Yom Kipur*, or the Day of Atonement, excepted; and this is still celebrated, as originally commanded, from *eve* to *eve*.

Among the ancient Jews at Jerusalem, it was customary, when criminals had been condemned to death, to reserve them for execution till the celebration of the most solemn feasts, of which there were three in the year; viz. the Passover, the Feast of Weeks, and the Feast of Tabernacles. Then, when the Jews came up to Jerusalem to sacrifice, these malefactors were executed, in order "that all Israel might see, and fear." *Time's Telescope*, 1815. *Brown's Dict. Bible.*

PASSOURA, *f.* in botany, a genus of Aublet's, of which the flower is totally unknown. He describes the fruit as follows: "Pericarpium: capsula oblong, triangular, of one cell, and three valves; seeds orbicular, three affixed to a longitudinal partition in the middle of each valve." No account is given of the origin of the name. The tree, which is a native of the Timoutou woods in Guiana, and bore fruit in May, is described by Aublet as having a trunk sixteen or eighteen feet high, branched to the summit; leaves opposite, stalked, ovate, acute, smooth, entire; fruit forming a terminal spike, yellowish. Seeds spherical, green.

PASS'PORT, *f.* [*passport*, Fr.] Permission of passage. —Under that pretext, fain she would have given a secret *passport* to her affection. *Sidney.*

Let him depart; his *passport* shall be made,
And crowns for convoy put into his purse. *Shakespeare.*

PASSUMACAN' BAY, a bay on the east coast of the island of Luçon: fifteen miles south of Cape Engano.

PASSUM'SICK, a river of North America, in Vermont, which runs into the Connecticut.

PASS'US, *f.* A Roman measure of length, being about four feet ten inches, or the thousandth part of a Roman mile. The word properly signifies, the space betwixt the feet of a man walking at an ordinary rate. See MEASURE, vol. xiv. p. 600.

PASSY, a small town of France, nearly adjoining to Paris on the west. See the article PARIS, p. 494.

PASSY-MEASURE, *f.* [*passamezzo*, Ital.] An old stately kind of dance; a cinque-pace. See PASSING-

MEASURE.—After a *passy-measure*, or a pavin, I hate a drunken rogue. *Shakespeare's Tw. Night.*

PASSYUNK, a town of America, in Philadelphia county, Pennsylvania, containing 884 inhabitants.

PAST, *part. adj.* [from *pass*.] Not present; not to come. —*Past* and to come seem best; things present, worst. *Shakespeare.*

This not alone has shone on ages *past*,
But lights the present, and shall warm the last. *Pope.*
Spent; gone through; undergone.—A life of glorious labours *past*. *Pope.*

PAST, *f.* Elliptically used for *past* time:

The *past* is all by death possest,
And frugal fate that guards the rest,
By giving bids us live to-day. *Fenton.*

PAST, *prep.* Beyond in time.—Sarah was delivered of a child, when she was *past* age. *Heb. xi. 11.*—No longer capable of.—Fervent prayers he made, when he was esteemed *past* sense, and so spent his last breath in committing his soul unto the Almighty. *Hayward.*

Past hope of conquest, 'twas his latest care
Like falling Cæsar decently to die. *Dryden.*

Beyond; out of reach of.—That France and Spain were taught the use of shipping by the Greeks and Phœnicians is a thing *past* questioning. *Heylin.*—Love, when once *past* government, is consequently *past* shame. *LEstrange.*

What's gone, and what's *past* help,
Should be *past* grief. *Shakespeare's Wint. Tale.*

Her life she might have had; but the despair
Of saving his had put it *past* her care. *Dryden.*

Beyond; further than.—We will go by the king's highway, until we be *past* thy borders. *Num. xxi. 22.*—Above; more than.—The northern Irish Scots have bows not *past* three quarters of a yard long, with a string of wreathed hemp, and their arrows not much above an ell. *Spenser on Ireland.*

PASTA'CA, a river of Quito, South America, which rises near Riobamba, and runs into the Maragnon fifty miles west of St. Joachim de Omaguas.

PASTE, *f.* [*pâte*, Fr. from the Lat. *pasco*, to feed.] A soft composition of flour, wrought up with proper fluids, as water, milk, or the like, to serve for cakes or coffins, therein to bake meats, fruits, &c. It is the foundation and roof of pies, tarts, patties, pasties, and other works of pastry.—Dr. Cullen observes, that *paste* is very hard and indigestible without butter; and, even with it, is apt to produce heartburn and acedency. Perhaps this is increased by the burned butter, from a certain sensibility in the stomach, which occasions all empyreumatic oils to be long retained, and so produce acidity. *Ency. Brit.*

PASTE, in confectionary, &c. a preparation of some fruit, made by beating the pulp thereof, with some fluid or other admixture, into a soft pappy consistence, spreading it into a dish, and drying it with sugar, till it becomes as pliable as an ordinary paste.

PASTE is likewise used for a preparation of wheaten flour, boiled up and incorporated with water; used by various artificers, as upholsterers, saddlers, bookbinders, &c. instead of glue or size, to fasten or cement their cloths, leathers, papers, &c. When paste is used by bookbinders, or for paper-hangings to rooms, they mix a fourth, fifth, or sixth, of the weight of the flour of powdered resin; and, where it is wanted still more tenacious, gum arabic, or any kind of size, may be added. Paste may be preserved, by dissolving a little sublimate, in the proportion of a dram to a quart, in the water employed for making it; which will prevent not only rats and mice, but any other kind of vermin and insects, from preying upon it.

PASTE, a sort of composition made from calcined crystal, lead, and metallic preparations, to imitate the several

ral natural gems. These are no way inferior to the native stones, when carefully made and well polished, in brightness and transparency, but want their hardness. See the articles GEM and GLASS, vol. viii.

TO PASTE, v. a. To fasten with paste.—By *pasting* the vowels and consonants on the sides of dice, his eldest son played himself into spelling. *Locke*.—Young creatures have learned their letters and syllables, by having them *pasted* upon little flat tablets. *Watts*.

PASTEBOARD, f. A kind of thick paper, formed of several sheets pasted together.—Tintoret made chambers of board and *pasteboard*, proportioned to his models, with doors and windows, through which he distributed on his figures artificial lights. *Dryden*.

There is also a coarse kind of pasteboard, made of old paper and old pasteboard, beaten in a mortar with water, and reduced into a kind of pulp; to which is added a little paste, to give the mass a consistence; after which it is formed into a mould, and, to finish it, laid in a press, to squeeze out all the water, and reduce it to its proper thickness. Each kind is distinguished by marks, which express the fineness and value; the finest is covered on both sides with a very white smooth paper; others only on one side; and others on both sides with common paper.

The chief use of pasteboard is in the binding of books, and the making of letter-cases, hat-cases, &c. For the duty on pasteboard, see the article PAPER, p. 375.

PASTEBOARD, adj. Made of pasteboard.—Put silk-worms on whitened brown paper into a *pasteboard* box. *Mortimer*.

PASTEK, a town of Asiatic Turkey, in the province of Diarbekir: fifty-six miles west-north-west of Diarbekir.

PASTEL. See PASTIL.

PASTER, f. [*pâture*, Fr.] That part of the leg of a horse between the fetlock, or joint next the foot, and the hoof.—This part should be short, especially in the middle-sized horses; because long *pasterns* are weak, and cannot so well endure travel. *Chambers*.

Upright he walks on *pasterns* firm and straight;
His motions easy, prancing in his gait. *Dryden*.

The legs of a human creature, in contempt, Dr. Johnson says; citing the example from Dryden. Elder poetry seems to exhibit the word for a *patten*.—She had better have worn *pasterns*. *Béaumont and Fl. Chances*.

So straight she walk'd, and on her *pasterns* high;
If, seeing her behind, he lik'd her pace,
Now, turning short, he better lik'd her face. *Dryden*.

PASTER, JOINT, f. The joint above the pastern.—The *pastern-joint*, after travelling, is very apt to be crowned; i. e. to have a swelling round it, beneath the skin, in form of a circle, a third of an inch broad. *Chambers*.

PASTIC'CIO, f. [Ital. a pie or pasty.] An oglio; a medley.—On our first entrance into the palace, which is a *pasticio* of Saracenic, Conventual, and Grecian, architecture, I was much taken with the principal front of the inner-court. *Swinburne's Trav. through Spain*—In music, an opera made up of detached airs by different composers.

PASTIL, f. [*pastillus*, Lat. *pastille*, Fr.] A sort of paste, made of several colours, ground up with gum-water, either together or separately, in order to make crayons to paint with on paper or parchment.—To draw with dry colours, make long *pastils*, by grinding red lead with strong wort, and so roll them up like pencils, drying them in the sun. *Peacham on Drawing*.

PASTIL is also used for a dry composition, yielding a fragrant smell when burnt in a perfuming-pan, to clear and scent the air of a chamber. It is composed of odorous resins, mixed with aromatic woods or drugs pulverised, and incorporated with mucilages of gum tragacanth. Some call these compositions *offsets of Cyprus*.

PASTIL, in confectionary, is a preparation of sugar with lemon-water, &c. boiled up with gum-water,

strained, beat up, and, by the addition of more dry sugar, worked into a pliable paste, and thus formed into round or oblong figures, and dried in a stove.

PASTIME, f. Sport; amusement; diversion. For a history of ancient pastimes, in this and other countries, see the article GAME, vol. viii. p. 199–204. also ARCHERY, vol. ii. LONDON, vol. xiii. and MAY, vol. xiv.—*Pastimes* of some kind seem to be absolutely necessary, and to none more than to the man of study; for the most vigorous mind cannot bear to be always bent. Constant application to one pursuit, if it deeply engage the attention, is apt to unhinge the mind, and to generate madness; of which the Don Quixote of Cervantes, and the astronomer of Johnson, are two admirably-conceived instances. Such *pastimes* or amusements, however, ought to be considered only as necessary relaxations from fever and more useful employment; and, in this point of view, they may be innocently and even wisely pursued; but they become criminal when they occupy the place of the business of life. *Ency. Brit.*

I'll be as patient as a gentle stream,
And make a *pastime* of each weary step,
Till the last step has brought me to my love. *Shakespeare*.

TO PASTIME, v. n. To sport; to take pastime. *Hulot*.

When did Perseda *pastime* in the streets,
But her Erastus over-ey'd her sport?

Soliman and Perseda, 1599.

PASTINACA, f. [said by some to be derived from *pasto*, Lat. to feed, or from *pastus*, a pasture, on account of the nourishing qualities of its roots, which are eaten by the poor. Linnæus rather considered the name as derived from *pastinum*, a forked tool used in digging or planting vineyards, which the root of *Pastinaca* resembles.] The PARSNIP; in botany, a genus of the class pentandria, order digynia, natural order of umbellatæ or umbelliferæ. Generic characters—Calyx: umbel universal, manifold, flat; partial manifold. Involucre: universal, none; partial none. Perianthium proper, obsolete. Corolla: universal, uniform; florets all fertile; proper of five lanceolate, involute, entire, petals. Stamina: filaments five, capillary; anthers roundish. Pistillum: germ inferior. Styles two, reflex. Stigmas blunt. Pericarpium: none. Fruit compressed, flat elliptic, bipartite. Seeds two, elliptic, girt, round the edge, almost flat on both sides.—*Essential Character*. Fruit elliptic, compressed, flat; petals involute, entire. There are but three species.

1. *Pastinaca lucida*, or shining-leaved parsnip: root-leaves simple, cordate-lobate, shining, acutely crenate: stem-leaves ternate and pinnate; branch-leaves simple, wedge-shaped. Root biennial, thick, milky. Stem stiff, rugged, grooved and angular, branched from the bottom, almost the height of a man; when cut, yielding a fetid, rue-like, whitish, tenacious, gum. Branches numerous, panicled. Root-leaves cordate, of different sizes, seldom lobed, netted scabrous, acutely crenate; petiole angular above. The first (or lower) stem-leaves ternate, with the lateral leaflets sessile and obliquely-ovate, the end leaflet petioled, cordate, three-lobed or five-lobed. The second (or upper) stem-leaves quinate (or pinnate with two pairs of lobes and an odd one), but very like the others; the leaflets three inches long, with sharp notches terminating in a white point, but sometimes obliterated. The uppermost leaves are quite simple, cordate-ovate, lobed, like those of the fig. All the branch-leaves wedge-shaped, quite entire from the base to the middle; thence to the tip acutely crenate, an inch long, on a petiole of the same length. Umbels very numerous, commonly with ten rays; the principal one terminating the stem; at the base of this are two, three, or four, branches, whence the top of the stalk becomes as it were proliferous. Seed suborbiculate, about three lines in diameter.

According

According to Linnæus, the stem is *smooth* and even, a foot and a half high and more. Leaves cordate, sometimes lobed, stiffish, wrinkled, shining, acutely notched or serrate. Petals yellow, entire, acute, bent in. Native of the south of Europe. Introduced in 1771, by Mons. Richard. It flowers in June and July.

2. *Pastinaca sativa*, or common parsnep: leaves simple, pinnate. Of this there are two varieties.

a. *P. sylvestris*, the wild parsnep, has a biennial, simple, whitish root, putting forth some large fibres from the side. Stem single, three or four feet high, erect, rigid, angular, pubescent, hollow, branched. Leaves alternate, smaller than those of the garden-parsnep, and of a darker green; in open situations pubescent, especially the root-leaves. Flowering-branches come out from the axils of the leaves from top to bottom, supporting umbels which are smaller than that which terminates the stem. Flowers small, yellow, with inflex regular petals. Wild parsnep is native of most parts of Europe, on the borders of ploughed fields and on the banks of hedges, chiefly in a calcareous or marly soil. It flowers from the end of June through August.

β. *P. sativa*, or garden-parsnep, has smooth leaves, of a light or yellowish green colour; in which it differs from the wild plant. The stalks also rise higher, and are deeper channelled; the peduncles are much longer, and the flowers of a deeper yellow colour. The roots are sweeter than carrots, and are much eaten by those who abstain from animal-food in Lent, or eat salt fish on fast-days: they are highly nutritious. In the north of Ireland they are brewed, instead of malt, with hops, and fermented with yeast. The liquor thus obtained is agreeable. Hogs are fond of these roots, and quickly grow fat with them.

Old Gerarde says, "There is a good and pleasant food or bread made of the roots of parsneps, as my friend Master Plat hath set forth in his book of experiments." It is asserted, says Ray, by some of our writers, that the roots, when old, bring on delirium and madness, and hence are called *madneps*. Parkinson, after informing us, that the seed ripens the second year after sowing, adds; "if they do flower the first year, the country people call them *madde neepes*." The seeds contain an essential oil, and will often cure intermittent fevers. The seeds used in medicine should be those of the wild plant; but the druggists commonly sell the seeds of the garden kind for it, which they purchase at an easy price when it is too old to grow. Villars says, that they have two remarkable varieties of the wild parsnep in Dauphiné: one with an angular branched stem approaching very near to the garden parsnep; the other with a simple round stem, very slightly striated, and receding so far from the cultivated plant, that it seems to be a distinct species.

3. *Pastinaca opopanax*, or rough parsnep: leaves pinnate and bipinnate, leaflets gashed at the base in front. Root perennial, as thick as the human arm, yellow, branched; the branches an inch or an inch and a half in thickness, a foot and a half in length, tubercled, with a corky bark. Stem from three feet to the height of a man, the thickness of a finger, striated, covered at the base with scariose membranaceous scales, like the ferns; in other parts very smooth and shining; angular at top, especially at the branches. Primary (or root) leaves quite simple, cordate, acutely crenate; the others ternate or quinate, with the end leaflet always cordate and very large; the lateral ones obliquely cordate, with the upper lobe shorter. The lowest stem-leaves more compound, considered as a whole triangular, two feet long, bipinnate, having five pinnules on each side; the lowest pinna pinnate, commonly with five leaflets, the end one cordate, the rest sessile and obliquely cordate: the leaflets are an inch to two inches long; the other pinnules are first ternate, then simple. The other stem-leaves decrease, and are first quinate, next ternate, and at the branches simple. Fruits flat, with the rim thicker, three or four lines in diameter, and a little longer. Juice

yellow, bearing no marks of a resinous or aromatic principle. This juice flows out where either the leaf or stalk is broken. They are both very rough; the former dark green, the latter seven or eight feet high. The stalks divide towards the top into many horizontal branches, each terminated by a large umbel of yellow flowers. They appear in July. Native of the south of Europe, south of France, Italy, and Sicily. Cultivated in 1731 by Mr. Miller.

This plant commonly ripens its seeds with us, and its juice manifests some of the qualities discovered in the officinal opopanax: but it is only in the warmer regions of the east, where this plant is also a native, that the juice concretes into this gum-resin. It is obtained by means of incisions made at the bottom of the stalk; and is imported from Turkey and the East Indies sometimes in little round drops or tears, but more commonly in irregular lumps, of a reddish-yellow colour, specked with white on the outside; internally paler, and frequently variegated with large white pieces. This gum-resin has a strong disagreeable smell, and a bitter, acrid, somewhat nauseous, taste. It readily forms a milky liquor with water by rubbing; and this on standing deposits a portion of resinous matter, and becomes yellowish: to rectified spirit it yields a gold-coloured tincture, which tastes and smells strongly of the drug. Water distilled from it is impregnated with its smell, but no essential oil is obtained on committing moderate quantities to the operation. Opopanax has been long esteemed for its attenuating, deobstruent, and aperient, virtues; but, as it is commonly prescribed in combination with other medicines, these qualities are by no means ascertained, nor do its sensible qualities indicate it to be a medicine of much power. Dr. Cullen classes it with the anti-spasmodics; it is however less fetid than galbanum, though more so than ammoniacum. It has commonly been given in hypochondriacal affections, visceral obstructions, menstrual suppressions, and asthma, especially when connected with a phlegmatic habit of body.

Propagation and Culture. The parsnep is cultivated in kitchen-gardens, the roots being large, sweet, and accounted very nourishing. It is propagated by seeds, which should be sown in February or March, in a rich mellow soil, well dug, that their roots may run downwards, the greatest excellency being the length and bigness of the roots. These may be sown alone, or with carrots, as is practised by the kitchen-gardeners near London; some of whom also mix leeks, onions, and lettuce, with their parsneps; but it is not possible that so many different things can thrive well together, except they are allowed a considerable distance; and, if so, it will be equally the same to sow the different sorts separate. However, carrots and parsneps may be sown together very well, especially where the carrots are designed to be drawn off very young; because the parsneps generally spread most towards the end of the summer, when the early carrots are gone.

When the plants are come up, hoe them out to ten or twelve inches asunder, cutting up all the weeds. This must be repeated three or four times, according as the weeds grow; but in the latter part of summer, when the plants cover the ground, they will prevent the growth of weeds. When the leaves begin to decay, the roots may be dug up for use. Before this they are seldom well tasted; nor are they good for much in the spring, after they have shot out again. To preserve them for this season, dig them up the beginning of February, and bury them in the sand in a dry place, where they will remain good until the middle of April or later.

To save seeds, make choice of some of the longest, straightest, and largest roots, and plant them two feet asunder, where they are defended from strong south and south-west winds, for the stems grow to a great height; keep them clear from weeds, and, if the season should prove dry, water them twice a-week. At the end of August or the beginning of September, the seeds will be ripe;

ripe; then carefully cut off the umbels, and spread them upon a coarse cloth for two or three days to dry; after which, beat off the seeds and put them up for use. Never trust to seeds that are more than a year old, for they will seldom grow beyond that age. The leaves are dangerous to handle, especially in a morning, while the dew remains upon them. Gardeners, when they have been drawing up carrots from among parsneps, while their leaves were wet with dew, and have turned the sleeves of their shirts up to their shoulders, have had their arms covered with large blisters, full of a scalding liquor, which have proved very troublesome for several days.

To cultivate parsneps for the farmer, sow the seed in autumn, soon after it is ripe; by which means the plants will come on early the following spring, and will get strong before the weeds can grow so as to injure them. The young plants never materially suffer through the severity of the seasons. The best soil for them is a rich deep loam; next to this is sand, or they will thrive well in a black gritty soil; but will never pay for cultivating in stone-brash, gravel, or clay soils; and they are always the largest where the staple is deepest. If the soil be proper, they do not require much manure. A very good crop has been obtained for three successive years without any. Forty cart-loads of sand laid on an acre of very stiff loam, and ploughed in, has answered very well. If land cannot be got in a proper condition to receive the seed in autumn, sow a plat in the garden or the corner of a field, and transplant thence at the end of April or early in May. The plants must be carefully drawn, and the land that is to receive them well pulverized by harrowing and rolling. When it is thus in order, open a furrow six or eight inches deep, and lay the plants in it regularly at the distance of ten inches or a foot, taking care not to let the root be bent, and that the plant stand upright after the earth is closed about it, which should be done immediately by persons following the planter with a hoe, and who must be attentive not to cover the leaves. Open another furrow eighteen inches distant from the last, plant it as before, and so proceed till the field is completely cropped. When any weeds appear, hoe the ground, and earth the plants.

With attention to the soil, the season for sowing, cleaning, and earthing the plants, and raising the seed from the largest and best parsneps, there is no doubt but the crop would answer much better than a crop of carrots. They are equal to them, if not superior, in fattening pigs; for they make the flesh whiter, and the animals eat them with more satisfaction. Clean washed and sliced among bran, horses eat them greedily, and thrive with them; nor do they heat horses, or, like corn, fill them with disorders. In France, and our islands adjoining to it, parsneps are held in high esteem both for cattle and swine. In Brittany this crop is said to be little inferior in value to wheat. Milch-cows fed with it in winter give as much and as good milk, and yield butter as well-flavoured, with parsneps, as with grass in May or June. See DAUCUS, ECHINOPHORA, HERACLEUM, and TOR-
DYLIUM.

To PASTINATE, *v. n.* [from the Lat. *pastino*, to loosen the earth.] To dig in a garden. *Cole.*

PASTINATION, *f.* The act of digging the earth. *Phillips.*

PASTITIUM, *f.* [in old records.] A pasture-ground.

PASTO, a town of Peru: eighty miles north-north-east of Lima.

PASTO, or St. JUAN DE PASTO, a town of South America, in the province of Popayan, capital of a district, in the viceroyalty of New Grenada, containing above 7000 inhabitants: 115 miles north-north-east of Quito, and eighty south-south-west of Popayan. Lat. 1. 15. N. lon. 76. 46. W.

PASTON, a village of Northumberland, on the borders of Scotland, near which is Harelaw-Hill, on which
Vol. XVIII. No. 1280.

is a circular entrenchment with a double rampart and fosse. *England's Gazetteer.*

PASTOPH'ORI, *f.* [from the Greek *πασος*, a veil, and *φερω*, to bear.] Priests whose office it was to carry the images, along with the shrines, of the gods, at solemn festivals, when they were to pray to them for rain, fair weather, or the like. The Greeks had a college of this order of priests in Sylla's time.

The cells or apartments near the temples, where the pastophori lived, were called *pastophoria*. Clemens Alexandrinus, describing the temples of the Egyptians, says, that, after having paced through magnificent courts, you are conducted to a temple, which is at the farther end of these courts, and then a pastophorus gravely lifts up the veil, (*πασος*;) which is the door, to show you the deity within: which is nothing but a dog, or a cat, or some other animal. These pastophori also supported the shrine, or niche, of these ridiculous divinities, when they were carried in procession. Apuleius speaks of the pastophori that carried the Syrian goddesses.

In the temple of Jerusalem there were two courts surrounded with galleries, and all round about were several lodging-rooms for the priests, and to lay up wood, wine, oil, salt, meal, spices, incense, vestments, valuable vessels, and provisions, necessary for the sacrifices and lamps, as also for the support and maintenance of the priests. See 1 Chron. ix. 26, 33. Ezek. xl. 17, 18. 1 Chron. xxvi. 16.

PASTOR, *f.* [Lat. *pastor*, old Fr.] A shepherd:

Receive this present by the Muses made,
The pipe on which the Aescæan *pastor* play'd. *Dryden.*

A clergyman who has the care of a flock.—*Pastor* originally signifies one that (*pastit*) feeds. Hence it was anciently used for a shepherd, or advocate; and is now appropriated to a minister, or one that has souls to feed with sound doctrine. *Chambers.*

PASTORAL, *adj.* [Fr. from *pastoralis*, Lat.] Rural; rustic, befitting shepherds; imitating shepherds.—In those *pastoral* pastimes, a great many days were sent to follow their flying predecessors. *Sidney.*—Relating to the care of souls.—Their lord and master taught concerning the *pastoral* care he had over his own flock. *Hooker.*—The bishop of Salisbury recommended the tenth satire of Juvenal, in his *pastoral* letter, to the serious perusal of the divines of his diocese. *Dryden.*

PASTORAL, *f.* A poem in which any action or passion is represented by its effects upon a country life, or according to the common practice in which speakers take upon them the character of shepherds; an idyl; a bucolic.—*Pastoral* is an imitation of the action of a shepherd: the form of this imitation is dramatic or narrative, or mixed of both; the fable simple, the manners not too polite nor too rustic. *Pope.*—There ought to be the same difference between *pastorals* and elegies, as between the life of the country and the court; the latter should be smooth, clean, tender, and passionate; the thoughts may be bold, more gay and more elevated than in *pastoral*. *Walsh.*

Most authors, says Dr. Blair, have indulged the fancy, that, because the life which mankind led at first was rural, their first poetry was therefore pastoral, or employed in the celebration of rural scenes and objects: but he is of opinion that, though it would borrow many of its images and allusions from those natural objects with which men were best acquainted, the calm and tranquil scenes of rural felicity were not the first objects which inspired that strain of composition which we now call poetry. The first themes were furnished to the bards of every country by objects and events that roused men's passions; such as the actions of their gods and heroes, their own exploits in war, and the successes or misfortunes of their countrymen and friends. What was of a pastoral kind in their compositions was merely incidental. It was not till men had begun to be assembled in great cities, after the distinctions

tinctions of rank and station were formed, and the bustle of courts and large societies was known, that pastoral poetry assumed its present form. It was in the court of king Ptolemy that Theocritus wrote the first pastorals with which we are acquainted; and in the court of Augustus he was imitated by Virgil.

Pastoral poetry, whatever was its origin, is undoubtedly a natural and very agreeable form of composition. It recalls to our imagination those gay scenes, and pleasing views of nature, which are commonly the delight of our childhood and youth; and to which, in more advanced life, most men recur with pleasure. It exhibits to us a life, with which we are accustomed to associate the ideas of peace, of leisure, or of innocence; and therefore we readily set open our hearts to such representations as promise to banish from our thoughts the cares of the world, and to transport us into calm Elysian regions. No subject, at the same time, seems to be more favourable to poetry. Amidst rural objects, nature presents, on all hands, the finest field for description; and nothing appears to flow more, of its own accord, into poetical numbers, than rivers and mountains, meadows and hills, flocks and trees, and shepherds void of care. Hence it is, that this species of poetry has, at all times, allured many readers and excited many writers. Nevertheless, there is hardly any species of poetry more difficult to be carried to perfection, or in which fewer writers have excelled.

Pastoral life is described by the author now cited in three different states of it: either as it now is, when shepherds are reduced to a mean, servile, and laborious condition; or such as it may be supposed to have been in the more early and simple ages, when flocks and herds were numerous, and shepherds, though unrefined in their manners, were respectable in their station; or such as it never was, nor can be, when, to the ease, innocence, and simplicity, of the early ages, we attempt to add the polished taste and cultivated manners, of modern times. The first of these states is too gross and mean, and the last too refined and unnatural, to become the groundwork of pastoral-poetry. Theocritus is censured for having deviated too much to the first extreme; and some of the French and Italian writers of pastorals have erred in making their shepherds discourse like courtiers and scholars; and in either way a person may retain the name, whilst he wants the spirit, of pastoral poetry. He that would succeed in this species of composition must keep in the middle station between these two extremes.

The great charm of pastoral poetry arises from the view which it exhibits of the tranquillity and happiness of a rural life. Yet the scenes of country life will be thought by many, and perhaps not without reason, too barren of incidents. The tenor of the shepherd's life is uniform, and does not admit of that variety which renders poetry interesting. Hence it is that, of all poems, the most meagre commonly in the subject, and the least diversified in the strain, is the pastoral. Common-place topics have been thrummed over by all eclogue-writers, since the days of Theocritus and Virgil; and to this circumstance is owing much of that insipidity which prevails in modern pastoral compositions. But why, says Dr. Blair, may not pastoral poetry take a wider range? Human nature, and human passions, are much the same in every rank of life; and, whenever these passions operate on objects that are within the rural sphere, there may be a proper subject for pastoral. In the mean time, as Dr. Johnson well observes, "an intelligent reader, who is acquainted with the scenes of real life, sickens at the mention of the crook, the pipe, the sheep, and the kids, which it is not necessary to bring forward to notice; for the poet's art is selection; and he ought to show the beauties without the grossness of the country life."

The two great fathers of pastoral poetry are Theocritus and Virgil. In those Idyllia of the former which are properly pastorals, there are many great beauties.

He is distinguished for the simplicity of his sentiments; for the great sweetness and harmony of his numbers; and for the richness of his scenery and description. He is the original after which Virgil has copied; but he has followed him with judgment, and in some respects improved upon him. Moschus and Bion, two other Greek poets, have also considerable merit in the pastoral style; and, if they want the simplicity of Theocritus, they excel him in tenderness and delicacy.

The modern writers of pastorals have generally contented themselves with imitating the ancient poets. Sannazarius, indeed, a famous Latin poet in the age of Leo X. attempted a bold innovation, by composing Pictorial Eclogues; changing the scene from woods to the sea, and from the life of shepherds to that of fishermen. But he has gained no followers among the moderns. Gesner, a poet of Switzerland, has been, in the judgment of Dr. Blair, the most successful in his pastoral compositions. He has introduced into his Idylls many new ideas. His rural scenery is striking, and his descriptions are lively. He presents pastoral life to us, with all the embellishments of which it is susceptible, but without any excess of refinement. The chief merit of this poet consists in his writing to the heart; and he has enriched the subjects of his Idylls with incidents which give rise to much tender sentiment. Scenes of domestic felicity are beautifully painted. The mutual affection of husbands and wives, of parents and children, of brothers and sisters, as well as of lovers, are displayed in a pleasing and touching manner.

Shenstone's Pastoral Ballad, in four parts, may justly be reckoned, says Dr. B. one of the most elegant poems of this kind in the English language. Neither Pope's nor Philips's pastorals do any great honour, in our author's opinion, to the English poetry. Mr. Gay published his Shepherd's Week, in six pastorals, with a design of ridiculing that sort of simplicity which Philips and his partisans extolled; and they are an ingenious burlesque of pastoral writing, when it rises no higher than the manners of modern clowns and rustics. The literary distinction which Ambrose Philips had obtained from the success of his tragedy of the Distressed Mother, was probably the cause of an exaggerated compliment from Tickell, which eventually exposed him to ridicule and mortification. That writer, in a paper in the Guardian upon pastoral poetry, absurdly enough made the true pastoral pipe to descend in succession from Theocritus to Virgil, Spenser, and Philips. Pope, who thus found his own juvenile pastorals undervalued, sent to the Guardian a comparison between his and those of Philips, in which he ironically gave the preference to the latter; and the irony was so well concealed, that Steele was deceived, and it was not till Addison had made the discovery that the purpose was detected. It probably ruined the pastoral reputation of Philips; and thenceforth open war prevailed between the two poets, envenomed by the double hostility of party and rivalry.

Pastoral writing has appeared in later ages under the form of a regular drama, blending plot, characters, and passions, with the simplicity and innocence of rural manners. Accordingly pastoral has been defined a dramatic piece, in which the persons are clad like nymphs and shepherds, and act their own amours. The scene is always in the fields or woods; whence Tasso calls pastoral *favole boscareccie*. Such are the Pastor Fido of Guarini; the Aminta of Tasso; the Sylvia of Mairat, the French poet; and the Comus of Milton, &c. Tasso assumes to himself the honour of having invented pastoral; but the first idea of this kind of drama seems to be Beccari's, who made the attempt in 1552: yet, Tasso's Aminta, which did not appear till the year 1573, effacing what had been done by Beccari, the first author was forgot, and Tasso left as the inventor. It is certain this kind of pastoral fable, composed according to the rules of the stage, was unknown among the ancients. The Greeks

Greeks and Latins have indeed introduced shepherds in their eclogues; but these eclogues had nothing theatrical in them, nor were the shepherds ever brought upon the stage. Tasso's *Aminta* claims the preference, as it is less intricate in the plot and conduct, and less strained and affected in the sentiments, than the *Pastor Fido* of Guarini. Both possess great beauties, and are entitled to the reputation they have gained. Dr. Blair mentions another pastoral drama, which will bear being brought into comparison with any composition of this kind, in any language; that is, Allan Ramsay's *Gentle Shepherd*. The characters are well drawn, and the incidents affecting; the scenery and manners lively and just. It affords a strong proof, both of the power which nature and simplicity possess, to reach the heart, in every sort of writing; and of the variety of pleasing characters and subjects, with which pastoral poetry, when properly managed, is capable of being enlivened. *Blair's Lectures*, vol. iii. *Johnson's Life of Shenstone*.

PASTORAL. A book relating to the cure of souls.—The Lord prosper the intention to myself, and others, who may not despise my poor labours, but add to those points which I have observed, until the book grow to a compleat *pastoral*. *Herbert's Country Parson*, 1632.

PASTORIUS (Joachim), a writer of history, was born in 1610, at Great Glogau in Silesia. He was brought up to the medical profession, took the degree of doctor, and received the title of honorary professor at Elbing and Dantzic; but his avowal of Socinian principles subjected him to various ill offices. His constancy at length gave way, and he conformed to the Roman-catholic religion. This change was of great advantage to his fortune: he was ennobled, created apostolic prothonotary, canon of Warmia and Chelm, dean and official general of Dantzic, and finally historiographer, secretary, and commissary, of the kingdom of Poland. He died at Frauenberg in Prussia in 1681. This author published several historical works in the Latin Language; viz. 1. *Theodosius Magnus, seu Vita illius excellentis Imperatoris*, 1664. 2. *Florus Polonicus, seu Polonica Historiæ Epitome*, 1679. 3. *Historiæ Polonæ plenioris Partes duæ, ab anno 1647 ad annum 1651; accedit Dissertatio de Originibus Sarmaticis*, 1685. 4. *Bellum Scythico-Cosaicum*, 1659. 5. He also published the *Aristotelian Ethics* of Crellius, with a life of the author; and some *Orations*, *Poems*, &c.

PASTORLIKE, or **PASTORLY**, *adj.* Becoming a pastor.—The *pastorlike* and apostolick imitation of meek and unlordly discipline. *Milton of Ref. in England*.—Against negligence or obstinacy will be required a rousing volley of *pastorly* threatenings. *Milton's Anim. Rem. Defence*.

PASTORSHIP, *f.* The office or rank of a pastor.—The universal *pastorship* or government of the catholic church, was never claimed by any bishop till towards the end of the sixth century; and then it was thought to be challenged by John, patriarch of Constantinople. *Bp. Bull's Corrupt. of the Ch. of Rome*.—Why may not the bishop of Antioch pretend to succeed St. Peter in his universal *pastorship*? *Barrow on the Pope's Supremacy*.

PASTRENGO, a village of Italy, in the Veronese, on the Adige.

PASTRY, *f.* [*pâtisserie*, Fr. from *paste*.] The act of making pies:

Let never fresh machines your *pastry* try,
Unless grapes or magistrates are by;
Then you may put a dwarf into a pie.

King.

Pies or baked *paste*.—Remember the feed-cake, the *pastries*, and the furmenty-pot. *Tusser*.

Beasts of chase, or fowls of game,

In *pastry* built, or from the spit, or boil'd. *Milton's P. R.*

The place where *pastry* is made.—They call for dates and quinces in the *pastry*. *Shakespeare*.

PASTRY-COOK, *f.* One whose trade is to make and sell things baked in *paste*.—I wish you knew what my

husband has paid to the *pastry-cooks* and confectioners. *Arbuthnot*.

PASTURABLE, *adj.* [from *pasture*.] Fit for pasture.

PASTURAGE, *f.* [*pâturage*, Fr.] The business of feeding cattle.—I wish there, were ordinances, that whosoever keepeth twenty kine, should keep a plough going; for otherwise all men would fall to *pasturage*, and none to husbandry. *Spenser*.—Lands grazed by cattle.—France has a sheep by her, to shew that the riches of the country consisted chiefly in flocks and *pasturage*. *Addison*.—The use of pasture.—Cattle fatted by good *pasturage*, after violent motion, die suddenly. *Arbuthnot on Aliments*.

PASTURANO, a village of Italy: eight miles south-east of Alexandria.

PASTURE, *f.* [*pâturage*, Fr.] Food; the act of feeding.—Unto the conservation is required a solid *pasture*, and a food congenious unto nature. *Brown's Vulg. Err.*—Ground on which cattle feed.—When there was not room for their herds to feed together, they, by consent, separated and enlarged their *pasture* where it best liked them. *Locke*.

The new tribes look abroad

On nature's common, far as they can see
Or wing, their range and *pasture*.

Thomson.

Pasture-ground is of two sorts: the one is low meadowland, which is often overflowed; and the other is upland, which lies high and dry. The first of these will produce a much greater quantity of hay than the latter, and will not require manuring or dressing so often; but then the hay produced on the upland is much preferable to the other, as is also the meat which is fed in the upland more valued than that which is fatted in rich meadows; though the latter will make the fatter and larger cattle, as is seen by those which are brought from the low rich lands in Lincolnshire. But, where people are nice in their meat, they will give a much larger price for such as has been fed on the downs, or in short upland pasture, than for the other, which is much larger. Besides this, dry pastures have an advantage over the meadows, that they may be fed all the winter, and are not so subject to poach in wet weather; nor will there be so many bad weeds produced; which are great advantages, and do, in a great measure, recompense for the smallness of the crop.

We have already mentioned the advantages of meadowland, or such as is capable of being overflowed with water, and given directions for draining and improving low pasture-land. (See the articles *DRAINING* and *IRRIGATION*.) We shall now therefore notice some methods for improving upland pasture.

The first improvement of upland pasture is, by fencing it, and dividing it into small fields of four, six, eight, or ten, acres each, planting timber-trees in the hedge-rows, which will screen the grafs from the drying pinching winds of March, which prevent the grafs from growing in large open lands; so that, if April prove a cold dry month, the land produces very little hay; whereas in the sheltered fields the grafs will begin to grow early in March, and will soon after cover the ground, and prevent the sun from parching the roots of the grafs, whereby it will keep growing, so as to afford a tolerable crop, if the spring should prove dry. But, in fencing your land, it must be observed not to make the inclosures too small, especially where the hedge-rows are planted with trees; because, when the trees are advanced to a considerable height, they will spread over the land; and, where they are close, will render the grafs sour; so that, instead of being an advantage, it will greatly injure the pasture.

The next improvement of upland pasture is, to make the turf good, where, either from the badness of the soil, or want of proper care, the grafs has been destroyed by rushes, bushes, or mole-hills. Where the surface of the land is clayey and cold, it may be improved by paring it off, and burning it: but, if it is a hot sandy land, then chalk, lime, marle, or clay, are very proper manures to lay

lay upon it; but this should be laid in pretty good quantities, otherwise it will be of little service to the land.

If the ground is over-run with bushes or rushes, it will be of great advantage to grub them up towards the latter part of the summer, and after they are dried to burn them, and spread the ashes over the ground just before the autumnal rains; at which time the surface of the land should be levelled, and sown with grafs-feed, which, if done early in the autumn, will come up in a short time, and make good grafs the following spring. So also, where the land is full of mole-hills, these should be pared off, and either burnt for the ashes, or spread immediately on the ground where they are pared off, observing to sow the bare patches with grafs-feed, just as the autumnal rains begin.

There are some pasture-lands which are full of ant-hills, which are not only disagreeable to the sight, but, where they are in any quantity, the grafs cannot be mowed; therefore the turf which grows over them should be divided with an instrument into three parts, and pared off each way; then the middle or core of the hills should be dug out and spread over the ground, leaving the holes open all the winter to destroy the ants, and in the spring the turf may be laid down again; and, after the roots of the grafs are settled again in the ground, it should be rolled to settle the surface, and make it even. If this is properly managed, it will be a great improvement to such land.

Where the land has been thus managed, it will be of great service to roll the turf, in the months of February and March, with a heavy wooden roller, always observing to do it in moist weather, that the roller may make an impression: this will render the surface level, and make it much easier to mow the grafs than when the ground lies in hills; and will also cause the turf to thicken, so as to have what the people usually term a good bottom. The grafs likewise will be the sweeter for this husbandry, and it will be a great help to destroy bad weeds.

Another improvement of upland pasture, is the feeding them every other year; for, where this is not practised, the land must be manured at least every third year; and, where a farmer has much arable land, he will not care to part with his manure to the pasture. Therefore every farmer should endeavour to proportion his pasture to his arable land, especially where manure is scarce, otherwise he will soon find his error; for the pasture is the foundation of all the profit which may arise from the arable land.

Whenever the upland pastures are mended by manure, there should be a regard had to the nature of the soil, and a proper sort of manure applied; as, for instance, all hot sandy lands should have a cool manure; neat's dung and swine's dung are very proper for such lands, as also marle and clay; but, for cold lands, horse-dung, ashes, or sand, and other warm manures, are proper. And, when these are applied, it should be done in autumn, before the rains have soaked the ground, and rendered it too soft to cart on; and it should be carefully spread, breaking all the clods as small as possible, and early in the spring harrowed with bushes, to let it down to the roots of the grafs. When the manure is laid on at this season, the rains in winter will wash down the salts, so that the following spring the grafs will receive the advantage of it.

There should be also great care taken to destroy weeds in the pasture, every spring and autumn. "Not a weed," says Mr. Marshall, "ought to seed, nor a tuft of stale grafs be suffered to stand, in a pasture-ground; which should at least once during the summer be levelled with the scythe; thus, at a small expense, converting weeds into nutriment, and waste-ground into after-grafs."

These upland pastures seldom degenerate the grafs which is sown on them, if the land is tolerably good;

whereas the low meadows, which are overflowed in winter, in a few years turn to a harsh rushy grafs; but the upland will continue a fine sweet grafs for many years without renewing.

There is no part of husbandry, of which the farmers are in general more ignorant, than that of the pasture; most of them suppose, that, when the old pasture is ploughed up, it can never be brought to have a good sward again; so their common method of managing their land after ploughing, and getting two or three crops of corn, is, to sow with their crop of barley some grafs-seeds as they call them; that is, either the red clover, which they intend to stand two years after the corn is taken off the ground, or ray-grafs mixed with trefoil; but, as all these are at most but biennial plants, whose roots decay soon after their seeds are perfected, so the ground, having no crop upon it, is again ploughed for corn; and this is the constant round which the lands are employed in, by the better sort of farmers. But it is very possible to lay down land, which has been in tillage, with grafs, in such manner as that the sward shall be as good, if not better, than any natural grafs, and of as long duration. This, however, is never to be expected in the common method of sowing a crop of corn with the grafs-seeds; for, wherever this has been practised, if the corn has succeeded well, the grafs has been very poor and weak; so that, if the land has not been very good, the grafs has scarcely been worth standing; for the following year it has produced but little hay, and the year after the crop is worth little, either to mow or feed. Nor can it be expected it should be otherwise, for the ground cannot nourish two crops; and, if there were no deficiency in the land, yet the corn, being the first, and most vigorous of growth, will keep the grafs from making any considerable progress; so that the plants will be extremely weak, and but very thin, many of them which came up in the spring being destroyed by the corn; for, wherever there are roots of corn, it cannot be expected there should be any grafs. Therefore the grafs must be thin; and, if the land is not in good heart to supply the grafs with nourishment, that the roots may branch out after the corn is gone, there cannot be any considerable crop of clover; and, as the roots are biennial, many of the strongest plants will perish soon after they are cut; and the weak plants, which had made but little progress before, will be the principal part of the crop for the succeeding year, which is many times not worth standing.

Therefore, when ground is laid down for grafs, there should be no crop of any kind sown with the seeds; and the land should be well ploughed, and cleaned from weeds; otherwise the weeds will come up the first, and grow so strong as to overbear the grafs, and, if they are not pulled up, will entirely spoil it. The best season to sow the grafs-seeds upon dry land is about the middle of August, if there is an appearance of rain; for, the ground being then warm, if there happen some good showers of rain after the seed is sown, the grafs will soon make its appearance, and get sufficient rooting in the ground before winter, so will not be in danger of having the roots turned out of the ground by the frost, especially if the ground is well rolled before the frost comes on, which will press it down, and fix the earth close to the roots. Where this has not been practised, the frost has often loosened the ground so much, as to let in the air to the roots of the grafs, and done it great damage; and this has been brought as an objection to the autumnal sowing of grafs; but it will be found to have no weight, if the above direction is practised; nor is there any hazard in sowing the grafs at this season, but that of dry weather after the seeds are sown; for, if the grafs comes up well, and the ground is well rolled in the middle or end of October, and repeated the beginning of March, the sward will be closely joined at bottom, and a good crop of hay may be expected the same summer. In very open ex-
posed

posed cold lands, it is proper to sow the seeds earlier than is here mentioned, that the grass may have time to get good rooting before the cold season comes on to stop its growth; for, in such situations, vegetation is over early in autumn, so the grass, being weak, may be destroyed by frost; but, if the seeds are sown in the beginning of August, and a few showers follow soon after to bring up the grass, it will succeed much better than any which is sown in the spring. But, where the ground cannot be prepared for sowing at that season, it may be performed the middle or latter end of March, according to the season's being early or late; but, whenever the seeds are sown late in the spring, it will be proper to roll the ground well soon after the seeds are sown, to settle the surface, and prevent its being removed.

The sorts of seeds which are the best for this purpose, are the best sort of upland hay-seeds, taken from the cleanest pastures, where there are no bad weeds; if this seed is sifted to clean it from rubbish, three, or at most four, bushels, will be sufficient to sow an acre of land. The other sort is the *Trifolium pratense album*, which is commonly known by the names of white Dutch clover, or white honeyfuckle-grass: eight pounds of this seed will be enough for one acre of land. The grass-seed should be sown first, and then the Dutch clover-seed may be afterward sown; but they should not be mixed together, because the clover-seeds, being the heaviest, will fall to the bottom, and, consequently, the ground will be unequally sown with them. After the seeds are sown, the ground should be lightly harrowed to bury the seeds; but this should be performed with a short-toothed harrow, otherwise the seeds will be buried too deep. Two or three days after sowing, if the surface of the ground is dry, it should be rolled with a barley-roller to break the clods and smooth the ground, which will settle it, and prevent the seeds from being removed by the wind. When the seeds are come up, if the land should produce many weeds, these should be drawn out before they grow so tall as to overbear the grass; for, where this has been neglected, the weeds have taken such possession of the ground, as to keep down the grass and starve it; and, when these weeds have been suffered to remain until they have shed their seeds, the land has been so plentifully stocked with them, as entirely to destroy the grass; therefore it is one of the principal parts of husbandry, never to suffer weeds to grow on the land.

If the ground is rolled two or three times at proper distances after the grass is up, it will press down the grass, and cause it to make a thicker bottom; for, as the Dutch clover will put out roots from every joint of the branches which are near the ground, so, by pressing down the stalks, the roots will mat so closely together, as to form a sward so thick as to cover the whole surface of the ground, and form a green carpet, which will better resist the drought. If we do but examine the common pastures in summer (in most of which there are patches of this white honeyfuckle-grass growing naturally), we shall find these patches to be the only verdure remaining in the fields. And this the farmers in general acknowledge is the sweetest feed for all sorts of cattle, yet they never had any notion of propagating it by seeds till of late years. Nor has this been long practised in England; for till within a few years, that some curious persons imported the seed from Brabant, where it had been long cultivated, there were not any of the seeds saved in England; though now there are several persons who save the seeds here, which succeed full as well as any of the foreign seeds which are imported.

As this white clover is an abiding plant, so it is certainly the very best sort to sow where pastures are laid down to remain; for, as the hay-seeds which are taken from the best pastures will be composed of various sorts of grass, some of which may be but annual and others biennial, so, when those go off, there will be many and large patches of ground left bare and naked, if there is

not a sufficient quantity of the white clover to spread over and cover the land. Therefore a good sward can never be expected where this is not sown; for, in most of the natural pastures, we find this plant makes no small share of the sward; and it is equally good for wet and dry land, growing naturally upon gravel and clay in most parts of England; which is a plain indication how easily this plant may be cultivated to great advantage, in most sorts of land throughout this kingdom.

The true cause why the land which is in tillage is not brought to a good turf again, in the usual method of husbandry, is, from the farmers not distinguishing which grasses are annual, from those which are perennial; if annual or biennial grasses are sown, these will of course soon decay; so that, unless where some of their seeds may have ripened and fallen, nothing can be expected on the land but what will naturally come up. This, together with the covetous method of laying down the ground with a crop of corn, has occasioned the general failure of increasing the pasture in many parts of England, where it is now much more valuable than any arable land.

After the ground has been sown in the manner before directed, and brought to a good sward, the way to preserve it good is, by constantly rolling the ground with a heavy roller, every spring and autumn, as has been before directed. This piece of husbandry is rarely practised by farmers; but those who do, find their account in it, for it is of great benefit to the grass. Another thing should also be carefully performed, which is, to cut up docks, dandelion, knapweed, and all such bad weeds, by their roots every spring and autumn; this will increase the quantity of good grass, and preserve the pastures in beauty. Dressing these pastures every third year, is also a good piece of husbandry, for otherwise it cannot be expected the ground should continue to produce good crops. Besides this, it will be proper to mow one season, and feed the next; but, where the ground is every year mown, it must be constantly dressed, as most of the grass-grounds near London, otherwise the ground will be soon exhausted.

Of late years there has been an emulation, especially among gentlemen, to improve their pastures, by sowing several sorts of grass-seeds; and there have been some persons of little skill in these matters, who have imposed on many ignorant people, by selling them seeds of some foreign grass, recommending them for some particular quality, but when tried have proved of little worth, whereby they have lost a season or two, and have had their work to begin again. Therefore we would advise every person not to trust too much upon the faith of such practitioners, who, upon slight experiments, have ventured to recommend without judgment; for, of all the sorts of grass-seeds which have been brought from America, none is equal to the *Poa* grass, which grows naturally in England, either for duration or verdure; therefore that, and about six or seven other sorts, are the best worth cultivating; but the trouble of collecting these in quantity is so great as to deter most people from attempting it: and, in the purchasing of hay-seeds, there is generally more seed of weeds than grass, which will soon fill the ground. There are no two better plants yet known for the purpose of fodder, than the lucern and saintfoin; for, where these are properly sown upon right soils and duly cultivated, they will produce a much greater quantity of food than can be procured from the same quantity of land sown with any other abiding plant; therefore let those who are desirous to have much fodder for their cattle, apply themselves to the culture of these, and not engage in uncertain experiments.

The following directions for laying down land to grass are given by Mr. Stillingfleet. Plough the land in March as deep as the nature of the soil will admit. Harrow when the weeds are about flowering, namely, some time in May, or sooner if it be a forward spring. Plough about ten days after harrowing. Harrow when the
9 K weeds

weeds are come up again. If any dung or compost be prepared for the land, let it be laid on. Plough at this time, and plough it in a moderate depth immediately, so that the teeth of the harrow after rolling may reach it. Roll the land every day as it is ploughed with a light roller, and observe not to spread the dung long before it is ploughed in. Harrow well when the weeds come up that are produced by the dung, so as to bring the dung up and mix it with the soil; observing not to harrow more at once than can be ploughed in one day. Plough it up after the harrows the same depth as before, and follow the plough with a roller. The land will now lie under the proper preparation for the seeds, which may be sown after the first soaking rain from the end of August to the end of September, in the following manner. Plough the land about the same depth as before: harrow it once in a place, and sow the seeds after the harrow: then with a hurdle bushed with black-thorn bushes, harrow the seeds in. When the plants appear, roll the land with a light roller, and not before, except the weather prove very dry, in which case it will be necessary to roll it with a very light roller after the bush-harrow. A light dressing of good manure laid on with the first frost, will be of great use in preserving the grass the first season, and encouraging its growth afterwards. And a light roller used after every frost, will be of great service the first winter.

In Yorkshire they have three ways of sowing grass-seeds: 1st, in August; 2dly, with barley, which is most used; 3dly, upon wheat, in March. The first way is the best; and the second is better than the last. The quantity sown is ten bushels to the acre, four pounds of hop-trefoil (*Medicago lupulina*, black nonesuch), or white clover, and some add two pounds of ray-grass. After the crop is cut, suffer no cattle to enter till next hay-harvest, when the grass may be either cut or fed. But there is danger from the cattle in the last way. The farmers generally mow the first crop for the sake of seeds, because that affords more than the succeeding ones. If sown with barley, roll as soon as the barley is off the ground. Lay on dung after the first crop of grass is mowed.

As to the different kind of herbs of pasture, and their qualities, see the article GRASS, vol. viii. See also the article HUSBANDRY, vol. x. p. 521, 548.

PASTURE. Human culture; education. *Not used.*

From the first *pastures* of our infant age,
To elder cares and man's severer page,
We lash the pupil.

Dryden.

To PASTURE, *v. a.* To place in a pasture.

To PASTURE, *v. n.* To graze on the ground.—He [Nebuchadnezzar] like an ox shall *pasture*. *Gower's Conf. Am.*

The cattle in the fields and meadows green :
Thofe rare and solitary, thefe in flocks,
Pasturing at once, and in broad herds upspring. *Milton.*

PA'STY, [from *paste*.] A work of paste, or pastry; being a preparation of some proper meat, as beef, venison, lamb, or the like, well boned, beaten up to a pulp, and highly seasoned; put up in a paste, and then baked in an oven.—I will confess what I know; if ye pinch me like a *pastry*, I can say no more. *Shakespeare.*

Of the paste a coffin will I rear,
And make two *pestles* of your shameful heads. *Shakespeare.*
If you would fright an alderman and mayor,
Within a *pastry* lodge a living hare. *King.*

PASZ/BERG, or Pas, a town of Istria: twenty-five miles south-south-east of Trieste, and nine north-north-east of Pedena.

PAT, *adj.* [*pas*, Teut. opportunity; or, by a change of letters, from the Lat. *aptus*, fit, apt.] Fit; convenient; exactly suitable either as to time or place. This

is a low word, and not now used but in burlesque writings, or in colloquial expression. Yet formerly our best writers employed it in their most serious compositions.—Sometimes it [facetiousness] lieth in *pat* allusion to a known story. *Barrow.*—There are some instances of vengeance befalling very flagitious men so signally, and with such *pat* and significant circumstances, that (without any uncharitableness) we may be led by the suffering to the sin; as in the famous case of Adonibezek, Judg. i. 7. *Goodman's Wint. Ev. Conference.*—Zuinglius dreamed of a text, which he found very *pat* to his doctrine of the Eucharist. *Atterbury.*

They never saw two things so *pat*
In all respects as this and that.

Hudibras.

PAT, *adv.* Fitly; conveniently; in a way exactly suitable either as to time or place.—Touching opinion, so various are the intellectuals of human creatures, that one can hardly find out two who jump *pat* in one. *Howell's Letters.*

He was sorely put to't at the end of a verse,
Because he could find no word to come *pat* in. *Swift.*

PAT, *f.* [*patie*, Fr. is a foot, and thence *pat* may be a blow with the foot. *Dr. Johnson.* Others derive it from the Fr. *but*, a blow; and that from the very ancient word *bata*, as Serenius observes, to strike. It may, by a metathesis, however, be no other than the word *tap*, a gentle blow. *Todd.*] A light quick blow; a tap.—The least noise is enough to disturb the operation of his brain; the *pat* of a shuttle-cock, or the creaking of a jack, will do. *Collier on Human Reason.*—Small lump of matter beat into shape; as, a *pat* of butter.

To PAT, *v. a.* To strike lightly; to tap.—Children prove, whether they can rub upon the breast with one hand, and *pat* upon the forehead with another; and straightways they *pat* with both. *Bacon's Nat. Hist.*

PA'TA, a town on the north coast of the island of Luçon. Lat. 18. 15. N. lon. 121. 20. E.

PA'TA, a small island in the Sooloo Archipelago. Lat. 5. 45. N. lon. 121. 10. E.

PATABEA, *f.* [derivation unknown.] In botany, a genus of the class tetrandia, order monogynia, natural order rubiaceæ, *Juss.* Generic characters—Calyx: perianthium superior, of one leaf, turbinate, with four acute little teeth. Corolla: of one petal; tube oblong, inserted into the disk, above the germen; limb cloven into four oblong acute lobes. Stamina: filaments four, short, inserted into the tube at its throat; antheræ oblong, two-celled. Pistillum: germen inferior, firmly united to the bottom of the calyx, crowned by the disk; style oblong, cloven; stigmas two, obtuse. Pericarpium and seeds unknown.—*Essential Character.* Calyx four-toothed; flowers in little heads, which are scaly on the outside; corolla tubular, four cleft; antheræ nearly sessile.

Patabea coccinea, a single species. It is a native of woods and forests in Guiana, particularly at Orapu, where it flowers in the month of June. The stem of this shrub is four or five feet in height, furnished with numerous branches even to its summit, scattered in all directions; the smaller ones knobbed and opposite. Leaves opposite, stalked, oval, smooth, pointed, paler beneath. Flowers red, in a terminal head, separated from each other by little scales. *Aublet*, t. 43.

PATACA, *f.* Coins of Brazil of 600 and 640 rees value, current only in that country, and whose intrinsic value is 10 per cent. less than that of the Portugal coins. The Spanish patacas, or dollars, are reckoned in Lisbon at 830 rees, more or less. The old pataca of Brazil, of 640 rees, is in sterling value 3s. 1½d. The pataca of 600 rees (1755) is worth 2s. 10½d. The impression on the pataca is the arms of Portugal, with 640 on the side, and the date near the top; legend, the name and title of the reigning sovereign, with the addition of ERAS. D. *Brasilia*

flie Dominus or *Domine*, Lord or Lady of Brasil; reverse, an armillary sphere, placed on a cross; legend, *SUBQUE SIGNO NATA STABILI*; "Born under a steady sign."

PATACA is also the name given to the German dollars in Egypt; which formerly passed for 85 medini, but have been raised to 90 medini. In making bargains, however, where patacas are to be received in payment, it is necessary previously to settle the value of the coin.

PATACA Chica and **PATACA Gourda**, two moneys of account at Algiers. The *pataca chica* is worth 11½d. sterling; the *pataca gourda*, or *piastre*, contains three *patacas chicas*.

PATAC'CHE, *f.* [French.] A small ship. *Ainsworth.*

PATAK', a town of Hindoostan, in Palnaud: twenty miles west of Timerycotta.

PATACOO'N, *f.* A silver coin, worth four shillings and eight pence English.—This makes Spain to purchase peace of her with his Italian *patacoons*. *Howell.*

The **PATACOO'N**, *patacon*, or *patagon*, is a denomination of silver coin current in Switzerland, and also at Liege in Germany. The *patagon*, or *ecu*, of Geneva, which is sometimes used in accounts, is a real coin, worth 3 livres, or 10½ florins; or 4s. 1d. sterling. The *patagon*, or crown, of Bern, is in value 4s. 9½d. sterling. The old *patagon* of Basil, is in value 4s. 4½d. sterling: the *patagon* of 1795 is in value only 3s. 10d. sterling. The *patagon* of Geneva is worth 4s. 1d. sterling. Lastly, the *patacon* of Liege is worth 4s. 4d. sterling; but the *patacon* of account is worth only 4s. 2½d.

PATADA', a town of Hindoostan, in the circar of Aurungabad: thirty miles north of Darore.

PATAGO'A, a river of Brasil, which runs into the sea near Rio Janeiro.

PATAGO'NIA, [so named by Magellan from the Spanish *pata*, foot, and *guanaco*, because the inhabitants wore on their feet the hairy skin of the *guanaco*, or *huanaco*, *Camelus huanacus*.] A country of South America, bounded on the north by the vice-royalty of La Plata or Buenos Ayres, on the east by the Atlantic Ocean, on the south by the Straits of Magellan, and on the west by the South Pacific Ocean, extending from about lon. 64. 30. to 74. 30. W. and from about lat. 38. to 54. S. The boundaries of this country, however, are not accurately ascertained, and its figure is very irregular.

This country was first discovered in the year 1519, by Ferdinand Magellan, who passed through the narrow sea which separates this country from the island of Fuego; and the country, as well as the straits, was called by his name; as *Land of Magellan*, or *The Magellanic Lands*; and by others, we cannot tell why, *Tehuella*; but it is now more generally known by the name of Patagonia.

The Voyage of Magellan round the World was the first ever made; for it would be ungenerous to deny, the title, because that great navigator was slain at the Philippine islands. Pigafetta, who accompanied Magellan, drew up an account of this memorable voyage in Italian, which has been recently published in a splendid manner. But the sixteenth century was not the age of philosophy; it was an age wherein marvellous stories met with a ready belief; and accordingly Pigafetta thought fit to assign to the Patagonians a stature of more than *four yards*; but, abstracting from the little credit due to this author, on account of the absurdities and falsehoods scattered over his work, in the circumstance of their size he is so inconsistent, that, after having furnished them with heads of a monstrous size, he says, that Magellan, amongst other presents, gave to one of them his own cap, which the other immediately put on and wore, although Magellan was himself far from being a giant. Maximilian Transilvanus, who in his work only translated Pigafetta's book, repeats the same absurd story, and embellishes it with some improbabilities of his own invention. As these two were the only works which had general circulation for some time, they fell into the hands of authors of more simplicity than discernment, such as Gonzalo

Fernandez Oviedo, who translated the above and many other fables into his General and Natural History of the Indies; enlarging much on the Patagonians, confiding in the information he received from the clergyman Arizaga, who, wantonly abusing his credulity, told him many things which do not appear in the formal declaration he afterwards made, and which are totally undeserving of credit: such as, that even a tall man could not reach with his hand to the waist of a Patagonian; that these people devoured a couple of pounds of raw flesh at a mouthful; that they drank off six or seven arrobas (18 or 20 gallons) of water at a draught, and other ridiculous exaggerations, to be seen in the above history. When all this came to be published by Oviedo, a cotemporary author, it is not to be wondered at that it began to gain credit, and was adopted by Gomara, Argensola, and other writers, who, with excessive credulity, committed to writing whatever they heard of these remote regions. Gomara not only copied Pigafetta, but added many other absurdities, collected from other quarters.

Our countryman Cavendish allowed 18 inches to the foot of the Patagonians, in which he is followed by Hawkins and Knivet. But those who have added the most to their bulk, were the Dutch navigators; and Sebaldus Veert even goes so far as to say, that they were of a height to fill men with horror; that they used to pluck up whole trees by the roots, &c. &c. and he has been followed, but with some moderation, by Noort, Spilberg, and Le Maire. The adventurers of St. Maloes likewise bear testimony to the tallness of the Patagonians; but other travellers, and those undoubtedly of more credit, such as Winter and Narborough, the Dutch admiral, S. Hermite, and the French M. Froger, have refuted these impostures: and also such as have made no mention at all of that people, are evidently against the vulgar opinion, as they never would have omitted a matter of such note and singularity. But, after all, the great stature of the Patagonians remained problematical, having still many supporters; although the assertions of the gigantic size of that people were far from being agreed amongst themselves, fluctuating in their imaginary measurements from 10 to 13 feet; until the latest and repeated expeditions of the English, the French, and the Spaniards, in our own times, under the command of officers of distinction, judgment, and veracity, have for ever overturned and destroyed those fables and falsehoods, and reduced the Patagonians to their true and proper stature and appearance.

Commodore Byron and his men, who entered the straits in 1764, represent them to be of a gigantic stature, and to realize the tales of monsters in a human shape. One of them, who appeared to be a chief, had the skin of some wild beast thrown over his shoulders, and was painted so as to exhibit a hideous appearance: round one eye was a large circle of white, a circle of black surrounded the other, and the rest of his face was streaked with paint of different colours. Byron did not measure him; but, judging of his stature by its proportion to his own, he concluded it could not be much less than *seven feet*. This was the general size of the men; the women were proportionably less. They were all painted and clothed nearly in the same manner: their teeth were as white as ivory, remarkably even and well set; but, except the skins, which they wore with the hair inwards, most of them were naked, some few only having upon their legs a kind of boot, with a short pointed stick fastened to each heel, which served as a spur. When they were prevailed upon to sit down, they accepted a quantity of yellow and white beads, which were distributed among them, with pleasure. They did not appear to be wholly strangers to European ornaments; for one woman among them, of an enormous size, and having her face frightfully painted, had bracelets, either of brass or very pale gold, upon her arms, and some beads of blue glass strung upon two plaits of her hair. These apparent giants had with them
a great

a great number of dogs, with which, it was supposed, they chased the wild animals which served them for food. Their horses, though not large nor in good condition, seemed to be nimble, and well broken. Their bridle was a leathern thong, with a bit of a small piece of wood, and their saddles resembled the pads used among the country people in England. The women rode altride, and both men and women without stirrups; and yet they galloped without fear over the spit on the shore, the stones of which were large, loose, and slippery. Such is the account given by Byron, in Hawkefworth's *Voyages*, vol. i. Mr. C. Clarke, an officer of Byron's ship, in a letter published in the *Philosophical Transactions*, vol. lvii. describes the Patagonians as of a copper colour, with long black hair, and says, that some of them were *certainly nine feet*, if they did not exceed this stature. They are stout and well made: the women, he says, were from seven and a half to eight feet, though there was hardly a man less than eight feet. It does not appear, however, that these people were actually measured.

The country is represented as somewhat hilly: the soil, in that part which lies off Port Desire, is sandy, producing nothing but a coarse harsh grass. Captain Wallis, who visited this coast in 1766, measured those that appeared to be the tallest among them. One of these was six feet seven inches high, several more were six feet five inches, and six feet six inches; but the stature of most was from five feet ten inches to six feet. Captain Carteret's account agrees with that of Wallis. (See *Phil. Trans.* vol. ix.) These seem to have been the same people, whose size had been so much over-rated in the year 1764; for several of them had beads, and red baize, such as that which had been put on-board Wallis's ship, and which he naturally concluded they had got from Byron. In 1767 they were again measured by M. Bougainville, whose account agrees nearly with that of Wallis. To these testimonies we may here add another of great weight. In the year 1762, Don Bernardo Ibanez de Echavarri accompanied the marquis de Valdelirios to Buenos Ayres, and resided there several years. He observes, that the southern extremity of America is inhabited, not by the fabulous Patagonians, who have been supposed to occupy this district, but by Indians of the same stature with Spaniards, among whom no one was seen that exceeded in height two *varas* and two or three inches, i. e. about 80 or 81³³² English inches, if Echavarri make his computation according to the *vara* of Madrid. This agrees nearly with the measurement of captain Wallis. Mr. Falkner, who resided as a missionary forty-eight years in the southern parts of America, says, that "the Patagonians, or Puelches, are a large-bodied people; but I never heard of that gigantic race which others have mentioned, though I have seen persons of all the different tribes of Southern Indians. Falkner published, in 1774, a two-sheet map of Patagonia; but, when compared with the great six-sheet map of South America by La Cruz (Madrid 1775, Lond. 1779.) it will be found to be very erroneous.

Captain Wallis describes them as being of a deep copper colour, like that of the Indians in North America, with straight hair as harsh as hog's bristles, which was tied back with a cotton string: they are well made, robust, and bony; but their hands and feet are remarkably small. They were clothed with the skins of the guanaco, an animal resembling a deer, without horns, and having a hump on its back: these skins were sowed together in pieces about six feet long and five feet wide, wrapped round the body, and fastened with a girdle, with the hairy side inwards: some of them had a square piece of cloth made of the downy hair of the same animal, through which a hole being cut for the head, the rest hung round them about as low as the knee. They also wore a kind of drawers, and buskins, reaching from the mid-leg to the instep before, and behind brought under the heel: the rest of the foot was without any covering. Round their eyes were the circles already mentioned; and they were

painted on their arms, and on other parts of the face. The eye-lids of all the young women were painted black. Every one had a missile weapon, tucked into the girdle. This weapon consisted of two round stones, covered with leather, and weighing about a pound, which were fastened to the ends of a string about eight feet long. This they used as a sling, keeping one end in the hand, and whirling the other round the head, till, with the force it had acquired, they discharged it upon the object. In the management of this double-headed shot they are so expert, as to be able to hit a mark not larger than a shilling, with both the stones, at the distance of fifteen yards: it is not, however, their custom to strike either the guanaco or the ostrich with them in the chase; but they discharge them so that the cord comes against the legs of the ostrich, or two of the legs of the guanaco, and so twisted round them by the force and swing of the balls, that the animal, being unable to run, became an easy prey to the hunter. They eat their flesh raw, and the paunch of the ostrich without any preparation besides turning it inside out and shaking it.

Each of these people, both men and women, says Wallis, had a horse, with a saddle, stirrups, and bridle. The men had wooden spurs, except one who had a large pair of such as are worn in Spain, brass stirrups, and a Spanish scymitar without a scabbard; but, notwithstanding these distinctions, he did not appear to have any authority over the rest: the women had no spurs. Their horses, about fourteen hands high, appeared to be of a Spanish breed. Although they had no objection to familiar intercourse, they manifested no intention of mischief, and jumped into the English boats with alacrity and joy, and when in them sung several of their country songs; when on-board they expressed no curiosity or wonder which the multiplicity of objects around them had a tendency to excite: they partook of the ship's provisions without hesitation or scruple, but they would drink nothing besides water. The animals on-board, particularly the hogs and sheep, and the Guinea hens and turkeys, engaged their attention, but they seemed not to desire any thing which they saw except the apparel; and only one of them, who was an old man, asked for that. When the first volley was fired by the marines in their exercise, they were struck with astonishment and terror; the old man in particular, threw himself down upon the deck, pointed to the muskets, and then striking his breast with his hand, lay some time motionless, with his eyes shut; thus, as it was supposed, intending to show that he was not unacquainted with fire-arms, and their fatal effects. The rest, seeing the people on-board merry, and finding themselves unhurt, soon resumed their cheerfulness and good humour, and heard a second and a third volley fired without much emotion: but the old man continued prostrate upon the deck for some time, and never recovered his spirits till the firing was over. Although they were pleased with the beads and other trinkets which were distributed among them, and seemed very desirous of hatchets and bill-hooks, they did not give the least intimation that they would part with any provisions; therefore no traffic was carried on between them and the English navigators.

This country consists, for the greater part, of open deserts and savannas: with a few willow-trees on the rivers; and seems to enjoy a temperate but rather cool climate. But, separated in the middle by the vast mountains of the Andes, one part of it, and also its inhabitants, differ widely from the other. To the northward of La Plata this part of South America is covered with wood, and stored with an inexhaustible fund of large timber: but to the southward of that river the eye can scarcely discover a single tree or shrub fit for any mechanical purpose; but even this seemingly-barren country has some good pastures, and numerous droves of wild horned cattle; and every district abounds with horses, which are supposed to have been brought hither by the Spaniards.

It has been suggested, that the Patagonians are descendants

scendants of the natives of the Canaries, who are a tall people; and it is said that they bury their dead on the eastern shores, as looking towards the country of their ancestors. Bougainville suggests, that they lead the life of Tartars. They are said to ramble through the immense plains of South America, being constantly on horseback, pursuing the game or wild beasts with which these plains abound, and dressing or covering themselves with their skins. *Pinkerton*, vol. ii. *Adm. Cordova's Voyage of Discovery to the Strait of Magellan, by order of the King of Spain.*

PATAGO'NIAN, *adj.* Belonging to Patagonia.

PATAGO'NIAN, *f.* A native of Patagonia.

PATAGON'ICA, or **PATAGON'ULA**, *f.* in botany. See **CORDIA patagonula**, vol. v.

PATA'IA, or **PATHAY**, a town of Hungary: seven miles north of Colocza.

PATAK', a town of Hungary, on the Latorcza, where the Protestants have a college: forty-four miles west-north-west of Munkacz, and twenty-five south-fourth-east of Caschau.

PATALA', a town of Sweden, in the province of Tavastland: forty-five miles north-north-east of Jamsio.

PAT'ALA, one of the receptacles for sinners, or hells of the Hindoos. It means rather the lower regions, a sort of purgatory perhaps, over which Yama presides, who is, however, usually styled King of Hell. See **YAMA**.

PAT'ALA-DE'VI, a name of the Hindoo goddess Parvati, in her character of consort of Yama, regent of the lower or infernal regions. In this character she corresponds with Proserpine, or Hecate, and, like the Grecian goddess, has a triple character, being sometimes called Tri-fakti-devi, and Tri-fakti-devi-kumari, meaning the goddess with three powers, and the thrice-potent-virgin-goddess. Thus the triple-virgin-goddess Diana is so named as a terrestrial deity; and Parvati is similarly named *Bhu-devi*, Goddess of the Earth.

PATAMAT', *f.* A two-masted vessel used in India; each mast carries one sail of four unequal sides. *Robert's Indian Glossary.*

PATANAM', a town of Hindoostan, in Marawar: forty miles north-west of Ramanadporum.

PATA'NI, a town of Asia, and capital of a kingdom subject to Siam, situated on the east coast, at the bottom of a bay, bounded by a promontory, in the gulf of Siam; containing between 7000 and 8000 inhabitants, composed of sundry nations, Chinese, Malays, Siamese, and Europeans. The Siamese have a grand pagoda, and the Mahometans a mosque. The Siamese in general cultivate the land; the Chinese are mostly artisans: 250 miles north of Malacca. Lat. 6. 58. N. lon. 101. 40. E.

PATANJA'LI, one of the systems or schools among the Hindoos. It corresponds, in many points, with that of the Stoics, and its promulgator, Patanjala, with Zeno; but the commentators on the Hindoo systems have buried the succinct works of the founders in such a mass of illustration, as they term it, that their precise differences are not easily determinable.

PATAPA', a town on the north coast of the island of Samar. Lat. 12. 40. N. lon. 125. 14. E.

PATAPAS'CO, a river of Maryland, which runs into the Chesapeake three miles south of Baltimore.

PATARA, in ancient geography. See the modern name, **PATERA**.

PATA'RD, or **PATAC'**, *f.* A copper coin in Flanders. Patacs are florins or gilders of 20 stivers, each of which was formerly subdivided into 16 pennings, but for a long time they have been divided into 12 parts or deniers. Accounts were formerly kept at Dunkirk, as at Antwerp, in florins, patards, and pennings; but of late years the new French system of francs and centimes has been adopted; and the new coins of France are also used at Dunkirk. At Lille, a patard, or stiver, is reckoned at 1½ sou, or 15 deniers; however, the present current coins are chiefly those of France.

PATAR'NE, a town of France, in the department of Vol. XVIII. No. 1281.

the Sarthe, and chief place of a canton, in the district of Mamers; containing 9941 inhabitants.

PATASPOUR, a town of Bengal: twenty-eight miles south-fourth-east of Midnapour. Lat. 22. 2. N. lon. 87. 37. E.

PATA'TE, a town of South-America, in the audience of Quito, and jurisdiction of Riobamba; celebrated for its sugar.

PATAVIL'CA. See **PATIVILCA**.

PATAVIN'ITY, *f.* [*patavinitas*, Lat.] Among critics, a fault objected to in the writings of Livy, which he derived from his country Padua, by the ancients called *Patavium*. Asinius Pollio, as we are informed by Quintilian, first taxed Livy with patavinity. But what this patavinity consisted in, the critics have been much puzzled to find out. All we know for certain is, that it was a fault in the language of Livy, not in the sentiments or manners. In all probability it is one of those delicacies that are lost in a dead language.

Dan. Georg. Morhof has an express treatise "*De Patavinitate Liviana*," printed at Kiel in 1685; from which we gather, that he considered *patavinity* to consist in a certain turn of expression, or provincial dialect, containing some phrases peculiar to the Paduese, and not strictly conformable to the purity and refined language of the authors who flourished in or near the Augustan age. See Liv. 10. c. 2. l. 41. c. 27.

PATAVINUS, or **PADOVA'NO** (Gaspar), otherwise called *Gaspar ab Avibus*, an engraver of the Italian school, was born at Padua in the year 1530. He appears to have been the pupil of Mantuanus, whose style he imitated, but never equalled. His prints are dated from the year 1560 to 1580, and signed in different manners, sometimes in the manner that appears in the upper corner of the Plate of **PATELLA**, over-leaf.

PATAVIR'CA, a town of Peru, in the jurisdiction of Santa, or Guarmey, consisting of about 60 houses; and lying upon the road from Paita to Lima, 67 miles north of that city. In its vicinity, at the distance of about three quarters of a league, and near the sea-coast, are the ruins of a palace of the Indian princes. Lat. 10. 25. S.

PATAVIUM, in ancient geography, a town of Italy, in Venetia. The honour of its foundation is ascribed to Antenor. It was situated in a country so fertile, that Constantine Palæologus is said to have declared, that throughout the East he did not know a place so proper for the seat of the terrestrial paradise. Its citizens were distinguished at Rome more than those of other towns, as they had a right of suffrage in common with the Roman citizens themselves. It was taken and destroyed by Attila, about the year 450 or 452, and soon after re-established by Narfes. It was taken by the Lombards in 601, and reduced to ashes; but Charlemagne restored its former lustre.

We learn from Tacitus (*Annal.* xvi. 21.) that this city was accustomed to celebrate the antiquity of its origin, and the name of its founder, in annual games, said to have been instituted by that hero. Livy informs us, that a Naumachia, exhibited annually on one of the rivers that water the town, perpetuated the memory of a signal victory obtained by the Paduans, long before their union with Rome, over a Lacedæmonian fleet, commanded by Cleonymas. They are also said to have not unfrequently assisted the Romans, and contributed in no small degree to their victories, particularly over the Gauls, the common enemy of both states, while an immense population furnished them with the means of giving effect to their measures, by sending powerful armies into the field. Padua afterwards submitted to the genius of Rome, but submitted with dignity, and was accordingly treated not as a conquered, but an allied republic: she was admitted to a participation not only of the franchise, but even of the riches, of Rome, as she could count at one period 500 Roman knights among her citizens; and drew by her manufactures, from the emporium of the world,

no small share of the tribute of the provinces. After having shared the glory of Rome, Padua partook of her disasters: like her she was plundered by Alaric and Attila; and, like her, half depopulated by the flight of her dismayed inhabitants, and obliged to bend under the yoke of a succession of barbarian invaders. Padua was, after the expulsion of the Goths, subjected to the Lombards, the Franks, and the Germans. At length it shook off the yoke, and with its sister states, Verona, Vicenza, Ferrara, and Mantua, experienced the advantages and disadvantages of republicanism, occasionally blessed with the enjoyment of freedom, and occasionally, with all its forms, smarting under the rod of a powerful usurper. At length, in the 15th century, Padua united itself to the Venetian territory, and under the influence of its laws acknowledged the supreme authority of that republic. At a later period it suffered much by fire and sword, as well as by earthquakes and pestilence. In ancient times, Padua was famous for its woollen manufactures, celebrated in prose by Strabo, and in verse by Martial; it still retains much of its reputation in this respect, its wool and woollen articles being considered as the best in Italy. For its present state, see the modern name PADUA, p. 186 of this volume.

PATA'Y, a town of France, in the department of the Loiret, near which the English were defeated by the French, under the conduct of the celebrated Maid of Orleans, in the year 1429: twelve miles north-north-west of Orleans, and eighteen north of Beaugency.

PATAZ'. See CAXAMARQUA, vol. iv.

PATCH, *f.* [piece, Fr. *pezzo*, Ital. *pars*, *particula*, Lat. a small part.] A piece sewed on to cover a hole:

Patches set upon a little breach,
Discredit more, in hiding of the flaw,
Than did the flaw before it was so patch'd. *Shakespeare.*

A piece inserted in mosaic or variegated work.—They suffer their minds to appear in a piebald livery of coarse patches and borrowed shreds, such as the common opinion of those they converse with clothe them in. *Locke*.—A small spot of black silk put on the face.—They were patched differently, and cast hostile glances upon one another; and their patches were placed in different situations, as party-signals to distinguish friends from foes. *Addison.*

If to every common funeral,
By your eyes martyr'd, such grace were allow'd,
Your face would wear not patches, but a cloud. *Suckling.*

A small particle; a parcel of land:

We go to gain a little patch of ground,
That hath in it no profit but the name. *Shakespeare.*

A paltry fellow. *Obsolete*.—It seems probable that fools were nicknamed *patch* from their dress; unless there happen to be a nearer affinity to the Italian *pazzo*, which signifies foolish. But, though a *patch* denotes a fool or simpleton, and, by corruption, a clown, it seems to have been occasionally used in the sense of any low or mean person. Thus in the *Midsummer Night's Dream*, Puck calls Bottom and his companions "a crew of patches, rude mechanicals," certainly not meaning to compare them to pampered and sleek buffoons. Whether in this sense the term have a simple reference to that class of people whose clothes might be pieced or *patched* with rags, or whether it is to be derived from the Sax. verb *præcan*, to deceive by false appearances, as suggested by the acute and ingenious author of the *Diversions of Purley*, must be left to the reader's own discernment. *Douce's Illustr. of Shakespeare*.—He was yet more fool in Plautus, whome his malaperte quire made to believe that all women accounted him so fayre, as they ran in every place after him. The *patche*, supposing it to be true, sayd, It is a greates paine to be an over-fayre man! *North's Tr. of Philosopher at Court.* 1575.

Laugh at me;
I do deserve it; call me *patch*, and puppy. *Beaum. and Fl.*

A small piece of greased leather, &c. which is put round the ball of a rifle before it is driven down, in order to fill up the interstices of the grooves, which, without this precaution, would occasion too great a windage.—As leather patches are frequently cut by the sharp edges of the rifles, they have latterly been much discontinued, and calico, dimity, Russia duck, fustian, thickset, and other substances, adopted in their stead. *Patches* are also used in duelling-pistols. *James's Mil. Dict.*

PATCH, a word used at Madras for a lot of three pieces of cloth. *Roberts's Ind. Gloss.*

To PATCH, *v. a.* To cover with a piece sewed on.—They would think themselves miserable in a *patched* coat, and yet their minds appear in a piebald livery of coarse patches and borrowed shreds. *Locke*.—To decorate the face with small spots of black silk.—In the middle boxes, were several ladies who *patched* both sides of their faces. *Addison.*

We begg'd her but to *patch* her face:
She never hit one proper place. *Swift.*

To mend clumsily; to mend so as that the original strength or beauty is lost.—Any thing mended is but *patch'd*. *Shakespeare.*

Physick can but mend our crazy state,
Patch an old building, not a new create. *Dryden.*

To make up of shreds or different pieces. Sometimes with *up* emphatical.—There is that visible symmetry in a human body, as gives an intrinsic evidence, that it was not formed successively and *patched up* by piece-meal. *Bentley*.—Enlarging an author's sense, and building fancies of our own upon his foundation, we may call paraphrasing; but more properly changing, adding, *patching*, piecing. *Felton.*

His glorious end was a *patch'd* work of fate,
Ill sort'd with a soft effeminate life. *Dryden.*

To dress in a party-coloured coat.—Man is but a *patched* fool. *Shakespeare's Midf. N. Dream.*

PATCH'-BOX, *f.* A box to hold those little round bits of silk which ladies used to stick upon their faces about a hundred years ago:

And this the morning-omens seem'd to tell:
Thrice from my trembling hand the *patch-box* fell. *Pope.*

PATCH'-WORK, *f.* Work made by sewing small pieces of different colours interchangeably together.—When my cloaths were finished, they looked like the *patch-work*, only mine were all of a colour. *Swift*.—Whoever only reads to transcribe shining remarks, without entering into the genius and spirit of the author, will be apt to be misled out of the regular way of thinking; and all the product of all this will be found a manifest incoherent piece of *patch-work*. *Swift.*

To *patch-work* learn'd quotations are ally'd:
Both strive to make our poverty our pride. *Young.*

PATCHEPALIAM', a town of Hindoostan, in Coimbatore: thirteen miles north-north-east of Coimbatore.

PATCH'ER, *f.* One that patches; a botcher:

PATCH'ERY, *f.* Botchery; bungling work; forgery. *Not in use.*

You hear him cogg, see him dissemble,
Know his gross *patchery*, love him, and feed him;
Yet remain assured that he's a made-up villain. *Shakespeare.*

PATCHIEU', a river of Bootan, called by the Bootans Jumta Chieu, or the junction of three rivers, viz. the Hatchieu, the Tchintchieu, and the Patchieu.

PATCH'WARY, a town of Bengal: thirty-two miles south of Rajamal.

PATCOO'M,

PATELLA.

CR

Eleven Species of Limpet.

PATCOO'M, a town of Bengal: fifty miles south-west of Rogonatpour. Lat. 23. 3. N. lon. 87. 2. E.

PATE, *f.* [derived by Skinner from *tête*, Fr. It may be, however, a corrupted contraction of the Lat. *caput*.] The head. Now commonly used in contempt or ridicule, but anciently in serious language.—If any young novice happens into the neighbourhood of flatterers, presently they are plying his full purse and empty pate with addresses suitable to his vanity. *South*.

He is a traitor; let him to the Tower,
And crop away that factious pate of his. *Shakespeare*.

Thank your gentler fate,
That, for a bruised or broken pate,
Has freed you from those knobs that grow
Much harder on the married brow. *Hudibras*.

PATE, a small island of France, in the river Gironde, near Blaye.

PATEABAR'RY, a town of Bengal: twenty miles south of Moorshedabad.

PATEAGUR', a town of Hindoostan, in the circar of Sallapour: thirty-five miles north-west of Sallapour.

PATED, *adj.* Having a pate. It is used only in composition: as, long-pated, or cunning; shallow-pated, or foolish.

PATEE, *adj.* in heraldry. See vol. ix. p. 423.

PATEE'BA, a town of Hindoostan, in Benares: eight miles south of Chunar.

PATEFACTION, *f.* [*patefactio*, Lat.] Act or state of opening; declaration.—The decalogue he [Moses] received from the hand of God, written with the finger of God; the rest of the divine *patefactions* he wrote himself. *Pearson on the Creed*.—God hath still preserved and quickened the worship due unto his name, by the *patefaction* of himself. *Ibid*.

PATEGO'W, a town of Hindoostan, in the circar of Hindia: eight miles south of Hurdah.

PATEL', a French landscape-painter much esteemed. The place of his birth, and the date of it, are equally unknown. The execution of his pictures is of an easy, light, and agreeable, character; and his general taste of a pleasing nature; but he does not rank above the class of artists merely agreeable.

PATELI, or PUTA'LA, a town of Thibet, in the district of Lassa, where, upon a mountain, is the temple or palace of the grand lama: three miles east of Lassa, and 272 north-north-west of Ghergong.

PATELLA, *f.* The round bone of the knee; the knee-pan.

PATELLÆ. Soft orbicular raised moveable bodies at the base of the thighs, in some insects, as the genus *Ichneumon*.

PATELLA, *f.* [Lat. a little plate, or dish, from the shape.] The LIMPET; in natural history, a genus of worms of the class vermes, order testacea, of which there are about 250 species described. Generic characters.—Animal a limax; shell univalve, subconic, shaped like a basin, and without a spire. In all cases the shells are attached to some hard body: their summit is sometimes acute, sometimes obtuse, flattened, turned back or perforated. The rock, or other hard body, to which they are always found adhering, serves as a kind of second or under shell to preserve them from injury; hence they have by some naturalists, though erroneously, been classed among the bivalves. The shells have been analysed, and they are found to consist chiefly of carbonate of lime. When exposed to a red heat, they emit a smell like horn, and when dissolved in acids, a semi-liquid gelatinous matter was left behind. For farther general remarks, see the article CONCHOLOGY, vol. v. p. 20. where several of the species are figured; and HELMINTHOLOGY, vol. ix. p. 354. The species are separated into five divisions, from the peculiarities of the shell.

I. *Labiata*. Furnished with an internal lip; shell entire.

1. *Patella equestris*: shell orbicular, perfoliate outwardly; lip vaulted perpendicular. This species inhabits the Indian and American seas. It is an inch wide; and is represented, of the full size, on the annexed Plate, at fig. 1. an inside view of the same at fig. 2.

2. *Patella neritoidea*: shell ovate, with a subspiral tip; lip lateral. The native place of this species is not known; it is generally found adhering to other testaceous substances. The shell is the size of a cherry; and the inhabitant is red.

3. *Patella Sinensis*: shell subconic, smooth; lip somewhat lateral. It inhabits the Mediterranean, Atlantic, and Indian, seas. The shell is very thin and pellucid; sometimes it is of a chestnut colour, speckled with minute grey dots; but generally it is white, with brown spots and rays.

4. *Patella porcellana*: shell oval, with a recurved tip; lip placed behind and flat. It inhabits India and Goree. The shell is convex; within white, the outside red, with white scaly spots, and transverse undulate blue lines.

5. *Patella fornicata*: shell oval, obliquely recurved behind; lip placed behind, and concave. This is found in the Mediterranean and near the island of Barbadoes. It is represented at fig. 3. and an inside view of the same at fig. 4.

6. *Patella aculeata*: shell oval, brown, with prickly striæ; crown recurved. Inhabits the American islands. This is represented on the CONCHOLOGY Plate I. fig. 7. vol. v.

7. *Patella trochiformis*: shell conic, longitudinally plaited; internal lip lateral. It inhabits Tranquebar, and the Falkland islands.

8. *Patella auricula*: shell roundish, with radiate grooves and striate; crown recurved; internal cavity ear-shaped. Inhabits Borneo, Santa Cruz, and St. Thomas's islands. This is represented on the annexed Plate, at figs. 5, 6.

9. *Patella rugosa*: shell ovate, thin, hyaline, obsoletely wrinkled transversely; margin unequal; lip unequally repand, hyaline. It inhabits China, and is generally found in the *Buccinum spiratum*.

10. *Patella Goreensis*: shell oval, flat, thin, white, glossy, lamellate on the outside. This is found adhering to rocks at Goree; and is about half an inch in diameter.

11. *Patella contorta*: shell granulate with white, with very fine perpendicular oblique ribs: the lip is very thin, oblique, and covering half the cavity. This is a very small shell.

12. *Patella explanata*: shell white, very finely striate; crown inclining downwards, and dilated, behind which the shell is depressed.

13. *Patella plicata*: shell conic, ochraceous, with ferruginous rays within, with longitudinal transversely-striate plaits.

14. *Patella striata*: shell conic, white and striate, with undulate grooves; the crown is a little lateral. See fig. 7.

15. *Patella solea*: shell a little twisted, pellucid, with ferruginous spots, thinly plaited and transversely grooved above; lip undulately repand.

16. *Patella echinata*: shell conic, prickly, glabrous within. It is found fossil near Crignon. The shell is calcareous and whitish, covered on the outside with prickles.

II. *Dentata*. With the margin angular or irregularly toothed.

17. *Patella crepidula*: shell oval, flattish, smooth; the lip flat behind. It is found in the Mediterranean, especially about the coasts of Barbary.

18. *Patella laciniosa*: shell with elevated unequal rays, thicker and obtuse on the outside. This is an inhabitant of India.

19. *Patella*

19. *Patella saccharina*: shell angular, with seven carinate obtuse ribs. It is found at Java and Barbadoes.

20. *Patella barbara*: shell toothed, with nineteen elevated vaulted muricate rays. It is found near the Falkland-islands.

21. *Patella granularis*: shell toothed, with elevated angular imbricate striæ. Inhabits southern Europe, and the Cape of Good Hope. See CONCHOLOGY, Plate I. fig. 6.

22. *Patella granatina*: shell angular, with numerous muricate striæ. It inhabits Jamaica and southern Europe, is from one to three inches long. The inside of the shell is shown on the annexed Plate, fig. 8.

23. *Patella vulgata*: shell with about fourteen obsolete angles, and dilated acute crenate margin; crown central. This is described and figured in "Donovan's Shells:" it inhabits the marine rocks of Europe and India. It is about two inches high, and from three to four wide: in the older shells the margin is nearly even, and the number of ribs irregular.

In Collinson's History of Somerset, we find a description of a species of limpet, picked up at low water near the town of Minehead, which contains a liquor fit for marking linen. The particular species is not noted; but, as the present is the most common, we think it may be a variety of it. "When the shell is picked off, there will appear a white vein lying transversely in a little furrow next the head of the fish, which may be taken out by a bodkin or any other pointed instrument. The letters or figures made with this liquor on linen will presently appear of a light-green colour, and, if placed in the sun, will change into the following colours: (if in winter, about noon; if in summer, an hour or two after sun-rising, and so much before setting; for in the heat of the day in summer it will change so fast, that the succession of each colour will scarcely be distinguished.) Next to the first light green, it will appear of a deep green, and in a few minutes change to a full sea-green; after which, in a few minutes more, it will alter to a blue, then to a purplish red; after which, lying an hour or two, (if the sun shines,) it will be of a deep purple red; beyond which the sun does no more. But this last beautiful colour, after washing in scalding water and soap, will, on being laid out to dry, be a fair bright crimson, which will abide all future washing. This species of limpets are some red, others white, black, yellow, brown, and sand-colour, and some are striped with white and brown parallel lines."

24. *Patella depressa*: shell with fourteen angles, oblong; crown lateral. This is described and figured in Pennant's British Zoology. It inhabits the rocks of Europe.

25. *Patella cærulea*: shell crenate, subangular, with numerous unequal striæ; beneath blue. This is an inhabitant of the Mediterranean.

26. *Patella tuberculata*: shell slightly toothed, conic, tuberculate, refuse behind. The shell is yellowish, with white tubercles disposed in rows.

27. *Patella lepas*: shell roundish, pectinate, with imbricate, tuberculate, transversely-striate, rays; crown incurved. There are two varieties, the one found in Chili, the other in the Falkland-islands. The second is usually named the *bronze limpet*.

28. *Patella tricoftata*: shell oval, three-ribbed, white, striate at the sides; internal margin flattish and a little jagged. It is found in the Indian Ocean.

29. *Patella Mytilina*: shell carinate, rounded on the fore-part, with undulate striæ, brown, perlaceous within, the hinder margin crenate. Found in different parts of South America; and is an inch and a quarter long.

30. *Patella ovata*: shell toothed, oval, rather conical, ribbed, white, brown between the ribs, within brown with white grooves.

31. *Patella stellata*: shell angular, ovate, depressed,

with ten elevated rays, and shorter intermediate ribs. See CONCHOLOGY, Plate I. fig. 5.

32. *Patella Islandica*: shell solid, ovate, gibbous, unequally ribbed; within glabrous, with alternate cinereous and horny rays; margin crenate. It inhabits, as its specific name denotes, the shores of Iceland; and is about an inch and a half long.

33. *Patella Cypria*: shell oval, subpellucid, ribbed; the ribs are occasionally tuberculate, and foliaceous on the outside. It inhabits the shores of Cyprus.

34. *Patella costata*: shell ovate, a little gibbous, white, with crowded unequal tuberculate rugged ribs.

35. *Patella leucopleura*: shell ovate, dusky, with crowded white smooth unequal ribs.

36. *Patella striatula*: shell a little rugged, white, with brown flexuose striæ branching outwards, with two brown spots in the bottom of the hollow.

37. *Patella octoradiata*: shell convex, with eight large tuberculate ribs, besides smaller ones. It inhabits the American islands.

38. *Patella rubra*: shell toothed, red under the brown skin, with elevated rounded striæ, and smaller imbricate ones, within white.

39. *Patella hepatica*: shell ovate, gibbous, thin, toothed, and of a livid colour, with elevated carinate obtusely-spined striæ.

40. *Patella badia*: shell subconvex, brown; within bay, with twelve larger rays, each surrounded by a rib, and as many smaller ones.

41. *Patella fuscifrons*: shell flattish and brown, with ten elevated striæ; crown of a different colour; bottom with a pale liver-coloured spot, edged with glaucous and gold; the inner margin brown. The shell is from two to four inches long; more or less convex.

42. *Patella maculosa*: shell flattened, the fore part narrow and rounded; yellowish, spotted with brown, with a white crown, with flat rounded equal rays.

43. *Patella rotundata*: shell suboval, flattened, varied with brown, with rounded flat ribs and a differently-coloured crown and bottom.

44. *Patella pecten*: shell ovate, obscurely edged with white, radiate, with distant striæ pectinate outwardly; crown grey; bottom with a spot surrounded with a white belt. It is found in North America.

45. *Patella corrugata*: shell ovate, wrinkled, chestnut, crown with a white circle; within cinereous, radiate with white; bottom pale brown, edged with white.

46. *Patella albo-radiata*: shell ovate; each side brown, radiate with white, with elevated pectinate striæ; the crown is white, and the bottom yellowish. It is about half an inch long.

47. *Patella olivacea*: shell ovate, and olive-colour; within brown, varied with white, with elevated unequal striæ; the margin with two rows of unequal spines; crown pale yellow; bottom silvery, with a brown centre. The shell is half an inch long, and the bottom is surrounded with a white belt.

48. *Patella cerea*: shell ovate, both sides waxen colour, perpendicularly striate, with thirteen flattened ribs and white bottom.

49. *Patella impressa*: shell ovate, with elevated, transversely-striate, brownish striæ, spotted with white, and reaching half-way down; crown with a white impressed circumference.

50. *Patella aurantia*: shell ovate, solid; citron undulate with brown, with elevated crowded wrinkled striæ and white bottom.

51. *Patella cingulum*: shell ovate, denticulate, cinereous, with three black belts, within milk-white, with elevated unequal striæ, nodulous on the outside, and spinous at the margin.

52. *Patella oculata*: shell ovate, white, with flattened ribs of unequal length, brownish between them; crown with a brown belt.

53. *Patella*

53. *Patella Magellanica*: shell thin, ovate, white, with a nodulous margin, within perlaceous, with elevated striæ, crown pointed, brown; bottom brown. It inhabits the straits of Magellan.

54. *Patella ochroleuca*: shell ochraceous, with three yellow bands; and elevated, acute, unequal striæ; crown white; bottom silvery.

55. *Patella dentata*: shell white, denticulate, with elevated, acute, unequal striæ; crown surrounded with a double row of cinereous dots, and a dusky-grey band.

56. *Patella nodosa*: shell yellow, radiate with brown, with elevated, nodulous, unequal striæ; crown and bottom white.

57. *Patella cinerea*: shell toothed, cinereous, with unequal elevated striæ, between which it is brown and rugged; crown pointed, milk-white.

58. *Patella exalbida*: shell whitish, with brown rays, and elevated, rounded, unequal striæ, between which it is rugged; crown obtuse, white, with a broad interrupted brown band, and another marginal one.

59. *Patella cancellata*: shell cinereous and brown, with decussate striæ and two rows of tubercles; the crown is yellowish, and the bottom has a white spot. There is a variety that is grey, with dusky rays, and a few yellow striæ; within dirty yellow with a white bottom. It is found in Jamaica, and is about one inch and a half long.

60. *Patella lævis*: shell rounded, smooth, yellowish, with a broad citron marginal band spotted with brown, and another narrow one; margin dilated, acute, and a little rugged.

61. *Patella argentea*: shell smooth, thick, a little silvery; with eleven brown rays; margin silvery; crown pale yellow; bottom ivory, with a double white ring. This is about two inches long, but is very rare.

62. *Patella cuprea*: shell white, with strong, rounded, brown ribs, within perlaceous; crown and bottom coppery.

63. *Patella rubida*: shell pale, liver-coloured both sides, with alternate larger and smaller carinate ribs; it has a flat and white crown.

64. *Patella glabra*: shell brown, glabrous above, with elevated crowded white striæ beneath; crown obtuse, white, with a fulvous border; bottom fulvous.

65. *Patella flaveola*: shell yellowish, varied with brown, with flattened unequal ribs; crown obtuse; bottom varied reddish and white.

66. *Patella infundibulum*: shell denticulate, compressed on each side, rounded, yellow, with perpendicular striæ and carinate ribs; bottom varied with white and cinereous.

67. *Patella cyathus*: shell rounded, glabrous, white.

68. *Patella finica*: shell ovate, entirely yellow, with undulate grooves, within striate perpendicularly; margin scalloped. It is found in China, and is about three inches and a half long.

69. *Patella punctata*: shell roundish, white, with many coloured dots, radiate at the base, and surrounded with two brown rings; margin a little flexuous.

70. *Patella lugubris*: shell ovate, with annular striæ, black, with elevated unequal striæ; margin crenate; crown and bottom white.

71. *Patella ulysiponenfis*: shell ovate, toothed, yellowish, with elevated flattened striæ; crown pointed, and of an orange colour.

72. *Patella umbella*: shell oblong, red, with elevated unequal white striæ; the margin is crenate. It inhabits Africa, in numerous varieties. The shell is rarely of a straw-colour; it is sometimes spotted or clouded.

73. *Patella crenata*: shell thin, pellucid, striate, blackish, with olive rays, within glaucous or cinereous; crown pointed; margin crenate; bottom milk-white. It is found on the shores of Africa, Malaga, and Lisbon.

74. *Patella ferruginea*: shell ferruginous, with angular or undulate russet lines, and cinereous belts, within

milk-white, with elevated knotty striæ; the margin is plaited.

75. *Patella melanogramma*: shell oval, ochraceous, with elevated black striæ, within silvery, spotted; crown pointed, white; bottom with a straw-colour spot.

76. *Patella repanda*: shell ovate, thin, within silvery, with brownish rays, and thin undulate striæ, with bay-coloured granulations. The margin is flexuous. It inhabits the seas of Magellan.

77. *Patella angulosa*: shell oval, white, with very thin striæ, and varied with red spots and dots; margin eight-angled.

78. *Patella tigrina*: shell oval, smooth, polished; pellucid, striate with seven yellowish ribs; the colour is bluish-olive, dotted with brown; the margin is seven-angled.

79. *Patella monopis*: shell oblong, flattish, bay striate with white, within milk-white, with eleven elevated unequal striæ; crown rounded, white. It inhabits the American islands.

80. *Patella chlorosticta*: shell ovate, toothed, brown, dotted with green, with eleven elevated, hollow, broader striæ, and as many narrower ones; the crown is white.

81. *Patella margaritacea*: shell thin, unequally striate, white, within perlaceous; crown with an orange mark, surrounded with a yellowish ring; the margin crenate. This is an Iceland shell.

82. *Patella tenuissima*: shell oval, thin, ochraceous, with angular chefnut lines, and elevated, obtuse, hollow, unequal striæ.

83. *Patella mitrula*: shell solid, sub-conic, transversely plaited, with a flexuous margin. It inhabits Barbadoes.

84. *Patella plicaria*: shell ovate, toothed, with thirty elevated, obtuse, undulate, and transversely wrinkled, striæ. Found in the straits of Magellan.

85. *Patella pentagona*: shell whitish, obtusely pentagonal, with a dilated crenate margin; crown obtuse; bottom reddish.

86. *Patella ænea*: shell ovate, tender, pellucid, with elevated striæ, covered with a whitish cuticle, under which it is silvery, with russet rays; crown and bottom coppery. It inhabits the straits of Magellan.

87. *Patella conchacea*: shell thin, oblong-ovate, with very fine undulate striæ, yellowish, with elevated darker rays; crown recurved. It inhabits South America, and resembles the common muscle, except in the hinge.

88. *Patella stanæa*: shell ovate, silvery, with elevated flattened striæ; crown obtuse, coppery; bottom with an oval bay mark; the margin is flexuous.

89. *Patella candidissima*: shell orbicular, striate, white, with a brownish band, dotted with brown; within grey, with unequal striæ; margin transversely wrinkled.

90. *Patella distorta*: shell rugged and distorted, without regularity; rather depressed, with an irregular margin, and very small papillæiform vertex, not central: the inside is not glossy, but appears through a lens to be minutely granulate. This is a Shetlandic species, discovered by Mr. Fleming; it is not uncommon on stones in deep water, and was first noticed on the stones attached to the cod-lines which had lain long under water. The colour is invariably brown, as well on the inside as without; and when examined by a glass appears papillous. The largest specimens are about half an inch in diameter. Described and figured by Mr. Montague in the Linn. Transf. vol. xi. 1815.

III. *Mucronata*. With a pointed recurved tip, or crown.

91. *Patella Hungarica*: shell entire, conic, pointed, striate, with a hooked revolute crown. This is described and figured in Donovan's British Shells; and likewise in Pennant's British Zoology. It inhabits the American, Mediterranean, and Asiatic, seas.

9 M

92. *Patella*

92. *Patella imbricata*: shell entire, oblong, imbricate, the crown placed behind.

93. *Patella mammillaris*: shell entire, conic, striate, subdiaphanous, with a reflected smooth crown. This is described and figured by Pennant, and it inhabits the shores of the Mediterranean and Africa.

94. *Patella tricarinata*: shell substriate, with three ribs on the fore-part.

95. *Patella pectinata*: shell entire, ovate, with wrinkled slightly-branched striæ; crown nearly central, reflected, and pointed. It is found on the shores of the Mediterranean, and is about two inches long.

96. *Patella lutea*: shell entire, oval, convex, striate, with a sub-marginal, reflected, mucronate crown. It inhabits divers parts of India, and is about the size of a melon-seed.

97. *Patella cristata*: crown revolute; back crested, carinate.

98. *Patella lacustris*: shell very entire, oval, membranous, with a nearly-central, mucronate, reflected, shell. It inhabits the fresh waters of Europe.

99. *Patella fluviatilis*: shell very entire, oval, a little horny, with a marginal mucronate crown; aperture oval. This is very like the last; and inhabits, like it, the fresh waters of Europe.

100. *Patella caeca*, the blind limpet: shell entire, with elevated dots, and striate; crown acute, straight. Found in the bays of Norway, on stones. The shell is white, with from sixty to eighty striæ; the inhabitant is white, ovate, without the least appearance of eyes. A magnified view of the shell is given on the annexed Plate, at fig. 9. and of the blind inhabitant, of the natural size, at fig. 10. This and the three following species are figured from the Zoologia Danica.

101. *Patella virginea*: shell very entire, white, with red bars. This is found on fuci in the bays of Norway. The shell is represented of the natural size at fig. 11. and the animal at fig. 12.

102. *Patella tessellata*: shell very entire, of a whitish colour tessellated with red. Found on the rocks and fuci about Norway. The shell with the inhabitant is shown at fig. 13. the empty shell at fig. 14.

103. *Patella fulva*, the red limpet: shell very entire, orange, with a mucronate and nearly vertical crown. It inhabits Norway, on fuci, and testaceous substances. See fig. 15.

104. *Patella subspiralis*: shell ovate, with an obtuse subspiral tip. Found in Norway.

105. *Patella ambigua*: shell ovate, with a slightly toothed margin, and a rather acute and reflected point. Inhabits Norway.

106. *Patella rubicunda*: shell very entire, rather conical, smooth, and reddish. It inhabits the deeps of Greenland.

107. *Patella Borniana*: shell ovate, very entire, with very fine longitudinal striæ, white, with red veins.

108. *Patella calyptra*: shell entire, with imbricate ribs; the crown is hooked; the margin sinuate. Inhabits North America.

109. *Patella melanoleuca*: shell striate, very entire: alternately black and white.

110. *Patella pectunculus*: shell oblong, convex, with elevated nodulous striæ, slightly toothed, within polished; crown curved forwards.

111. *Patella fasciata*: shell ovate, white with a brown band, and elevated acute striæ; the margin is dilated, crenate, and cinereous within.

112. *Patella elegans*: shell with decussate striæ, white radiate with red, denticulate; crown grey.

113. *Patella squamosa*: shell with elevated striæ, transversely undulate on the outside, brown, silvery towards the margin, crown bronzed, hooked.

114. *Patella squalida*: shell entire, brown, within whitish with a bluish bottom; the margin bluish, radiate with brown, with elevated obsolete striæ; crown knotty.

115. *Patella crocea*: shell smooth, subangular, yellow, radiate with brown; crown obtuse, white; bottom with a whitish spot.

116. *Patella candida*: shell ovate, smooth, on both sides white, with a rosy belt on the outside.

117. *Patella trigona*: shell compressed, convex in the middle, cancellate, white, with a brownish band on the outside, and margin within; crown marginal, obtuse.

118. *Patella minima*: shell rounded, convex, thin, smooth, whitish, with reddish spots; crown very obtuse, and white. It inhabits Ferroe island.

119. *Patella Tranquebarica*: shell ovate, thin, pellucid, with very fine crowded striæ, chestnut with white scales; within milk white, with a brown spot at the bottom; the crown is marked with an azure spot. It inhabits Tranquebar, as its name imports.

120. *Patella perversa*: shell oblong, horny, very thin, pellucid, glabrous, with a ferruginous base. It is found in Africa. The point of the crown is bent back towards the hind parts of the snail.

121. *Patella cernua*: shell with decussate grooves, thin, pale flesh-colour, with an oblong aperture.

122. *Patella incurva*: shell entirely white, flat; point of the crown twisted.

123. *Patella interrupta*: shell oval, depressed, glabrous, brownish, with green dots disposed in oblique interrupted rays: crown with an obtuse hook.

IV. *Integerrima*. Very entire, and not pointed at the tip or crown.

124. *Patella afra*: shell conic, striate, greenish, or pale brown, within white; crown glabrous, white, obtuse, central; margin glabrous. It inhabits the island of Goree.

125. *Patella Lusitanica*: shell conic, white, with brown rays marked with striæ, granulate with black; crown acute, not radiate, and surrounded with a chestnut ring. It inhabits Portugal, on the sea-rock; and is very small.

126. *Patella radiata*: shell rounded, convex, grey, with decussate striæ; crown pointed, central, and marked with twelve orange radiate lines; the bottom is horny. It inhabits Jamaica. See CONCHOLOGY Plate I. fig. 8.

127. *Patella areolata*: shell pyramidal, reddish-grey, with very thin circular striæ, crossed by longitudinal ones; crowned violet. It resembles the *P. Magellanica* of a former section, but is more depressed, and broader at the base.

128. *Patella flammea*: shell ovate, with very fine annulate striæ, reddish-grey, with undulate brown rays; the crown is acute, central, white in the middle.

129. *Patella Indica*: shell reddish-grey, with radiate striæ; glabrous, narrower on one side; crown acute, smooth, surrounded with a reddish ring. It inhabits India, is nearly four inches long, and resembles the *P. rustica*, to be described hereafter.

130. *Patella Surinamensis*: shell thick, subovate, yellowish, with black rays, and longitudinal unequal striæ, and surrounded with knotty belts; crown obtuse, smooth, and white. It inhabits Surinam.

131. *Patella vitellina*: shell ovate, yellow, with an unequally striate base, and obtuse whitish crown.

132. *Patella sanguinolenta*: shell ovate, convex, white, solid, with intermixed, capillary, and flexuous, elevated longitudinal striæ; the crown is surrounded with a broad ring, dotted with red. It is found in Africa.

133. *Patella lævigata*: shell ovate, yellow, within bluish-white, with oblique striæ, the crown is white, smooth, and polished.

134. *Patella punctulata*: shell rounded, white, with many-coloured dots, radiate towards the base, and surrounded with two brown rings.

135. *Patella pellucida*: shell very entire, ovate, gibbous, pellucid, with four blue rays. This is described and figured by Donovan, Pennant, Lister, and others. It is

is about the size of a walnut; and is found in the European and Northern seas.

136. *Patella testudinaria*: shell very entire, acute, smooth, glabrous. It inhabits the Indian and Northern seas in numerous varieties.

137. *Patella testudinalis*: shell very entire, ovate, and striate; a variety has its crown obtuse, and nearly central. It inhabits the seas about Greenland, among fuci.

138. *Patella compressa*: shell very entire, oval, oblong, striate, smooth, compressed on the back. It inhabits India, and is about four inches long.

139. *Patella rustica*: shell very entire, conic, with fifty obtuse striæ.

140. *Patella fusca*: shell very entire, ovate, obtuse, with elevated striæ.

141. *Patella notata*: shell entire, striate, with a submucronate erect crown, within white, with a black heart-shaped spot white in the middle. It inhabits the Mediterranean.

142. *Patella cruciata*: shell very entire, oval, sub-convex, brown, with a white cross.

143. *Patella radians*: shell entire, oval, pellucid, depressed, striate, horny, radiate, with black spots. It inhabits New Zealand.

144. *Patella rota*: shell roundish, the inside somewhat silvery, the outside with reddish streaks and a yellowish border. Inhabits the Indian and American seas.

145. *Patella umbellata*: shell entire, roundish, diaphanous, depressed, with yellowish rays within; crown pale yellow, margin very acute. It is about four inches and a half long, and is found in the Indian ocean.

146. *Patella pustulata*: shell thin, oval, depressed, radiate, white, dotted with red, within smooth.

147. *Patella symmetrica*: shell ovate, conical, solid, brown, divided into partitions by perpendicular white lines; within smooth, white; margin cut archwise.

148. *Patella citrina*: shell ovate, convex, with very fine decussate striæ, white, with two broad yellow bands, within whitish, with a milk-white bottom; crown brownish.

149. *Patella Capensis*: shell oval, with decussate striæ, the longitudinal ones alternately brown and white, within somewhat perlaceous, with a white bottom. It inhabits the Cape of Good Hope.

150. *Patella anomala*: shell coarse, brown, orbicular, with a submarginal crown. It inhabits the deeps of the Norway seas, on rocks and dead testaceous substances; and has been particularly described under the article *HELMINTHOLOGY*, vol. ix. p. 356. Plate IV. fig. 17.

151. *Patella guttata*: shell finely striate, and varied with dots of different colours; the bottom is dusky. It is about an inch and a half long, and resembles the compressa.

152. *Patella mytiliformis*: shell glabrous, lead colour, with a white horse-shoe shaped band within. It inhabits the Ferroe island, adhering to zoophytes.

153. *Patella scutiformis*: shell oval, thin, black, with white perpendicular flattened striæ.

154. *Patella cochlear*: shell white, flattish, one part narrow, caniculate within, with a bluish callus shaped like a horse-shoe, the other part rounded.

155. *Patella craticulata*: shell oval, thin, depressed, cancellate, radiate.

156. *Patella cruentata*: shell oval, a little convex, varied with red, and slightly toothed, with elevated unequal rough striæ.

157. *Patella papyracea*: shell depressed, thin, hyaline, dotted with red, with chefnut rays outwardly, and crowded thinner, and granulate thicker striæ.

158. *Patella cylindrica*: shell oval, flat, with crowded longitudinal striæ of unequal thickness, and all granulate.

159. *Patella decussata*: shell somewhat convex, white, with crowded red dots; within radiate with red and white, with decussate glabrous striæ, and a few longitudinal thicker white ones.

160. *Patella hæmatosticta*: shell thin, depressed, white, dotted with red; within brownish, spotted, striate; crown varied with cinereous and brownish.

161. *Patella asteroides*: shell flattish, cancellate, cinereous, with a chefnut star and rays towards the margin; crown smooth, grey, surrounded with brown dots.

162. *Patella ovalis*: shell oval, somewhat convex, thin, with crowded striæ, grey, with blackish rays and spots.

163. *Patella rubella*: shell a little convex, striate, reddish; crown whitish, spotted with red; the bottom part is whitish.

164. *Patella spectabilis*: shell flattish, a little wrinkled, striate, reddish-white, with a chefnut band towards the crown, and another bay one at the margin.

165. *Patella conspurcata*: shell solid, flattish, striate, black, with striate dots, within bluish, crown dirty-yellow.

166. *Patella melanosticta*: shell solid, flattish, striate, whitish, with cinereous rays and black dots, within bluish; crown a little pointed and whitish.

167. *Patella atra*: shell black, striate, with a paler crown; bottom with a brownish mark, surrounded with a white horse-shoe shaped band.

168. *Patella specularis*: shell oval, convex, solid, glabrous, liver-colour, within and the crown brownish, the latter surrounded with a white border, and interrupted brownish band.

169. *Patella canescens*: shell oval, black, within bluish, striate, the larger striæ flattened and grey; crown obtuse, brownish, with a whitish area.

170. *Patella virescens*: shell oblong, flattish, dilated on each side, and striate; olivaceous, radiate, and spotted with white, within blue.

171. *Patella pulla*: shell rounded, convex, longitudinally striate, and transversely wrinkled, brownish, within russet brown, with whitish and brownish rays, and two milk-white bands above.

172. *Patella revoluta*: shell sub-oval, crenate, striate, ochraceous, with red spots and rays, broader on one side; margin revolute.

173. *Patella squamata*: shell ovate, convex, striate, the striæ scaly, varied with white and black; crown nearly central, grey.

174. *Patella testacea*: shell ovate, very finely striate, testaceous, with three transverse brownish rings, within pale yellow, with a whitish bottom.

175. *Patella capillaris*: shell ovate, thin, brown, with darker bands, and paler striæ, within brownish, crown and bottom white.

176. *Patella glauca*: shell ovate, narrower on one side, very finely striate, bluish, with a white band towards the margin, and another bluish one; crown and margin white.

177. *Patella obscura*: shell ovate, flattish, striate, varied with yellowish and brown, dotted with green, within brown, crown bay.

178. *Patella exoleta*: shell oval, sub-convex, unequally striate, whitish, with a few black lines reaching half way; bottom with an ochraceous spot.

179. *Patella affinis*: shell oval, flattish, solid, with a few black rays reaching half way; the bottom is marked with a white spot.

180. *Patella rotalis*: shell white, opaque, flat, round, with a regular toothed margin. It is found occasionally at Sandwich: is very minute and rare.

181. *Patella fuscata*: shell ovate, convex, very finely striate, and varied with brown.

182. *Patella mellia*: shell rounded, solid, glabrous, honey-colour, within white; crown brownish; margin spotted with brown, and silvery within; bottom with a liver-colour spot.

183. *Patella anceps*: shell solid, glabrous, a little pointed, pale chefnut, within pale flesh-colour.

184. *Patella Guineensis*: shell ovate, convex, very smooth, one side broader and chefnut-coloured, the other with the crown pale yellow; margin flesh-coloured on each side.

185. *Patella*

185. *Patella complanata*: shell depressed-hemispherical, obsoletely cancellate, varied with white and brownish.
186. *Patella virgata*: shell ovate, longitudinally striate, whitish with brown rays and crown, within perlaceous.
187. *Patella nivea*: shell subconic, solid, glabrous, snowy, with transverse concentric rings. Inhabits Africa.
188. *Patella grisea*: shell oval, with crowded radiate grooves, within polished; crown nearly central. It inhabits Africa.
189. *Patella navicula*: shell narrow, with decussate striæ, rosy with a whitish callous belt on one side in the middle, and whitish bottom, the margin is revolute on each side.
190. *Patella cingulata*: shell suboval, obsoletely striate, ferruginous, with two elevated obscurely barred belts; crown nearly central.
191. *Patella scarpa*: shell clear white, with undulate striæ, narrow, the broader side with an acute callus, the narrower side repand.
192. *Patella parva*: shell small, entire, without gloss, whitish, faintly radiate with red. This is described and figured by Donovan. It is found on the Devonshire coasts, but is very rare.
193. *Patella oblonga*, or oblong fresh-water patella: shell perfectly entire, oblong, compressed, with reflex oblique mucronated vertex. Found in the waters near Beaconsfield, adhering to the leaves of the *Iris pseudacorus*. It is about a quarter of an inch in length, and a tenth of an inch in diameter, turned downwards, and leaning to one side. Described by the Rev. John Lightfoot in the *Phil. Trans.* for 1786. It is shown, magnified, on the annexed Plate, at fig. 16.
- V. *Perforatæ*. Crown, or tip, perforate.
194. *Patella fissura*: shell oval, conic, with reticulate striæ, cleft on the fore-part; crown recurved. It is found on divers parts of the coasts of Europe and Barbary, and in this country.
195. *Patella fissurella*: shell grooved and perforated on the fore-part; crown recurved. It is found adhering to stones in the Iceland seas.
196. *Patella pustula*: shell oval, gibbous, convex, with reticulate striæ, and crenate margin. It inhabits the Mediterranean, Atlantic, and Indian seas.
197. *Patella græca*: shell ovate, convex, reticulate; the margin crenulate inwardly.
198. *Patella nimbofa*: shell ovate, striate, rugged, brown, with an oblong perforation. It inhabits the Mediterranean and Atlantic. This shell is exhibited at fig. 17. and the inside of it at fig. 18.
199. *Patella nubecula*: shell subovate, rugged, white, radiate with red, with an ovate perforation. It inhabits the Mediterranean; and resembles the preceding.
200. *Patella picta*: shell ovate, solid, clouded, white and green, with oblique, undulate, alternate violet and white rays. It inhabits the Straits of Magellan.
201. *Patella Barbadenfis*: shell oblong, unequally striate; within smooth, milk-white, with greenish bands; margin crenulate. It inhabits Barbadoes.
202. *Patella Jamaicensis*: shell whitish, transversely annulate, with longitudinal striæ covered with foliaceous tubercles, which are larger outwardly. This is found on the coasts of Jamaica and Barbadoes.
203. *Patella Caffra*: shell ovate, compressed, striate, very finely annulate, and radiate with black; bottom milk-white; perforation nearly central. It inhabits the Cape of Good Hope.
204. *Patella perforata*: shell a little convex, transversely wrinkled, brownish with straw-coloured rays and spots, with longitudinal striæ alternately larger and scaly.
205. *Patella porphyrozonias*: shell oblong, compressed, unequally striate, white with five purple interrupted belts, within greenish-white. It inhabits North America. The perforation is very minute, orbicular, and surrounded on the inside with a red circle.
206. *Patella rosea*: shell very thinly striate, with alternate rosy and white rays; the perforation is oval.
207. *Patella scutellum*: shell each side repand, compressed; perforation radiate with grooves.
208. *Patella avellana*: shell thin, white, with very fine striæ; perforation oblong, and divided by a ligament. There is a variety of which the margin is a little revolute on each side.
209. *Patella spinosa*: shell ovate, convex, white, with elevated striæ, growing thicker towards the margin, and marked with four rows of tubercles, the exterior tubercles are spinous.
210. *Patella denticulata*: shell ovate, gibbous, whitish radiate with brown, within green, with elevated striæ; margin denticulate, crenate within.
211. *Patella nodulosa*: shell ovate, convex, with elevated nodulous striæ, crossing thinner transverse ones, within white; crown black.
212. *Patella angusta*: shell depressed, white, with elevated striæ, every fourth of which is larger; perforation very narrow, and surrounded with a chefnut band on the outside, and a green one within.
213. *Patella inæqualis*: shell ovate, convex, with decussate striæ, white, something triangular on the broader side; perforation surrounded with an elevated ring, round which is a red line.
214. *Patella minuta*: shell oval, pyramidal, reddish, with twelve elevated white striæ; bottom white; perforation oval, and nearly central; margin denticulate.
215. *Patella conspersa*: shell ovate, convex, striate, yellowish, with red dots, and three oblique rays: within smooth, white.
216. *Patella rubescens*: shell oval, striate reddish, with a white band in the middle; within it is white; margin entire; perforation linear.
217. *Patella sanguinea*: shell oval, thin, red, within greenish-white, with longitudinal striæ crossing finer transverse ones, which are rugged outwardly.
218. *Patella ventricosa*: shell oval, ventricose, with decussate red striæ, within white; crown depressed, with an orbicular perforation; margin entire.
219. *Patella triradiata*: shell oval, flattish, striate, white, with three brown rays, within whitish, perforation linear; margin entire.
220. *Patella tenuis*: shell oval, a little convex, pellucid, longitudinally striate, white, with five half-brown rays; within yellowish.
221. *Patella melanozonias*: shell convex rosy, with an interrupted black band, and elevated unequal white striæ; within smooth, white; margin denticulate.
222. *Patella effusa*: shell convex, rosy, with elevated nodulous white, alternately larger striæ; perforation round and large.
223. *Patella punicea*: shell convex, chefnut, with unequal crowded decussate striæ, within smooth, with alternate green and white bands; the perforation is round.
224. *Patella rufescens*: shell convex, white shaded with red, and here and there striate with red, with granulate striæ; within it is smooth and white.
225. *Patella dimidiata*: shell convex, above clear white, cancellate, longitudinally striate towards the margin, with a rosy band.
226. *Patella lactea*: shell convex, white, with unequal acute glabrous striæ; within smooth; the crown is rosy; the perforation large and orbicular.
227. *Patella pyramidalis*: shell convex, rosy, striate, with twelve smooth ribs; within smooth and greenish-white.
228. *Patella bicolor*: shell narrow, alternately radiate with chefnut and white, with unequal, thick, lamellate, striæ; within smooth, white, margin crenulate.
229. *Patella erythrocephala*: shell convex, white, with red lines outwardly, and elevated rugged contrary striæ, ten of them larger; the margin repand and inflected.
230. *Patella verrucosa*: shell above brown, striate, terminated

minated by a knotty belt, beneath radiate with red, with acute nodulous ribs; margin denticulate, repand.

231. *Patella contaminata*: shell convex, with nodulous unequal ribs, the larger ones yellowish-brown, and marked with black dots disposed in interrupted circles, within greenish-white; the crown is cinereous.

232. *Patella atrata*: shell a little convex, narrow, white with red lines, outwardly spotted with black, with elevated, convex, unequal striæ; the perforation is oblong, with a chestnut margin.

233. *Patella candicans*: shell white, chestnut-coloured towards the margin, with twenty alternately larger ribs; the crown is reddish, with an oblong perforation.

234. *Patella fuccincta*: shell ovate, pointed, white, above smooth, with an elevated belt in the middle, dotted with ferruginous towards the margin, with elevated unequal smooth striæ; margin denticulate.

235. *Patella pusilla*: shell flattish, white, sub-orbicular, with twenty alternately less and shorter elevated striæ; the perforation is round, and surrounded on each side with a reddish circle.

236. *Patella flavescens*: shell very thin, pointed, finely striate, yellowish, with six brown rays; margin denticulate; crown cinereous, with an oblong perforation.

237. *Patella antiquata*: shell a little convex, obsoletely striate; white with red striate rays on the outside. The perforation is oblong and unequal.

238. *Patella galeata*: shell solid, ovate, compressed, within white; crown a little recurved, obtuse, with a linear perforation; margin crenate.

239. *Patella perforata*: shell convex, with decussate lines and black rays. It inhabits the Falkland Islands.

PATELLA'RIA, *f.* in botany. See *PARMELIA*.

PATELLA'RII, *f.* Certain idols among the Romans, placed by Plautus in the lowest class, and called by Horace also "the little gods."

PATEN, or *PATIN*, *f.* [*patina*, Lat.] A plate. *Not in use*:

The floor of heav'n

Is thick inlaid with *patens* of bright gold;
There's not the smallest orb which thou behold'st,
But in his motion like an angel sings. *Shakespeare.*

The cover of the chalice used in churches to hold the consecrated bread, or any little plate or dish for the same purpose; formerly *patel* also, from *patella*, Lat. a little dish.—Crosses, with your thombe on your forehead, an other upon your crowne, with the *patell* of the chalice. *Confut. of N. Shaxton*, 1546.—They have the chalice with wine, and *paten* with hosts, given unto them. *Bp. Bedell*.—Here the priest is to take the *paten* into his hand. *Communion Service*.

PATENO'DE, a town of the island of Ceylon, near the east coast: seventy-eight miles east of Candy. Lat. 7. N. lon. 82. E.

PATENT, *adj.* [*patens*, Lat. open.] Open to the refusal of all: as, letters *patent*.—In Ireland, where the king disposes of bishopricks merely by his letters *patent*, without any congé d'élire, which is still kept up in England; though to no other purpose than to shew the ancient right of the church to elect her own bishops. *Leslie*.—Something appropriated by letters patent.—Madder is esteemed a commodity that will turn to good profit; so that, in king Charles the first's time, it was made a *patent* commodity. *Mortimer's Husbandry*.—Apparent; conspicuous. This sense is perhaps of modern introduction.—In this country, the contract [between the king and nation] is not tacit, implied, and vague: it is explicit, *patent*, and precise: it is summarily expressed in the coronation-oath; it is drawn out at length and in detail in the Great Charter and the corroborating statutes, in the Petition of Right, in the Habeas Corpus Act, in the Bill of Rights, and in the Act of Settlement. *Bishop Horsley's Sermon*. 30 Jan. 1793.

VOL. XVIII. No. 1281.

PAT'ENT, *f.* A writ conferring some exclusive right or privilege. See *LETTERS PATENT*, vol. xii.—If you are so fond over her iniquity, give her *patent* to offend; if it touch not you, it comes near nobody. *Shakespeare*.—We are censured as obstinate, in not complying with a royal *patent*. *Swift*.

So will I grow, so live, so die,
Ere I will yield my virgin *patent* up
Unto his lordship. *Shakespeare's Midf. N. Dream*.

Under the article *LETTERS PATENT*, vol. xii. p. 542, we have explained how fully and clearly the *specification* must be made out, in order to secure the effect of the patent. This specification is lodged at the Rolls-office in Chancery-lane; and is open to the inspection of every body, without exception. Mr. Winsor, in a pamphlet which he wrote, in 1807, upon the subject of his invention or application of gas-lights, has some good remarks upon the inconvenience of this indiscriminate publicity, which we think merit serious consideration.

"Such publicity (says he) is plausibly, but too superficially, supposed necessary: 1st, to prevent monopoly after the patent is expired; and secondly, to prevent others from idly spending their time and money in the same pursuit, in order not to commit infringements unknown to themselves.

"This, I believe, is as much as can possibly be said in favour of *indiscriminate* publicity, by which the whole country is to become acquainted with, and of course to be benefited by, every specification. But I believe the following evils will outweigh the benefits it is intended to spread over the country.

"It is a positive fact, that several foreign agents are expressly and exclusively employed to attend in Chancery-lane, &c. to examine and copy every specification of any patent, together with all the drawings, if any. Such copies are almost immediately published in the next monthly publications all over the continent; but chiefly at Leipzig, Hamburg, Berlin, Frankfort, Paris, &c. It is by these means that the most beneficial patent-inventions are known and imitated abroad, and often much sooner than they can be promulgated in the British realm, because not only the labour, but also the materials, are much cheaper almost in every place on the continent of Europe, than in England.

"Long before I thought it probable that ever I should become a patentee myself, I have often seen, with surprise and regret, the English patent specifications, with drawings and explanations in German and French, inserted in the foreign journals.

"The laws against the emigration of artificers, and the exportation of tools, is very severe; for they inflict heavy penalties and imprisonment. Our manufacturers are very jealous and watchful in this respect, and they prosecute with the utmost rigour every transgression of this kind. But it is the more to be wondered at, that there is no prohibition against the exportation of patent specification. I am perfectly assured, they would not have made a fourth of the progress in English manufactures abroad, if it had not been for the indiscriminate and impolitic publication of these specifications. Patents are granted for many inventions abroad; but the particulars are never published, except their enrolment in the archives of state; and they can only be known, seen, or copied, by respectable inhabitants, after the terms of the patents are expired." Winsor's Defence against Nicholson, p. 53.

PATENTEE, *f.* One who has a patent.—If his tenant and *patentee* dispose of his gift, without his kingly consent, the lands shall revert to the king. *Bacon*.—In the patent granted to lord Dartmouth, the securities obliged the *patentee* to receive his money back upon every demand. *Swift*.

PATEQUEMA'DE, a town of the island of Cuba: twenty miles east of Villa del Principe.

9 N

PATER,

PA'TER, or PADER, a river of Germany, which rises near Paderborn, and runs into the Lippe about one mile east of Neuhaus.

PA'TER-NOSTER, *f.* [Latin.] The Lord's Prayer; a form so called from the two initial words thereof in Latin. —An ignorant plain man, having learned his *pater-noster* and ave-mary, wants to learn his creed. *Pope, cited by Warton.*

He did desire

Short *pater-nosters*, saying as a friar
Each day his beads.

Donne's Poems.

PETER-NOSTER is also used for a chaplet or string of beads; because serving to number the rehearsals of that prayer.

PATER-NOSTERS, in architecture, a sort of ornaments cut in form of beads, either round or oval; used on baguettes, astragals, &c.

PA'TER NOSTERS, rocks in the Atlantic, on the south side of the entrance into the bay of St. Helena. Lat. 32. 20. S.

PA'TER NOSTERS, or PIERRES DE LEC, rocks near the north coast of the island of Jersey.

PATER NOSTERS (Great), a cluster of shoals and islets in the Eastern Indian Sea, about 120 miles in length from north-east to south-west, and 30 in breadth. Lat. 6. 30. to 7. 42. S. lon. 117. 10. to 119. 10. E.

PA'TER NOSTERS (Little), a cluster of 13 rocks in the Eastern Indian Sea, between the islands of Borneo and Celebes, called by the Malays *Pulo Balabutaken*. They are covered with trees, and have navigable channels between them; but the anchorage is uneven.

PATER-NOSTRE, *adj.* in heraldry. A cross pater-nostre is a cross made of beads. This cross is to be so shadowed in drawing, as that the sphericity of the beads may appear, to distinguish them from besants.

PA'TER PATRA'TUS, *f.* among the Romans, the first and principal person of the college of heralds, which formed a kind of board or council, to examine the differences that arose between neighbouring states, and endeavour amicably to accommodate the same.

PATERA, *f.* among antiquaries, a goblet or vessel used by the Romans in their sacrifices; wherein they offered their consecrated meats to the gods, and wherewith they made libations. The word is Latin, formed from *pateo*, I am open; because it has a great aperture, in contradistinction to bottles, &c. which have only narrow necks, or whose aperture is less than the body of the vessel.

On medals the patera is seen in the hands of several deities, and frequently in the hands of princes, to mark the sacerdotal authority joined with the imperial, &c. Hence F. Joubert observes, that, besides the patera, there is frequently an altar upon which the patera seems to be pouring its contents.

The patera was of gold, silver, marble, brass, glass, or earth; and they used to inclose it in urns with the ashes of the deceased, after it had served for the libations of the wine and liquors at the funeral.

The PATERA, or PATRA as it is commonly written, of the Hindoos, is a vessel of capacity, to which, under a mythological aspect, a great deal of mysticism is attached. It is seen in the hand of Parvati, and of some other deities of the avenging character, in the shape of a small basin or cup; and is said to be for the purpose of receiving the blood of her victims, which she is poetically represented to quaff. The patra is, however, still more mystically contemplated in India, as an emblem or type of the world, and is then called argha-patra. The *argha* means a cup, or dish, in which fruits or flowers are offered to the deities; and ought to be shaped like a boat, as some are still seen, but more usually of a round form. A rim round the argha represents the mysterious Yoni, and a boss or convexity in the centre refers to the navel of Vishnu, whence, according to some popular fables, the

creative Brahma sprang on a lotos to perform his great work. We shall here notice no farther on this point than the coincidence of wild umbilical mysteries common to the mythologists of India, Egypt, and Greece. Such mythological coincidences are striking and curious, and we shall proceed to notice some connected with the subject of this article. The name, form, and use, of the patra as a drinking vessel, or for oblation, reminds us at once of the patera of the ancients.

In vol. xiv. of the *Archæologia*, a description and plate are given of a Roman patera and vase dug up when sinking a ditch in Essex in June 1800. They were found near an ancient Roman road between Camulodunum and Camboritum. "The metal vase and patera merit attention, as none similar to the first have been figured or described in the works of the society; nor do I know that any like either have been presented for their inspection. The vase is of that form which Montfaucon has figured in his 2d vol. pl. 19. fig. 10. and calls a *præfericulum*, used by the Romans at their sacrifices, for pouring wine into the patera. Another more nearly resembling that here presented is given in his 3d vol. pl. 24. fig. 9. and called by Beger an *epichrysis*, but not allowed to be such by Montfaucon. The metal patera which belongs to the above, differs from the earthen patera, in general, by being bossed in the centre, a circumstance not easily to be accounted for, unless it was for the firmer fixing the *præfericulum* upon, when placed with the body at the time of interment." With the above Roman antiquities were found several little cups of Samian ware. "The uses of these elegant little cups have not," the antiquary continues, "that I know of, been ascertained by any author. The real purposes to which they were applied must remain at present in obscurity."

The learned author of this communication, Thomas Walford, esq. F. A. S. earnestly invites an explanation of these several Roman antiquities. It is, perhaps, no explanation to state that the Hindoos, in their sacrifices and ceremonies, have immemorially used, and still use, articles exactly similar to those exhibited, with the above communication, in vol. xiv. of the *Archæologia*, Plate IV. V. But it is curious to see how nearly they agree in form. A comparison of the article in the plates just adverted to, with those in plates 83, 86, and 105, of the Hindoo Pantheon, will strikingly evince this. The "sacritical vase," in the latter plate, has the same form, though more elaborately ornamented, as the above described *præfericulum*; and the others exhibit metallic circular pateræ, and the central embossment, which, though "not easily accounted for," is found among Hindoo mystics to have very profound allusions. The Roman patera has also the mysterious rim, or Yoni, respecting which the reader may consult the work last referred to. Dr. Clarke, in his recently-published *Travels*, notices that the pateras used by priestesses in the rites of Ceres, had this pyramidal node or cone in the centre. A priestess is represented holding one of these, on a bas-relief, in the vestibule of the Cambridge University Library. Similar articles are still used in the rites of the Hindoo Ceres; as are also the "little cups" described and exhibited in the *Archæol.* as above referred to, and in many of the Hindoo Pantheon. In India they are used for holding clarified butter, a common ingredient in the frequent oblations to fire; and unguents, and holy water, in the Sradha or funeral obsequies, and in other rites and ceremonies. Adverting for a moment to the place near which the Roman patera was found, we may remark, without laying any stress on it, that Camulodunum might, by a determined etymologist, be derived from the Sanscrit word Kamal or goddess Kamala. And long after this remark was written, we find such a derivation adopted in the 11th vol. of the *Asiatic Researches*, art. 2. ch. 4.

PATERA, a town of Asiatic Turkey, in Natolia. This town, anciently called *Patara*, was a city of Lycia, and

and famous for a temple of Apollo, said to have been equal to that of Delphos for its oracle, magnificence, and riches; and that god is said to have divided his preference between them, being six summer months at Delphos, and the six winter months at Patara. Ptolemy Philadelphus directed it to be called *Arfinoe*, but it recovered its former name, and is celebrated for the martyrdom of St. Leo and St. Gregory. It was once the see of a bishop, but is now a mean place.

St. Paul, in his passage from Philippi to Jerusalem, came to Miletus, hence to Coos, then to Rhodes, and from Rhodes to *Patara*; where having found a ship that was bound for Phœnicia, he went on-board and arrived at Jerusalem, to be at the feast of Pentecost. *Acts* xxi. 1.

PATERCULUS (Caius Velleius), an ancient Roman historian, who flourished in the reign of Tiberius Cæsar, was born in the year of Rome 735. His ancestors were illustrious for their merit and their offices. His grandfather espoused the party of Tiberius Nero, the emperor's father; but, being old and infirm, and not able to accompany Nero when he retired from Naples, he ran himself through with his sword. His father was a soldier of rank, and so was Paterculus himself. He was a military tribune when Caius Cæsar, a grandson of Augustus, had an interview with the king of the Parthians, in an island of the river Euphrates, in the year 753 of Rome. He commanded the cavalry in Germany under Tiberius; and accompanied that prince for nine years successively in all his expeditions. He received honourable rewards from him; after having been quæstor, he was preferred to the higher dignity of the prætorship, A. D. 30. The praises he bestows upon Sejanus give probability to the conjecture, that he was looked upon as a friend of this favourite, and consequently was involved in his ruin. His death is placed by Mr. Dodwell in the year of Rome 784, when he was in his 50th year.

He wrote an Abridgement of the Roman History in two books, which is very curious. His purpose was only to deduce things from the foundation of Rome to the time wherein he lived; but he began his work with things previous to that memorable era: for, though the beginning of his first book is wanting, we yet find, in what remains of it, an account of many cities more ancient than Rome. He promised a larger history; and no doubt would have executed it well; for, during his military expeditions, he had seen, as he tells us, the provinces of Thrace, Macedonia, Achaia, Asia Minor, and other more easterly regions, especially upon the shores of the Euxine Sea, which had furnished his mind with much entertaining and useful knowledge. In the Abridgement which we have, many particulars are related that are no-where else to be found: and this makes it the more valuable. The style of Paterculus, though miserably disguised through the carelessness of transcribers, and impossible to be restored to purity for want of manuscripts, is yet manifestly worthy of his age, which was the time of pure Latinity. The greatest excellence of this historian lies in his manner of commending and blaming those he speaks of; which he does in the finest terms and most delicate expressions. He is, however, condemned, and indeed with the greatest reason, for his partiality to the house of Augustus; and for making the most extravagant eulogies, not only upon Tiberius, but even upon his favourite *Sejanus*; whom, though a vile and cruel monster, Paterculus celebrates as one of the most excellent persons the Roman commonwealth had produced. Lipsius, though he praises him in other respects, yet censures him most severely for his insincerity and partiality. "Velleius Paterculus (says he) raises my indignation: he represents Sejanus as endowed with all good qualities. The impudence of this historian! But we know that he was born, and died, to the destruction of mankind. After many commendations, he concludes, that Livia was a woman more resembling the gods than men: and, as to Tiberius, he thinks it a

crime to speak otherwise of him than as of an immortal Jove. What sincere and honest mind can bear this? On the other hand, how artfully does he every-where conceal the great qualities of Cæsar Germanicus! how obliquely does he ruin the reputation of Agrippa and others, whom Tiberius was thought to hate! In short, he is nothing but a court-prostitute. You will say, perhaps, it was unsafe to speak the truth at those times: I grant it; but, if he could not write the truth, he ought not to have written lies: none are called to account for silence." La Mothe le Vayer has made a very just remark upon this occasion: "The same fault (says he) may be observed in many others, who have written the history of their own times, with a design to be published while they lived."

It is strange, that a work so elegant and worthy to be preserved, and of which, by reason of its shortness, copies might be so easily taken, should have been so near being lost. One manuscript only has had the luck to be found, as well of this author among the Latins as of Hesychius among the Greeks: in which, says a great critic of our own nation, "the faults of the scribes are found so numerous, and the defects so beyond all redress, that notwithstanding the pains of the learned and most acute critics for two whole centuries, these books still are, and are likely to continue, a mere heap of errors." No ancient author but Priscian makes mention of Paterculus: the moderns have done him infinitely more justice, and have illustrated him with notes and commentaries. He was first published, from the manuscript of Morbac, by Rhennanus, at Basil in 1520; afterwards by Lipsius at Leyden in 1581; then by Gerard Vossius in 1639; next by Boeclerus at Strasburg in 1642. Of the numerous later editions, those of Burmann, Lugd. Bat. 1719, 1744, and of Ruhnken, 1779, are most esteemed.

PATERE'RO. See **PADERERO**.

PATER'NA, a town of Spain, in New Castile: three miles east of Alcaraz.

PATER'NAL, *adj.* [*paternus*, from *pater*, Lat.] Fatherly; having the relation of a father; pertaining to a father.—Grace signifies the *paternal* favour of God to his elect children. *Hammond*.

Here I disclaim all my *paternal* care,
Propinquity and property of blood,
And hold thee stranger to my heart and me. *Shakespeare*.
They spend their days in joy unblam'd; and dwell
Long time in peace, by families and tribes,
Under *paternal* rule. *Milton's P. L.*

Hereditary; received in succession from one's father.—He held his *paternal* estate from the bounty of the conqueror. *Dryden*.

Men plough with oxen of their own
Their small *paternal* field of corn. *Dryden*.

PATER'NITY, *f.* Fathership; the relation of a father.—The world, while it had scarcity of people, underwent no other dominion than *paternity* and eldership. *Raleigh*.—A young heir, kept short by his father, might be known by his countenance; in this case, the *paternity* and filiation leave very sensible impressions. *Arbuthnot*.

PATER'NO, a town of Sicily, in the Valley of Demona, built on the ruins of Hybla, so celebrated for its honey: fifteen miles west of Catania.

PATER'NO, a town of Naples, in Principato Ultra: three miles north of Monté Marano.

PATERSON (Samuel), an eminent bibliographer, well known among literary men for his rare talents in the arduous task of compiling scientific and classical catalogues of public and private libraries of books and manuscripts in the ancient and modern languages. His Catalogues, forming many volumes, are now become scarce, and of themselves form valuable articles in good libraries. Mr. Paterson also wrote many little works, having for their object public utility, sound policy, and moral admonition;

tion; but to which he did not affix his name. Among others, 1. *A Journey through Part of the Netherlands*, in 1766, by Coriat Junior, 3 vols. 12mo. 1769. 2. *Joinerina*, or the Book of Scraps, 2 vols. 8vo. He was born in London, March 17, 1728; and died Oct. 29, 1802. *Jones's Biog. Diet.*

PATERSONIA, *f.* [so named by Mr. R. Brown in honour of his friend colonel William Paterson, a gentleman to whose researches at the Cape of Good Hope many years ago, and more recently in Norfolk Island, as well as New South Wales, of which last settlement he has long been lieutenant-governor, botany is much indebted.] In botany, a genus of the class monadelphia, order triandria, natural order enfatæ, *Linn.* (irides, *Juss.*) Generic characters—Calyx: sheath many-flowered, of two compressed keeled rigid leaves, embracing each other, with numerous inner membranous scales, separating the flowers. Corolla: of one petal, salver-shaped, regular; tube very slender, about as long as the sheath; limb in six deep segments, three of them very large, ovate, horizontal, the three alternate ones very small, erect. Stamina: filaments three, united into a tube nearly all the way up, longer than the shorter segments of the corolla; anthers erect, oblong. Pistillum: germen within the sheath, below the corolla, angular; style capillary, about as long as the stamens, generally swelling towards the top, contracted at the apex; stigmas three, dilated, somewhat hooded, undivided. Pericarpium: capsule membranous, prismatic, with three blunt angles, three cells, and three valves. Seeds numerous, roundish.—*Essential Character.* Sheath of two leaves; three inner segments of the corolla equal, minute, erect; filaments distinct at the top; stigmas dilated, undivided.

There can scarcely be a doubt that this is the same genus which Labillardiere calls *Genofiris*, however incorrectly he may have described it. The species known are seven, all perennial herbaceous fibrous rooted plants, with either none, or a short, mostly simple, stem. Leaves sword-shaped, narrow and compact. Flower-stalks either radical or terminal, simple, naked; flowers coming out in succession, handsome, but very short-lived, blue, without spots; anthers and stigmas yellow. Seeds usually inserted into the inner angle of the cell: sometimes into a central column. The species, as far as known, are all natives of New Holland, mostly without the tropic, growing in open, barren, stony or sandy places, near the shore, rarely in moist meadows.

1. *Paterfonia sericea*, or silky paterfonia: stigmas deflexed; sheath, and upper part of the stalk, silky; leaves straight, finely fringed, doubly striated, woolly at the base of their keel. Native of the country about Port Jackson, as well as of the tropical part of New Holland. It was one of the first plants of which specimens were sent to England by the settlers. Messrs. Lee and Kennedy raised it from seed, and it flowered with them in 1807, being kept in the greenhouse. The leaves are several, erect, narrow, rigid, and elastic, about a foot high, in two ranks. Flowers violet, not-unlike *Tradescantia virginica* at the first glance, but rather larger, without scent.

2. *Paterfonia lanata*, or woolly paterfonia: stalk round, striated, longitudinally woolly, as well as the sheath; leaves slightly convex, simply striated; woolly at the base. Observed by Mr. Brown in the south part of New Holland.

3. *Paterfonia longifolia*, or long-leaved paterfonia: stigmas deflexed; sheath and stalk silky; leaves linear, narrow, many times longer than the stalk; fringed below the middle with spreading or inflexed hairs. From Port Jackson.

4. *Paterfonia media*, or intermediate paterfonia: stigmas deflexed; inner segments of the corolla but one-fourth as long as the tube of the stamens; sheath silky; flower-stalk smooth, longer than the stem; keel of the leaves woolly at the base. From Port Jackson.

5. *Paterfonia glabrata*, or smooth paterfonia: stigmas

deflexed; inner segments of the corolla half as long as the tube of the stamens; flower-stalk longer than the stem, very smooth and shining, like the sheath; keel of the leaves woolly at the base. From the same country.

6. *Paterfonia glauca*, or glaucous paterfonia: stigma erect; style slightly thickened at the top; sheath about three-flowered, striated, smooth; leaves linear, rather convex, naked at the edges and base, twice as long as the slender, thread-shaped, smooth, stalk. Gathered by Labillardiere in Van Diemen's Land; by Mr. Brown near Port Jackson. Corolla blue, rather smaller than in *P. sericea*.

7. *Paterfonia occidentalis*, or west-coast paterfonia: stigma erect; style of equal thickness throughout. Sheath about five-flowered, even; stalk very smooth, as long as the sword-shaped leaves, which are naked at the edges and base. Native of the south-west coast of New Holland, where it was gathered by Mr. Brown. *Prod. Nov. Hol.* vol. i. p. 303.

PAT'GONG, a town of Hindoostan, in Bengal three miles west of Beyhar.

PATH, *f.* [Saxon; from *passus*, *passus*, Lat. a step, or pace, because a path is made by frequent steps of the foot; or from *passage*, Fr. "*Il y a un passage à travers les prairies*, There is a path through the meadows." MS Gleanings in Etymology.] Way; road; track. In conversation it is used of a narrow way to be passed on foot; but in solemn language means any passage.—For darkness, where is the place thereof? that thou shouldst know the paths to the house thereof. *Job*, xxxviii. 20.—There is but one road by which to climb up, and they have a very severe law against any that enters the town by another path, lest any new one should be worn on the mountain. *Addison on Italy*.

On the glad earth the golden age renew,
And thy great father's path to heaven pursue. *Dryden*.

To PATH, *v. a.* To push forward; to cause to go; to make way for.—So from the neighbouring hills her passage Wey doth path. *Drayton's Polyolb.*

Where will they find a cavern dark enough
To mask thy monstrous visage? Seek none, conspiracy;
Hide in it smiles and affability:
For, if thou path thy native semblance on,
Not Erebus itself were dim enough
To hide thee from prevention *Shakespeare's Jul. Caf.*

PA' TH-FLY, *f.* A fly found in foot-paths, of a greyish colour; and supposed to live by sucking the ground.

PATH-HEAD, a considerable manufacturing town in the parish of Dysart, and county of Fife, Scotland, is situated on the acclivity of a hill, looking towards the Frith of Forth, at a short distance to the north-eastward of the ancient burgh of Kirkcaldy. It is divided into two parts, one called Dunnikier, and the other Sinclair-town, from the estates on which they happen to be respectively placed. Formerly Path-head was noted for the number of its nail-manufactories; but these have now considerably declined, and the inhabitants are chiefly engaged in different branches of weaving. There is no regular market held in this town; but it has the privilege of a large annual fair for woollen and linen cloths. According to the parliamentary returns of 1811, it contained 237 houses, and 1692 inhabitants.

On a free-stone rock, which projects into the Frith immediately below Path-head, stand the venerable ruins of Riven's or Raven's Craig castle, which was granted, with the neighbouring lands, by James III. of Scotland, to William St. Clair, or Sinclair, earl of Orkney, on his resignation of that title. During the time of the commonwealth it was garrisoned by a party of Cromwell's troops, but is now uninhabitable. *Beauties of Scotland*, vol. iv. *Sinclair's Statistical Account*, vol. xviii.

PA' TH-WAY, *f.* A road; in common acceptance; a narrow

a narrow way to be passed on foot.—In the way of righteousness is life, and in the *path-way* thereof there is no death. *Prov.* xii. 28.

Alas, that Love, whose view is muffled still,
Should without eyes see *path-ways* to his ill! *Shakesp.*

PATHE'MA, *f.* [Greek.] Pathos; warmth; affection of mind.

PATHET'IC, or PATHETICAL, *adj.* [*παθος*, Gr. passion.] Affecting the passions; passionate; moving.—How *pathetic* is that expostulation of Job, when, for the trial of his patience, he was made to look upon himself in this deplorable condition! *Speclator.*

While thus *pathetic* to the prince he spoke,
From the brave youth the streaming passion broke. *Pope.*

PATHET'IC, *f.* Pathos.—No man can think that the author of the Rape of the Lock and Eloisa, wanted imagination, sensibility, or *pathetic*. *Warton's Pope.*

PATHET'ICALLY, *adv.* In such a manner as may strike the passions.—These reasons, so *pathetically* urged, and so admirably raised by the prosopopoeia of Nature speaking to her children with so much authority, deserve the pains I have taken. *Dryden.*

PATHET'ICALNESS, *f.* Quality of being pathetic; quality of moving the passions.—These words close the discourse with wonderful grace; surprise the hearers with an agreeable civility; and impress upon them a strong opinion of the speaker's sincerity, charity, and benevolence to mankind. Had they been placed any-where else,

the *patheticalness*, grace, and dignity, of the sentence, had been much abated. *Blackwall's Sacr. Class.*

PATH'IC, *f.* [from *παθειν*, Gr. to suffer.] One who suffers himself to be abused contrary to nature.

PA'THLESS, *adj.* Untrodden; not marked with paths.—Ask thou the citizens of *pathless* woods. *Sandys.*

In fortune's empire blindly thus we go,
And wander after *pathless* destiny,

Whose dark resorts since prudence cannot know,
In vain it would provide. *Dryden.*

Through mists obscure she wings her tedious way,
Now wanders dazzled with too bright a day;
And from the summit of a *pathless* coast
Sees infinite, and in that sight is lost. *Prior.*

PATHOGNOMON'IC, or PATHOGNOMICAL, *adj.* [from the Gr. *παθος*, suffering, and *γνωσμος*, to know.] Denoting such signs of a disease as are inseparable, designing the essence or real nature of the disease: not symptomatic.—Fear and sadness are the *pathognomical* signs of all kinds of melancholy. *Ferrand on Love Mel.* 1645.—He has the true *pathognomonic* sign of love, jealousy; for no body will suffer his mistresses to be treated at that rate. *Arbutnot.*

PATHOGNOMON'IC, *f.* A proper distinguishing and inseparable sign of a disease.

PATHOLOG'ICAL, *adj.* [from *pathology*.] Relating to the tokens or discoverable effects of a distemper.

PATHOL'OGIST, *f.* [from *pathology*.] One who treats of the diseases of the human body.

INDEX to the Article PARTURITION.

- A**-KE, a remarkable monster, 690.
 Abortion, or premature labour, to avoid a greater evil, 692; a successful case, 693.
 Abstinence, to prevent the growth of the fœtus, 692.
 Ægineta, one of the first male practitioners, 666.
 Aetius, 663; a considerable writer on parturition, 665.
 Albucasis, an Arabian writer, 666.
 Amand, his method of extracting with a net, 669.
 Aristotle's Midwifery, 665; written by Dr. Salmon, 669.
 Arm-presentations, 686, 7.
 Aspasia, a writer on parturition, 663.
 Avicenna, 664; a good writer on parturition, 666.
 Bathing and anointing, the chief helps, anciently, in difficult labours, 664.
 Breasts of women after delivery, 711; treatment of the milk-abscess, 712, 13; breast-pump, 713.
 Breech-presentations, 685.
 Cæsarian section, 692; ancient practice, 695; curious cases, 696; why more used, and more successful on the continent, *ibid*; directions for performing it, 697; successful case, 698.
 Celsus, his directions for the delivery of dead children, 665.
 Chamberlen, inventor of the forceps, 668.
 Chapman's Treatise on the Improvement of Midwifery, 669.
 Child with two heads, 676; dissection of, 677; with two bodies, 690.
 China, parturition early studied there, 666.
 Cleopatra, a writer on parturition, 663.
 Conquest, Dr. his opinion as to superfœtation, 682; his craniotomy-forceps, 693.
 Convulsions, or epileptic fits, attending labour, 705; mode of treatment, 705, 6.
 Craniotomy forceps, advantage of, over the crotchet, 693, 4; 718.
 Croft (Dr.) his unfortunate exit, 710.
 Crotchet, improved by Mefnard, 670; its use, 693, 4; proposed to be set aside, 718.
 Culpeper, physician and astrologer, 668; his Directory for Midwives, and other works, 669.
 Denman's three stages of labour, 671; his system of spontaneous evolution, 688; thinks the symphysis pubis stretches at the time of parturition, 691.
 Deventer, an eminent Dutch accoucheur, 669.
 Ear-presentations, 686.
 Embryotomy, 692; the operation described, 694; sometimes impracticable, *ibid*.
 Emotions of the mind, 710, 712.
 Ergot of rye, for hastening labour, 678; its peculiar action, 679.
 Extra-uterine gestation, 698, 9.
 Fainting, useful in some cases of hæmorrhage, 709.
 Feet-presentations and deliveries not unknown to the ancients, 670; both feet, 684; one foot, 685.
 Fevers attendant on parturition, 674.
 Fillet, a very ancient assistant in difficult labour, first mentioned by Avicenna, 664; Dr. Merriman's account of the use of it, 717, 18.
 Flooding, or hæmorrhage, 706-9.
 Fœtus, weight and measure of, 671.
 Forceps, invented by Dr. Chamberlen, 668; how to be applied, 683; farther described, with directions for using it, 716, 17; long forceps, 717.
 Forster, Elizabeth, curious instance of deformed pelvis from softness of bones, 697.
 Funis, sometimes gets round the child's neck, 673, 677; how to tie and cut, 674; sometimes too short, 677; presentation of, 689.
 Galen, 663; wrote commentaries upon Hippocrates, but assumed to himself the discoveries of Rufus and Herophilus, 665.
 Haighton, Dr. his improved forceps, 693; his Inquiry concerning the Cæsarian operation, 695, 6.
 Head, wrong presentation of, 685; in various positions, 686.
 Heister's Treatise on Surgery, 670.
 Hemorrhage from the uterus, 706; after parturition, 708; general treatment, 709.
 Hernia of the uterus, 703.
 Hippocrates, the practice in his time, as described in his chief works, 664.
 Hogben's division of the stages of labour, 671.
 Jaundice, or yellow-gum, 715.
 Infant, treatment of, 713; if still-born or weakly, 714.
 Instruments for difficult labours, 666, 715-18; Chamberlen's forceps, and Roonhuyfen's lever, 668, 683; decried by some of the early practitioners, 669; improved by Mefnard and Smellie, 670; farther improved, 716; caution against the too-frequent use of them, *ibid*; instrument for returning the funis, 689; for measuring the pelvis, 692; for returning an inverted uterus, 703.
 Lever, first called Roonhuyfen's secret, 683; farther described, 716.
 Manningham, 669; establishes the first lying-in hospital, 670.
 Maubray, the first teacher of midwifery in England, 669.
 Mauriceau, his writings on parturition, 668.
 Men first employed as accoucheurs in France, 670.
 Menage, curious anecdote related by him, 682.
 Mercatus, a Spanish practitioner, 667.
 Mercurialis (Hieronymus), his practice, 664.
 Mefnard, improves the crotchet, 670.
 Midwives now properly instructed, 670, 1.
 Milk-abscess, 712; Dr. Burne's treatment, 713.
 Milk-fever, seldom dangerous, 674.
 Mollities ossium, a dreadful disease, 691; Mrs. Foster's case, 697.
 Montrofit, 676, 690.
 Nipples, why flat and imperfectly formed in young women, 713.
 Opium, sometimes useful in hæmorrhage, 709.
 Oribafius, wrote but little on parturition, 665.
 Osborne, Dr. his explanation of the second stage of natural parturition, 673; mentions the expulsion of six ova at once, 681; a great opponent of the cæsarian section, 696.
 Ould (Sir Fielding), 670.
 Ovarium, enlarged, an obstruction to delivery, 700; wanting, 704, 5.
 Pains, genuine and spurious, 672.
 Paré, Ambrose, an eminent French accoucheur, and great improver of midwifery, 667.
 Parturition, how effected, probably, and by women only, in very remote times, 663; in the time of Hippocrates, 664; of Celsus and Galen, 665; of Avicenna and the other Arabians, and in China, in remote times, 666; in the sixteenth century, when men began to practise, 667; in the seventeenth, 668; modern practice, 699. Natural Parturition, 671; after-treatment, 674; singular customs, 675; protracted labour, 675, 6; plural births, 679-682; superfœtation, 682, 3. Preternatural labours, 683-709; influenced by the emotions of the mind, 709; after-management, 709.
 Pelvimeter, 692.
 Pelvis, its malconformation not considered in ancient times, 664; sometimes too large, 690; more frequently too small, or distorted, 691; form and dimensions, 691; distortions of, 691, 2; measurement of, 692; curious instances of deformed, 697.
 Perforator, 693; farther described, 718.
 Placenta, management of, forms the fourth stage of parturition, 473, 4; its situation causing hæmorrhage, 707.
 Plato, his curious account of the action of the uterus, 665.
 Plugging, in cases of uterine hæmorrhage, 709.
 Plural births, 679-81; very curious instances, 682; to which we may add, that in April 1821, in the neighbourhood of Dunkerlin, the wife of P. O'Felan, was delivered of four sons and a daughter, all living, and, tho' delicate, likely to live; the mother is as well as can be expected. Sixteen months before, she had two daughters and one son at a birth.
 Presentations, unnatural, of the lower extremities, 684; of the upper extremities, 685; back, belly, sides, or funis, 689.
 Puerperal fever, 674; sometimes infectious, 675.
 Rachitis, or rickets, 691.
 Rhazes, an Arabian physician, 666.
 Rhodes, Martha, curious case of deformed pelvis, 697.
 Rhodion, his work De Partu, 667; in constant use for a hundred years, 668.
 Rocheus, a French writer on parturition, 667.
 Roonhuyfen's lever, 668.
 Rouffet's cases of cæsarian section, 695.
 Rueff, a Swiss writer and practitioner, 667.
 Rufus Ephesus, an early writer on midwifery, 665.
 Salmon, (Dr.), author of Aristotle's Midwifery, 669.
 Secundines, ancient directions for extracting, 664.
 Sigaultian operation, 693, 4, 5.
 Simfon's System of the Womb, 669.
 Smellie, his excellent works, and good advice, 670.
 Spachius's account of writers on parturition during the sixteenth century, 667.
 Spontaneous evolution, 688.
 Stages of labour, as given by different authors: First stage, 671; second, 672; third and fourth, 673.
 Still-born children, 714.
 Suckling, recommended to all mothers, 712.
 Superfœtation, apparent instances of, 682.
 Symphysis pubis, whether yielding or unyielding, 691; proposal for separating it in some cases, 693.
 Turning, that operation explained, 637, 8.
 Twin-cases, 679; management of, 680.
 Vectis, or lever, 683, 716.
 Uterus, curious account of it by Plato, 665; tumours in, 700; lacerated, 701; inverted, 701, 2; amputation of, 703; imperforate, and absent, 704.
 Waddington, Margaret, has five children at a birth, 681.
 Willughby, Dr. account of the practice in his time, 668.

Wine-hall, 490.

Wool-market, 489.

Wrede, commander of the Bavarian troops, reaches Paris, 553.

In p. 571. we expressed an opinion, that Napoleon's confinement would not end but with his life. That opinion, or prophecy, was written at the moment of its accomplishment, though impossible to be known to us. Our N^o 1265 was published on the 12th of May, 1821; and that extraordinary man had expired on the 5th of the same month. He was taken ill on the 17th of March, and kept to his apartments to the day of his death. During the early part of his indisposition, from the 17th to the 31st of March, he was attended by his own medical assistant, professor Antommarchi, alone. During the latter period, from the 1st of April to the 5th of May, he received the daily visits of Dr. Arnott, surgeon of his majesty's 20th regiment, generally in conjunction with professor Antommarchi. On Tuesday, the 1st of May, was the first time Napoleon's case was considered to be dangerous. Wednesday, the 2d, he got worse. Thursday his life was despaired of. Friday he was somewhat better, having taken a little refreshment. Saturday, the 5th, at five o'clock in the morning, no hopes were entertained of his recovery; and precisely at ten minutes past six o'clock in the evening, he terminated his mortal life. His age was 52; he was born in 1769, the same year that gave birth to his great and successful adversary the duke of Wellington.

As it was necessary that the chief officers of his majesty on the island should be qualified to testify officially the death of this illustrious exile; accordingly, the next morning, the 6th, at about seven o'clock, sir Hudson Lowe, the governor, proceeded to the apartment where the body lay, accompanied by rear admiral Lambert, naval commander in chief on the station; the marquis de Montchenu, commissioner of the king of France, charged with the same duty also on the part of the emperor of Austria; brigadier-general Coffin, second in command of the troops; Thomas H. Brooke, and Thomas Greentree, esqrs. members of council in the government of the island; and captains Brown, Hendry, and Marryat, of the royal navy. After viewing the person of Napoleon Bonaparte, which lay with the face uncovered, they retired. An opportunity was afterwards afforded, with the concurrence of the persons who had composed the family of Napoleon, to as many officers as were desirous, naval and military, to the East-India Company's officers and civil servants, and to various other individuals resident there, to enter the room in which the body lay, and to view it.

As it was the expressed wish of Napoleon that his body should be opened, and as it was also most desirable to the authorities there that the true seat of his disease should be ascertained, it took place at two o'clock, in the presence of the following medical gentlemen: Dr. Shortt, principal medical officer; Dr. Mitchell, surgeon of the Vigo; Dr. Arnott; Dr. Burton, surgeon in the 66th regiment; and Matthew Livingstone, esq. surgeon in the East-India Company's service. Professor Antommarchi operated in the dissection. General Bertrand and count Montholon were present. When the chest was opened, the liver was found to be perfectly sound, with not a mark of disease about it. The French surgeon even cut it through with his dissecting-knife; and all the surgeons who were present agreed that no liver-complaint had ever

existed. But, when they proceeded to the examination of the stomach, all the surgeons instantly called out, "There is the seat of the disease!" It was a cancer of the stomach; the same disorder, it is said, of which his father died: there was a hole in one part of it large enough to admit the point of a man's finger. The medical men unanimously agreed that it could not have been produced by the climate or by depression of mind; and that "he must have died," as madame Bertrand exclaimed when the appearance of the disorder was described to her, "had he been in the midst of his glory at Austerlitz!"

Napoleon was perfectly aware of the nature of his complaint, and frequently described it to those about him, but was never able to convince his surgeons that he had a just notion of it. Mr. O'Meara and Mr. Stokoe always insisted that Napoleon had a liver-complaint, brought on by the climate, and the mode of living he was partly forced to. His friends and adherents always re-echoed these complaints; and Mr. O'Meara has since published some angry remarks upon the report of the government-surgeons. The idea of an hereditary cancer of the stomach, perhaps, will not gain much credit with medical men; but, as the complaint was really cancerous, on the stomach, not hepatic, not produced by the climate, it will be pleasing to Englishmen, and to Napoleon's friends in every country, to be conscious that the treatment of that extraordinary person did not contribute to shorten his life.

With regard to the body's lying in state, and the general admission of the inhabitants of the island to view it, sir Hudson Lowe left the matter entirely to the option of Bertrand and Montholon, who both wished that it should be the case. Accordingly, in the afternoon, soon after the examination of the body by the surgeons, he was dressed in his green uniform with red facings and all his stars and orders. This gave rise to a report, that he had been dressed up before his death in full uniform, and had died so, like Frederic the Great of Prussia. He was placed on a small brass tent-bedstead, which he had with him in most of his campaigns. Under him was his cloak of blue cloth, embroidered with silver, which he wore at the battle of Marengo, which served afterwards for the pall of his funeral. The room where the corpse lay was small, and covered with black cloth; at the head of the corpse was the altar. The priest, marshal Bertrand, count Montholon, and all the servants, were in attendance. His person seemed small, and rather diminutive (exact height five feet seven inches); but the fineness of the countenance exceeded expectation: the face appeared to be large, compared with the body; the features pleasing and extremely regular, still retaining a half-formed smile; and must have been truly imposing, when enlivened by a penetrating pair of eyes. His skin was perfectly fallow, which seemed to be its natural colour.

The body of Napoleon was not embalmed. His heart which Bertrand and Montholon earnestly desired to take with them to Europe, was restored to the coffin, but it remains in a silver cup, filled with spirits: and the stomach, which his surgeon was anxious to preserve, was also restored, and is in another silver cup. At length the whole remains were consigned to three coffins; one of lead, one of plain mahogany, and an outer one of oak,

with

with plain top and sides, black ebony round the edges, and silver-headed screws raised above the lid. The funeral took place on Wednesday the 9th of May, about noon. The heavy coffins containing the body were placed on a car drawn by four of Napoleon's own horses, and attended by 24 grenadiers, 12 on each side, to carry the body down a steep hill where the car could not go. Count Montholon and General Bertrand were the pall-bearers, madame Bertrand with her family following. Next came lady Lowe and her daughters in deep mourning; then the junior officers of the navy; the staff of the army; last, sir Hudson Lowe and the admiral brought up the rear. The 66th and 20th regiments, the artillery, volunteers, and marines, in all full 3000 men, were drawn up, two deep, on the road-side, out of Longwood gates; each man resting the point of his musket on his foot, with the left hand on its butt, and the left cheek leaning on his hand in a mournful position; the band stationed at the head of each corps playing a dead march. The place of interment was at the head of Rupert's Valley, about half way between James-town and Longwood, under the shade of a large willow-tree, near a small spring-well. For some years past he had water carried to him daily from this well, in two silver tankards which he brought from Moscow. Some years since, when visiting this well, in company with madame Bertrand, he said, if the British government buried him on St. Helena, he wished this to be the spot. It is certainly a very retired pretty situation, surrounded by high hills in the form of an amphitheatre, the public road to Longwood leading along the top of the ridge. After letting the coffin into the grave, three volleys were fired, (see p. 719.) and the flag-ship also fired 25 minute-guns. A catholic priest had previously consecrated the place according to the rites of the Romish church. The grave was ten feet long, ten deep, and five wide; the bottom happened to be solid rock, in which a space was cut to receive the coffin; the sides and ends of the grave were each walled in with one large Portland flag, and three large flags were put immediately over the coffin, and fastened down with iron bars and lead, besides Roman cement. The top of the grave is elevated about eight inches above the surface of the ground, and covered over with three rough slates.

Napoleon Bonaparte, once the terror and the scourge of Europe, is now no more. He was the inveterate enemy of this country, it is true; but he paid the full forfeit; and, if he did us much injury by his hostility, it was also the means of calling forth so many energies, and producing such a display of patriotism on the part of the country, that it may be fairly doubted, whether he served or injured us most by his enmity. But he is dead; and the hatred which he excited when alive is buried in the grave which encloses his remains. Whatever shall be said of him henceforth will not be marked by vindictive feelings; an exception may occur here and there, but the generous and high-minded will mark it with indignation. The towering height to which he ascended; the self-possession which he displayed during his meteor-

like ascent; the humble level from which he darted; and the presence of mind, or rather perfect ease, which he displayed, when he alighted on that narrow and giddy summit, evidently proved that his genius was of the eagle kind. He rose by the natural strength of his wings; and, when he soared at a vast distance above the ordinary region of humanity—in that keen air, where mortals can scarcely breathe—it was plain that he was in a congenial element. But, if he had powers more than mortal, he wanted the amiable qualities of human nature—he neither loved nor pitied—he took no part in their feelings; and he never stopped a moment to consider, when he was rushing upon one of those enterprises which astonished the world by their grandeur, and by the rapidity with which they were executed, what mischief he might occasion in consequence. He was apparently unmoved by human sufferings, and he probably participated as little in their joys. This insensibility was one of the causes of his wonderful success; and it was, no doubt, one of the reasons of his rapid descent. He had nothing to arrest him in his ascent. Pleasure called to him in vain to stop and refresh himself in one of her bowers, whilst he was bounding up the steep and rugged hill of ambition. The Charities implored him to no purpose to check his furious pace; and, when we consider the natural strength of his genius, without any thing to impede it in its course, we are not astonished at the height to which he mounted. As to his military talents, they are so deeply engraved in the brazen tablet of fame, that it would show less stupidity, than the envy of a base spirit, to deny them. But it was in his capacity of ruler, that the hardness of his character chiefly displayed itself. There his solitary nature was most conspicuous. From his elevated throne he looked down only upon crouching slaves. He conferred upon them titles and honours and dignities; but they were badges of servitude, or the rewards of having ministered to his glory; they conferred no real dignity of mind; they imparted no conscious pride; and they served only by their decorations and wealth to swell the pomp of his court. The principle of his government was selfishness; and we are compelled to say, whilst we are disposed to do ample justice to his extraordinary genius, that he did not make use of it in such a manner as ought to give him a title to the respect and gratitude of mankind.

Never has there been a more striking instance of the insubstantiality and worthlessness of popular affection than the effect (or rather no effect) produced at Paris by the account of Bonaparte's death. The people who, but a few years back, either trembled before him in fear or hailed his appearance with shouts of enthusiasm, now listened to the narrative of his death with an absence of emotion nearly amounting to complete apathy; they took scarcely the trouble of expressing their surprise on the occasion; and the principal and almost only remark on the circumstance was, that "he should not have gone to die at St. Helena, but ought to have died, as he lived, an emperor, at Waterloo."
